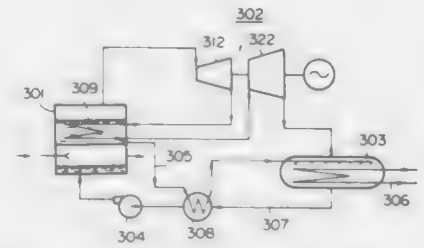
MASTER CYLINDER WITH SANDWICHED COMMUNICATION INTERFACES

John E. Steer, South Bend, Ind., assignor to Allied-Signal Inc., Morristown, N.J.

Filed Dec. 12, 1989, Ser. No. 449,196
Int. Cl.[5] B60T 11/20, 11/232, 11/236, 11/28
U.S. Cl. 60—562 22 Claims



1. A master cylinder, comprising a first housing part and a second housing part and having an end of one part received at the end of the other part so that the parts define therebetween an interior opening comprising a bore, a sleeve member received within said second housing part, first piston means slideably received within an end opening of said second part, second piston means received within said bore and biased by first resilient means, second resilient means biasing the first piston means, a reservoir communicating with said bore, and first and second interface members captured between said first and second parts, the interface members having sealing members molded thereupon to provide fluid flow paths between the reservoir and bore and between said bore and fluid outlets.

HYBRID RANKINE CYCLE SYSTEM

Tetsuyoshi Ishida; Shigeyoshi Kawano, both of Kure; Ikuo Kohtaka, Kamo; Kojiro Yamada; Hiroyuki Kaku, both of Hiroshima, and Tsuneo Narita, Tokyo, all of Japan, assignors to Babcock-Hitachi Kabushiki Kaisha, Tokyo, Japan

Filed Feb. 9, 1989, Ser. No. 308,812
Claims priority, application Japan, Dec. 18, 1987, 62-320579; Feb. 12, 1988, 63-30648; Mar. 24, 1988, 63-70438; Mar. 24, 1988, 63-70440
Int. Cl.[5] F01K 25/06
U.S. Cl. 60—673 8 Claims

1. A hybrid Rankine cycle system, comprising:
separating means including a heating device for separating working medium steam from weak absorbent solution including said working medium and a substance having a boiling point higher than a heating temperature in said heating device, thereby leaving a strong absorbent solution, said substance being selected from the group consisting of alkali metal halides and alkali earth metal halides;
wherein said separating means includes a boiler for heating said weak absorbent solution to separate said steam and said strong absorbent solution therefrom;
a steam driven prime mover through which said steam from said separating means expands to produce work outside, wherein said prime mover is a multiple-stage turbine, and said system includes heat transfer means disposed within said separating means for transferring heat from steam and/or said strong absorbent solution in said separating means to steam passing out from one stage of said turbine, and wherein the steam from said heat transfer means is delivered into a next stage of said turbine;
an absorber condenser means for introducing thereinto said strong absorbent solution to absorb into steam from said prime mover to produce said weak absorbent solution;
means for delivering said weak absorbent solution towards said separating means; and
means for delivering said strong absorbent solution from said separating means towards said absorber condenser means.

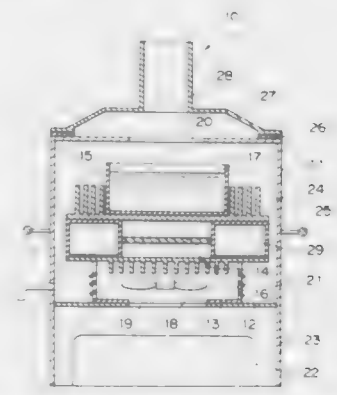
KINETIC ENERGY RECOVERY DEVICE OF LIQUID AND GAS

Yutaka Saitou, 24-25, 1-chome, Kikui, Nishi-ku, Nagoya-shi, Aichi-ken, Japan

Filed Sep. 12, 1989, Ser. No. 406,397
Int. Cl.[5] F01B 21/04; F02B 73/00
U.S. Cl. 60—698 10 Claims

1. A kinetic energy recovery device comprising:
(a) a gas guide member;
(b) a liquid guide member installed along said gas guide member, said gas guide member and said liquid guide member partly communicating with each other;
(c) a vane wheel supported rotatable by a rotary shaft supported at the communicating portion between said gas guide member and said liquid guide member in the lateral direction with respect to the longitudinal direction of both guide members and rotating on receiving the rotating force from a gas flow rising in said gas guide member and a liquid flowing down in said gas guide member;
(d) a first liquid storage member installed on the upper end of said liquid guide member;
(e) a second liquid storage member installed at lower side of said liquid guide member;



(f) a liquid pumping-up means for pumping up a liquid from said second liquid storage means into said first liquid storage member;
(g) an energy recovery means; and
(h) means for transmitting the rotation of said vane wheel to said energy recovery means.

THERMOELECTRIC HUMIDIFIER AND DISPLAY CASE PROVIDED WITH SUCH HUMIDIFIER

Hitoshi Nakayama, Kamagaya, Japan, assignor to Snow Brand Milk Products Co., Ltd., Hokkaido, Japan

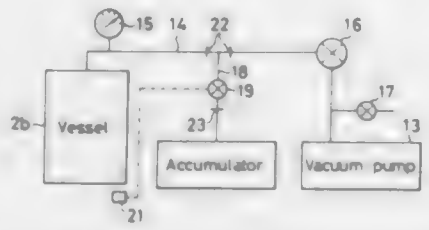
Filed Sep. 19, 1989, Ser. No. 409,338
Claims priority, application Japan, Sep. 30, 1988, 63-128485[U]
Int. Cl.[5] F25B 21/02
U.S. Cl. 62—3.2 7 Claims

1. A humidifier for producing cooled and humidified air, comprising:
(1) a Peltier effect element having a heat radiating side and a cooling side;
(2) means for passing air near said cooling side for producing cooled air,
(3) a reservoir for containing a quantity of water disposed apart from but near said heat radiating side such that radiated heat to said reservoir and said water is sufficient to heat said water and to produce water vapor from the quantity of water such as to substantially humidify said cooled air;
(4) passage means for passing said cooled air into and mixing with said water vapor, whereby cooled and substantially humidified air is produced; and

(5) an outlet to exhaust said cooled and humidified air from said humidifier.

5,007,243

VESSEL FOR MAKING HIGH-PURITY FINE PARTICLES OF ACTIVE METALS



Toru Yamaguchi, Sakura; Yukio Inazuki, Sayama, and Hideo Nakazawa, Funabashi, all of Japan, assignors to IHI Master Metal Ltd. and Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan

Division of Ser. No. 378,531, Jul. 11, 1989, Pat. No. 4,971,258. This application Nov. 21, 1989, Ser. No. 440,056

Claims priority, application Japan, Aug. 26, 1988, 63-210620; Sep. 2, 1988, 63-218486

Int. Cl.[5] F25B *19/00*

U.S. Cl. 62—51.1 **9 Claims**

1. Apparatus for use in manufacturing high-purity fine particles of reactive metals, comprising

a hermetically sealable vessel for containing inert gas atmosphere therein;

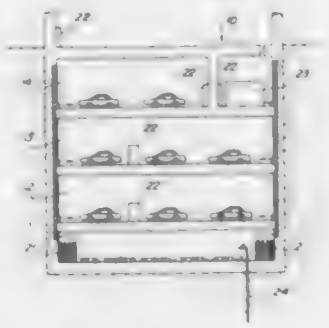
a pair of rubber gloves for conducting operations within the vessel under the inert gas atmosphere;

a cryogenic cooling device attached to one wall of the vessel so as to condense the moisture remaining in the inert gas atmosphere into dew droplets; and

an accumulator for equalizing the inner pressure of the vessel with the ambient atmospheric pressure.

5,007,244

DISASTER PREVENTION SYSTEM AND CONSTRUCTION FOR AN UNDERGROUND SPACE



Kei Mori, 3-16-3-501, Kaminoge, Setagaya-ku, Tokyo, Japan

Filed Oct. 11, 1989, Ser. No. 419,936

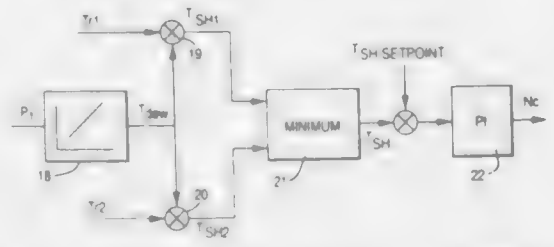
Claims priority, application Japan, Dec. 21, 1988, 63-322760; Feb. 21, 1989, 1-40886

Int. Cl.[5] F17C *1/00*

U.S. Cl. 62—53.1 **4 Claims**

1. A disaster prevention system for an underground space comprising liquid air storage means for storing liquid air in said underground space, a power generator means in said underground space, conduit means in said underground space leading from said liquid air storage means to a plurality of locations in said underground space such that liquid air released from said liquid air storage means provides compressed air in said conduit means, said conduit means having a plurality of compressed air outlets located at a plurality of locations in said underground space such that the compressed air in said conduit means is discharged through said outlets to thereby maintain said underground space at pressure higher than atmospheric pressure, said conduit means comprising a conduit means portion leading to said generator means such that the air for operating said generator means is supplied by said liquid air storage means via said conduit means.

5,007,245



VAPOR CYCLE SYSTEM WITH MULTIPLE EVAPORATOR LOAD CONTROL AND SUPERHEAT CONTROL

John F. Defenbaugh, Rockford, and Albert L. Markunas, Roscoe, both of Ill., assignors to Sundstrand Corporation, Rockford, Ill.

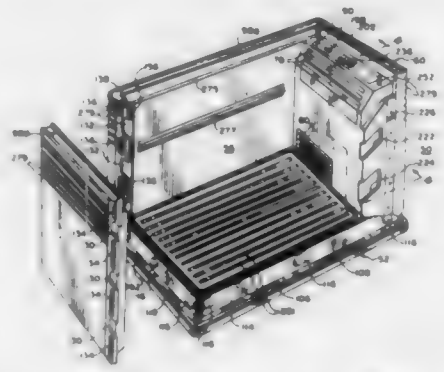
Filed Sep. 1, 1989, Ser. No. 401,866

Int. Cl.[5] F25B *1/00*

U.S. Cl. 62—117 **22 Claims**

1. A vapor control system, comprising a variable speed compressor, a condenser operatively associated with the compressor, a plurality of evaporators operatively associated with the compressor and the condenser, means for controlling compressor speed to provide a refrigerant superheat temperature at least equal to a selected value so as to provide substantially only refrigerant vapor at an inlet of the compressor, and means for individually controlling load temperature of each evaporator.

5,007,246



MODULAR MECHANICAL REFRIGERATION UNIT

Richard W. Kruck, Sodus Township, Berrien County; Omer N. Cur; Douglas D. Leclear, both of St. Joseph Township, Berrien County; Steven J. Kuehl, Royalton Township, Berrien County, all of Mich., and Ralph R. Burin, Milton Township, DuPage County, Ill., assignors to Whirlpool Corporation, Benton Harbor, Mich.

Division of Ser. No. 489,441, Mar. 12, 1990, which is a division of Ser. No. 218,233, Jul. 12, 1988, Pat. No. 4,907,419. This application May 18, 1990, Ser. No. 412,981

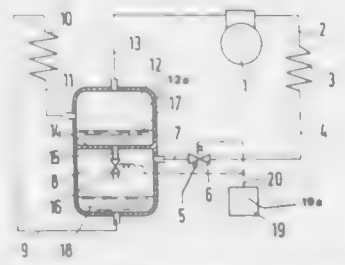
Int. Cl.[5] F25B *49/02*

U.S. Cl. 62—131 **7 Claims**

1. A system in a refrigeration unit for detecting when a closure panel of the unit is ajar comprising a first switch positioned to be engaged by a hinge side of said closure panel and having contacts which are open when said closure panel is open, said first switch contacts being closed in response to closure of said closure panel, a second switch positioned to be engaged by the outer edge of said closure panel and having contacts which are normally closed when said closure panel is open, said second switch contacts being opened in response to complete closure of said closure panel, delay means responsive to closure of said first switch contacts for initiating a time delay of predetermined duration, and means for energizing an alarm if said second switch contacts are not opened before the end of said time delay of predetermined duration.

5,007,247

REFRIGERATION OR HEAT PUMP INSTALLATION



Per Danig, Holte, Denmark, assignor to Danfoss A/S, Nordborg, Denmark

Filed Sep. 25, 1989, Ser. No. 411,880

Claims priority, application Fed. Rep. of Germany, Sep. 30, 1988, 3833209

Int. Cl.[5] F25B *41/00*

U.S. Cl. 62—174 **16 Claims**

1. A refrigeration or heat pump installation that utilizes a fluid refrigerant, comprising a liquid separator having an intermediate chamber and a liquid chamber, the liquid chamber having an upper portion and a lower portion above the intermediate chamber, a compressor, a suction conduit fluidly connecting the compressor to the upper portion of the liquid chamber, a condenser, a pressure conduit connecting the condenser to the compressor, an evaporator, a third circuit for conducting fluid from the intermediate chamber to the evaporator, a fourth conduit for conducting fluid from the evaporator to the liquid chamber and control means for controlling fluid flow from the condenser to the intermediate chamber and liquid flow from the lower portion of the liquid chamber to the intermediate chamber, the control means including first switching valve means operable between an opened and a closed position for controlling the flow of fluid from the condenser to the liquid separator, second switching valve means operable between an opened and a closed position for controlling the liquid flow to the intermediate chamber and being operated in the opposite sense from the first switching valve means, the first switching valve means including an expansion valve

BEVERAGE COOLING SYSTEM

Eliahu Maier, Petach Tikva; Yair Kovesh, and Abraham Zorea, both of Kfar Szold, all of Israel, assignors to Lordan & Co., Mobile Post Galil Elyon, Israel

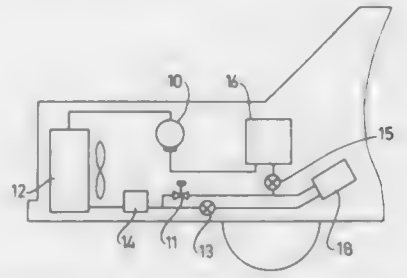
Filed Oct. 30, 1989, Ser. No. 429,145

Int. Cl.[5] B60H *1/32*

U.S. Cl. 62—244 **4 Claims**

4. A vehicle having an integrated air conditioning system and beverage cooling system comprising:

means for compressing a refrigerant fluid,



first means for receiving and evaporating the compressed refrigerant fluid,

means associated with said air conditioning system for circulating air across said first means for receiving and evaporating,

second means in heat conductive engagement with a beverage container for receiving and evaporating the compressed refrigerant fluid; and

first and second means located downstream of said means for compressing and upstream of respective said first and said second means for receiving and evaporating for receiving and causing expansion of the refrigerant fluid;

wherein said first means for receiving and evaporating receives the refrigerant fluid in liquid form at a first pressure and at a first temperature and is operative to reduce the pressure of the liquid too a second pressure and the temperature of the liquid to a second temperature, the second pressure and the second temperature being respectively substantially lower than the first pressure and the first temperature; said second means for receiving and evaporating receiving the refrigerant fluid in liquid form at a third pressure and at a third temperature and being operative to reduce the pressure of the liquid to a fourth pressure and the temperature of the liquid to a fourth temperature, the fourth pressure and the fourth temperature being respectively substantially lower than the third pressure and the third temperature;

wherein said first means for receiving and causing expansion comprises means for providing a first constriction to the fluid flow and aid second means for receiving and causing expansion comprises means for providing a second constriction to the fluid flow greater than said first constriction;

and wherein said first means for receiving and causing expansion and said first means for receiving and evaporating are arranged in series with and downstream of said second means for receiving and causing expansion and said second means for receiving and evaporating, there also being provided a valve associated with a fluid flow path extending between an inlet located upstream of said second means for receiving and causing expansion and an outlet located between said second means for receiving and evaporating and said first means for receiving and causing expansion, the fluid being permitted to flow through said valve when aid valve is open, substantially to the exclusion of fluid flow through said second means for receiving and causing expansion and said second means for receiving and evaporating, fluid flow being diverted through said second means for receiving and causing expansion and said second means for receiving and evaporating when said valve is closed.

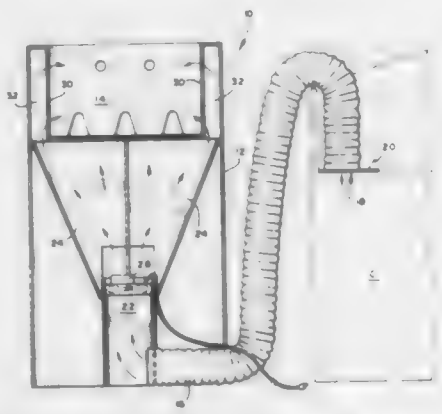
5,007,249

IN STORE KEEP-A-COOLER

Albert Van Druff, Jr., Lawrenceville, Ga., assignor to Cornerstone Products Inc., Norcross, Ga.

Filed Mar. 2, 1990, Ser. No. 487,147

Int. Cl.[5] A47F *3/04*



U.S. Cl. 62—255 **10 Claims**

1. An auxiliary, portable storage and cooling unit for use in combination with a primary source of refrigerated air comprising:

a housing having inner and outer wall surfaces and including a support base and upper opening;

a product storage compartment formed in said upper opening of said housing;

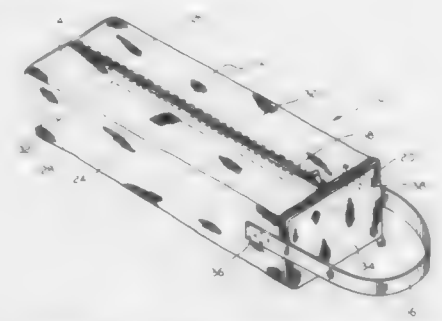
a refrigerated air flow path including, an air inlet duct having an inlet opening structured to be in fluid communication with said primary source of refrigerated air, an air inlet chamber connected to said air inlet duct;

a plurality of funnel-shaped air distribution ducts increasing in size upwardly and outwardly from said air inlet chamber toward said housing inner wall surfaces;

a plurality of air distribution chambers located between said product storage compartment and said inner wall surfaces of said housing; and

air flow openings formed in said product storage compartment permitting flow of refrigerated air from said air distribution chambers into said product storage compartment.

5,007,250



INSULATED COOLING CONTAINER FOR CANNED LIQUIDS

Ronald L. Musielak, Downers Grove, Ill., assignor to R.V.R. Enterprises, Ltd., Lombard, Ill.

Filed Nov. 1, 1989, Ser. No. 429,988

Int. Cl.[5] F25D *3/08*

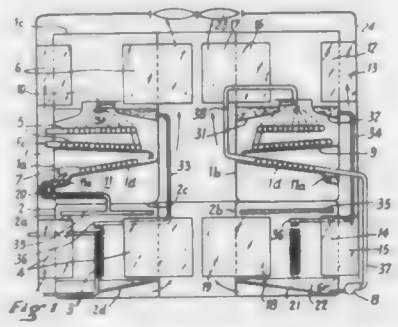
U.S. Cl. 62—372 **10 Claims**

1. A portable insulated cooling container comprising a first compartment adapted to receive beverage containers to be maintained in a cool state; a second compartment adapted to receive a coolant material, a pliant substantially non-insulating material in said cooling container separating said first compartment and said second compartment; a first opening in said first compartment, and first closure means to selectively open and close said first compartment; a second opening in said second compartment, and second closure means to selectively open and close said second compartment; said first and second compartment being independently accessible through said first and second openings, respectively.

5,007,251

INSTALLATION FOR AIR-CONDITIONING BY ABSORPTION

Jean-Luc Thuez, St-Germain-en-Laye, and Robert Dehausse, Joinville, both of France, assignors to A.R.M.I.N.E.S., Paris, France



PCT No. PCT/FR88/00598, § 371 Date Aug. 2, 1989, § 102(e) Date Aug. 2, 1989, PCT Pub. No. WO89/05427, PCT Pub. Date Jun. 15, 1989

PCT Filed Dec. 7, 1988, Ser. No. 392,953

Claims priority, application France, Dec. 7, 1987, 87 16981

Int. Cl.[5] F25B *15/00*

U.S. Cl. 62—476 **20 Claims**

1. Installation for air-conditioning by absorption, comprising:

a high-pressure enclosure **1** containing a heater heated to high temperature, in which a refrigerating fluid is driven by evaporation to form a gaseous refrigerant, and a condenser on which the refrigerating fluid is liquidified; and

a low-pressure enclosure **2** containing an evaporator on which the liquified refrigerant is vaporized for producing a desired cold and an absorber on which the gaseous refrigerant is reabsorbed in the depleted solution before being returned to the heater via a pump;

said high-pressure enclosure **1** and said low-pressure enclosure **2** each having a generally toric-shaped casing with a common vertical axis, said high-pressure enclosure **1** being located above and superimposed on said low-pressure enclosure **2**;

means enclosing a high-pressure and a low-pressure central free space in each said enclosure, said high-pressure central free space in said high-pressure enclosure is de-limited by central cylindrical wall **1***a* and being coaxial with said common vertical axis, and said low-pressure central free space in said low-pressure enclosure is de-limited by central cylindrical wall **1***b* and coaxial with said vertical axis; and

cooling means **16–18** positioned in said central free space delimited by said cylindrical inner walls **1***b* of said two casings of said two enclosures **1, 2**, for ensuring partial or total exchange of heat energy produced by condensation, absorption and possible evaporation.

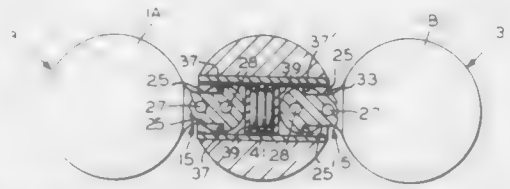
COMBINATION NECKLACE

Shigetoshi Mochizuki, Chofu-City, Japan, assignor to Satoru Yagi, San Francisco, Calif.



Filed Nov. 8, 1989, Ser. No. 433,651

Claims priority, application Japan, Jun. 20, 1989, 1-61737

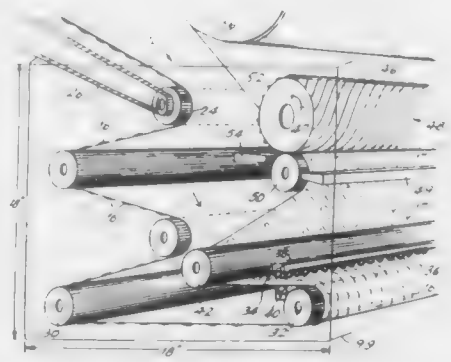
Int. Cl.[5] A44C *5/00*

U.S. Cl. 63—3 **5 Claims**

1. A combination necklace comprising a first necklace formed of a plurality of first stones, means for joining the first stones together into a first string of stones, a pair of first connection fittings, said first connection fittings being joined to a respective first stone at each end of the first string, each of said first connection fittings comprising a first end stone which includes an outwardly projecting mating part, a second necklace formed of a plurality of second stones of a type similar to the first stones, means for joining the second stones together into a second string of stones, and a pair of second connection fittings, said second connection fittings being joined to a respective second stone at each end of the second string, each of said second connection fittings comprising a second end stone which includes an outwardly projecting mating part, and at least one joining stone of a type similar to the first stones, said first and second stones and first and second end stones and said joining stone having substantially the same predetermined size and shape, said joining stone including means for removably

engaging said connection fittings to join ends of either of the first and second strings together, said last-mentioned means includes a bore formed through the joining stone with the bore having first and second openings on opposite sides of the joining stone, said bore being sized sufficient to slidably receive said mating parts of the first and second connection fittings through respective first and second openings, said joining stone including an engagement protrusion concealed within the bore for releasably holding the mating parts of the first and second connection fittings to the joining stone.

5,007,253



PORTABLE LACE CLIPPING AND SHEARING APPARATUS FOR SYNCHRONOUS OPERATION WITH A LACE-KNITTING MACHINE

Thomas Rahner, 1126 17th Ave., West Belmar, N.J. 07719

Continuation-in-part of Ser. No. 173,079, Mar. 25, 1988, abandoned. This application Feb. 6, 1989, Ser. No. 306,947

Int. Cl.[5] D04B *35/00*

U.S. Cl. 66—149 R **10 Claims**

1. A portable and wheelable clipping and shearing machine for finishing lace sheet produced by a lace machine, said portable machine comprising:

a housing and a plurality of wheel means mounted to the housing for supporting the housing and enabling the housing to be wheeled to a location adjacent a lace machine;

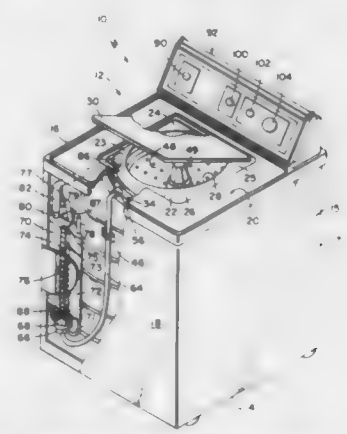
a take up roller, supported by the housing, for taking up lace sheet as it emerges from said lace machine and a conveying means for conveying lace sheet through said clipping and shearing machine along a predetermined path;

clipping means, supported by the housing, for clipping floats disposed on said lace sheet to cut said floats into strands, each one of said strands being connected at one end thereof to a respective motif located on said lace sheet;

shearing means, supported by the housing, for shearing said strands from said lace sheet close to said respective motives; and

coupling and synchronizing means for detachably coupling said portable machine to the lace machine in a manner enabling said portable machine to be driven from said lace machine and in a manner wherein the speed of movement of said lace sheet through said portable machine is synchronized to the speed at which said lace sheet emerges from said lace machine, said coupling and synchronizing means comprising the sole mechanical linkage between said portable machine and said lace machine whereby said machines may be easily and rapidly disattached and attached from and to one another.

5,007,254



ADDITIVE FLUID VIEWING

Robert E. Wolfe, Millis, and Ronald A. Goyette, Ashby, both of Mass., assignors to Raytheon Company, Lexington, Mass.

Continuation of Ser. No. 458,218, Dec. 28, 1989, abandoned. This application Nov. 9, 1990, Ser. No. 610,739

Int. Cl.[5] D06F *39/02*; **G01F** *23/02*

U.S. Cl. 68—17 R **6 Claims**

1. A clothes washing machine comprising:

a cabinet having a front defining wall provided with a vertically elongated window;

a drain tub disposed in said cabinet and adapted for holding wash water;

a spin tub rotatably disposed within said drain tub, for processing a wash load in said cabinet; and

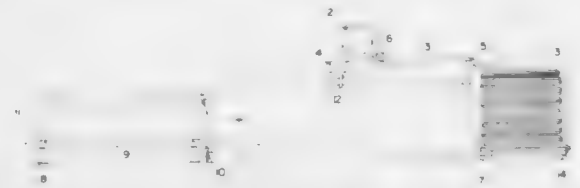
an additive liquid dispensing system disposed in said cabinet for dispensing additive liquid to said wash water, said dispensing system comprising a reservoir including housing means having a hollow interior portion for holding a multi-load quantity of the additive liquid and supplying respective smaller quantities of the additive liquid to successive wash loads in said drain tub, said dispensing system further comprising additive liquid viewing means comprising a transparent portion of said reservoir aligned with said window for determining the level reached by the quantity of additive liquid in said housing means.

5,007,255

AUTOMATIC LOADING AND UNLOADING SYSTEM FOR DYEING MACHINES USING WOUND-UP FABRIC AND RELATIVE DEVICE FOR ITS ACCOMPLISHMENT

Giampietro Brazzoli, Milan, Italy, assignor to Brazzoli S.p.A., Italy

Filed Nov. 27, 1989, Ser. No. 442,023



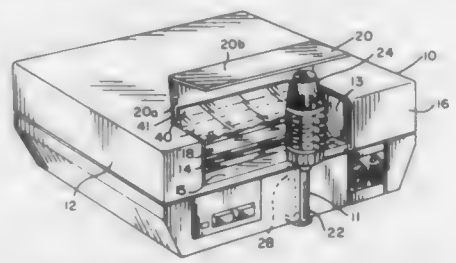
Claims priority, application Italy, Nov. 29, 1988, 22785 A/88

Int. Cl.[5] D06F *23/16*

U.S. Cl. 68—210 **7 Claims**

1. Automatic loading and unloading device for a dyeing machine of the type having a kier for receiving fabric folded up into cords, characterized by the fact that, the fabric to be dyed is folded outside the dyeing machine kier, and comprising a perforated vat similar in form and dimension to the kier of the

dyeing machine, means at the exterior of said machine for folding into said vat the fabric which is to be dyed, said folded fabric being disposed to be introduced with the vat into said machine where it undergoes a dyeing operation, said machine having thereon a water tight introduction door through which



said vat passes in and out of said machine, and the dyed fabric being disposed to be drawn out in the vat from the machine after the dyeing procedure, and to be immediately substituted with another amount of fabric to be dyed prefolded in another vat.

5,007,256

CARTRIDGE OPERATED ENTERTAINMENT SYSTEM WITH REMOVAL DETERRENT DEVICE FOR PREVENTING UNAUTHORIZED USE

Thomas E. Lowe, 35W528 Parsons, Dundee, Ill. 60118

Filed Sep. 20, 1989, Ser. No. 409,682
Int. Cl.[5] **E05B** *73/00*
U.S. Cl. 70—14 **23 Claims**

1. A cartridge-operated entertainment system comprising:
a housing having a cartridge receiving access opening,
a removable deterrent device for preventing unauthorized use of said entertainment system,
said deterrent device comprising a base with first means removably engageable with said housing and second means positionable adjacent said access opening for preventing insertion of a cartridge into said opening when said first means is engaged with said housing,
a removable locking head selectively positionable and lockable on said second means for preventing disengagement of said first means from said housing,
said housing including a door that is selectively movable between an open position for permitting access to said cartridge receiving access opening and a closed position, and
a flexible shield secured to an underside of said door for covering and protecting said cartridge receiving access opening from dust and other foreign matter when said deterrent device base is engaged with said housing and said cover is in an open position.

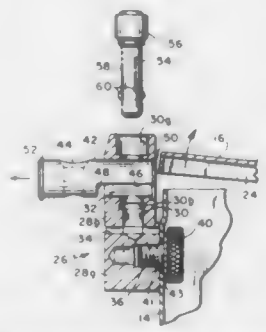
SAFETY SHIELD FOR DOUBLE-LOCK HANDCUFFS

Charles E. Thompson, 945 Garfield St., Oak Park, Ill. 60304

Filed Oct. 9, 1990, Ser. No. 594,414
Int. Cl.[5] **E05B** *75/00*
U.S. Cl. 70—16 **7 Claims**

1. A safety shield for handcuffs having a pair of wristlets connected by a chain, first lock means on each wristlet for disengagement and opening thereof after application to a wrist and second lock means on each wristlet for fixing the preset contracted position thereof on a wrist, comprising:
a rigid body having hinged members movable between open and closed positions operationally mountable on said wristlets to enclose said chain and first and second lock means and form a rigid connection between the wristlets; and



access means on said rigid body for enabling access to said second lock means,
whereby said rigid body is operationally mountable on said handcuffs before application to the wrists and said second lock means can be actuated after application to the wrists with said body members in the operationally closed position.

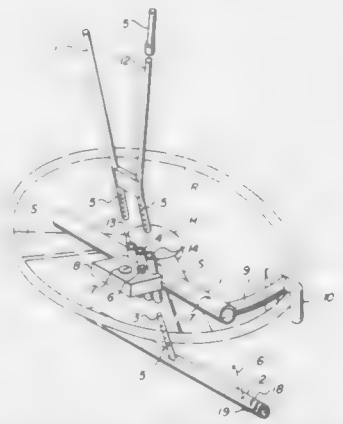
BOX LOCK ASSEMBLY

John C. Mahaney, Rutland, Mass., assignor to Olson Manufacturing Co., Holden, Mass.

Filed May 18, 1990, Ser. No. 525,736
Int. Cl.[5] **B65D** *55/14*
U.S. Cl. 70—159 **13 Claims**



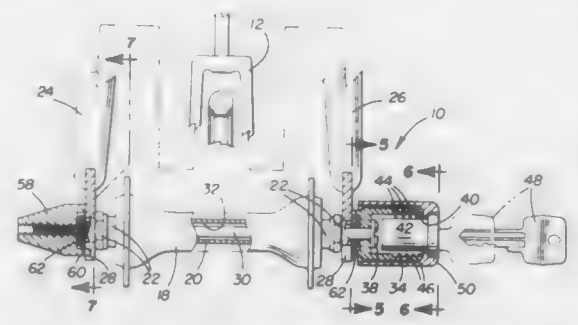
1. For use in combination with an electric meter box or other like enclosure having a base wall, a side wall, and a cover which may be opened to gain access to the interior of the box, and which when closed, overlaps said side wall and prevents such access, a lock assembly for maintaining said cover in its closed position, said lock assembly comprising:
a housing having a base portion and a head portion, said head portion defining a lock chamber intersected by a through first passageway;
means accessible from the interior of said box for securing said base portion to the exterior of said side wall at a location such that said head portion protrudes above the level of the closed cover;
a post member having a second passageway extending therethrough, said post member being receivable in said first passageway for selective movement between an operative position at which said post member overlaps the closed cover to prevent opening thereof and said second passageway is aligned with said lock chamber, and an inoperative position at which said post member is clear of the closed cover to permit opening thereof; and
a barrel lock removably receivable in said lock chamber to extend through the thus aligned second passageway to thereby prevent movement of said post member from said operative position to said inoperative position.

5,007,259

AUTOMOBILE ANTI-THEFT DEVICE

David Mellard, 701 SE. 22nd St., Fort Lauderdale, Fla. 33316

Filed Feb. 8, 1990, Ser. No. 476,785
Int. Cl.[5] **B20R** *25/02*
U.S. Cl. 70—209 **16 Claims**



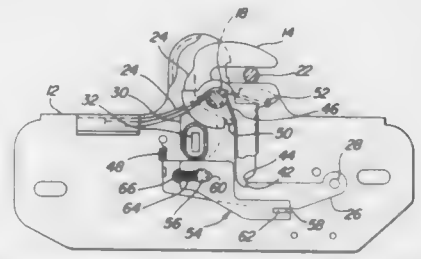
1. An anti-theft device for a motor vehicle having a driver's seat with a seatback and a steering wheel with opposite sides, a rim and a spoke, comprising a first rod disposed on one side of the rim and the spoke of the steering wheel, a projector bar, a second rod being disposed on the other side of the rim and the spoke of the steering wheel, a locking spike attached to said second rod, first means for locking between said first and second rods, and second means for locking said projector bar to said first rod with said projector bar extending toward the seatback regardless of the rotational position of the steering wheel for preventing a person from sitting on the driver's seat.

5,007,260

BICYCLE LOCKING SYSTEM

Harry Sharp, 430 Sanchez, Apt. B, San Francisco, Calif. 94114

Filed Jun. 29, 1990, Ser. No. 546,241
Int. Cl.[5] **E05B** *71/00*
U.S. Cl. 70—233 **19 Claims**



1. A system for lockingly affixing a removable component between a bifurcated portion of a wheeled vehicle comprising:
shaft means for passing between the bifurcated portion of the wheeled vehicle, said shaft means defining a bore therethrough;
spindle means for passing through said shaft means bore, the spindle means having an integrally formed enlarged end, said enlarged end formed to receive a wrench capable of turning said spindle means and said spindle means further defining a threaded end distal of said enlarged end;
a lug threadably engageable with said spindle means threaded end, said lug defining engagement means for engaging said bifurcated portion whereby said lug becomes non-removable when said spindle means is passed through said shaft means bore and when said spindle means is threadably engaged therewith; and
cylindrically shaped lock means for rotatably covering said enlarged end while said spindle means is passed through said shaft means and said lug is engaged with said bifurcated portion.

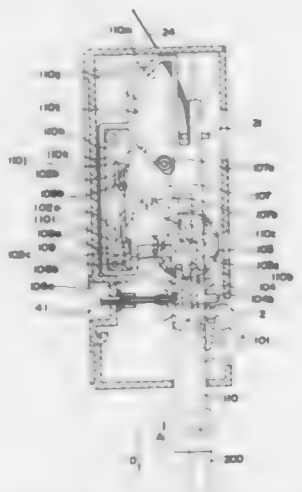
ELECTRICALLY ACTUATED LOCK MECHANISM WITH ELECTRICAL FAILURE PROTECTION

Norman G. Quantz, 2584 Norway Lake Rd., Lapeer, Mich. 48446



Filed Jul. 20, 1989, Ser. No. 383,198
Int. Cl.[5] **E05B** *60/19*
U.S. Cl. 70—240 **20 Claims**

1. A locking mechanism for entrapping a lock bar comprising:
a support frame;
a lock member pivotally attached to said support frame, said lock member having a lock dog and a guide tab;
a release member slidably attached to said lock member, said release member having a linear slot receiving said guide tab therein, said release member being displaceable along said linear slot between an engage and release position;
latch means having a latch member pivotally attached to said support frame and displaceable between an open and a locked position, said latch member having a dog catch engaging said lock dog to lock said latch member in said locked position, and a catch slot receiving said lock bar in said open position and entrapping said lock bar in said locked position, said latch means further being pivotable in response to forcibly rotating said latch member beyond said locked position to displace said release member to said release position;
first resilient means for producing a force biasing said latch member towards said open position;
second resilient means for producing a force biasing said lock member towards a locked position engaging said lock dog with said dog catch;
third resilient means for producing a force biasing said release member to said engage position;
a housing attached to said support frame;
a cam gear rotatably disposed in said housing, said cam gear having a predetermined cam surface;
an electric motor for rotating said cam gear;
at least one stud, protruding from said cam gear, engaging said latch means as said cam gear rotates through a first rotational interval to displace said latch member to said locked position, said at least one stud further engaging said release member when said release member is in said engage position to displace said lock member during a second rotational interval of said cam gear to disengage said lock dog from said dog catch, said at least one stud not engaging said release member when said release member is displaced by said latch means to said release position; and
cam actuated switch means responsive to the displacement of said latch means from said open position towards said locked position for providing electrical power to said electric motor and responsive to a first contour of said cam surface for terminating said electrical power to said electric motor after said latch member is in said closed position, said cam actuated switch means further being

responsive to an unlock signal for providing electrical power to said electric motor and responsive to a second contour of said cam surface for terminating said electrical power to said electric motor after said latch member is released from said locked position by the disengagement of said dog catch.

DIAL LOCK
Hatsuo Nakai, Toyonaka, Japan, assignor to Clover Co., Ltd., Osaka, Japan
Continuation-in-part of Ser. No. 215,584, Jul. 6, 1988, Pat. No. 4,905,488. This application Jun. 16, 1989, Ser. No. 367,722
Int. Cl.[5] E05B *37/02*
U.S. Cl. 70—312 4 Claims

1. A setting part of a dial clock comprising:
a lock pin having a plurality of projections formed at fixed spatial intervals along said axial direction thereof;
a slide bar having a projection and recess in a fixed configuration at said side thereof abutting one end of said lock pin, subjected to control over said movement thereof by engagement of said projection and recess with said lock pin, and serving for opening and closing said door while acting in association with said locking part to lock said door;
lock gears disposed on the same axis as the rotating axis of said lock pin, numerically corresponding to projections of said lock pin, having gates to detachably engage with projections of said lock pin of the inner periphery and also having gearing teeth on the outer periphery thereof;
intermediate gears having internal teeth to detachably engage with external teeth of said lock gears and further having gearing teeth on the other part, for example, the outer periphery thereof;
dials having gearing teeth to interlock with external teeth of said intermediate gears and each provided with code digits on the outer periphery thereof;
return-to-zero gears fixed to said dials for returning said dials to the zero-indicating positions;
interlocking levers to catch said slide bar while engaging with said return-to-zero gears when said dials are all set at zero and to permit locking operation of said slide bar when at least one of said dials is set at any number other than zero;
return cams provided on said slide bar for controlling the operation of said interlocking levers;
arms acting in association with locking and unlocking operation of said slide bar and driving said return-to-zero gears for adapting said dials to return to the zero-indicating positions at the time of locking and unlocking; and
manual operation plates having gearing teeth to engage with said external gearing teeth of said intermediate gears.

SECURITY DEVICE
Bryan V. Taylor, #601 - 7275 Salisbury Avenue, Burnaby, Canada V5E 4E1
Filed Jun. 22, 1990, Ser. No. 542,085
Int. Cl.[5] E05B *13/04*
U.S. Cl. 70—416 4 Claims

1. An improved security device mountable on an inside surface of a closure and comprising:
(a) a U-shaped member;
(b) a locking plate having upper, middle and lower regions, said locking plate having a first opening in said upper region being adapted to engage a latch of a deadbolt and a second opening in said middle region being adapted to engage a key head of a key inserted into a deadbolt; and
(c) pivotal connecting means in said lower region for removably connecting said U-shaped member to said locking plate with said U-shaped member extending below said locking plate;
(d) whereby said U-shaped member may engage a shaft of an interior doorknob of said closure, and said locking plate, while attached to said U-shaped member, may engage a latch or a key head associated with a deadbolt while in a locked position to prevent rotation thereof and unlocking of a said deadbolt

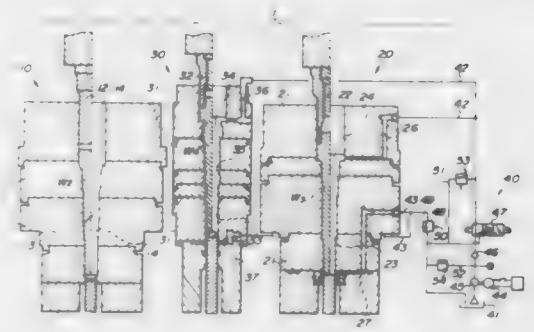
METHOD AND APPARATUS FOR THE BENDING OF WORKPIECES
Johannes Haack, Lyss, Switzerland, assignor to Feintool International Holding, Lyss, Switzerland
Filed Nov. 9, 1988, Ser. No. 269,192
Claims priority, application Fed. Rep. of Germany, Nov. 19, 1987, 3739173
Int. Cl.[5] B21D *5/04*
U.S. Cl. 72—10 28 Claims

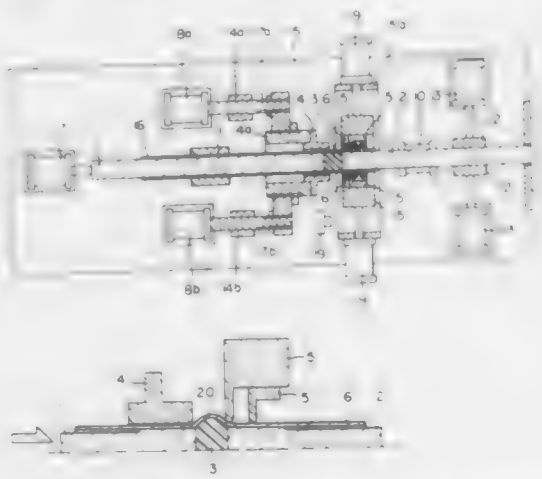
1. Apparatus for bending a workpiece by swivel bending jaws wherein the bent portion assumes a predetermined bending angle with respect to the workpiece, which comprises: a bending anvil; a bending punch spaced from the bending anvil and movable towards and away from the bending anvil; at least one swivel bending jaw associated with the bending anvil and movable in the direction of the bending punch; wherein the bending anvil, bending punch and swivel jaw are adapted to hold a workpiece between the bending anvil on the one hand and bending punch and swivel jaw on the other hand and wherein the swivel jaw is adapted to bend at least one first leg of the workpiece in the direction of the bending punch; and means in the bending punch for determining the actual bending angle of the bent leg by direct measurement of the distance between the bending punch and the bent leg of the workpiece.



5,007,265
OPTICAL MONITOR FOR SUPERPLASTIC FORMING
Murray W. Mahoney, Camarillo, Calif., and Amit K. Ghosh, Ann Arbor, Mich., assignors to Rockwell International, El Segundo, Calif.
Filed Dec. 19, 1988, Ser. No. 285,987
Int. Cl.[5] B21D *26/02*
U.S. Cl. 72—37 12 Claims

1. A device for optically monitoring the strain rate of a blank during superplastic forming of the blank against a die, comprising:
a light source positioned to direct light against the blank while it is being formed against said die;
a video camera positioned and focused to view light reflected from reference marks on the blank being formed and to provide a video signal of the reflected light;
a video monitor for receiving the video signal and for displaying the reference marks; and
means for measuring the strain rate occurring in the blank as it is being superplastically formed as a function of a detected change in dimensions of the reference marks during said superplastic forming of the blank.

5,007,266
SUCCESSIVE COLD WORKING PROCESS
Shohachi Nishiuchi; Shigeo Ohta; Hitoshi Imai, and Haruo Meguro, all of Saitama, Japan, assignors to Honda Giken Kogyo Kabushiki Kaisha, Tokyo, Japan
Filed Mar. 8, 1989, Ser. No. 320,466
Int. Cl.[5] B21J *3/00*; B21C *23/32*; B21K *1/00*
U.S. Cl. 72—44 20 Claims



1. A method of successively cold working a billet, comprising the steps of:
(a) forming a chemically converted lubricating coating on a surface of the billet;
(b) forging said billet into an intermediate product at a temperature below a transformation temperature of the billet;
(c) positioning said intermediate product in a die cavity in a die assembly;
(d) entirely immersing and covering said intermediate product with lubricating oil while said intermediate product is positioned in said die cavity in said die assembly; and
(e) forging said intermediate product at a temperature below the transformation temperature substantially simultaneously with a step (d) before the intermediate product gains a predetermined hardness due to age hardening resulting from said forging step (b).

5,007,267
METHOD AND APPARATUS FOR MANUFACTURING BELLOWS PIPE
Katsushi Washizu, Numazu, and Mitsumasa Ohtaka, Okazaki, both of Japan, assignors to Usui Kokusai Sangyo Kaisha Limited, Japan
Filed Feb. 9, 1990, Ser. No. 478,140
Claims priority, application Japan, Feb. 14, 1989, 1-34096
Int. Cl.[5] B21D *15/10*
U.S. Cl. 72—59 10 Claims

1. A bellows pipe manufacturing method for forming a bellows pipe having opposed first and second ends comprising,
providing a solid fixed core, a solid movable core and a solid elastic body all of which are dimensioned to be inserted into the pipe,
slidably moving the first end of the pipe over the solid fixed core,
inserting the solid elastic member into the second end of the pipe and into contact with the fixed core,
inserting the solid movable core into the second end of the pipe and into contact with the elastic member,
moving the solid movable core toward the solid fixed core for compressing the elastic body in an axial direction of the pipe to resiliently expand the elastic body radially of the pipe such that a peripheral portion of the pipe changes to an annular convex portion,
moving the solid movable core away from the solid fixed

core for permitting the elastic body to resiliently return to an unexpanded condition,

changing the annular convex portion to a bellows portion using a forming and holding means external of the pipe, and

pinching the bellows portion on opposed sides thereof and shifting the pipe to a selected position using the forming and holding means,

wherein the steps from the step of moving the movable core toward the fixed core are repeated with respect to the pipe shifted to the selected position to successively form bellows portions at selected intervals in the pipe

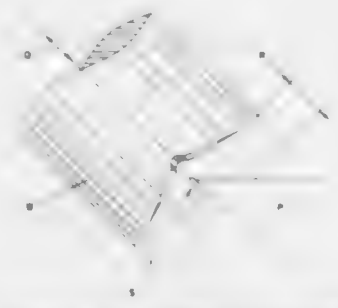
METHOD AND DEVICE FOR EDGE-FINISHING

Nigel B. Kelly, No. 1 Bellevue, Clifton, United Kingdom BS8 1DA , assignor to Nigel Brian Kelly, Clifton and Originations Limited, Woodland Way, both of, United Kingdom



Filed Feb. 5, 1990, Ser. No. 477,186

Continuation of Ser. No. 356,675, May 23, 1989, abandoned, which is a continuation of Ser. No. 209,478 filed as PCT GB 86/00777 on Dec. 18, 1986, published as WO87/03830 on Jul. 2, 1987, abandoned.

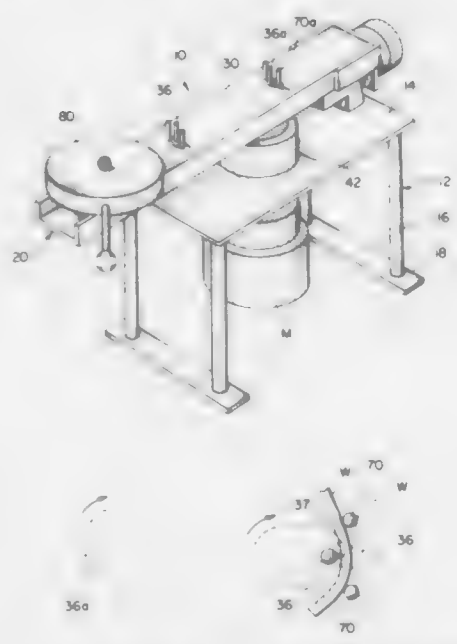
Claims priority, application United Kingdom, Dec. 19, 1985, 8531222; Jul. 30, 1986, 8618523

Int. Cl.[5] B25D *1/00*

U.S. Cl. 72—76 4 Claims

1. An edge-finishing device suitable for a right-angled edge of a workpiece, comprising a tip for reciprocation against the edge, the tip having a notch with outer flank surfaces which are at an obtuse angle to one another and serve to guide the tip initially onto the workpiece edge, the notch having inner flank surfaces which are at an obtuse angle to one another and serve to beat a burr or other protrusion thin enough to be broken or driven off from the edge and the base of the notch having a curved surface which, in use, determines the finish given to the edge of the workpiece.

5,007,269



WIRE BENDING DEVICE

Joseph H. Masse, 151 Coggeshall St., New Bedford, Mass. 02746

Filed Nov. 21, 1989, Ser. No. 440,037

Int. Cl.[5] B21D *7/00*

U.S. Cl. 72—173 7 Claims

1. A device for bending wire, or strip comprising a housing having a bending station, said housing including a generally elongated horizontally disposed frame having a flat upper generally horizontal surface in part forming said bending station and defining the plane of movement through which said wire moves while being bent, said bending station further including a generally vertically oriented driving pin projecting upwardly through said plane and freely terminating thereabove and guide means including a pair of laterally-spaced vertically-oriented guide pins projecting upwardly through said plane and freely terminating thereabove and disposed laterally to opposite sides of said driving pin so as to form a wire path laterally extending across said bending station frame upper surface within said plane whereby wire fed laterally in said plane to said bending station between said driving pin and said guide pins is contacted by said driving pin and forced against said guide pins so as to bend such wire, said frame including a generally elongated actuation arm having opposed ends longitudinally disposed therein and having at one end thereof said driving pin mounted thereto, means for moving said actuating arm in a longitudinal reciprocating motion including a cam eccentric and pivot means in said actuating arm for regulating the lateral motion of said one end, said wire engaging guide pin means disposed in longitudinal opposition to said driving member and laterally spaced from the driving pin extending further than the lateral extent of the eccentric travel path of said driving pin.

WEB HANDLING APPARATUS FOR METAL RIBBON STOCK

Bernard J. Wallis, 2215 Dacosta, Dearborn, Mich. 48128

Filed Nov. 7, 1989, Ser. No. 432,865

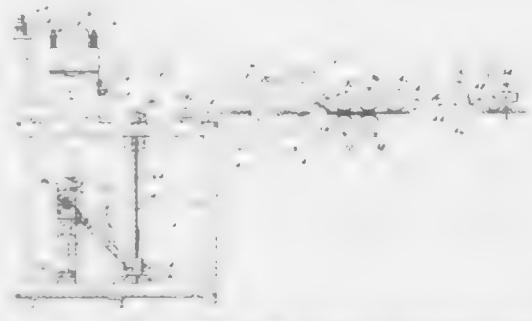
Int. Cl.[5] B21D *53/02*

U.S. Cl. 72—187 4 Claims

1. In a metal fin forming machine wherein a metal web is fed from a coil to a plurality of continuously rotating rolls for

corrugating the web, the improvement comprises a web handling apparatus comprising:

a frame,



uncoiling means adjacent said coil and fixedly attached to said frame for uncoiling the metal web from the coil,

said uncoiling means having a housing with a pair of drive pinch rollers centrally located and attached to said housing,

an entry guide roller attached to an entrance of said housing for guiding the metal web into said drive pinch rollers and an exit guide roller attached to an exit of said housing for guiding the web from the housing,

a drive motor mounted alongside said frame for driving said pinch rollers,

an accumulator apparatus disposed between said uncoiling means and the metal fin forming machine comprising a pair of vertical tracks on said frame and a movable track roller assembly movably mounted on said vertical tracks for taking up slack in the metal web.

a dancer arm in advance of said metal fin forming machine, pivoted at one end to one of said accumulator rollers over which the web is fed by said uncoiling means,

pivot means for pivoting the other end of said dancer arm about a fixed axis while permitting axial movement thereof relative to said pivot means,

a RVDT transducer attached to the pivot means and electrically connected to said drive motor to provide a signal due to rotary movement of said arm for controlling the speed of said drive motor, and

said movable track roller assembly comprising first and second movable guide rollers supported on said movable track roller assembly and guided on said tracks for vertical movement thereon and

first and second stationary guide rollers supported on said frame and located above said movable track roller assembly, said web being trained in succession from said uncoiling means under said first movable guide roller, thereafter over said first stationary guide roller, under said second movable guide roller, over said second stationary guide roller and into said metal fin forming machine.

5,007,271

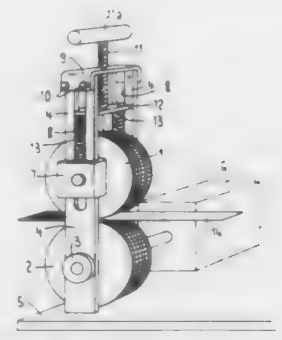
DEVICE AND A METHOD FOR EMBOSSING A METAL FOIL

Karl Boegli, Rue des Essertons 2, 2074 Marin, Switzerland

Continuation of Ser. No. 651,752, Sep. 18, 1984, abandoned. This application Oct. 1, 1990, Ser. No. 593,265

Claims priority, application European Pat. Off., Oct. 21, 1983, 83810484.2

Int. Cl.[5] B21D *13/04*



U.S. Cl. 72—196 11 Claims

1. A device for embossing a delicate metal foil packaging material comprising:

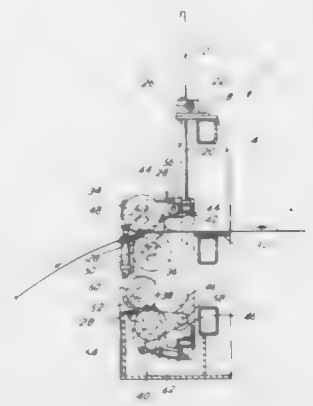
a pair of opposing, embossing rollers, each having a hard, generally cylindrical surface and an array of pointed pyramid-shaped teeth means for embossing the delicate metal foil extending along said surface in both the axial and circumferential directions, the pitch between adjacent teeth being on the order of about 0.4 millimeters and the size of each tooth being on the order of about 0.25 to 0.3 millimeters;

a drive means operatively connected to drive a first of said rollers;

a second of said rollers being displaceably and adjustably

mounted opposite said first roller and positioned so that the teeth of the first roller are staggered relative to the teeth of the second roller whereby the teeth of the first roller are operable, when engaged by the opposing teeth of the second roller, to synchronously drive the second roller.

5,007,272



TENSION ROLLER

Douglas S. Matsunaga; Jan W. Slabowski, both of Schiller Park, and Tadeusz Marecki, Chicago, all of Ill., assignors to Braner, Inc., Schiller Park, Ill.

Filed Nov. 9, 1989, Ser. No. 433,754

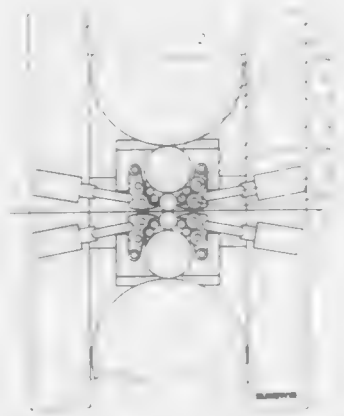
Int. Cl.[5] B21B *31/08*

U.S. Cl. 72—226 8 Claims

1. A tensioning machine positioned along a metal slitting line, said machine constituting means for maintaining tension of slit metal, said machine comprising a main frame, a second frame slidably mounted to said main frame, first and second sets of rotatable tension rollers carried by said second frame, adjustment means connecting each first and second set of tension rollers wherein said first set of tension rollers is in an operating position and engages slit material to apply tension to the slit material prior to recoiling, said second set of tension rollers in a standby position, and drive means for rotating said first set of tension rollers when in the operating position, and means for shifting said second frame relative to said first frame wherein the first set of tension rollers is in a standby position with the second set of tension rollers in said operating position.

5,007,273

FOUR-HIGH ROLL OR SIX-HIGH ROLL STAND HAVING LATERALLY SUPPORTED WORKING ROLLS



Gerhard Kummerhoff, Hemer, Fed. Rep. of Germany, assignor to Sundwiger Eisenhütte Maschinenfabrik Grah & Co., Hemer-Sundwig, Fed. Rep. of Germany

Filed Jul. 23, 1990, Ser. No. 556,901

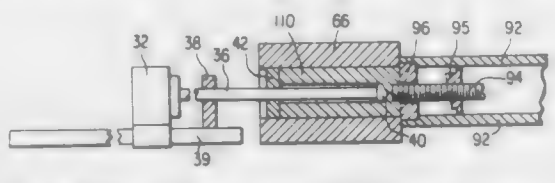
Claims priority, application Fed. Rep. of Germany, Aug. 1, 1989, 3925408

Int. Cl.[5] B21B *13/14*

U.S. Cl. 72—242.2 1 Claim

1. Four- or six-high roll stand having laterally supported working rolls (4), each support having a radially unmounted lateral intermediate roll (5) resting against the associated working roll (4), and two radially mounted supporting rollers (6, 8), characterized in that the support has a further lateral intermediate roll (7) and in that one lateral intermediate roll (5) is supported against one of the two supporting rollers (6) and the further lateral intermediate roll (7), which is supported against the other supporting roller (8) and, in the case of a four-high roll stand, against the supporting roll of the said supporting roller and, in the case of a six-high roll stand, against the intermediate roll (3) of the said supporting roller.

5,007,274



BILLET PRE-PIERCER APPARATUS AND METHOD

Charles L. Stewart, 1733 Addison Rd., Palos Verdes Estates, Calif. 90274

Filed Sep. 20, 1989, Ser. No. 409,800

Int. Cl.[5] B21C *23/08*

U.S. Cl. 72—254 22 Claims

1. An apparatus for pre-piercing billets, comprising:

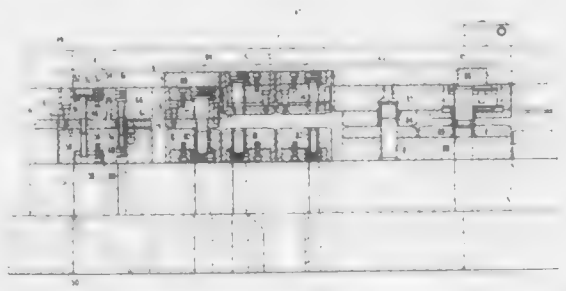
a generally cylindrical container having first and second open ends for receiving and supporting a generally cylindrical billet;

a mandrel bar mounted adjacent said first end of said cylinder for axial movement along the axis of said cylinder for penetrating the billet;

bolster means disposed adjacent said second end of said cylinder for engaging the billet during penetration of the billet by said mandrel bar, said bolster means including a bolster pin which is axially movable along said axis of said container, said bolster pin having an end which contacts the billet during penetration of the billet by said mandrel bar such that the billet deforms about said end of said bolster pin, and

a movable support carried by said mandrel bar toward the billet during advancement of said mandrel bar prior to pre-piercing the billet, said movable support being configured to enter said generally cylindrical container to engage a portion of said container so as to provide additional structure rigidity to said mandrel bar to resist deflection of said mandrel bar during penetration of the billet

5,007,275



PROGRESSIVE DIE FOR DRAWLESS FIN

Harlan F. Voss, Punta Gorda, Fla., assignor to Tridan Tool & Machine, Inc., Danville, Ill.

Division of Ser. No. 462,618, Jan. 9, 1990. This application Aug. 13, 1990, Ser. No. 566,969

Int. Cl.[5] B21D *28/14, 28/34*

U.S. Cl. 72—335 8 Claims

1. A progressive die for forming a collared hole in a sheet of material comprising:

a main frame;

a plurality of spaced apart first punches mounted on said main frame at a first station and arranged in a pattern about a center point;

a plurality of first bushings mounted on said main frame at said first station and arranged in said pattern to receive said first punches and form a plurality of first holes in a sheet of material leaving material extending between said holes;

a main punch mounted on said main frame at a second station;

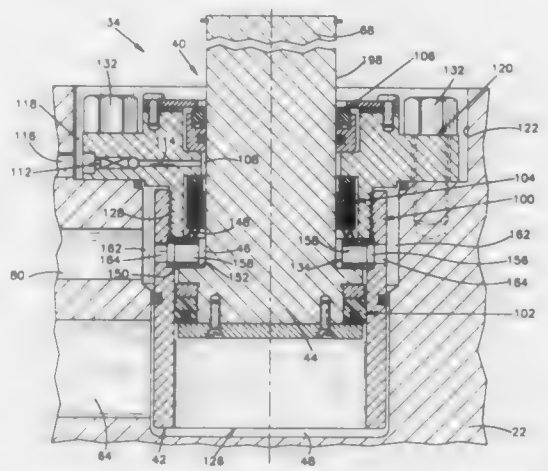
a main bushing mounted on said main frame to receive said main punch removing some of said material extending between said holes forming a main hole in said sheet of material and leaving portions of material extending inwardly in said main hole;

a straightening punch mounted on said main frame at a third station;

a straightening busing mounted on said main frame to receive said straightening punch to bend said portions outwardly and form a collared hole in said sheet of material, said straightening punch having an outside diameter larger than said main punch to first draw material continuously around said main hole and then bend said portions outwardly forming a collar continuously surrounding said main hole; and,

means for forcing a sheet of material through the die and stopping said sheet of material sequentially at said first station, said second station and said third station.

5,007,276



SEAL ARRANGEMENT FOR USE IN A PRESS ASSEMBLY

Paul M. Kadis, Chardon, and Susan E. Pfaff, Seven Hills, both of Ohio, assignors to Teledyne Industries, Inc., Cleveland, Ohio

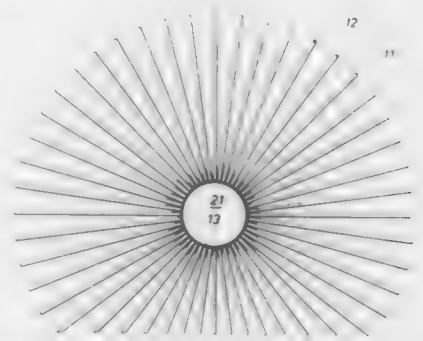
Filed May 9, 1990, Ser. No. 521,095

Int. Cl.[5] B21D *24/08*

U.S. Cl. 72—351 35 Claims

1. A press assembly operable from an open condition to a closed condition to deform a workpiece, said press assembly comprising a first movable member for engaging a first side of the workpiece, a second movable member for engaging a second side of the workpiece, said first member being movable in a first direction toward said second member during operation of said press assembly from an open condition toward a closed condition, said first and second members being movable together in the first direction with at least a portion of the workpiece disposed between said first and second members during operation of said press assembly from the open condition toward the closed condition, and a cushion assembly operable toward a retracted condition to provide a yieldable force opposing movement of at least one of said members in the first direction during operation of said press assembly from the open condition toward the closed condition, said cushion assembly including a cylinder, a piston disposed in said cylinder and cooperating with said cylinder to at least partially define first and second variable volume chambers, a piston rod connected with said piston, said piston rod extending from said piston through said second variable volume chamber to an outer end portion disposed adjacent to one end of said cylinder, first high pressure seal means connected with said piston and disposed in sealing engagement with said cylinder for blocking fluid flow between said first and second variable volume chambers, second high pressure seal means connected with said cylinder and disposed in sealing engagement with said piston rod for blocking fluid flow from said second variable volume chamber along said piston rod, low pressure seal means connected with said cylinder at a location adjacent to said one end of said cylinder and disposed in engagement with said piston rod for blocking contaminants in the environment outside said cylinder from entering said cylinder, said second high pressure seal means and said low pressure seal means cooperating with said cylinder and said piston rod to at least partially define a third chamber for receiving fluid which leaks past said second high pressure seal means, and pressure relief means for exhausting fluid pressure from the third chamber when the fluid pressure in the third chamber reaches a predetermined fluid pressure to thereby prevent exposure of said low pressure seal means to excessive fluid pressures during operation of said press assembly.

5,007,277



METHOD FOR FORMING PRECISION LIQUID/VAPOR SEPARATED BRISTLE ASSEMBLY

Boyd B. Moore, Houston, Tex., assignor to Shell Oil Company, Houston, Tex.

Filed Oct. 30, 1989, Ser. No. 428,527

Int. Cl.[5] B21D *53/00*

U.S. Cl. 72—379.2 4 Claims

1. A method for forming bristles to be used in a bristle assembly comprising:

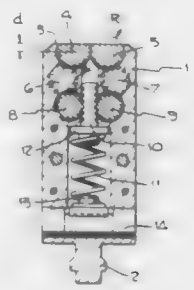
forming a plurality of slots in a thin rectangular shaped sheet to form a plurality of narrow flat bristles, said slots extending from one edge of the sheet toward the opposite edge, and terminating short of said opposite edge;

bending the portion of the sheet adjacent said opposite edge to form a flange on said sheet, said flange including at least a portion of said slots; and

bending said flange into a cylindrical shape with the narrow strips projecting radially outward.

5,007,278

DIE DEVICE



Rolf Haberstock, Rheinhöhe 14, Küssaberg, Fed. Rep. of Germany D-7897

Filed Jan. 16, 1990, Ser. No. 465,385

Claims priority, application Switzerland, Jan. 18, 1989, 154/89

Int. Cl.[5] B21D *5/02*

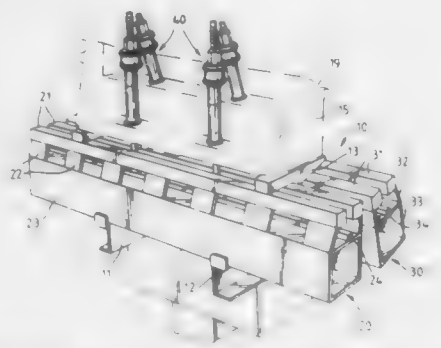
U.S. Cl. 72—383 21 Claims

1. A die device for use in bending metal stock having:

a body with a flat upper surface;

a pair of die bars in direct meshing engagement supported rotatably around their lengthwise axis having substantially flat upper surface and substantially cylindrical undersurfaces and being arranged contiguously, side-by-side in a lengthwise direction; and

coupling means by which each die bar, of the pair of die bars, is engaged with the other die bar to effect a desired force-coupling such that each die bar rotates in a direction opposite that of the other die bar, a number of teeth being formed in the cylindrical undersurfaces of each die bar, said teeth being contained only in a predetermined angle of the cylindrical undersurface of each die bar, said angle



corresponding to a maximum desired angle of rotation of each die bar during a bending process, said coupling means further including said die bars being engaged with each other by cogwheel means adapted to rotate said die bars, which effect the desired force-coupling.

5,007,279

CYLINDER HEAD STRAIGHTENER

Derek L. Miall, 150 Wakefield Street, Bald Hills, Queensland 4036, Australia

Filed Mar. 16, 1990, Ser. No. 494,969
Claims priority, application Australia, Mar. 16, 1989, PJ3254
Int. Cl.[5] B21D *41/00*
U.S. Cl. 72—394 8 Claims

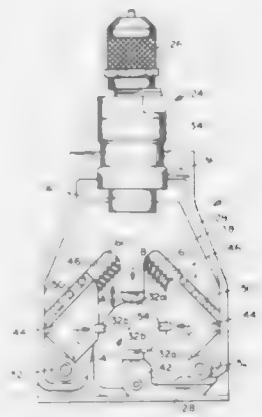
1. Apparatus for straightening a cylinder head of an internal combustion engine, said apparatus comprising:

a pair of elongate members adjustably spaced from each other and on which said head is mounted in use, each elongate member having a slot extending longitudinally along its upper side;

at least two tensionable members, each having (i) a retaining member at one end thereof which is captively received in the slot of an associated elongate member yet is adjustable in position along said slot, (ii) a shank portion which in use is located in a respective bore through the head, and (iii) adjustable tensioning means at the other end thereof for applying a force to said head;

whereby said head can be straightened by selected application of forces thereto by said tensionable members at predetermined locations.

5,007,280



TOOL HEAD FOR USE IN CRIMPING ELECTRICAL CONNECTORS

Robert L. Quinn, St. Petersburg, and Frank Pansari, Jr., Clearwater, both of Fla., assignors to Molex Incorporated, Lisle, Ill.

Filed Jan. 26, 1990, Ser. No. 470,671
Int. Cl.[5] H01R *43/04*
U.S. Cl. 72—402 15 Claims

1. In a tool head for use in crimping a connector to a conductor comprising means defining a crimping area of the tool head into which the connector and conductor extend in a longitudinal direction, at least three crimping nibs mounted around said crimping area, each said nib having a connector crimping face and being mounted for radial movement relative to said connector so that a portion of each said face acts to crimp said connector to secure said connector to said conductor during a crimping operation of the tool head, each said nib being mounted in said crimping area of said tool head so that the connector is crimped at spaced points located generally about the circumference of the connector, the improvement comprising:

first and second nibs having substantially identical connector crimping faces each defined by a major dimension and a minor dimension, said major dimension being larger than said minor dimension, and wherein said first nib is oriented such that said minor dimension is generally parallel to said longitudinal direction and said second nib is oriented such

that said minor dimension is generally perpendicular to said longitudinal direction.

5,007,281

PLASTIC WORKING METHOD AND APPARATUS

Syozo Aoshima, Nagoya; Kunio Hirota, Aichi; Hiroshi Sakakibara; Naoyuki Sawai, both of Nagoya, and Takeaki Sato, Kasugai, all of Japan, assignors to Brother Kogyo Kabushiki Kaisha, Aichi, Japan

Division of Ser. No. 227,301, Aug. 2, 1988, Pat. No. 4,936,125.
This application Apr. 24, 1990, Ser. No. 513,624
Claims priority, application Japan, Aug. 8, 1987, 62-198847; Aug. 8, 1987, 62-198848
Int. Cl.[5] B21J *9/02*
U.S. Cl. 72—406 3 Claims

1. In a plastic working apparatus including a frame, a first die having a shaping face, and a second die confronting the first die for mounting thereon a workpiece, the workpiece being depressed by co-operation of the first and second die, thereby applying a plastic work to the workpiece, the improvement comprising:

a die holder means having one end connected to the first die;

moving means for providing swivelling motion through an angle in three dimensional space to the die holder means for depressing the workpiece against the second die so that the first die moves against the workpiece in a compound motion;

guide means cooperating with said die holder for guiding vertical movement of the one end of the die holder, to thus enable vertical reciprocating motion of the first die; and

changing means for changing said angle of the die holder means with respect to an imaginary axis which extends through the workpiece to provide a vertical reciprocating motion of the first die relative to said second die.

5,007,282

STAMPING AND FORMING MACHINE HAVING INTERCHANGEABLE PUNCH SUB-ASSEMBLY

Johannes C. W. Bakermans, Harrisburg, Pa., assignor to AMP Incorporated, Harrisburg, Pa.

Filed Jan. 18, 1990, Ser. No. 467,095
Int. Cl.[5] B21D *37/04*
U.S. Cl. 72—481 20 Claims

1. A punch sub-assembly which is intended to be removably secured to a reciprocable punch ram which is cooperable with a die assembly in a stamping and forming machine, the sub-assembly comprising:

punch holder means, stripper plate means, and at least one punch,

the stripper plate means and the punch holder means being coupled to each other by lost motion coupling means which permits relative movement of the stripper plate means between an extended position and a retracted position with respect to the punch holder means, the stripper plate means being spaced from the punch holder means when in its extended position and being adjacent to the punch holder means when in its retracted position,

the punch has a fixed end, an intermediate shank portion, and a free end, the fixed end being fixed to the punch holder means, the shank portion extending from the fixed end towards the stripper plate means and into an opening in the stripper plate means which conforms to the cross-section of the punch,

spring means serving to bias the stripper plate means to its extended position,

fastener means for securing the punch holder means to a punch ram, and

aligning pin means secured to the punch holder means and extending therefrom in the direction which is opposite to the direction of the punch, the aligning pin means having an end portion which is dimensioned for reception in an aligning hole in a punch ram whereby,

a complete punch assembly is produced when the sub-assembly is secured to a punch ram.

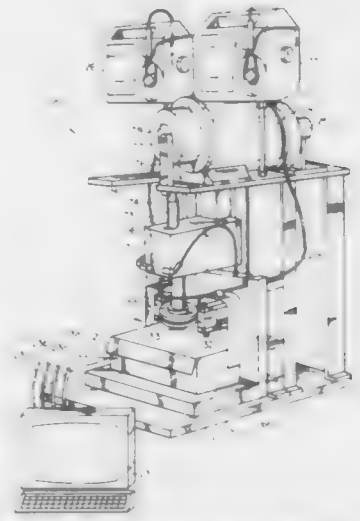
METHOD AND DEVICE FOR PROCESSING MEASURED VALUES

Stefan Ambos, Waiblingen, Fed. Rep. of Germany, assignor to Conducta Gesellschaft fur Meb-und Regeltechnik mbH & Co., Gerlingen, Fed. Rep. of Germany

Filed May 31, 1989, Ser. No. 359,477
Claims priority, application Fed. Rep. of Germany, Jun. 4, 1988, 3819101
Int. Cl.[5] G01N *27/04*; G01D *18/00*
U.S. Cl. 73—1 G 6 Claims

1. A method for processing measured values in a gas detection device evaluating a resistance variation of a gas sensor forming part of said device for a range of gas concentrations to be measured, comprising the steps of determining and storing at least once a basic resistance value (Ro) of said, without the influence of the gas to be measured, and determining for every subsequent measurement of the gas component, the concentration of which is to be measured, the ratio between a resulting



total resistance value (Rs) of said gas sensor dependent on gas concentration and the basic resistance value (Ro), by an arithmetic operation, and using thereafter the value (Rs/Ro) so obtained.

5,007,284

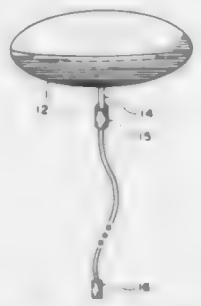
PISTON RING AND LINER WEAR SIMULATOR AND METHOD OF USING SAME

Ralph J. Slone, 945 Driftwood Ave., Columbus, Ind. 47203

Filed Feb. 27, 1990, Ser. No. 485,571
Int. Cl.[5] G01M *19/00*
U.S. Cl. 73—120 [illegible] Claims

1. A wear simulator for piston rings and cylinder liners comprises:

a piston ring holder having means for receiving a piston ring;



a cylinder liner holder having means for receiving a portion of a cylinder liner;

positioning means connected to said cylinder liner holder for placing a cylinder liner portion received by said cylinder liner holder in contact with a piston ring received by said piston ring holder;

reciprocating means connected to said piston ring holder for imparting a reciprocating stroke to a piston ring received by said piston holder; and

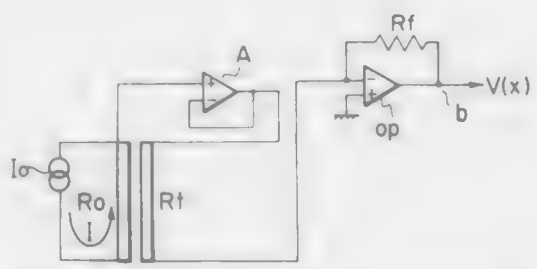
force measuring means cooperatively arranged with said cylinder liner holder for providing a signal corresponding to the level of frictional force between a piston ring received by said piston ring holder and a cylinder liner portion received by said cylinder liner holder.

5,007,285
LOW COST DRIFTER
John M. Dahlen, Duxbury; Narender K. Chhabra, Bedford; Richard K. Araujo, Tewksbury; James R. Scholten, Sudbury; Robert W. Reid, Acton, and Matti Soikkeli, Braintree, all of Mass., assignors to The Charles Stark Draper Laboratory, Cambridge, Mass.
Filed Mar. 17, 1989, Ser. No. 325,522
Int. Cl.[5] G01W *1/00*
U.S. Cl. 73—170 A 11 Claims

1. An economical drifter for following ocean currents comprising:
a buoy that includes a buoy hull of miniataure size, and data transmitting means disposed therein to take local measurement data and transmit said data to a communications satelite over a period of many years at sea; and
a drogue suspended from said bouy to provide a net slippage error of less than two centimeters per second when said drouge is immersed in an ocean current.

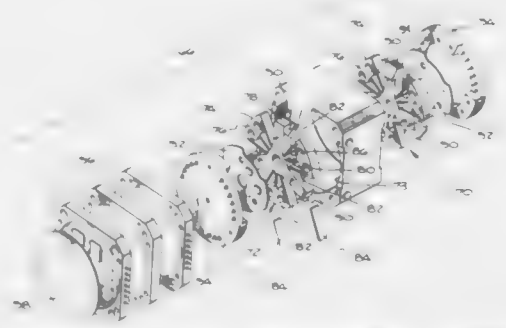
5,007,286
SOLID-STATE TRANSDUCER BASED DYNAMIC FLUID FLOW SENSING SYSTEM
Robert G. Malcolm, 1849 Watkins Lk. Rd., Pontiac, Mich. 48054, and Thomas W. Richardson, 3969 Lakewood, Prayton Plains, Mich. 48020
Filed Aug. 3, 1989, Ser. No. 389,123
Int. Cl.[5] G01G *71/10*
U.S. Cl. 73—181 23 Claims

6. A system for measuring relative fluid velocity with respect to a marine vessel, the system comprising:
solid-state pressure sensing transducer means for generating an electronic output signal in proportion to a sensed dynamic pressure of flowing fluid with respect to said marine vessel;
wherein said solid-state pressure sensing transducer means comprises:
a piezoresistive transducer sensor for sensing dynamic pressure;
constant current source means for exciting said piezoresistive transducer sensor;
differential amplifier means for amplifying a difference between two input signals from said piezoresistive transducer sensor into a differential floating output signal; and
single ended amplifier means for translating said differential floating output signal into a single output signal with reference to a ground; and
sensor housing means connected to said marine vessel, said sensor housing means having a forwardly facing external surface generally opposed to a direction of fluid flow supporting at least a portion of said transducer means such that asid solid-state pressure sensing transducer means is generally flush with the forwardly facing external surface and directly exposed to fluid flowing past said marine vessel



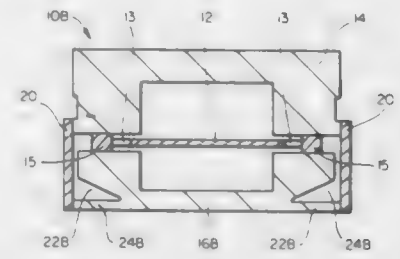
5,007,287
FILLER CAP OF JAR FOR WASHER
Kazuhiko Nagai, Yokohama, Japan, assignor to Jidosha Denki Kogyo K.K., Kanagawa, Japan
Filed Nov. 22, 1989, Ser. No. 440,172
Claims priority, application Japan, Nov. 24, 1988, 63-153398[U]
Int. Cl.[5] G01F *13/00, 23/02*
U.S. Cl. 73—290 B 1 Claim

1. A filler cap for a washer jar adapted to hold a supply of detergent liquid comprising:
a stopper portion for plugging a filler hole provided in a top portion of the washer jar;
a transversely extending knob portion connected to and extending upwardly from said stopper portion and having an increasing thickness in the upward direction from the stopper portion to define a pair of finger gripping surfaces on opposite sides thereof;
a pawl portion disposed circumferentially about a lower end of said stopper portion for engagement with the filler hole;
an air hole extending through said stopper and having a first opening disposed on one of said finger gripping surfaces of said knob portion and a second opening in a bottom surface of said stopper portion; and
a tubular gauge having a passage open at both ends thereof connected to said stopper portion with said passage in communication with said hole and adapted to extend into a bottom portion of the washer jar;
whereby upon gripping said plug portion and closing said first opening of said hole by means of a person's fingers and removing said stopper portion from said washer jar an amount of liquid will be retained in said passage of said tubular gauge indicative of the liquid level in the washer jar



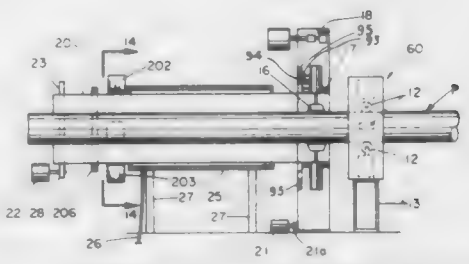
5,007,288
HEAT-RADIATION TYPE LEVEL SENSOR
Kazuyuki Sasaki, and Ichiro Katsuoka, both of Susono, Japan, assignors to Yazaki Corporation, Tokyo, Japan
Filed Dec. 1, 1989, Ser. No. 444,341
Claims priority, application Japan, Dec. 2, 1988, 63-156629[U]; Dec. 12, 1988, 63-311927
Int. Cl.[5] G01F *23/24*
U.S. Cl. 73—295 3 Claims

1. A heating radiating type liquid level sensor for indicating the weight of liquid within a tank, comprising:
a liquid level measuring assembly having a liquid level measuring resistor, said liquid level measuring resistor having a first temperature coefficient that causes a change in resistance due to an amount of heat generated when a current from a current source flows therethrough, said liquid level measuring resistor is substantially dipped in said liquid, with a level thereof being measured, when said liquid is filled to a maximum level in said tank;
a buffer amplifier for amplifying and outputting a voltage developed across said liquid level measuring resistor when said current flows therethrough; and



an inverting feedback amplifier for amplifying said voltage outputted from said buffer amplifier, said voltage outputted from said buffer amplifier representing the weight of said liquid within said tank, said inverting feedback amplifier having a feedback resistor and a series input resistor which has a second temperature coefficient, said series input resistor being substantially dipped in said liquid when said liquid is filled to a maximum level in said tank and functioning as a temperature compensating resistor, wherein
said first temperature coefficient is larger than said second temperature coefficient.

5,007,289
THREE AXIS INERTIAL MEASUREMENT UNIT WITH COUNTERBALANCED, LOW INERTIA MECHANICAL OSCILLATOR
Robert E. Stewart, Woodland Hills, and Samuel N. Fersht, Studio City, both of Calif., assignors to Litton Systems, Inc., Beverly Hills, Calif.
Continuation of Ser. No. 251,918, Sep. 30, 1988, abandoned. This application Mar. 20, 1990, Ser. No. 497,766
Int. Cl.[5] G01R *9/00*
U.S. Cl. 73—510 4 Claims



1. A mounting device for the dithered rotation of a measurement unit, comprising:
a mounting member having inwardly extending radial mounting webs with mounting pads on the outer periphery of said mounting member to mount said mounting device;
a rotor member having outwardly extending radial mounting legs for mounting said measurement unit, said legs mounted between said inwardly extending radial mounting webs; and
said inwardly extending radial mounting webs including: web members joining said mounting member to said rotor member; and driving web members on each side of said first mentioned web members for further joining said mounting member to said rotor member and for providing said dithered rotation to said rotor member;
wherein said mounting device is a low inertia mounting device.

5,007,290
METHOD AND APPARATUS FOR PRODUCING PRELOAD OF AN ACCELEROMETER ASSEMBLY
Bert Egley, Tacoma, and Richard A. Hanson, Redmond, both of Wash., assignors to New SD, Inc, San Francisco, Calif.
Filed Oct. 31, 1989, Ser. No. 429,709
Int. Cl.[5] G01P *15/08*
U.S. Cl. 73—517 R 12 Claims

1. In an accelerometer in which a generally planar proofmass assembly is supported between upper and lower members clamped together under a compressive load normal to the plane of said proofmass by band means bonded to the upper and lower members, the improvement comprising means forming part of at least one of said members, said last-mentioned means being more compliant in the direction of said compressive load than the rest of said one member and the other of said members, whereby said more compliant means compresses a greater distance under and in the direction of said compressive load than the rest of said one member and the other member, and wherein said band means is bonded to said more compliant means of one member, with the latter in its compressed position, and to the other of said members, whereby to maintain said members including said compliant means under said compressive load.

5,007,291
ULTRASONIC INSPECTION APPARATUS WITH CENTERING MEANS FOR TUBULAR MEMBERS
William T. Walters, La Marque, and Carroll R. Thompson, Woodlands, both of Tex., assignors to Scan Systems, Inc., Channelview, Tex.
Filed Oct. 5, 1989, Ser. No. 417,439
Int. Cl.[5] G01N *29/20, 29/26*
U.S. Cl. 73—640 6 Claims

1. An apparatus for positioning devices for the transmission of acoustic energy in non-contacting fixed spaced relation to the outer diameter surface of a tubular member in a procedure for the non-destructive testing and inspection of the tubular member, said apparatus comprising:

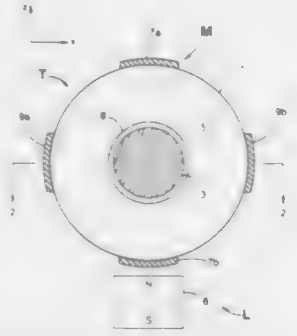
a plurality of contact elements comprising at least two pairs of rollers in which the rollers of each pair are disposed in contact with the outer surface of the tubular member in alignment with each other and the central axis of the tubular member in diametrically opposed positions relative thereto and said pairs of rollers are disposed and aligned in mutual orthogonal relationship,

a proximity sensor for sensing the distance of said devices from the tubular member and generating an electrical signal corresponding to said sensed distance, and

driving means responsive to said proximity sensor signal for driving the rollers of each pair in a linear radial direction with respect to said tubular member axis whereby the axis is moved to coincidence with the center of the circular array of transmitting devices.

5,007,292

MULTICOMPONENT TRANSDUCER



Christopher Crowe; Ralph L. Cordell, both of Tulsa, and Seun K. Kahng, Norman, all of Okla., assignors to Amoco Corporation, Chicago, Ill.

Continuation of Ser. No. 239,367, Aug. 31, 1988, Pat. No. 4,905,517. This application Nov. 13, 1989, Ser. No. 435,841

The portion of the term of this patent subsequent to Mar. 6, 2007, has been disclaimed.

Int. Cl.[5] G01P *15/08*

U.S. Cl. 73—654 **10 Claims**

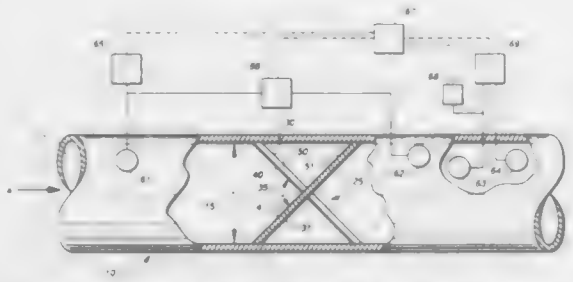
1 A multicomponent transducer, comprising:

(a) a nonconductive, nonmagnetic inertial mass, wherein the inertial mass is coated with a conductive coating;

(b) means for ferrohydrodynamically levitating the inertial mass, whereby the inertial mass is responsive to motion along at least two separate axes; and

(c) motion sensing means for sensing components of motion of the inertial mass along the separate axes.

5,007,293



TWO-PHASE FLOW METER

Douglas B. Jung, 3209 Franz Valley Rd., Santa Rosa, Calif. 95404

Filed Dec. 16, 1988, Ser. No. 285,735

Int. Cl.[5] G01F *1/74, 15/08*

U.S. Cl. 73—861.04 **11 Claims**

1 A flow meter for measurement of a two-phase liquid and vapor mixture flowing within a conduit, said conduit having an inside surface, said flow meter comprising:

spin generating element means for generating a spin to said two-phase mixture flowing within said conduit, said spin generating means comprising a pair of blades presenting opposing planar surfaces to said flowing two-phase mixture, said spin generating element means conditioned to separate said liquid and said vapor and to urge said liquid to flow against said inside surface of said conduit in the form of an annulus, and to urge said vapor to flow through said annulus;

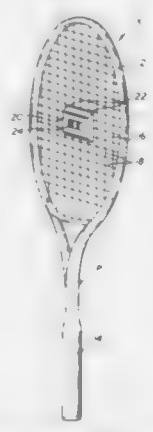
first measurement means for measurement of the liquid-vapor rate, and

second measurement means for measurement of the annular vapor rate.

5,007,294

PROCESS AND DEVICE FOR MEASURING THE TENSION OF RACKET STRINGS

Klaus Matjasic, Schwalmtal, Fed. Rep. of Germany, assignor to Karl-Eberhard Mauve, Fed. Rep. of Germany



PCT No. PCT/EP88/00957, § 371 Date Jun. 21, 1989, § 102(e) Date Jun. 21, 1989, PCT Pub. No. WO89/03709, PCT Pub. Date May 5, 1989

PCT Filed Oct. 25, 1988, Ser. No. 378,228

Claims priority, application Fed. Rep. of Germany, Oct. 29, 1988, 3736219

Int. Cl.[5] G01L *5/10*

U.S. Cl. 73—862.41 **20 Claims**

1. A method of measuring the tension of racket strings wherein the strings form a membrane mounted on the racket, which comprises:

providing a device including means for measuring the frequency at which said device oscillates and for producing a signal corresponding thereto;

affixing said device to said membrane;

aperiodically inducing said membrane to oscillate freely at the natural frequency of said membrane and said device; and

converting the signal produced by said measuring means to a value representing the tension of said strings

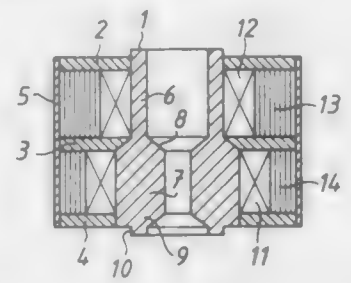
5,007,295

MAGNETOELASTIC FORCE TRANSDUCER

Pär Gustafsson; Jarl Sobel, and Lars Ornholmer, all of Västeras, Sweden, assignors to Asea Brown Boveri AB, Västeras, Sweden

Filed Jan. 3, 1990, Ser. No. 460,515

Int. Cl.[5] G01L *1/12*



U.S. Cl. 73—862.69 **8 Claims**

1. A magnetoelastic force transducer comprising a force-absorbing rotationally symmetrical core of magnetoelastic material provided with two excitation windings supplied with alternating current, two measuring windings, flux closure yokes in the form of a first, a second, and a third flange, and a surrounding sleeve, said core comprising:

a thin-walled tubular section and a thick-walled tubular or solid section with an intermediate first transition zone and a second transition zone located at the other end of the tick-walled tubular or solid section, said second zone changing into a short zone with the same outer diameter as the outer diameter of the thin-walled tubular section;

a first force-dependent magnetic circuit consisting of the thin-walled tubular section of the core, the first transition zone, the first and second flanges and that part of the sleeve which lies between these flanges and an excitation winding and a measuring winding;

a second force-independent magnetic circuit consisting of the thick-walled tubular or solid section of the core, the first and second transition zones, the second and the third

flanges and the remaining part of the sleeve, and an excitation winding and a measuring winding;

the frequency of the supply voltage being chosen such that the penetration depth into the magnetoelastic material is much smaller than the wall thickness of the thick-walled tubular section and much smaller than the radius of the thick-walled section when this thick-walled section is formed as a solid part;

the numbers of turns of the excitation windings being adapted such that the magnetic conditions are the same in the two magnetic circuits;

the measuring windings being connected in opposition; and

the numbers of turns of the measuring windings being adapted such that the output voltage of the transducer amounts to the desired level in the case of an unloaded transducer

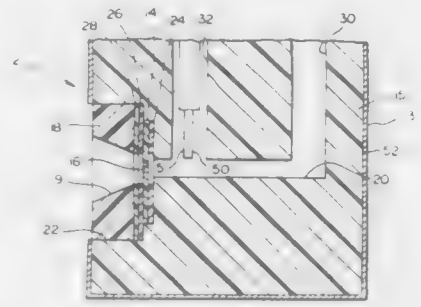
APPARATUS FOR MEASURING A LIQUID SPECIMEN



Takahito Hukuhara, Kakogawashi, Japan, assignor to 501 Toa Medical Electronics Co., Ltd., Kobe, Japan

Filed Oct. 19, 1989, Ser. No. 424,343

Claims priority, application Japan, Jan. 26, 1989, 1-7912

Int. Cl.[5] G01N *15/14*

U.S. Cl. 73—865.87 **7 Claims**

1. A particle detector for detecting particles in an electrolyte, comprising:

a body;

means for forming an aperture in said body;

a fluid path in said body communicating with said aperture;

a syringe liquid path in said body communicating with said aperture;

said syringe liquid path terminating in said fluid path;

a first electrode in said body;

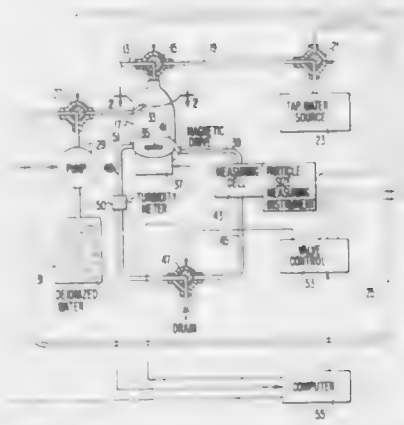
said first electrode being disposed in said syringe liquid path near a junction of said syringe liquid path with said fluid path;

a second electrode external to said body;

a colorimeter in series flow with said fluid path; and

means for preventing direct electrical conduction through said body, whereby electrical conduction between said first and second electrodes is constrained to flow in said electrolyte through said aperture.

5,007,297



PARTICLE SIZE MEASURING SYSTEM WITH AUTOMATIC DILUTION OF SAMPLE

Holger T. Sommer, Greenbelt, Md., assignor to Pacific Scientific Company, Newport Beach, Calif.

Filed Dec. 6, 1988, Ser. No. 280,334

Int. Cl.[5] G01N *15/00*

U.S. Cl. 73—865.5 **6 Claims**

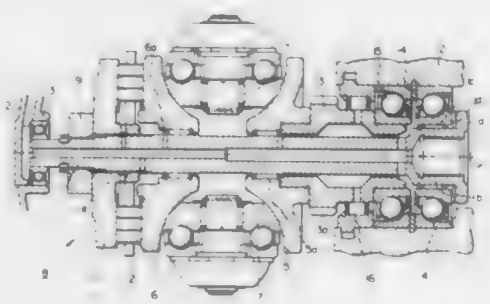
1. A particle measuring system comprising a mixing chamber for receiving a sample of particles to be measured, means to continuously introduce a diluent into said mixing chamber while withdrawing a mixture of said diluent and said sample from said mixing chamber, measuring means to receive a mixture of said diluent and said sample from said mixing chamber in a fluid stream and to measure the size of the particles entrained in said fluid stream, a stirrer within said mixing chamber, and control means to rotate said stirrer within said mixing chamber while automatically repeatedly reversing the direction of rotation of said stirrer, wherein said control means reverses the direction of rotation of said stirrer after an interval which varies randomly between limits.

5,007,298

TOROIDAL-TYPE INFINITELY VARIABLE TRANSMISSION

Hisashi Machida, Maebashi, Japan, assignor to Nippon Seiko Kabushiki Kaisha, Tokyo, Japan

Filed Sep. 8, 1989, Ser. No. 404,824



Claims priority, application Japan, Oct. 31, 1988, 63-275073

Int. Cl.[5] F16H *15/08, 13/00*

U.S. Cl. 74—200 **1 Claim**

1. In a toroidal-type infinitely variable transmission comprising an input shaft having one end connected to a rotation drive, an output disk and an input disk successively disposed on said input shaft from a rotation drive side of said input shaft with a predetermined interval between said input disk and said output disk, power rollers rollably and tiltably disposed between said input disk and said output disk, and a pressing mechanism having a loading cam and disposed on said input shaft at a rear

side of said input disk and having a pressure adjusting elastic member interposed between a flange of said input shaft formed at said rotation drive side thereof and an axial opposing surface of a bearing disposed at the rotation drive side of said input shaft for receiving an axial force of said input shaft, the improvement comprising:

a needle-shaped roller bearing disposed between said input shaft and said bearing receiving the axial force of said input shaft to allow said input shaft to slide in an axial direction with a reduced sliding resistance against a spring force of said elastic member when a thrust in an axial direction increases to thereby prevent slip between said loading cam and said input shaft

METHOD OF OVERRIDING RATIO MATCHING FEATURE IN POWER SHIFT TRANSMISSIONS

Garth H. Bulgrien, Ephrata, Pa., assignor to Ford New Holland, Inc., New Holland, Pa.

Division of Ser. No. 444,312, Dec. 1, 1989. This application May 10, 1990, Ser. No. 521,630

Int. Cl.[5] **B60K** *20/10*

U.S. Cl. 74—335 **17 Claims**

1. A method of controlling the operation of a vehicle transmission operably connected to an engine and having a plurality of clutches for selectively interconnecting an engine driven input drive shaft, an output drive shaft operatively coupled to ground engaging wheels of said vehicle to effect movement thereof over the ground, and a plurality of gears rotatably housed in said transmission in driving relationship with said input and output drive shafts such that a selective engagement of said clutches will effect a varying of the speed of operation of said output shaft for a given speed of operation of said input shaft, said transmission further having an electrical control system including a microprocessor responsive to switches actuated by manual movement of a gearshift means between a plurality of positions, including forward, reverse, and neutral positions, for controlling said clutches in the transmission, said microprocessor being operable to engage a ratio matching routine when said gearshift means is placed in said neutral position to select a gear having a gear ratio substantially equivalent to the ratio derived from the respective speeds of rotation of said input and output shafts, the method comprising

signalling said microprocessor for an upshift or a downshift of said transmission while engaged in said ratio matching routine; and

exiting said ratio matching routine and entering a gear selection routine in said microprocessor while said gearshift remains in said neutral position to effect a selection of an alternative gear other than the gear selected by said ratio matching routine.

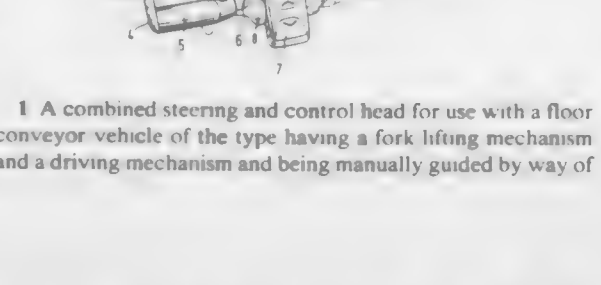
MULTI-AXIS HAND CONTROLLER



Kumar V. Siva, Lightwater, United Kingdom, assignor to United Kingdom Atomic Energy Authority, London, England

Filed Jan. 22, 1990, Ser. No. 468,249

Claims priority, application United Kingdom, Mar. 3, 1989, 8904955

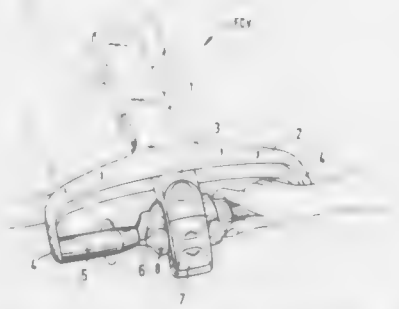
Int. Cl.[5] **G05G** *9/00*; **B25J** *3/00*

U.S. Cl. 74—471 XY **2 Claims**

1. A hand controller whereby an operator can control movements of a mechanism, the controller comprising a base, a support frame connected to the base by three parallel non-telescopic link arms with universal joints at each end so as to allow displacements of the frame relative to the base, and an operating handle connected by four serially arranged links to the support frame, the said links respectively allowing rotation of the handle about three independent axes and linear displacement of the handle relative to the support frame.

5,007,301

COMBINED STEERING AND CONTROL HEAD FOR A FLOOR CONVEYOR VEHICLE



Robert Powell, Pforzheim, Fed. Rep. of Germany, assignor to Dr. Ing. h.c.F. Porsche AG, Fed. Rep. of Germany

Filed Nov. 30, 1989, Ser. No. 443,327

Claims priority, application Fed. Rep. of Germany, Dec. 1, 1988, 3840800

Int. Cl.[5] **B62D** *1/06*; **G05G** *1/10*

U.S. Cl. 74—557 **8 Claims**

1 A combined steering and control head for use with a floor conveyor vehicle of the type having a fork lifting mechanism and a driving mechanism and being manually guided by way of

a shaft coupled to the combined steering and control head, said combined steering and control head comprising:

a steering head at the end of the shaft;

a shaft horn on the combined steering and control head and located adjacent the end of the shaft;

handles on the combined steering and control head arranged one on each side of the shaft horn;

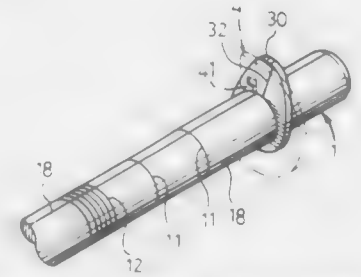
driving control means disposed next to the horn for controlling the drive mechanism; and

a lifting and lowering switch means arranged adjacent an end face of the horn for controlling a lifting mechanism of a lifting fork;

wherein the driving control means includes an approximately disk-shaped segment having at a circumference thereof a first actuating surface which extends transversely with respect to the handles, and

a second actuating surface arranged at the circumference of the disk shaped segment and opposite to the first actuating surface such that at least one of the actuating surfaces can be gripped together with an operating surface of the lifting and lowering switch means.

5,007,302



ALIGNMENT APPARATUS FOR A STROKE CONTROLLING MECHANISM OF A MACHINE TOOL

Tien C. Chen, No. 11, Chiu Chia Lane, Sung Chu Li, Pei Tun Chu, Taichung, Taiwan

Filed Sep. 29, 1989, Ser. No. 414,693

Int. Cl.[5] **F16H** *53/00*; **G01B** *3/02*

U.S. Cl. 74—568 R **3 Claims**

1. An alignment apparatus in combination with a stroke controlling mechanism, said stroke controlling mechanism comprising a cam shaft with a number of cams disposed thereon; said alignment apparatus comprising at least one circular line being formed around said cam shaft, at least one longitudinal line being formed on an outer surface of said cam shaft in a direction parallel to a longitudinal axis of said cam shaft, and a check line being formed on a side surface of each said cam; said cams being disposed on said cam shaft by aligning said check line of each said cam with said longitudinal line and by aligning each said cam with each said circular line; a removable C-shaped protractor mounted on said cam shaft for aligning of said cams on said cam shaft when said check line of each said cam is not aligned with said longitudinal line; a notch which has a diameter substantially equal to an outer diameter of said cam shaft being formed in a center of said protractor so that said protractor is engageable onto said cam shaft.

5,007,303

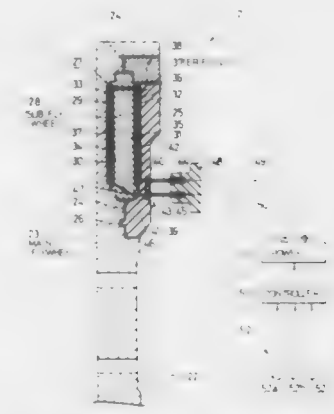
VARIABLE INERTIAL MASS FLYWHEEL

Hiroshi Okuzumi, Yokosuka, Japan, assignor to Nissan Motor Co., Ltd., Yokohama, Japan

Filed Apr. 13, 1989, Ser. No. 337,488

Claims priority, application Japan, Apr. 13, 1988, 63-92300

Int. Cl.[5] **F16F** *15/10, 15/18*; **F16D** *27/00*



U.S. Cl. 74—573 F **5 Claims**

1. A variable inertial mass flywheel connected to an engine via an engine output shaft, which comprises:

(a) a main flywheel member connected to the engine output shaft and rotatable therewith;

(b) a subflywheel member disposed opposingly to said main flywheel member and rotatable relative to said main flywheel member;

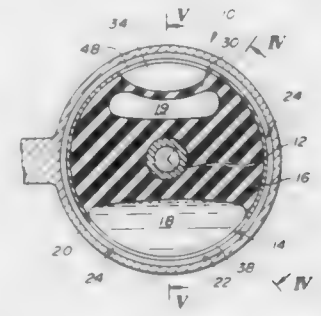
(c) at least one pair of electrodes formed on both opposing surfaces of said main flywheel member and said subflywheel member;

(d) a power supply controller, connected to said electrodes, for controllably generating an electric field between said electrodes formed on said main flywheel member and said subflywheel member; and

(e) a fluid disposed between said electrodes, a viscosity of said fluid being varied according to the intensity of the electric field generated between said electrodes to controllably couple or decouple said subflywheel member to or from said main flywheel member via said fluid.

5,007,304

FLUID FILLED ELASTOMERIC DAMPING DEVICE



Takanobu Ide, Isehara, Japan, assignor to Nissan Motor Company, Ltd., Japan

Filed May 15, 1989, Ser. No. 352,382

Claims priority, application Japan, May 18, 1988, 63-65414[U]

Int. Cl.[5] **F16F** *15/22, 15/10*; **G05G** *1/00*

U.S. Cl. 74—573 F **2 Claims**

1. An elastomeric damping device comprises:

concentric rigid inner and outer sleeves having a space therebetween;

a resilient member within said space connecting said inner and outer sleeves together and thereby subdividing said space into two pockets;

a working chamber in one of said pockets enclosed between said resilient member and said outer sleeve, said working chamber containing a fluid;

a flexible wall member integral with said resilient member, disposed in the other of said pockets;

a compensation chamber within the other of said pocket

enclosed between said flexible wall member and said outer sleeve;

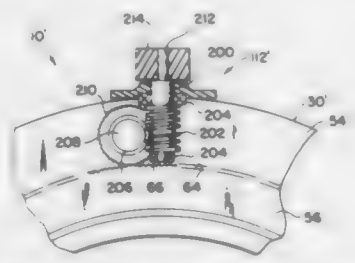
a generally tubular bracket fitted on said outer sleeve; and

a passageway defined between said bracket and said outer sleeve and communicating with said working chamber and said compensation chamber to provide fluid communication therebetween;

in which said outer sleeve is axially separated to include first and second sleeve sections and a spacer section interposed between said first and second sleeve sections, said spacer section being in the form of a split ring and having an opening for providing fluid communication between said working chamber and said passageway;

in which said resilient member and flexible wall member having a pair of axially spaced annular sealing lips projecting outward from an outer circumferential surface, said sealing lips being interposed between matched ends of said first and second sleeve sections and said spacer section and sealingly contacting an inner circumferential wall of said bracket.

5,007,305



RING BALANCER

Rene Linder, Genestrenio, Switzerland, assignor to Schmitt Industries, Inc., Portland, Oreg.

Division of Ser. No. 201,482, Jun. 1, 1988, Pat. No. 4,951,526. This application Aug. 20, 1990, Ser. No. 570,320

Int. Cl.[5] F16F *15/22*

U.S. Cl. 74—573 R **12 Claims**

1. A balancer for dynamically balancing a machine having an elongated rotatable element power driven in at least a first rotational direction about a longitudinal rotational axis, comprising:

an annular case with first and second radially extending annular sidewalls and a central aperture extending fully through said first and second sidewalls and sized to receive the rotatable element therein with the rotatable element projecting fully through said central aperture and beyond said first and second sidewalls to permit positioning of said case at an intermediate position on the rotatable element, said case having an interior annular chamber extending about said central case aperture in substantially coaxial alignment with the rotatable element;

means for fixedly attaching said case to the rotatable element for rotational travel therewith;

a first friction engagement wheel supported by said case for rotational travel therewith, said first engagement wheel being selectively rotatable about a first engagement wheel rotational axis in first wheel first and second opposing rotational directions;

first contact members mounted to the machine in position to rotate as said first engagement wheel as said first engagement wheel passes by, said first contact members being selectively movable to frictionally contact said first engagement wheel to selectively rotate said first engagement wheel in said first wheel first or second rotational direction as said first engagement wheel travels by said first contact members carried by said rotating case;

a second friction engagement wheel supported by said case for rotational travel therewith, said second engagement wheel being selectively rotatable about a second engagement wheel rotational axis in second wheel first and second opposing rotational directions;

second contact members mounted to the machine in position to rotate said second engagement wheel as said second engagement wheel passes by, said second contact members being selectively movable to frictionally contact said second engagement wheel to selectively rotate said second engagement wheel in said second wheel first or second rotational direction as said second engagement wheel travels by said second contact members carried by said rotating case;

first and second eccentrically weighted balancing members coaxially and rotatably mounted within said case chamber for rotational travel with said case, each said balancing member having a rotational axis in substantially coaxial alignment with the rotatable element, and each said balancing member being selectively rotatable in first and second opposing rotational directions relative to the other of said balancing members and to said case, each said balancing member having an engagement portion extending at least partially about said balancing member;

first force transmission means, supported by said case for rotational travel therewith, for drivably interconnecting said first engagement wheel and said first balancing member engagement portion to convert rotation of said first engagement wheel in said first wheel first and second rotational directions into rotation of said first balancing member in said first balancing member first and second rotational directions, respectively; and

second force transmission means, supported by said case for rotational travel therewith, for drivably interconnecting said second engagement wheel and said second balancing member engagement portion to convert rotation of said second engagement wheel in said second wheel first and second rotational directions into rotation of said second balancing member in said second balancing member first and second rotational directions, respectively, whereby said first and second engagement wheels are rotated in selected directions by said first and second stationary contact means when selectively operated as said first and second engagement wheels revolve with said case to progressively and independently rotate each of said first and second balancing members until the machine is dynamically balanced

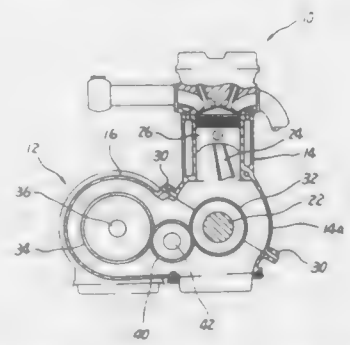
POWER PLANT FOR VEHICLES



Tsuyoshi Tamazawa, Yokohama, and Yoshimasa Hayashi, Kamakura, both of Japan, assignors to Nissan Motor Co., Ltd., Yokohama, Japan

Filed Apr. 26, 1989, Ser. No. 343,214

Claims priority, application Japan, Apr. 26, 1988, 63-101354

Int. Cl.[5] F16H *57/02*

U.S. Cl. 74—606 R **10 Claims**

1. A power plant for an automotive vehicle comprising:

(A) a first independent unit comprising an engine having a cylinder block,

a crankshaft supported on said cylinder block, and

a crankshaft gear installed on said crankshaft;

(B) a second independent unit comprising a transmission arranged in parallel with said crankshaft and including a transmission casing,

an input shaft arranged in parallel with said crankshaft and supported on said transmission casing,

an input gear installed on said input shaft,

an intermediate shaft interposed parallelly between said input shaft and said crankshaft and supported on said transmission casing, and

an idler gear which is installed on said intermediate shaft and which meshes with said crankshaft gear and said idler gear; and

(C) means for detachably attaching said first unit to said second unit.

LINE PRESSURE CONTROL FOR AUTOMATIC TRANSMISSION

Yasushi Narita, Yokohama, Japan, assignor to Nissan Motor Co., Ltd., Yokohama, Japan

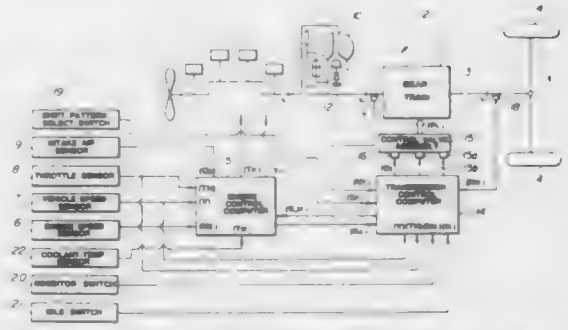
Filed Jul. 19, 1989, Ser. No. 382,120

Claims priority, application Japan, Jul. 19, 1988, 63-178057; Aug. 2, 1988, 63-192010; Aug. 23, 1988, 63-207369

Int. Cl.[5] B60K *41/18*

U.S. Cl. 74—866 **14 Claims**

1. A line pressure control system for an automatic transmission when the automatic transmission undergoes a shifting operation where the line pressure is used to activate a friction element, the line pressure control system, comprising:



means for storing a target value of a predetermined variable that is representative of a quality of the shifting operation occurring under predetermined circumstances;

means for determining an actual value of said predetermined variable for the shifting operation after occurrence of the shifting operation and generating an actual value indicative signal indicative of said actual value determined;

means for detecting circumstances surrounding said occurrence of the shifting operation;

means for comparing said circumstances detected with said predetermined circumstances and generating a deviation indicative signal when a deviation therebetween fails to fall in a predetermined range;

means for comparing said actual value indicative signal with said target value when said deviation indicative signal is absent and generating a comparison result signal indicative of a difference between said actual value measured and said target value; and

means for adjusting the magnitude of the line pressure in response to said comparison result indicative signal during the next occurrence of the shifting operation in such a direction as to decrease said difference indicated by said comparison result indicative signal, whereby the friction element is activated by the line pressure adjusted during the next occurrence of the shifting operation.

AUTOMATIC TRANSMISSION CONTROL SYSTEM AND METHOD OF OPERATION

Robert W. Lemon, Farmington Hills, and John Arzoian, Dearborn, both of Mich., assignors to Rockwell International Corporation, Pittsburgh, Pa.

Filed Jun. 8, 1989, Ser. No. 363,653

Int. Cl.[5] B60K *41/22*; **F16H** *61/14*

U.S. Cl. 74—869 **5 Claims**

1. A method of controlling the operation of an automatic transmission of a vehicle having a fluid torque converter with a bypass clutch connecting a drive shaft from a prime mover to an output shaft of a speed change gear assembly of the transmission and a plurality of friction engaging elements arranged in the speed change gear assembly to provide a plurality of forward speed ratios between the input shaft and the output shaft of the speed change gear assembly upon selective engagement of the engaging elements by selectively enabling or preventing the flow of fluid from a source of pressurized fluid through two passages in a hydraulic circuit by controlling only two solenoid values in response to signals generated by a central processing unit that processes input signals derived from sensed vehicle operating parameters comprising:

opening the second passage to the source of pressurized fluid

to cause engagement of first and second friction engaging elements to produce a first forward drive gear condition while maintaining the first passage closed;

closing both passages from the source of pressurized fluid to cause engagement of only the first friction engaging element to produce a second forward drive gear condition;

opening the first passage to the source of pressurized fluid while maintaining the second passage closed to the pressurized fluid to engage only a third friction engaging element to produce a third forward drive gear position;

and opening both of the passages to the source of pressurized fluid to engage the second and third friction engaging elements along with the torque converter bypass clutch to produce a fourth, direct drive lockup forward drive condition.

PLIERS

James R. Jeromson, Jr., Aurora, and J. Edward C. Anderson, Moreland Hills, both of Ohio, assignors to Milbar Corporation, Chagrin Falls, Ohio

Continuation of Ser. No. 182,016, Apr. 29, 1988, abandoned, which is a continuation-in-part of Ser. No. 46,851, May 7, 1987, abandoned. This application Jul. 10, 1989, Ser. No. 378,448

Int. Cl.[5] B23P *19/04*

U.S. Cl. 81—486 **27 Claims**

1 A plier tool comprising:

(a) a pair of levers each including a handle portion, a jaw portion including a tip and a boss portion fixedly interconnecting the handle and jaw portions;

(b) a pivot interconnecting the levers in a permanently intended, boss portion juxtaposed, but relatively movable and slidable relationship;

(c) the tool including a work position selection means to permit the shifting of the levers in a sliding motion as the boss portions are maintained in their juxtaposed, slidable relationship by the pivot, the motion including relative longitudinal movement such that one tip is passed by the other as the levers are moved between a first working position in a crossed relationship and a second working position in a side by side relationship and such said one tip is passed by the other as the levers are moved from the second to the first position; and,

(d) the work position selection means including a position locating means for retaining the bosses in at least one of the working positions when the tool is in use, the locating means being constructed such that when the tool is used in one of the working positions reaction forces occasioned by work operation apply position retention force to the locating means and when in the other of the working positions the selection means overcomes reaction forces tending to move the levers from the working position.

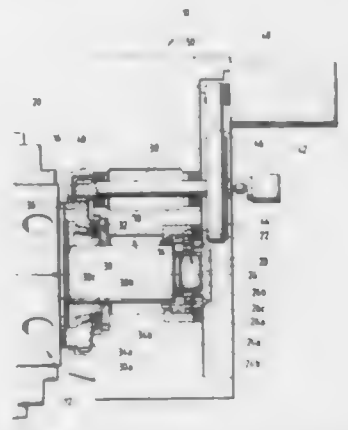
LATHE

Dietmar F. Hafla, Hohengehren, and Guenther Sommer, Esslingen, both of Fed. Rep. of Germany, assignors to Index-Werke Komm. -Ges. Hahn & Tessky, Esslingen, Fed. Rep. of Germany

PCT No. PCT/DE89/00004, § 371 Date Aug. 22, 1989, § 102(e) Date Aug. 22, 1989, PCT Pub. No. WO89/06176, PCT Pub. Date Jul. 13, 1989

PCT Filed Jan. 6, 1989, Ser. No. 415,290

Claims priority, application Fed. Rep. of Germany, Jan. 9, 1988, 3800403



Int. Cl.[5] B23B *3/00*

U.S. Cl. 82—120 **4 Claims**

1. A lathe comprising a main work spindle mounted for numerically controlled rotation about a main spindle axis, a tool turret having a turret body with several stations as well as a turret shaft fixedly connected to said turret body and being mounted on a turret slide for rotation about a turret axis, at least one of said turret body stations being provided with a driveable tool, said lathe also comprising turret drive means for numerically controlled rotation of said turret body and turret shaft about the turret axis, the improvement comprising:

(a) turret shifting means for axially displacing said turret relative to said slide between a first and a second axial position;

(b) releaseable locking means for securing said turret against rotation, said locking means comprising a first ring of teeth connected with said turret in a rotationally fixed manner and a second ring of teeth connected with said slide in a rotationally fixed manner, said first and second rings of teeth being arranged adjacent to the turret body and displaceable relative to one another in the direction of the turret axis by displacing the turret by said shifting

means so that the teeth of said two rings are interengaged when the turret is in its second axial position;

(c) a first bearing means for said turret, said first bearing means being arranged adjacent to said locking means and having two conical races, one of which being connected with the turret so that the two conical races are displaceable relative to one another in the direction of the turret axis in order to make said first bearing means free of radial play when the turret is in its first axial position; and

(d) a second means for said turret, said second bearing means being spaced from said first bearing means in the direction of the turret axis and being axially displaceable as a unit together with the turret.

AUTOMATIC SIDEWALL SERVICER

Joseph H. Alexander; Stanley L. Radcliffe; Martin N. Robertson, all of Summit County; Eugene A. Bator, and John E. Anderson, both of Portage County, all of Ohio, assignors to General Tire, Inc., Akron, Ohio

Division of Ser. No. 77,705, Jul. 24, 1987. This application Nov. 21, 1988, Ser. No. 274,260

Int. Cl.[5] B26D *5/00*

U.S. Cl. 83—72 **5 Claims**

1. Apparatus for cutting a strip of unvulcanized rubbery material comprising:

(a) a plurality of rollers freely rotatable about parallel axes lying in a common plane for supporting the strip to be cut

and for conveying the strip in a direction perpendicular to said roller axes;

(b) a guide means mounted above the roller and extending parallel to the roller axes and beyond both lateral edges of the strip conveyed on the rollers;

(c) a carrier mounted on the guide means and slidable back and forth along the guide means in a direction parallel to the roller axes;

(d) a cutting anvil located between two of said plurality of rollers, said anvil having a head surface located above the rollers, said head surface being sloped at an acute angle to the plane of the roller axes in the same direction as the direction in which the strip is to be conveyed;

(e) an ultrasonic cutter also mounted on the carrier and including an ultrasonically vibrated knife blade which is inclined at the same angle as the sloped head surface of the anvil and has a portion resting on top of said sloped head surface of the anvil;

(f) said anvil and said ultrasonic cutter both being connected to said carrier and being movable with said carrier back and forth parallel to the axes of said rollers between positions that are outside the lateral edges of the strip conveyed on said rollers;

(g) means in close proximity to the anvil for clamping the strip to the rollers on both the upstream and downstream sides of the anvil, in respect of the direction of travel of the strip on the rollers; and

(h) a sensor movable with the carrier which senses a thickness of the strip and controls speed at which the cutter moves along the anvil in relation to the thickness of the strip.

APPARATUS FOR CUTTING SHEET MATERIALS

Stephen O. Ketcham; Paul W. Ortiz, both of Mt. Vernon; Jamie S. Jarvis, Evansville, and Clyde S. McCray, Mt. Vernon, all of Ind., assignors to General Electric Company, Mt. Vernon, Ind.

Continuation of Ser. No. 943,457, Dec. 19, 1986, abandoned. This application Mar. 14, 1990, Ser. No. 494,932

Int. Cl.[5] B26F *1/14*

U.S. Cl. 83—167 9 Claims

6. A punch and die assembly for cutting from sheet of synthetic, polymeric resin, an article, which comprises;

a cutting die block for use in a punch and die assembly, which comprises;

a die plate having a face surface, a back surface and a peripheral surface which extends perpendicular to said die face surface, said peripheral surface defining an outer boundary of the face and back surfaces of the plate;

said plate having a punch receiving aperture located inwardly of the peripheral surface and communicating between the face surface and the back surface;

said punch receiving aperture being defined by a die cutting edge on the face surface at a boundary between the face surface and the aperture;

collecting means comprising a plurality of open grooves extending from the die cutting edge towards the peripheral surface for collecting slivers and bits of waste material generated as a result of such cutting;

a punch adapted by size and configuration to pass into the aperture of the block; and

wherein said particle is cut only along the die cutting edge and said collecting means provides a repository for said slivers and bits of waste material.

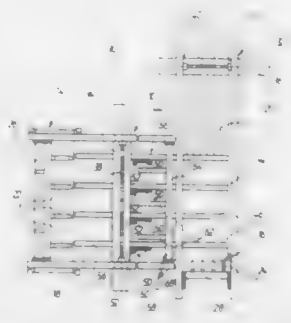
APPARATUS FOR THE PROGRAM CONTROLLED LONGITUDINAL AND TRANSVERSE CUTTING OF WORKPIECE PLATES



Erwin Jenkner, Lindenstrasse 13, Gechingen, Fed. Rep. of Germany D-7261

Filed Apr. 10, 1990, Ser. No. 508,061

Claims priority, application Fed. Rep. of Germany, Apr. 10, 1989, 3911639

Int. Cl.[5] B27B *5/06;* B23D *47/04*

U.S. Cl. 83—256 3 Claims

1. An apparatus for the program-controlled cutting of workpiece plates into multiple workpiece plate pieces, said apparatus being operably arranged for longitudinal cutting of edge strip stacks from workpiece plate stacks, subsequent longitudinal sectioning of said workpiece plate stacks into workpiece plate piece stacks, transverse sectioning of said plate piece stacks cut from said workpiece plate stacks, and transverse sectioning of said edge strip stacks, said apparatus for the program-controlled cutting of workpiece plates into multiple workpiece plate pieces comprising:

a longitudinal cutting saw for cutting said edge strip stacks from said workpiece plate stacks and for cutting said workpiece plate stacks into said workpiece plate piece stacks;

a first advancing device for feeding said workpiece plate stacks to said longitudinal cutting saw;

a first support table for supporting said workpiece plate stack as they are fed to said longitudinal cutting saw by said first advancing device;

a transverse cutting saw for cutting said workpiece plate piece stacks and said edge strip stacks, operably arranged generally perpendicular to said longitudinal cutting saw;

a second advancing device for feeding said workpiece plate piece stacks and said edge strip stacks to said transverse cutting saw;

a second support table for supporting said workpiece plate piece stacks and said edge strip stacks as they are fed to said transverse cutting saw by said second advancing device;

a transport device for moving said edge strip stacks and said workpiece plate piece stacks from said longitudinal cutting saw to said second support table; and

a pick-up device for collecting each said edge strip stack as it is cut from a workpiece plate stack, up to a predetermined number of edge strip stacks,

said pick-up device including a lifting device for raising said collected edge strip stacks to a holding position to permit said workpiece plate piece stacks to pass under said collected edge strip stacks and advance to said transverse cutting saw,

said lifting device being operably arranged to collect said predetermined number of edge strip stacks so that once said predetermined number of edge strip stacks has been collected, operation of said longitudinal saw is interrupted, said lifting device lowers said edge strip stacks from said holding positions for advancing to said transverse saw for transverse cutting.

METAL STRIP EDGE TRIMMING APPARATUS

Laurence C. Cox, Portage; Raymond Dugan; Daniel D. Evans, both of Chesteron; Robert Griffith, Hamlet; Terry L. Handley, Westville, and Jeffrey J. Leeper, Valparaiso, all of Ind., assignors to National Steel Corporation, Pittsburgh, Pa.

Filed Dec. 20, 1989, Ser. No. 453,599

Int. Cl.[5] B23D *25/12*

U.S. Cl. 83—425.2 8 Claims

1. For use in an edge trimming operation for trimming the opposite marginal side edges of a running length of metal strip, a pair of edge trimmers positioned one adjacent each side edge of the strip, said edge trimmers each comprising an upper cutter disc mounted above the plane of the strip and a lower cutter disc mounted below the plane of the strip, said upper and lower cutter discs being mounted for rotation about spaced parallel horizontal axes extending transversely of the strip and cooperating to receive and trim the strip along a trim line extending closely adjacent one marginal edge of the strip, the improvement wherein each said edge trimmer further comprises,

first strip edge stabilizing means mounted for coaxial rotation with said lower cutter disc, said lower cutter disc having a cylindrical outer surface and said first strip edge stabilizing means having a cylindrical outer surface extending inward from and forming an extension of the cylindrical surface of said lower cutter disc in contact with the bottom surface of a strip to be trimmed,

second strip edge stabilizing means mounted for coaxial rotation with said upper cutter disc, said second strip edge stabilizing means having a cylindrical outer surface extending inward from said top cutter disc and contacting the top surface of the strip adjacent said trim line in opposition to said lower cutter disc and a portion of said first stabilizing means,

said first stabilizing means extending inwardly from said trim line a distance greater than said second stabilizing means, and

movable holddown roll means mounted for rotation about an axis parallel to the axis of said upper and lower cutter discs and contacting the top surface of a strip in opposition to said first stabilizing means at a location of said second stabilizing means.

COMPASS

Stuart Craig, Willowdale, and Earl Helland, Toronto, both of Canada, assignors to Inventive Ideas Incorporated, Toronto, Canada

Continuation-in-part of Ser. No. 209,956, Jun. 22, 1988, abandoned. This application Jun. 22, 1989, Ser. No. 369,235

Int. Cl.[5] B26D *5/00*

U.S. Cl. 83—745 26 Claims

1. A compass for sweeping an arc of a circle on a target material comprising:

a base having a lower surface engagable with said material;

a support member rotatably supported on said base;

a toolholder mounted on said support member and being moveable therewith to sweep an arc of a circle upon rotation of said support member about an axis relative to said base, said toolholder including radial adjustment means permitting the radial position of said toolholder with respect to said axis to be varied;

a toolpost mounted on said toolholder for supporting a tool, said toolpost permitting movement of said tool relative to said support member in a direction generally normal thereto between an operative position wherein said tool extends beyond said lower surface to contact said material

and an inoperable position wherein said tool is retracted from said lower surface; and

depth adjustment means allowing the position of said tool in said operative position to be varied, said depth adjustment

means being operable independently of said radial adjustment means such that the position of said tool in said operative position does not change when the radial position of said toolholder is adjusted.

POWER OPERATED STRING VIBRATING DEVICE FOR SELECTIVELY VIBRATING A STRING OF A STRINGED MUSICAL INSTRUMENT

Frederick J. Mastroni, Jr., 89 Gregory Pl., Richboro, Pa. 18954

Filed May 16, 1989, Ser. No. 352,785

Int. Cl.[5] G10D *3/16*

U.S. Cl. 84—325 **9 Claims**

1. A power operated string vibrating device for selectively vibrating a string of a stringed musical instrument having at least one string, said string vibrating device comprising:

a support member positioned on said musical instrument proximate said string;

a first pulley rotatably mounted on said support member on a first side of said string for receiving a cable;

a second pulley for receiving a cable rotatably mounted on a shaft which is mounted on said support member on a second side of said string, said support member receiving said shaft in a cam-like slot for guiding said second pulley and shaft between a first position and a second position;

a spring interconnected between said shaft and said support member for biasing said second pulley and shaft towards said first position;

an endless cable drivingly interconnected to said pulleys, said cable being alternately drivingly engaged between said first and second pulleys such that when said second pulley is in said first position, said cable does not contact the string and, when said second pulley is in said second position, said cable contacts the string;

an electric motor positioned on said support member and having a drive pulley drivingly engaged to said cable for driving said cable, said electric motor driving said cable at selectively variable speeds;

at least one guide pulley for guiding said cable between said first and second pulleys and said drive pulley; and

a finger engageable button secured to said shaft and slidably positioned on said support member for selectively moving said second pulley between said first and second positions, whereby when said second pulley is in said first position, said string does not produce sound and when said second pulley is in said second position, said string is vibrated by said cable and thereby produces sound.

POLYPHONIC ELECTRONIC MUSICAL INSTRUMENT

Ryuji Usami, Tokyo, Japan, assignor to Casio Computer Co., Ltd., Tokyo, Japan

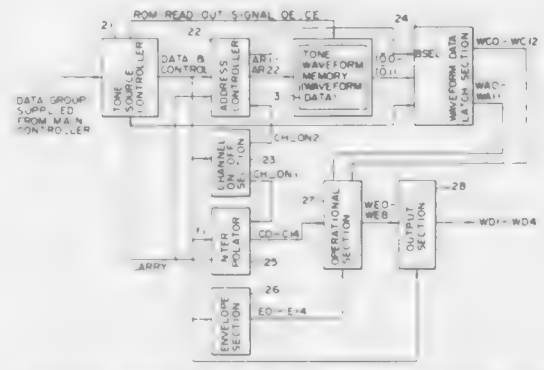
Filed Aug. 1, 1988, Ser. No. 226,936

Claims priority, application Japan, Aug. 7, 1987, 62-196455; Aug. 17, 1987, 62-203200

Int. Cl.[5] G10H *7/00*

U.S. Cl. 84—607 **6 Claims**

1. A polyphonic electronic musical instrument for simultaneously generating a plurality of tone signals through a time-division process on a plurality of channels, comprising:



first memory means for storing tone waveform data;

second memory means for storing waveform control data including access data for accessing said first memory means for each channel;

allotting means for successively allotting on a time-division basis a channel time for each of a plurality of channels as a process time of that channel;

dividing means for dividing each channel time alloting by said allotting means into a plurality of divisions; and

read/write control means for functioning in at least one division of time provided by said dividing means for accessing said first memory means by reading out the waveform control data corresponding to the current channel time from said second memory means, and also for functioning in at least one of the remaining divisions of time for writing the waveform control data of a given channel designated at that time to be changed in an area of said second memory means corresponding to said given channel.

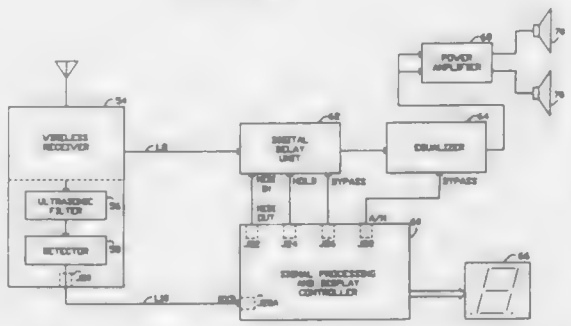
SPECIAL EFFECTS CONTROL FOR PORTABLE MUSICAL INSTRUMENT



Glenn DeMichele, 2217 West Leland Ave., Chicago, Ill. 60625

Filed May 14, 1989, Ser. No. 347,815

Int. Cl.[5] G10H *1/46, 1/02*

U.S. Cl. 84—741 **45 Claims**

1. In combination:

a portable musical instrument having audio-frequency vibration-sensing means responsive to sound-indicating vibrations from said instrument for converting said vibrations into sound-indicating electrical signals;

communication means for communicating said sound-indicating signals to remote audio amplifier means adapted for connection to loudspeaker means;

user-operable first alteration means affixed to said instrument and operable over a range of states for altering said sound-indicating signals over a corresponding range of signal alterations;

generating means associated with said instrument for generating a range of status-indicating electrical signal conditions indicative of the chosen state of said first alteration means;

visual display means adapted for placement remote from said instrument for providing a readily visible indication at the remote location from where the operator is playing the instrument and powered by a source remote from said instrument for producing a plurality of different display conditions; and

display control means responsive to said status-indicating signal conditions for selectively actuating said display means to produce a display condition indicative of said chosen state of operation of said instrument.

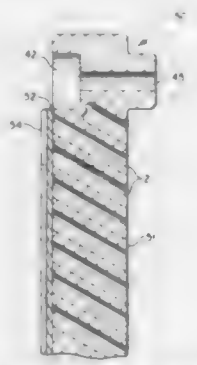
CAST SINGLE PLATE P900 ARMOR

William A. Gooch, Jr., Bel Air; Matthew S. Burkins, Baltimore, both of Md.; Leo F. Mills, Bettendorf, Iowa; James W. Ogilvy, Detroit, Mich., and Antonio J. Ricchiazzi, Havre de Grace, Md., assignors to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed Jan. 16, 1990, Ser. No. 468,324

Int. Cl.[5] F41H *5/04*



U.S. Cl. 89—36.02 **4 Claims**

1. A defensive applique armor for covering and protecting a substrate which may be exposed to attack by projectiles:

said applique comprising a flat armor plate composed of

castable metal having predetermined thickness and having a plurality of slotted holes,

said slotted holes being sufficiently small so that a projectile cannot pass therethrough.

said slotted holes being set at obliquity, and

said applique further comprising a thin skin castable metal layer which increases the maintainability or protecting ability of said armor.

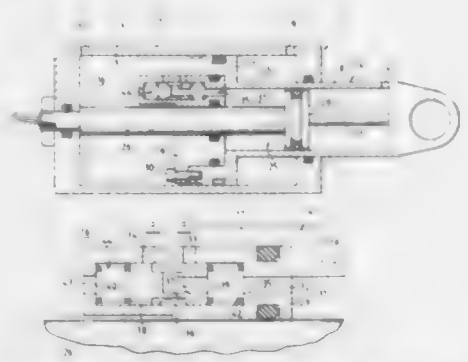
SERVO ACTUATOR



Toshio Kamimura, and Shigeyuki Takagi, both of Gifu, Japan, assignors to Teijin Seiki Company Limited, Osaka, Japan

Filed Sep. 8, 1989, Ser. No. 404,566

Claims priority, application Japan, Sep. 9, 1988, 63-225897

Int. Cl.[5] F15B *11/08*

U.S. Cl. 91—422 **7 Claims**

1. A hydraulic servo actuator adapted to control a driven member in accordance with an operation of a servo circuit through which servo oil flows, comprising:

a main cylinder and an associated main piston, said main piston being reciprocal within said cylinder and said main cylinder divided by said piston into a first chamber and a second chamber which are adapted to be in fluid communication with said servo circuit;

damper means provided within said main piston for dampening reciprocating movement of said main piston, said damper means having a sub piston and a detecting rod coupled at one end to said sub piston and at the other end to said main cylinder for defining a damper chamber in association with said main piston, and

throttle means for imparting a predetermined restriction to the servo oil that flows between said second chamber and said damper means along a predetermined passage formed within said piston.

5,007,328

LINEAR ACTUATOR

John H. Otteman, 4005 Hecker Pass Hwy., Gilroy, Calif. 95020

Filed Jul. 24, 1989, Ser. No. 384,715

Int. Cl.[5] F01B *7/00*

U.S. Cl. 92—63 **1 Claim**

1. A linear actuator having an axis, said actuator comprising

a body having a peripheral sidewall, and inside said side wall, a first and second cylinder wall axially spaced apart and concentric on said axis;

a coupler for releasably mounting said body to a next assembly, enabling the body, when the coupler is loosened, to be rotated around said axis,

a partition between cylinder walls dividing them from one another;

a first piston slidably and sealingly fitted in said first cylinder wall, said first piston having a first face and a second face;

a second piston slidably and sealingly fitted in said second cylinder wall, said second piston having a first face and a second face;

a partition providing a fluid sealing barrier between said first and second cylinder walls;

vent ports means through said body venting said second faces to the atmosphere;

force bias means exerting an axial bias force against said second face of first piston;

inlet port means entering said body through said peripheral side wall for enabling supply of fluid under pressure to regions inside said cylinder walls, applied to said first faces of both pistons;

abutment means on said pistons enabling said pistons to contact one another for transmission of bias force to hold them in abutment;

one of said pistons including a post sealingly and slidingly fitted to said partition to pass therethrough, so as to accomplish said abutment of said pistons;

said inlet port being a single port passing into one of said cylinder walls, and in which by-passing conduitry extends through said post between regions facing both of said first faces;

and in which the uppermost of said pistons includes a central axially extending recess, and in which a guide pin is fixed to said body, projecting axially into said recess in a sliding close-fitting relationship to prevent the piston from cocking, and to serve as a limit stop for upward movement of said piston.

5,007,329

WORKING PISTON, IN PARTICULAR FOR A BRAKE BOOSTER

Bernd Toepperwien, Russelsorf, Fed. Rep. of Germany, assignor to Alfred Teves GmbH, Frankfurt am Main, Fed. Rep. of Germany

Filed Apr. 11, 1989, Ser. No. 336,171

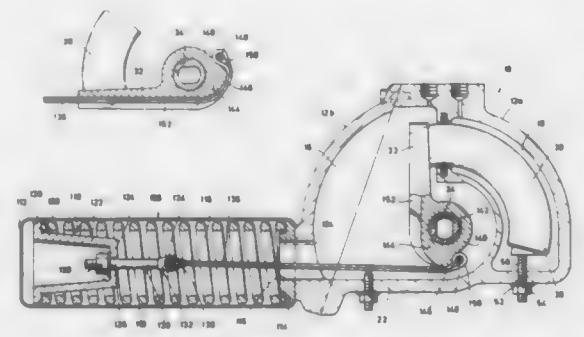
Claims priority, application Fed. Rep. of Germany, Apr. [redacted], 1988, 3813144

Int. Cl.[5] F01B *19/00*

U.S. Cl. 92—98 D **10 Claims**

1. A working piston for a brake booster, comprising a substantially plate-shaped piston (3) is centrally held by a guide housing (1) and is axially guided in a working cylinder, and wherein a rolling diaphragm (2) which, on its outer circumference, is sealingly fixed on the inside wall of the working cylinder and which substantially covers the piston surface, is held immediately adjacent the central mounting of the plate-shaped piston (3) in a groove (8) in the guide housing (1) wherein the centrally held plate-shaped piston (3) has a surrounding arching portion (10) by means of which the plate-shaped piston rests on a corresponding supporting surface (11, 12) on the guide housing (1).

5,007,330



ROTARY ACTUATOR AND SEAL ASSEMBLY FOR USE THEREIN

William B. Scobie, Houston, and Robert A. Frenzel, Waller, [redacted]ith of Tex., assignors to Keystone International Holdings Corp., Houston, Tex.

Filed Dec. 18, 1989, Ser. No. 452,207

Int. Cl.[5] F01C *9/00*

U.S. Cl. 92—120 **23 Claims**

1. A rotary actuator comprising:

a housing defining an arcuate chamber, said housing including a first monolithic portion and a second portion, said arcuate chamber being completely contained within said first portion, said first portion defining an aperture in open communication with said arcuate chamber, said second portion being adjacent to said first portion such that said second portion faces said aperture;

a piston disposed in said housing for reciprocable movement in said arcuate chamber;

a shaft journaled in said housing and connected to said piston, said shaft being rotated in response to movement of said piston;

a seal means disposed between said piston said housing for effecting sealing between said piston and said housing;

means to introduce fluid pressure into said housing to effect movement of said piston in a first direction; and

means to effect movement of said piston in an opposite, second direction.

20. An apparatus for sealing between relatively movable members comprising:

a first member, said first member having a surface defining a bore, a peripheral groove being formed in said surface in surrounding relationship to said bore, said groove having peripherally extending, spaced first and second side walls;

a second member disposed in said bore and relatively movable with respect to said first member;

a seal assembly for effecting fluid tight sealing between said first and second members, said seal assembly including:

a resilient, generally elliptical seal ring, said second member being received in and sealingly engaged by said seal ring;

a generally flexible band in surrounding, engaged relationship with said seal ring;

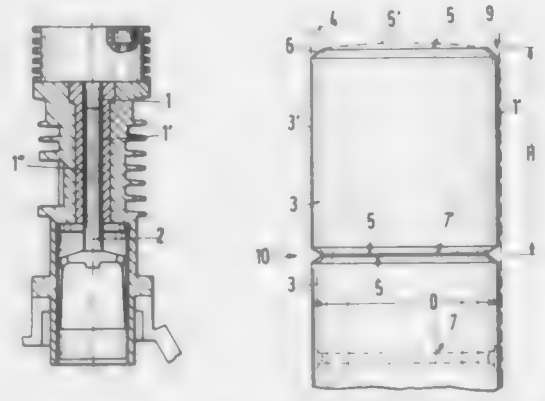
said seal assembly being received in said groove such that said resilient seal ring is in sealing engagement with said first and second side walls in said groove, said band serving to prevent outward movement of said seal ring away from said second member, said groove having a depth sufficient to permit said seal assembly to float.

5,007,331

DRY RUN-HIGH PRESSURE STAGE OF A MULTISTAGE PISTON COMPRESSOR

Peter Greiner, Damooser Weg 15, DE- 7981 Vogt, and Hubert Pflüger, Schlier-Wetzisreute, both of Fed. Rep. of Germany, assignors to Peter Greiner, Vogt, Fed. Rep. of Germany

Filed Dec. 12, 1989, Ser. No. 449,576



Claims priority, application Fed. Rep. of Germany, Dec. 13, 1988, 3841833

Int. Cl.[5] F16J *15/18*

U.S. Cl. 92—165 R **7 Claims**

1. A dry-run, high-pressure stage of a multi-stage piston compressor comprising a cylinder defining a compression chamber and having a working barrel whose interior wall defines a bore, a piston including a tappet guided for reciprocal displacement in the working barrel bore, the tappet having a free end extending into the bore, and at least two cylindrical self-lubricating sealing elements loosely placed on top of each other on the free tappet end and sealing the working barrel bore from the compression chamber, the cylindrical sealing elements having a height corresponding at least to the diameter thereof, circumferential guide surfaces extending at least along

a portion of the circumferential surfaces of the sealing elements and defining an annular gap with the interior working barrel wall, and two end faces having circumferentially extending chamfers.

PISTON FOR PISTON MACHINES

Ludwig Wagenseil, Vöhringen, Fed. Rep. of Germany, assignor to Hydromatik GmbH, Elchingen, Fed. Rep. of Germany

Filed Mar. 30, 1990, Ser. No. 502,460

Claims priority, application Fed. Rep. of Germany, Apr. 13, 1989, 3912213

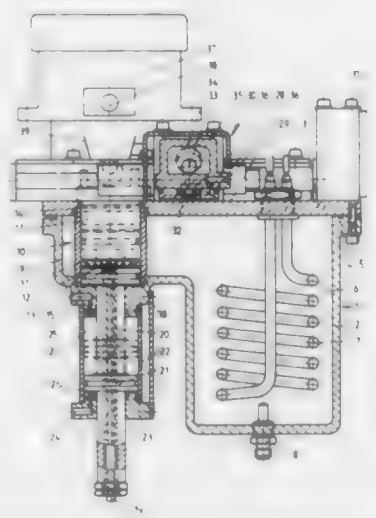
Int. Cl.[4] F01B *31/00;* **F04B** *21/04;* **F16J** *1/00*

U.S. Cl. 92—181 R **11 Claims**

1. A piston for piston machines comprising a hollow body, open at least at its free end, having an axial cavity in which there is a filler piece at least partly filling the latter and consisting of a material of lower specific gravity than the material of the piston, said filler piece being secured in said cavity and being held axially in said cavity by a locking element arranged at the free end of said hollow body and a spring arranged between said locking element and said filler piece, wherein said filler piece is inserted axially into said cavity and the axial securing and locking is effected solely by said spring and said locking element, said spring being pretensioned by said locking element so far that it acts against said filler piece with a spring force greater than the maximum inertial forces of the filler piece acting against said spring to be expected when in operation.

5,007,333

AUTOMATIC COFFEE MACHINE



Peter Sager, Boppelsen, Switzerland, assignor to HGZ Maschinenbau AG, Dallikon, Switzerland

Filed Nov. 27, 1989, Ser. No. 441,514

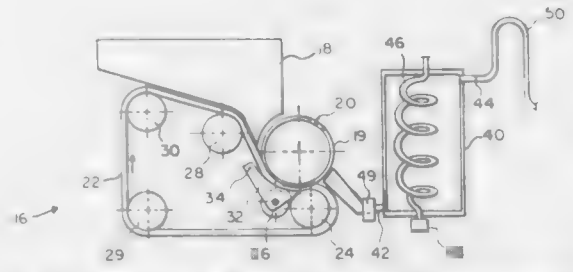
Claims priority, application Fed. Rep. of Germany, Dec. 23, 1988, 3843568

Int. Cl.[5] A47J *31/42*

U.S. Cl. 99—286 **10 Claims**

1. An automatic coffee machine, in particular for the preparation of individual cups and small pots, comprising a housing, an instantaneous water heater for the preparation of hot water in said housing, a brewing chamber comprising a stationary tube section having a vertical axis and upper and lower ends and upper and lower locking pieces with at least a portion of said tube section being located within said housing and adapted to be surrounded by hot water, feeding means for feeding coffee powder into said brewing chamber, radial drive means for moving said upper locking piece toward and away from the vertical axis of said tube section and axial drive means for moving said upper locking piece along the vertical axis of said tube section toward and away from said upper end of said tube section, said upper locking piece having inlet means for introducing hot water into said brewing chamber and comprising a support piece and a partially conically shaped centering piece mounted on said support piece and adapted for limited radial and axial movement with respect thereto and having a single gasket for sealing said brewing chamber and said inlet means, said gasket having a diameter sufficient to seal said brewing chamber at the upper end of said tube when said centering piece is centered over said upper end, and said lower locking piece being adapted to function as a piston within said tube section and having a gasket adapted to bear against the walls of said tube, means for maintaining said lower locking piece within said tube section, and vertical drive means for driving said lower locking piece for movement solely within said tube section.

5,007,334



APPARATUS FOR MAKING ENZYME INACTIVATED VISCOUS FRUIT PULP AND PRODUCTS THEREFROM

Gerald W. Kobes, and Thomas A. Eisele, both of Selah, Wash., assignors to Tree Top, Inc., Selah, Wash.

Division of Ser. No. 437,290, Nov. 16, 1989, Pat. No. 4,950,493, which is a continuation of Ser. No. 935,291, Nov. 26, 1986, abandoned. This application Jun. 20, 1990, Ser. No. 541,253

Int. Cl.[4] A23L *1/212*

U.S. Cl. 99—483 **8 Claims**

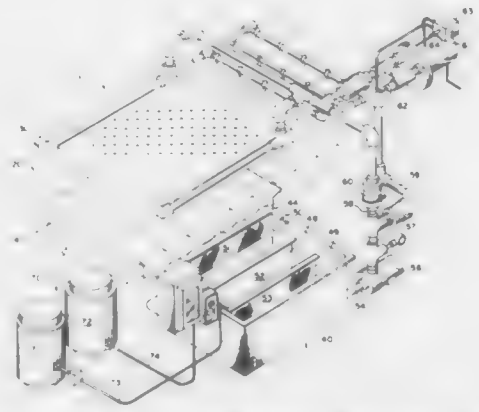
1. An apparatus for making enzyme inactivated fruit pulp from fruit having an outer skin surrounding an inner meat, comprising:

means for simultaneously separating said meat from said skin and for converting said meat to pulp;

means for heating said pulp to a temperature sufficiently high to inactivate enzymes which tend to discolor said meat, said heating means communicating with said separating and converting means; and

means for conveying said pulp from said separating and converting means to said heating means.

5,007,335



APPARATUS FOR TREATING FRESH FRUIT AND THE LIKE TO PREVENT AND RETARD THE GROWTH OFF FUNGUS

Charles R. Orman, San Bernardino; Paul E. Johnson, Riverside, and Bruce C. Adams, Pomona, all of Calif., assignors to Sunkist Growers, Inc., Sherman Oaks, Calif.

Division of Ser. No. 204,722, Jun. 10, 1988. This application Aug. 24, 1989, Ser. No. 398,791

Int. Cl.[5] A23B *7/00, 7/16*

U.S. Cl. 99—487 **8 Claims**

1. An apparatus for treating debris laden fresh fruit in a primary treating step to prevent and retard the growth of fungi comprising in combination:

(a) means for scrubbing said debris laden fruit in a fruit scrubbing station wherein said fruit is contacted by scrubbing means to remove the debris from said fruit;

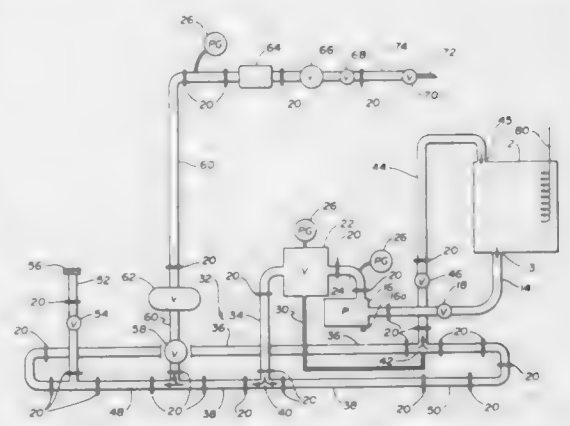
(b) means for simultaneously with said scrubbing means drenching said fruit with a falling liquid in a quantity sufficient to remove substantially all debris carried by said fruit, said liquid containing a funicide;

(c) means for simultaneously maintaining the quantity and concentration of fungicide of said falling liquid in an amount to apply fungicide from said falling liquid to said fruit;

(d) means for simultaneously maintaining the conditions of said falling liquid within a range to deposit said fungicide on said fruit sufficient to prevent fungus growth on said fruit, said means for applying said fungicide being capable of applying fungicide in an amount not exceeding that which would deleteriously affect the quality of said fruit; and

(e) means for simultaneously treating said scrubbing means with said fungicide to prevent and retard the growth of fungus on said scrubbing means.

5,007,336



APPARATUS FOR TREATING SLAUGHTERED ANIMALS

Douglas H. Bernhardt, Minnetonka; Guillermo R. Matheu, Eden Prairie; Spencer E. Crum, Minneapolis, and John T. Adelmann, Prior Lake, all of Minn., assignors to Meat Processing Service Corporation, Minneapolis, Minn.

Filed Feb. 11, 1987, Ser. No. 13,580

Int. Cl.[5] A23B *4/00;* **A23L** *3/34*

U.S. Cl. 99—487 **23 Claims**

1. Apparatus for injection of treatment solution into slaughtered animals comprising:

a container for holding a quantity of treatment solution;

means for establishing flow of solution from the container source;

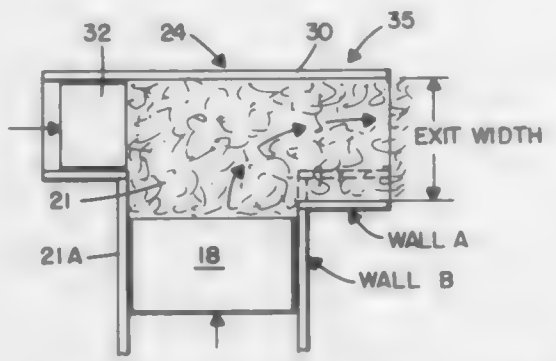
automatic valve means for receiving the flow of solution, the valve means including control means for downstream pressure control of the solution flow;

header means for receiving solution flow from the control valve;

conduit means joining the header means to container for recirculating solution thereto;

pressure sensing means positioned proximate the joining area of the header means and conduit means thereat for sensing pressure;

control line means connecting the pressure sensing means to the control means to the automatic valve whereby pressure downstream of the control valve is controlled to a steady value, and



at least one dispensing conduit means connected to the header means for accepting solution therefrom at controlled pressure and being constructed and arranged for injecting the solution into the circulatory system of a slaughtered animal.

5,007,337

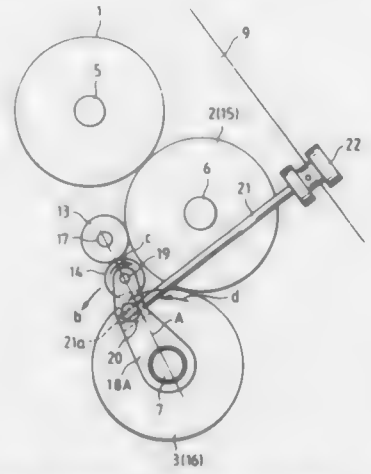
OVERSIZE BALE RELEASE MECHANISM FOR WASTE MATERIAL BALER

Horace R. Newsom, Midland, Tex., assignor to Mosley Machinery Co., Inc., Waco, Tex.

Filed Oct. 3, 1989, Ser. No. 416,707
Int. Cl.[5] B30B *1/00, 15/32*
U.S. Cl. 100—188 R 7 Claims

1. A waste baling machine including a compressing chamber of generally parallelopiped configuration having fixed opposite top and bottom walls and a fixed first sidewall, a horizontally extending charging passage including said fixed top and bottom walls and having an exit at said compressing chamber opposite said fixed first wall, a charging plunger reciprocable in said charging passage for pushing waste material into said compressing chamber and defining, in one position, a fourth compressing chamber wall, a horizontally extending discharge passage defined by said top and bottom walls, said fixed first sidewall and another sidewall adjacent the exit end of said charging passage and leading from said compressing chamber at right angles to said charging passage, and an ejection plunger advanceable through said compressing chamber and said discharge passage for ejecting bales of compressed waste material which, when in a retracted position, defines a fifth compressing chamber wall, wherein the sidewall of the discharge passage which is adjacent the exit end of said discharge passage comprises a first vertically oriented planar surface supported on a structure which is mounted for back and forth horizontal movement in a direction parallel to the sidewalls of said charging passage, said first vertically oriented planar surface normally being positioned substantially adjacent the exit end of said charging passage and perpendicular to the sidewalls of said discharge passage and together with said fixed first sidewall defining the normal width of the discharge passage, said structure being movable if desired to a second position at which said first vertically oriented planar surface is displaced parallel to itself from said normal position in a direction to increase by a desired amount the width of the discharge passage throughout its length to permit the ejection therethrough of an oversize compressed bale of waste material,

wherein the sidewall of said charging passage which is adjacent said first vertically oriented planar surface is shorter than the opposing sidewall of the charging passage by approximately twice the desired increase in the width of said discharge passage and is extended by substantially said desired distance by an extender plate which is much thinner than said sidewall, and



wherein said structure has a second vertically oriented planar surface disposed adjacent and perpendicular to said first vertically oriented planar surface for slidably engaging the outer surface of said extender plate as said structure is moved back and forth.

5,007,338

IMAGE POSITION ADJUSTING DEVICE IN PRINTING MACHINE

Koji Ishii, Fuchu, Japan, assignor to Ryobi Ltd., Hiroshima, Japan

Filed Jul. 11, 1989, Ser. No. 377,996
Claims priority, application Japan, Jul. 14, 1988, 63-176279
Int. Cl.[5] B41F *5/22, 13/14*
U.S. Cl. 101—142 14 Claims

1. An image position adjusting device for controlling an imaging position in a longitudinal direction of a sheet in a printing machine, the printing machine including side frames (**9, 10**), a plate cylinder (**1**), a blanket cylinder (**2**), an impression cylinder (**3**), a sheet feed cylinder (**4**), and gear transmission means (**11, 12**) for synchronously rotating the plate cylinder (**1**) and the blanket cylinder (**2**), the image position adjusting device comprising:

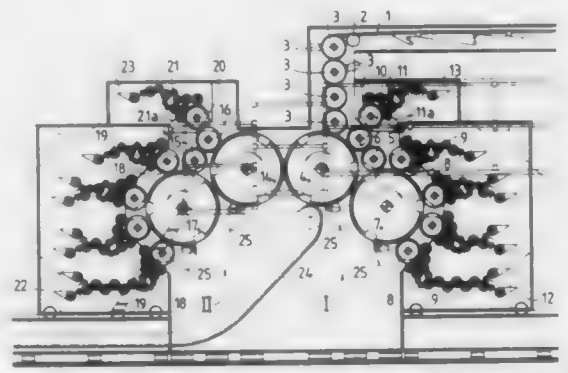
a first intermediate gear (**13** 13A) rotatably supported to the side frames (**9, 10**);

a second intermediate gear (**14**) in meshing engagement with the first intermediate gear (**13** 13A), the second intermediate gear (**14**) being drivingly engaged with a gear (**15, 16**) which is coaxial with and rotatable together with one of the impression cylinder (**3**) and the blanket cylinder (**2**);

a supporting shaft (**17, 8**) extending between the side frames (**9, 10**) for mounting the first intermediate gear (**13** 13A) such that said first intermediate gear (**13** 13A) is rotatable in a stationary position about an axis of said supporting shaft (**17, 8**);

means (**18** 18A 18B) for pivotally moving the second intermediate gear (**14**), the second intermediate gear (**14**) being meshedly moved along the first intermediate gear (**13** 13A) in response to the pivotal movement of the moving means for rotating said gear (**15 16**) and said one of the impression and blanket cylinders in an amount which is different than an amount of rotation occurring during the same time period of the remaining one of the blanket and impression cylinders; and

means (**20** *20a* **21** *21a* **22**) for driving the moving means, the driving means being connected between one of the side frames (**9, 10**) and the moving means;



wherein the second intermediate gear has a rotation axis which is positioned on a line connecting between a rotation axis of the first intermediate gear and a rotation axis of said one of the impression cylinder and the blanket cylinder when the driving means is at a reference position, wherein none of said second intermediate gear, said first intermediate gear and said one of said impression cylinder and blanket cylinder through which said line is connected have the same rotational axis.

5,007,339

CONVERTIBLE MULTI-COLOR PRINTING MACHINE, ESPECIALLY FOR THE PRINTING OF BANKNOTES

Albrecht J. Germann, Wurzburg, Fed. Rep. of Germany, assignor to De La Rue Giori S.A., Lausanne, Switzerland

Filed May 4, 1989, Ser. No. 347,503
Claims priority, application Switzerland, May 18, 1988, 1888/88
Int. Cl.[4] B41F *5/16, 5/22;* B41L *15/10*
U.S. Cl. 101—177 10 Claims

1. A convertible multi-color printing machine for printing paper (**1**), especially banknotes, comprising:

two cooperating impression cylinders (**4, 14**) arranged and constructed to pass said paper (**1**) therebetween and to apply a multi-colored image on a respective side of said paper;

a plurality of inking units (**9**), each inking unit having a different color;

a plurality of convertible cylinders (**8**), each convertible cylinders being inked by a corresponding inking unit (**9**);

converting means for converting said convertible cylinders (**8**) to one of color selecting cylinders and offset plate cylinders;

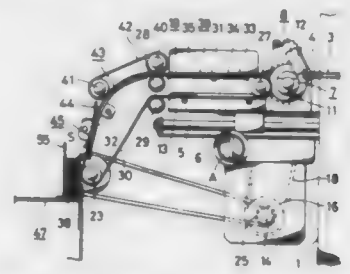
a blanket cylinder (**7**) having a periphery, with said convertible cylinders (**8**) being arranged around and in contact with said periphery;

blanket cylinder mounting means for selectively mounting said blanket cylinder into one of an offset printing position in which said blanket cylinder (**7**) contacts one of said impression cylinders (**4**), and a collect printing position in which blanket cylinder is spaced away from said impression cylinders (**4, 14**);

an image transfer cylinder (**6**) in contact with said one of said impression cylinders (**4**) for applying a multi-colored image thereon;

a collect plate cylinder (**5**) carrying a collect printing plate;

a collect plate mounting means for selectively mounting said collect plate cylinder to an operative position and an inoperative position, in said operative position said collect plate cylinder being in contact with said blanket cylinder (**7**) so that the collect printing plate is inked by said blanket cylinder (**7**) in said collect printing position, and with said image transfer cylinder for picking up said multi-colored image; and



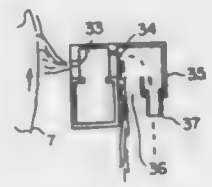
an additional single-color printing unit having an additional plate cylinder (**10**) with a single color image and an additional inking unit (**11**), said additional single-color printing unit being in contact with said image transfer cylinder (**6**) for transferring said single color image thereto.

5,007,340

PRINTER WITH SHEET FEEDING APPARATUS

Kazuaki Sugimoto; Tomio Nishijima, both of Numazu; Teruhisa Inoue, Tagata; Yoshihiko Sugimoto, Susono; Masashi Suzuki, Sunto, and Izumi Matsushita, Tagata, all of Japan, assignors to Tokyo Electric Co., Ltd., Tokyo, Japan

Filed Jan. 23, 1990, Ser. No. 469,021
Claims priority, application Japan, Jan. 24, 1989, 1-14796; Jan. 25, 1989, 1-15651; Jan. 26, 1989, 1-16676; Jan. 27, 1989, 1-18574; Jan. 27, 1989, 1-18575
Int. Cl.[4] B05C *17/06*
U.S. Cl. 101—227 9 Claims



1. A printer with a sheet feeding apparatus comprising a printer case incorporating a printing mechanism for printing onto continuous forms, said printer case having a continuous forms discharging port adjacent to which a cutter is provided, said cutter being locationally followed downstream by a sheet feeding belt which rotates at a rate higher than the feed rate of said continuous forms, said belt being equipped therealong with a sheet traversing section which seizes and horizontally feeds each sheet of paper cut by said cutter from said continuous forms, a sheet direction changing section which perpendicularly changes the feed direction of said sheet, and a sheet pushing section which pushes said sheet onto a sheet stacker.

5,007,341

KEYLESS PRINTING PRESS

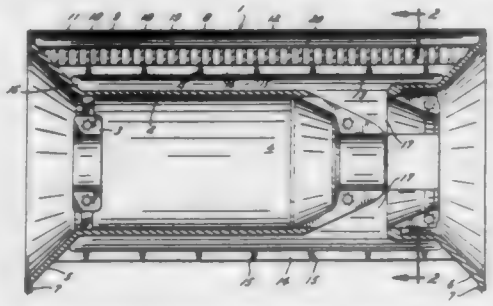
Takafumi Nakano; Akikazu Seo, both of Mihara; Hiromitsu Soeda, and Kazufumi Sueoka, both of Hiroshima, all of Japan, assignors to Mitsubishi Jukogyo Kabushiki Kaisha, Tokyo and Ryomei Engineering Co., Ltd., Hiroshima, both of, Japan

Filed Aug. 23, 1989, Ser. No. 397,655
Claims priority, application Japan, Aug. 23, 1988, 63-109547
Int. Cl.[4] B41F *31/08*
U.S. Cl. 101—349 14 Claims

1. In a keyless printing press including an ink source roller, a closed and pressurized delivery nozzle disposed in opposition to said ink source roller and provided with a plurality of delivery ports aligned in a direction parallel to the axial direction of said ink source roller, and an ink circulation system for circulating a mixture of printing ink and water under pressure into said delivery nozzle and through said delivery ports onto said ink source roller, the improvement comprising means for, while a portion of the mixture containing an acceptable proportion of water is discharged through said delivery ports onto said ink source roller, simultaneously ensuring that a portion of the mixture including an excessive proportion of water will be discharged from said delivery nozzle without being discharged onto said ink source roller, said means comprising:

at least one outflow port provided in said delivery nozzle at a level higher than any of said delivery ports and directed in a direction other than toward said ink source roller;

whereby said circulation system will discharge a portion of



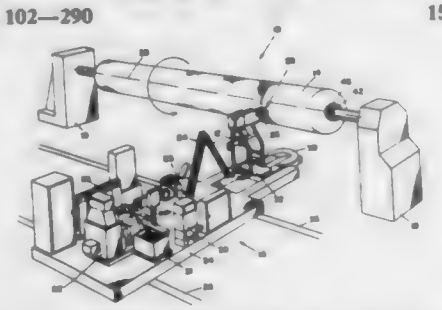
the mixture with a lesser proportion of water from a lower portion of the interior of said delivery nozzle through said delivery ports onto said ink source roller and will discharge the portion of the mixture with the excessive proportion of water from an upper portion of said interior of said delivery nozzle through said at least one outflow port away from said ink source roller.

5,007,342

AIR CUSHION DRUM OR SHEET-FED PRINTING PRESSES

Paul Abeadroth, Offenbach am Main; Harry Brandes, Obertshausen, and Rudolf Raab, Hanau, all of Fed. Rep. of Germany, assignors to Man Roland Druckmaschinen AG, Fed. Rep. of Germany

Filed Aug. 9, 1989, Ser. No. 391,165
Int. Cl.[5] B41F *13/08*
U.S. Cl. 101—420 9 Claims



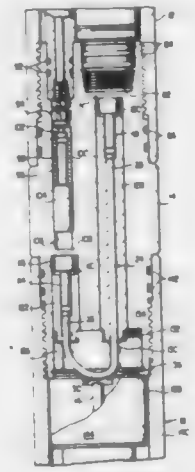
1. An air cushion drum for supporing sheets in sheet-fed printing presses, said drum comprising in combination, an inner drum body and an outer drum casing, said outer drum casing having a plurality of orifices therein, said body and said casing defining a cavity therebetween, means for supplying air streams into the drum cavity so that air issuing from said orifices in the drum casing forces the sheets away therefrom, and a sound-absorbent layer disposed in said cavity between said inner drum body and said outer drum casing opposite said orifices in said casing, said sound-absorbent layer being disposed concentrically in said cavity and spaced radially inwardly from said outer drum casing so as to define an air distribution space therebetween, and said sound-absorbent layer forming an air-permeable partition through which said air streams flow from said supply means into said air distribution space and then out through said orifices in said outer drum casing.

5,007,343

ROCKET MOTOR INSULATION AND LIKE MADE WITH THIN TACKY RIBBON

John D. Marks, Salt Lake County, Utah, assignor to Hercules Incorporated, Wilmington, Del.

Continuation-in-part of Ser. No. 165,408, Feb. 26, 1988, and Ser. No. 762,743, Sep. 12, 1985, which is a division of Ser. No. 378,588, May 17, 1982, Pat. No. 4,596,619, said Ser. No. 165,408, is a continuation of Ser. No. 851,988, Apr. 14, 1986, abandoned, which is a continuation-in-part of Ser. No. 378,588,.
This application Mar. 4, 1988, Ser. No. 164,319
Int. Cl.[5] C06D *5/06*
U.S. Cl. 102—290 15 Claims



1. An elastomeric liner for sealing and insulating a rocket motor case having a dome and a center axis which extends through the apex of said dome, said liner made by a method comprising adjacently positioning and tacking together substantially circumferentially relative to said center axis integral segments of a thin tacky ribbon comprising curable elastomer in forming a continuous, variably thick, layer of said elastomer for lining around said center axis at least that portion of said rocket motor case which includes said dome, and then curing said elastomer in providing said liner.

DUAL FIRING SYSTEM FOR A PERFORATING GUN

Thomas D. Ricles, Kingwood, and Richard M. Ward, Laporte, both of Tex., assignors to Dresser Industries, Inc., Dallas, Tex.

Filed Dec. 1, 1988, Ser. No. 278,659
Int. Cl.[5] F42B *3/00*; E21B *7/00*
U.S. Cl. 102—31.2 26 Claims

1. A dual firing system for use with detonation perforating apparatus in a well completion operation, comprising:
an elongate detonator having two ends each fireable by a different source;
a first firing apparatus adapted for activating said detonator in response to a first input thereto;
a second firing apparatus adapted for activating said detonator for firing said perforating apparatus in the event said first firing apparatus fails such that a dual firing of said perforating apparatus is permitted;
a housing for containing said first and second firing apparatus and said detonator as a unit attachable with resect to one end of the perforating apparatus; and
a chamber in said housing for containing said elongate detonator in fluid isolation from said first and second firing apparatus, said chamber having two bulkhead membrane sidewall areas each adjacent a respective said detonator end, said bulkhead membranes being adapted for penetration for setting off said detonator.

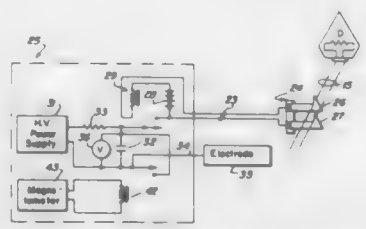
METHOD AND APPARATUS FOR CHARGING WATERLOGGED BOREHOLES WITH EXPLOSIVES

Phil O'Garr, R.R. #3, Frankford, Ontario, Canada K0K 2C0

Filed Aug. 30, 1989, Ser. No. 400,695
Int. Cl.[5] F42B *3/00*
U.S. Cl. 102—313 12 Claims

1. A method of charging waterlogged boreholes with water resistant particulate explosive material, comprising inserting a pneumatic line with upwardly directed nozzles at the lower end thereof and a material supply line into a borehole, blowing compressed air through said pneumatic line such that at least a portion thereof is directed through said nozzles to form a substantially water-free air pocket around the lower end of the supply line, supplying particulate explosive material through the supply line to a charging zone in the vicinity of the lower



end thereof, and gradually withdrawing said line as the borehole fills up with explosive material.

DEVICE FOR DETECTING AND/OR SWEEPING ELECTRICALLY CONTROLLED MINES

James L. Kirkland, Panama City, Fla., assignor to United States of America as Represented by the Secretary of the Navy, Washington, D.C.

Filed Oct. 11, 1967, Ser. No. 675,277
Int. Cl.[5] B63G *9/00*; F42B *22/42*
U.S. Cl. 102—402 10 Claims

1. Means for detecting an insulated electrical conductor located within a subaqueous medium, comprising:
means submerged within said subaqueous medium for penetrating the insulation of and making electrical contact with said electrical conductor upon impact therewith;
a source of high potential electrical energy;
an electrode means connected to said source of high potential energy disposed within the aforesaid subaqueous medium in such manner as to make electrical connection therewith;
means connected to said insulated electrical conductor contacting means and to said electrode means for timely and effectively connecting said high potential electrical source to the electrical conductor of said insulated electrical conductor in response to the impact of said electrical conductor contacting means thereon; and
means connected across said high potential electrical energy source and responsive to variations in said high potential electrical energy source for indicating the connection of said high potential electrical source to the aforesaid insulated electrical conductor.

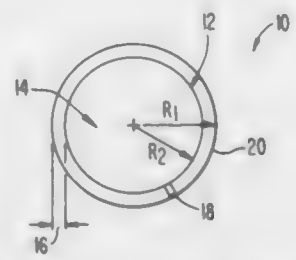
MODULAR MISSILE UPGRADE APPARATUS

Sidney R. Greene, Tucson, Ariz., assignor to Hughes Aircraft Company, Los Angeles, Calif.

Filed Jul. 19, 1989, Ser. No. 382,154
Int. Cl.[5] F42B *10/00, 12/02*
U.S. Cl. 102—473 6 Claims

1. A kit for the conversion of a missile to provide an improved warhead module (13), said kit comprising:

(a) an adapter (11) having a first neck and a second neck, said first neck being attachable to said warhead module;
(b) a probe module (10) attachable to the second neck of said adapter; and,



(c) a faring (12) attachable to the second neck, said faring extending past said warhead module.

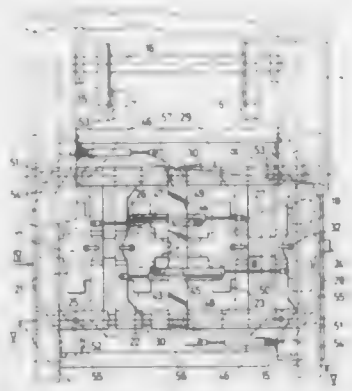
MOBILE TRACK LEVELING, LINING AND TAMPING MACHINE



Josef Theurer, Vienna, Austria, assignor to Franz Plasser Bahnbaumaschinen-Industriegesellschaft m.b.H., Vienna, Austria

Filed Jan. 24, 1990, Ser. No. 469,174

Claims priority, application European Pat. Off., Mar. 10, 1989, 89890069.1

Int. Cl.[5] E01B 27/11

U.S. Cl. 104—12 15 Claims

1. A mobile track leveling, lining and tamping machine, a track comprising two rails fastened to ties supported on ballast and each rail having a gage side and a field side, which comprises the combination of

(a) a machine frame mounted for mobility along the track in an operating direction and carrying drive, brake, operating energy source and operating control means,

(b) two widely spaced undercarriages supporting the machine on the track, including a rear undercarriage in the operating direction,

(c) four ballast tamping units mounted between the undercarriages and immediately preceding the rear undercarriage in the operating direction, the ballast tamping units being mounted for independent transverse and vertical adjustment with respect to the machine frame, a respective one of the ballast tamping units being arranged at the gage side and the field side of each rail, and each ballast tamping unit comprising

(1) a pair of vibratory tamping tools reciprocable in the direction of the track and immersible in the ballast with a respective one of the ties positioned between the tamping tools,

(d) a carrier frame for the four ballast tamping units, the carrier frame being pivotal about a substantially vertical axis constituted by a line of intersection between a vertical plane of symmetry extending in the longitudinal direction of the machine and a vertical plane of symmetry extending transversely thereto and passing between the pairs of tamping tools of the four ballast tamping units,

(e) transverse and vertical guide means on the pivotal carrier frame for independently vertically and transversely adjusting each unit,

(f) power drive means linking each unit to the pivotal carrier frame for independently vertically and transversely adjusting each unit,

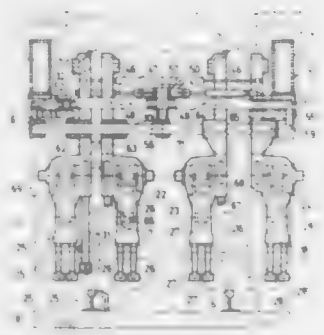
(g) a power drive for pivoting the carrier frame about the vertical axis whereby the pairs of tamping tools may be centered with respect to obliquely positioned ties,

(h) a track leveling and lining unit mounted on the machine between the two undercarriages and immediately preceding the ballast tamping units in the operating direction, and

(i) a leveling and lining reference system controlling the track leveling and lining unit operation.

5,007,350

UNIVERSAL MOBILE TRACK LEVELING, LINING AND TAMPING MACHINE



Josef Theurer, Vienna, Austria, assignor to Franz Plasser Bahnbaumaschinen-Industriegesellschaft m.b.H., Vienna, Austria

Filed Jan. 24, 1990, Ser. No. 469,355

Claims priority, application European Pat. Off., Mar. 10, 1989, 89890068.3

Int. Cl.[5] E01B 27/11

U.S. Cl. 104—12 4 Claims

1. A universal mobile track leveling, lining and tamping machine useful for work in track switches and tangent track, the track comprising two rails fastened to ties supported on ballast and each rail having a gage side and a field side, which comprises the combination of

(a) a machine frame mounted for mobility along the track in an operating direction and carrying drive, brake, operating energy source and operating control means,

(b) two widely spaced undercarriages supporting the machine on the track, including a rear undercarriage in the operating direciton,

(c) four ballast tamping units mounted between the undercarriages and immediately preceding the rear undercarriage in the operating direction, the ballast tamping units being mounted for independent transverse and vertical adjustment with respect to the machine frame, a respective one of the ballast tamping units being arranged at the gage side and the field side of each rail, and each ballast tamping unit comprising

(1) a frame and

(2) a pair of vibratory tamping tools mounted on the frame and reciprocable in the direction of the track and immersible in the ballast with a respective one of the ties positioned between the tamping tools,

(d) an independent vertical guide means for independently vertically adjusting each ballast tamping unit,

(e) at least one transverse guide means for independently transversely adjusting the ballast tamping units, the ballast tamping unit frames being transversely displaceably mounted on the transverse guide means,

(f) a mechanical coupling for releasably connecting the frames of the tamping units at the gage and field sides of each rail for common transverse displacement thereof,

(g) independent power drive means connected to each ballast tamping unit for independently vertically and transversely adjusting each unit along a respective one of the vertical guide means and the transverse guide means,

(h) a track leveling and lining unit mounted on the machine between the two undercarriages and immediately preceding the ballast tamping units in the operating direction, the track leveling and lining unit comprising

(1) power-driven, transversely and vertically adjustable lifting hooks and flanged lining rollers, and

(i) a leveling and lining reference system controlling the track leveling and lining unit operation.

MOBILE CARRIAGE WITH CENTER DRIVE

James C. Muth, Eagle, Wis., assignor to Spacesaver Corporation, Fort Atkinson, Wis.

Filed Feb. 3, 1989, Ser. No. 306,540

Int. Cl.[5] B61C 9/00; B60L 13/02; A47F 3/08; A47B 53/00

U.S. Cl. 105—101 1 Claim

1. A center drive mobile carriage system comprising:

a. a pair of spaced and parallel end rails fixed to a support surface;

b. at least one intermediate rail fixed to the support surface and located parallel to and between the pair of end rails, the intermediate rail being formed with a longitudinal groove therein;

c. at least one carriage supported on the end and intermediate rails for moving therealong, the carriage comprising:

i. an elongated frame that spans the end rails;

ii. first wheel means for supporting the carriage on the end rails;

iii. a pair of second wheels mounted to the carriage for supporting the carriage on the intermediate rail, each second wheel having a flange that engages the groove in the intermediate rail and a sprocket; and

iv. a chain trained around the two second wheels; and

d. drive means for moving the carriage along the rails, the drive means comprising:

i. a source of power mounted to the carriage frame and having an output shaft;

ii. a power sprocket connected to the power source output shaft and meshing with the carriage chain; and

iii. adjustment means for changing the location of the power source output shaft and power sprocket on the carriage frame to thereby adjust the tension of the carriage chain.

INCINERATOR IMPROVEMENTS

John N. Basic, Sr., 41 W. 202 Whitney Rd., St. Charles, Ill. 60174

Continuation-in-part of Ser. No. 659,849, Oct. 9, 1984, Pat. No. 4,706,578, which is a continuation of Ser. No. 362,853, Mar. 29, 1982, Pat. No. 4,475,469, which is a continuation-in-part of Ser. No. 248,054, Mar. 27, 1981, Pat. No. 4,438,705. This application Jun. 1, 1987, Ser. No. 60,761

Int. Cl.[5] F23B 5/00; F23C 9/00; F23G 5/06

U.S. Cl. 110—212 279 Claims

1. In an incinerator system for bulk refuse and hydrocarbon-containing liquids having:

(1) a main combustion chamber with:

(a) a first inlet opening for the introduction of solid bulk refuse; and

(b) a first outlet opening for the egress of the gaseous products of combustion from said main chamber; and

(2) a reburn unit with:

(a) a second inlet opening, coupled to and in fluid communication with said first outlet opening;

(b) a second outlet opening for the egress of the gaseous products of combustion from said reburn unit;

(c) burner means, coupled to said reburn unit, for burning a fuel in said reburn unit; and

(d) oxygenating means, coupled to said reburn unit, for introducing an oxygen-containing gas into said reburn unit,

the improvement wherein:

(A) said reburn unit includes first and second separate reburn sections;

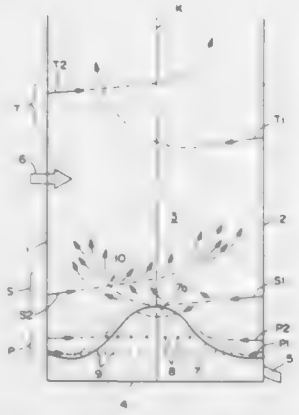
(B) said first outlet opening has first and second outlet ports each for permitting the egress of the gaseous products of combustion from said main combustion chamber;

(C) said second inlet opening has first and second inlet ports, coupled to and in fluid communication with, respectively, said first and second outlet ports, said first and second inlet ports opening into said first and second reburn sections, respectively;

(D) said second outlet opening includes third and fourth outlet ports from said first and second reburn sections, respectively;

(E) said burner means includes first and second burner sections, coupled to said first and second reburn sections, respectively, for burning a fuel in said first and second reburn sections, respectively, and

(F) said oxygenating means includes first and second oxy-



genating sections, coupled to said first and second reburn sections, respectively, for introducing an oxygen-containing gas into said first and second reburn sections, respectively.

COMBUSTION AIR SUPPLY SYSTEM FOR A RECOVERY FURNACE

Erik Uppstu, Slivikkala, Finland, assignor to Oy Tampella Ab, Tampere, Finland

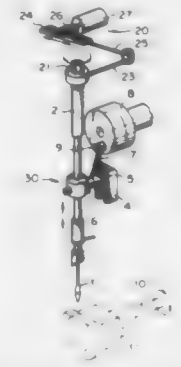
Filed Feb. 16, 1990, Ser. No. 480,926
Claims priority, application Finland, Feb. 20, 1989, 890803
Int. Cl.[5] F23G *7/04*
U.S. Cl. 110—238 **11 Claims**

1. A combustion air supply system for a recovery furnace which includes a combustion chamber defined by a front and a rear wall, side walls and a floor serving as heat transfer surfaces, means mounted above the floor for delivering into the combustion chamber a waste liquor, particularly black lye, obtained from an industrial process and serving as fuel, and an outlet means communicating with combustion chamber floor and intended for discharging melt substance from a carbonization layer building up on the floor as a result of incineration, said combustion air supply system comprising:

combustion air inlet ports disposed in at least one wall of the combustion chamber, said combustion air inlet ports including secondary air inlet ports which are located in the vertical direction of the combustion chamber between a waste liquor supply point and the carbonization layer formed on the floor of the combustion chamber during the processing, said secondary air inlet ports being divided into two arrays in such a manner that:

(a) the combustion air coming in through inlet ports of a first array is directed such that at least a portion of the air contact the outer surface of the carbonization layer, and the remaining portion of the air bypasses substantially along the central region of the carbonization layer;

(b) the combustion air coming in through inlet ports of a second array is adapted to bypass substantially above the combustion air coming through inlet ports of the first array; and



(c) said inlet ports making up said first and second arrays are located on the opposite walls of the combustion chamber.

LEATHER OR SIMILAR WORK SEWING MACHINE HAVING FLAT-NEEDLE CONTROLLER AND SEWING METHOD BY USE OF THE SEWING MACHINE

Gennai Yanagisawa, Matsumoto, Japan, assignor to Kabushiki Kaisha Iida, Kawaguchi, Japan

Filed Aug. 2, 1989, Ser. No. 389,057
Claims priority, application Japan, Aug. 10, 1988, 63-198072
Int. Cl.[5] D05B *15/08, 19/00*
U.S. Cl. 112—54 **3 Claims**

1. A sewing machine for leather comprising a needle bar holding a flat needle and supported for movement up and down, and up/down movement mechanism for up/down moving said needle bar, and a control means for controlling the movement of said flat needle, said flat-needle control means including:

a circumferential position control means comprising a needle-bar rotating means and a control motor connected to said needle-bar rotating means for controlling a circumferential position of said flat needle, said needle-bar rotating means being provided on said needle bar at a portion thereof so as to rotate integrally with said needle bar while allowing said needle bar to move up and down; and

a needle bar holding means attached to a portion of said needle bar where said up/down movement mechanism is connected to said needle bar so that said needle-bar holding means is connected to said up/down movement mechanism and said needle-bar holding means moves up/down integrally with said needle bar while allowing said needle bar to rotate.

CUTTER ACTUATOR OF A BUTTON PERFORATING SEWING MACHINE

Katsuo Hiratsuka; Yoshiyuki Odaka, and Takeshi Yoshida, all of Tochigi, Japan, assignors to SSMC Inc., Edison, N.J.

Filed Jul. 3, 1989, Ser. No. 374,808
Claims priority, application Japan, Jul. 26, 1988, 63-97940[U]
Int. Cl.[5] D05B *3/00*
U.S. Cl. 112—68 **4 Claims**

1. A cutting actuator adapted for use on a button perforating machine, said actuator comprising:

a first wheel supported on said machine and continuously rotated about an axis;

a second wheel rotatable about said axis;

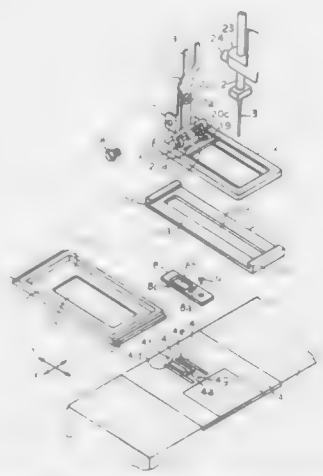
a clutch disposed adjacent the first and second wheels, the clutch having a first clutch position wherein said first wheel engages the second wheel and causes the second wheel to be driven by and rotated with the first wheel, the clutch having a second clutch position wherein the first and second wheels are disengaged and the second wheel does not rotate;

a cutting actuator lever supported on the machine and coupled to the clutch, the lever having a first lever position wherein the clutch is placed in the first clutch position and the second wheel is rotated, the lever having a second lever position wherein the clutch is placed in the second clutch position and the second wheel does not rotate;

solenoid means coupled to the lever, said solenoid means when actuated placing the lever in the first lever position and when deactuated placing the lever in the second lever position;

a first elongated cutting arm having a knife at one end;

a second elongated cutting arm having a block at one end, and



cam means coupled to the first and second arms, said cam means coupled to the second wheel and responsive to rotation of the second wheel to move the knife and block into button hole forming position with respect to any sewn material disposed between the knife and block, said cam means when the second wheel does not rotate moving the knife and block out of button hole forming position.

EMBROIDERING DEVICE FOR A SEWING MACHINE

Hideaki Takenoya, and Yoshikazu Ebata, both of Tokyo, Japan, assignors to Janome Sewing Machine Co., Ltd., Tokyo, Japan

Filed Jun. 26, 1989, Ser. No. 371,417
Claims priority, application Japan, Jun. 24, 1988, 63/154612; Sep. 30, 1988, 63/244584
Int. Cl.[5] D05B *21/00*; D05C *7/04, 9/04*
U.S. Cl. 112—103 **3 Claims**

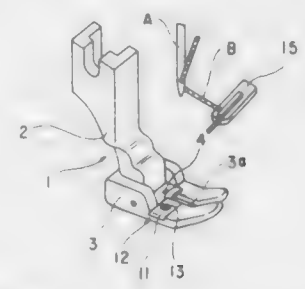
1. An embroidering device for a sewing machine including a frame, stitch forming means comprising a vertically reciprocating and laterally swinging needle bar and a needle attached to a lower end of the needle bar, a needle plate attached to the sewing machine frame, a presser bar having a presser foot attached to a lower end thereof for pressing a fabric to be sewn against the needle bar, and a feed dog movable in synchronism with a vertical movement of the needle bar to transport, in cooperation with the presser foot, a fabric to be sewn in a direction transverse to lateral swinging and vertical reciprocating directions of the needle bar, said embroidering device comprising:

first guide means associated with the needle plate of the sewing machine;

first drive means to be supported on the needle plate of the sewing machine and comprising a first elongate member engaging said first guide means and to be connected with the feed dog for displacement thereby relative to said first guide means in the direction in which the fabric to be sewn is transported;

second drive means comprising a second elongate member having an intermediate part to be pivotally supported on the presser bar, an upper end to be operatively connected to the needle bar, and a lower end;

second guide means supported at said lower end of said second elongate member; and



fabric expanding means connected with said first elongate plate for movement therewith relative to said second guide means and for movement relative to said first elongate plate in the lateral swinging direction of the needle bar.

CLOTH PRESSER PROVIDED WITH A THREAD END HOLDER

Kiyoshi Kawakubo, and Shuichi Sato, both of Tochigi, Japan, assignors to SSMC Inc., Edison, N.J.

Filed Jul. 3, 1989, Ser. No. 374,892
Claims priority, application Japan, Jul. 26, 1988, 63-97941[U]
Int. Cl.[5] D05B *29/06, 27/04*
U.S. Cl. 112—235 **2 Claims**

1. In combination:

a cloth presser;

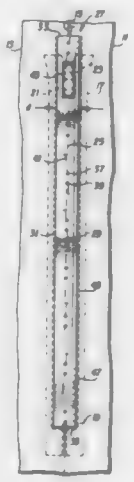
a thread end holder positioned beside the cloth presser and adapted to hold an end of an extension thread;

a presser supporter;

said cloth presser foot pivotally mounted on the presser supporter, said foot having a base with a pair of projections projecting laterally from the base;

a needle location groove disposed between the pair of lateral projections and extending in a direction of projection;

a thread end guide groove disposed in the base and communicating with the needle location groove;



a needle thread restriction plate mounted on the cloth presser foot for preventing a needle thread from sliding into the thread end guide groove;

a stationary knife secured to rear surface of one of the lateral projections of the cloth presser foot and having a cutting blade disposed at the right angles to and intersecting the thread end guide groove;

the needle thread restriction plate covering an upper surface of the thread end guide groove at an inclined angle $\theta 1$ defined between an inclined portion of the needle thread restriction plate and a sewn material, said angle $\theta 1$ is larger

than an inclination angle $\theta 2$ defined between the extension thread and the sewn material.

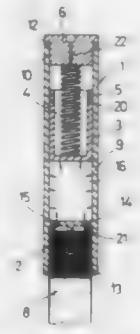
AIR-LEAK INDICATOR FOR VEHICLE TIRE
Feng-Lin Hwang, No. 21, Pa Te Rd., Li Tu District, Keelung City, Taiwan
Filed Jan. 17, 1990, Ser. No. 466,192
Int. Cl.[5] B60C *23/04;* **G01L** *19/12*
U.S. Cl. 116—34 R **1 Claim**

1. An air-leak indicator for use in cooperation with a tire air valve of a tire comprising;

a tubular body having a transparent mid-section;



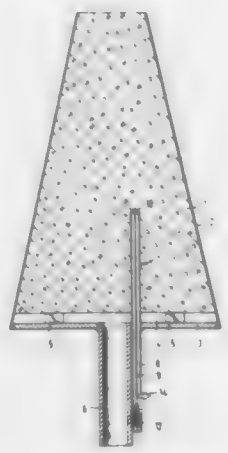
fastening means at a lower end of said tubular body for engaging, a tire valve stem;

a horizontal annular partition with holes there through, fixed in said tubular body above said fastening means;

a tire valve actuator projection mounted at the center of said annular partition and projection downward, coaxially with said fastening means;

a tubular indicator piston having bands of different fluorescent colors around an outer periphery of said tubular

indicator piston, each color band representing a predetermined pressure range;
said tubular indicator piston having a closed bottom and being slidably contained within said tubular body above the annular partition;
said tubular indicator piston having seal means along the outer periphery thereof to provide airtight cooperation between said tubular indicator piston and an inner periphery of said tubular body;
an end cap threaded to an upper end of said tubular body;
said end cap having a hole communicating with an interior of said tubular body;



a return spring mounted between an under side of said end cap and said closed bottom of said tubular indicator piston;
wherein, air pressure from the tire is released to act upon the closed bottom of said tubular indicator piston against the bias of the return spring when said fastening means engages the tire valve stem and said actuator projection opens the tire air valve and actuates said tubular indicator piston, said transparent mid-section permitting a viewer to observe the tubular indicator piston and determine the relative air pressure of the tire.

REFRACTORY GAS PERMEABLE BUBBLING PLUG

Rudolf Handler, Neunkirchen, Austria, assignor to Veitscher Magnesitwerke-Actien-Gesellschaft, Vienna, Austria

PCT No. PCT/AT89/00035, § 371 Date Nov. 28, 1989, § 102(e) Date Nov. 28, 1989, PCT Pub. No. WO89/09836, PCT Pub. Date Oct. 19, 1989
PCT Filed Apr. 13, 1989, Ser. No. 457,766
Claims priority, application Austria, Apr. 13, 1988, 958/88
Int. Cl.[5] C21B *7/24;* **G01D** *5/26;* **C21C** *5/48*
U.S. Cl. 116—208 **7 Claims**

1. A refractory, gas-permeable bubbling plug for a vessel containing a molten metal radiating heat, the plug having a cold end remote from the molten metal and a hot end facing the molten metal, the hot plug end being subject to wear by the heat radiated from the molten metal to leave a remaining plug size after wear, and the plug comprising at least one measuring probe displaying the remaining plug size, the measuring probe comprising a small tube having a tip extending into the plug and spaced a predetermined distance from the cold plug end, and an end section protruding from the cold plug end, a wire movably mounted within the small tube, a spring preloading the wire, a connection connecting an end of the wire to the tip of the small tube and detachable by the effect of the radiated heat, and an optical display unit attached to the wire in the protruding end section of the measuring probe tube.

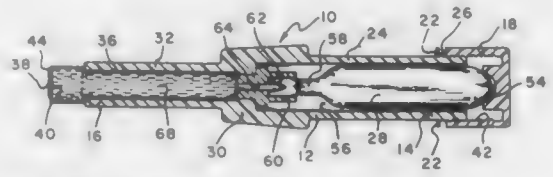
INFLATABLE BALLOON DISTRESS SIGNAL DEVICE

Lawrence A. Matteucci, 777 Meadowsweet Dr. #108; Shirley J. Rager, 223 Baltimore Ave., both of Corte Madera, Calif. 94925, and Ambrose P. Maher, 381 Lynbrook Dr., Pacifica, Calif. 94044

Filed Dec. 12, 1988, Ser. No. 283,167
Int. Cl.[5] A63H *27/10;* **B64B** *1/50;* **B65H** *49/18*
U.S. Cl. 116—210 **3 Claims**

1. A distress signal device comprising:
a generally spherical balloon;
a net containing said balloon;
said net having a bottom opening smaller in diameter than the maximum horizontal diameter of said ballon;
a base member;
four guide lines extending between and converging continuosly from said net at 90° intervals around said balloon to said base member;
a spindle carrying said base member having four spools to wind said guide lines thereon; means for inflating said balloon with lighter-than-air gas; and
means for anchoring said base member to the ground.

5,007,368



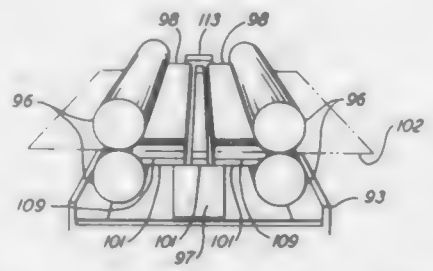
EMERGENCY SKI ALTERING DEVICE AND METHOD

Timothy P. Bush, 9 Bayberry Dr., Tuckerton, N.J. 08087

Filed Feb. 26, 1990, Ser. No. 484,256
Int. Cl.[5] G08B *1/00*
U.S. Cl. 116—211 **31 Claims**

1. A device to alert other skiers of a downed skier that is incapacitated in the snow out of direct sight from the other skiers, the device comprising:
(A) a cartridge comprising:

(i) an interior storage volume sufficient to store a charge of liquid,
(ii) aperture means to provide an opening to the interior storage volume for continuously dispensing said charge of liquid from the cartridge as the cartridge is projected through the air, and
(iii) a closure means to
(a) prevent inadvertant opening of the aperture means prior to actuating the trigger means, and
(b) be openable to permit dispensing of said charge of liquid from the opening of the cartridge, and



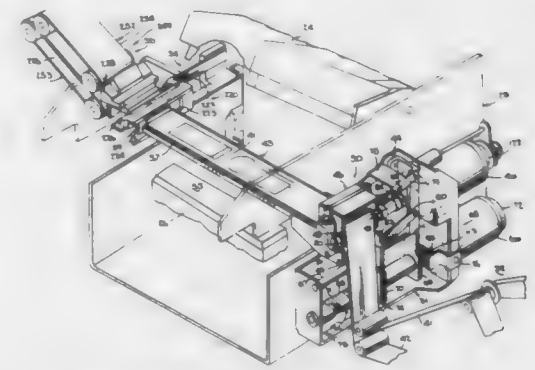
(B) a body comprising:
(i) projection means to provide a source of power to project the cartridge from the body, and
(ii) trigger means on the body to actuate the projection means, and
(C) said charge of liquid in the cartridge having physical characteristics to disperse from the aperture means into droplets as the cartridge is projected through the air and to have high visibility when sprinkled on the snow.

5,007,369

APPARATUS FOR SOLDER COATING PRINTED CIRCUIT PANELS

Gilbert V. Morris, Amherst, N.H., assignor to Teledyne Industries, Inc., Los Angeles, Calif.

Continuation-in-part of Ser. No. 199,604, May 31, 1988, Pat. No. 4,903,631. This application Sep. 1, 1989, Ser. No. 402,224
Int. Cl.[5] H05K *3/22*
U.S. Cl. 118—56 **7 Claims**



1. In apparatus for soldering printed circuit panels comprising a plurality of stations through which the printed circuit panels are conveyed in line, through a horizontal path, the stations including a preheat station having heating means and means for conveying the panels through the preheat station to elevate the temperature of the panels, a flux station for coating the panels with a flux and including means for conveying the panels through the flux station, a soldering station including at least one solder immersion chamber through which said printed circuit panels may be horizontally conveyed for coating the panels with molten solder, the improvement wherein the solder station comprises a solder manifold below the travel path of the panels through the soldering station, and means for pumping molten solder into the manifold whereby to form a standing wave of molten solder, the crest of which extends above the travel path of the panels, said standing wave of molten solder having sufficient volume flow so as to flood at least in part the top side of the panels as they are conveyed through the standing solder wave, said soldering station also comprising a solder immersion chamber defined by upper and lower retainer guide means and two pairs of rolls, the rolls functioning to convey printed circuit panels horizontally through the chamber, each roll pair including an upper roll and a lower roll, the guide means being parallel to the rolls and the lower guide means positioned close to the lower rolls to minimize solder leakage, an opening in the lower guide means parallel to the rolls, the manifold parallel to and below the solder chamber communicating with the opening in the lower guide means, the manifold including side plates terminating below the travel path of said panels for draining excess solder from said manifold.

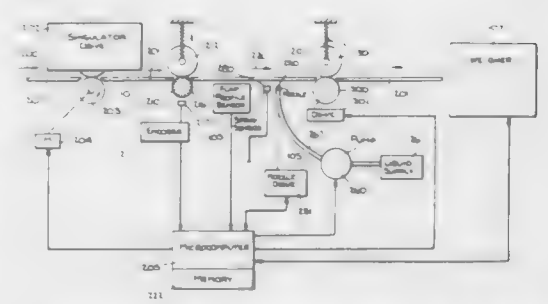
MAILING MACHINE TAPE MODULE AND TAPE TAKE-UP AND MOISTENING SYSTEM THEREOF

Hugh St. L. Dannatt, 119 Milwaukee Ave., Bethel, Conn. 06801

Filed Dec. 28, 1988, Ser. No. 291,468
Int. Cl.[5] B05C *1/04*
U.S. Cl. 118—246 **2 Claims**

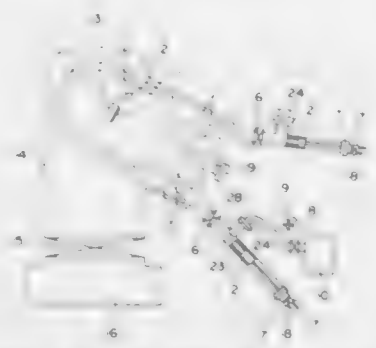


1. A device for moistening tape comprising:
a reservoir;
a roller rotatable in said reservoir;
a conveyer mounted to engage said roller to rotate it in said reservoir and to receive said tape between said conveyer and said roller and advance said tape with rotation of said roller.

5,007,371

CONTROL SYSTEM FOR MOISTENER

Kevin J. O'Dea, Sandy Hook; Norman J. Bergman, Danbury; Peter C. Digiulio, Bridgeport; Donald T. Dolan, Ridgefield, and James L. Vanderpool, Easton, all of Conn., assignors to Pitney Bowes Inc., Stamford, Conn.



Filed Dec. 28, 1988, Ser. No. 291,088
Int. Cl.[5] B05B *3/18, 13/04*
U.S. Cl. 118—680 **3 Claims**

1. A moistening arrangement for moistening the flaps of envelopes comprising a guide path for guiding envelopes, a moistener, means for moving said moistener transversely of said guide path, first means for moving envelopes at a first speed onto said guide path, means for detecting said first speed, second means for moving envelopes away from said guide path at a second speed, means for detecting said second speed, said

first and second means being spaced apart a distance less than the lengths of said envelopes, means for sensing the widths of the flaps of envelopes at a determined position between said first and second means, and means for controlling the position of said moistener as a function of the speed of said first means for an initial portion of the envelope, and as a function of the speed of the second means for a final portion of the envelope.

VACUUM DEPOSITING APPARATUS
Shintarou Hattori; Takayuki Takahagi, and Akira Ishitani, all of Shiga, Japan, assignors to Research Development Corporation, Tokyo, Japan
Filed Dec. 5, 1988, Ser. No. 280,152
Claims priority, application Japan, Dec. 4, 1987, 62-308426; Dec. 4, 1987, 62-308427; Dec. 4, 1987, 62-308428
Int. Cl.[5] C23C *16/00*
U.S. Cl. 118—715 10 Claims

1. A vacuum depositing apparatus, comprising a vacuum vessel containing a substrate used for the purpose of applying a vapor-deposited film thereupon by means of vapor deposition; a sputtering cell charged with a material to be vapor-deposited, a collimator containing long channels to impart directivity to the evaporated material to be vapor deposited from the spouting cell to the substrate, thereby serving a rectifying function between said spouting cell and said substrate, said collimator being installed between said substrate and said spouting cell along a straight line connecting the center of said substrate with the center of said spouting cell for the purpose of preventing impurities from contaminating the vapor-deposited film, wherein said collimator is maintained at a temperature lower than that of said spouting cell or that of said substrate.

3. A vacuum depositing apparatus, comprising a vacuum vessel containing a substrate used for the purpose of applying a vapor-deposited film thereupon by means of vapor-deposition; one or more spouting cells charged with a material to be vapor-deposited, each spouting cell including one or more separation mechanisms which make it possible to charge the spouting cell with said material under substantially atmospheric pressure, while said substrate is kept under vacuum

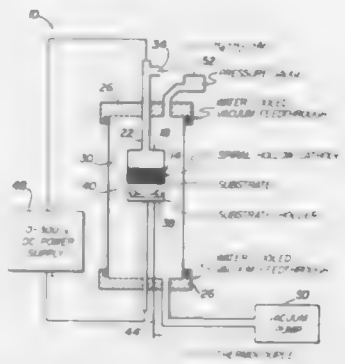
SPIRAL HOLLOW CATHODE
Keith O. Legg, Dunwoody, Ga., and Yonhua Tzeng, Auburn, Ala., assignors to Ionic Atlanta, Inc., Atlanta, Ga.
Filed May 24, 1989, Ser. No. 356,433
Int. Cl.[5] C23C *16/50*
U.S. Cl. 118—723 9 Claims

9. An apparatus for generating uniform electron beams and plasmas over a large area comprising:



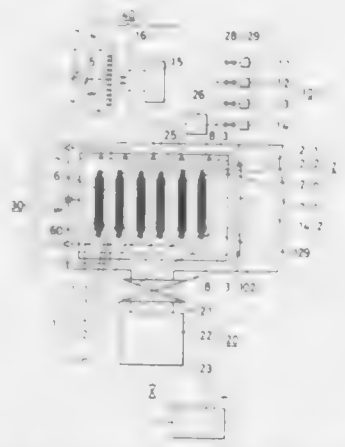
a. a cathode having a spiral shape in which spaces approximately 0.5 mm wide exist between adjacent layers and composed of a metal approximately 0.08 mm thick, 10 mm wide, and 150 mm long selected from the group consisting of tungsten, tantalum, and molybdenum;

b. a cylinder for receiving the cathode;

c. a gas mixture for flowing through the layers of the cathode,

d. an anode toward which the electrons in the electron beams are emitted.

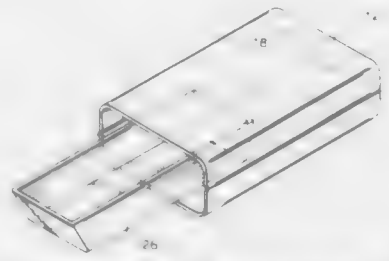
e. a thermocouple imbedded in the anode for measuring its temperature.



f. a substrate positioned on the anode for receiving the emitted electrons.

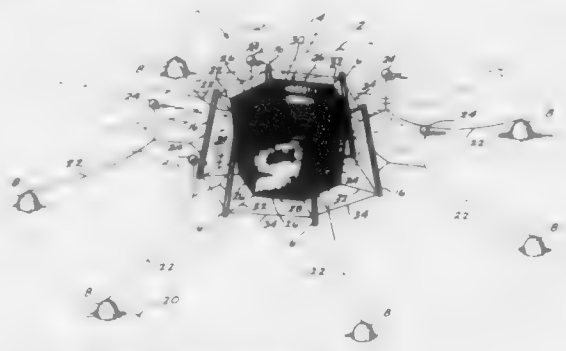
g. a vessel for containing the cylinder, anode, and gas mixture;

h. means for eliminating unwanted air from the vessel; and



i. a pressure gauge for measuring the pressure inside the vessel.

5,007,374
APPARATUS FOR FORMING THIN FILMS IN QUANTITY
Shunpei Yamazaki, Tokyo; Shinji Imatou; Mitsunori Tsuchiya, both of Atsugi; Kenji Itoh, Zama; Takashi Inushima, and Atsushi Kawano, both of Atsugi, all of Japan, assignors to Semiconductor Energy Laboratory Co., Ltd., Atsugi, Japan
Filed Mar. 17, 1989, Ser. No. 324,668
Claims priority, application Japan, Mar. 22, 1988, 63-67572
Int. Cl.[5] C23C *16/50*
U.S. Cl. 118—723 6 Claims

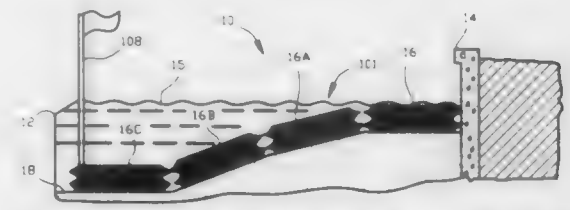


1. A plasma processing apparatus comprising a vacuum chamber, a gas introduction system for feeding a reactive gas into said vacuum chamber, a pair of electrodes provided in said vacuum chamber for generating plasma gas therebetween, a plurality of substrate holders arranged in subtantially parallel with the electric field induced between said electrodes in order not to provoke disturbance of the electric field, a first power source for applying first electric energy between said pair of electrodes and a second power source for applying second electric energy to said substrate holders.

5,007,375
LITTER BOX ENVELOPES
Francis P. Paciullo, Middlesex, N.J., assignor to Colgate-Palmolive Co., Piscataway, N.J.
Filed Apr. 16, 1990, Ser. No. 509,118
Int. Cl.[5] A01K *45/00*
U.S. Cl. 119—170 2 Claims

1. A litter box envelope for use in combination with a litter box received therein, comprising a top sheet and a bottom sheet bonded to each other along their side edges and an end edge of each thereof, a scratch proof, tear resistant facing sheet bonded to said top sheet, said facing sheet bonded to said top sheet, said facing sheet being formed of non-woven nylon fibers, which are spun bonded and heat treated, said bottom sheet being underneath said litter box, said top sheet being above said litter box.

5,007,376
SPAR BOUY PEN SYSTEM
Gary F. Loverich, and Barry A. Griffin, both of Bainbridge Island, Wash., assignors to Nor'Eastern Trawl Systems, Inc., Bainbridge Island, Wash.
Filed Apr. 18, 1989, Ser. No. 339,676
Int. Cl.[5] A01K *61/00*
U.S. Cl. 119—3 8 Claims



1. A spar buoy pen comprising:

a flexible water-permeable wall;

at least two buoyancy members having an elongated shape and weighted to float substantially vertically attached to said flexible wall at spaced-apart locations whereby at least one of the elongated buoyancy members is connected to said flexible wall by a first upper attachment line and a second lower attachment line, said first upper attachment line being shorter than said second lower attachment line so that said at least one buoyancy member is displaced from the vertical position at a pre-determined angle; and

separate anchor means attached to each said buoyancy member, each said anchor means urging the buoyancy member attached thereto away from said flexible wall so that said flexible wall is suspended between the buoyancy members.

5,007,377
APPARATUS AND METHOD FOR MARINE HABITAT DEVELOPMENT
August A. Muench, Jr., 3031 SW. Manatee Ave., Ruskin, Fla. 33570
Filed Feb. 6, 1990, Ser. No. 475,912
Int. Cl.[5] A01K *61/00*
U.S. Cl. 119—4 17 Claims

1. An improved apparatus for the development of a marine habitat through the growth of mollusks, comprising:

a plurality of generally cylindrical retaining members;

each of said plurality of retaining members having a mesh wall extending between a first and a second end;

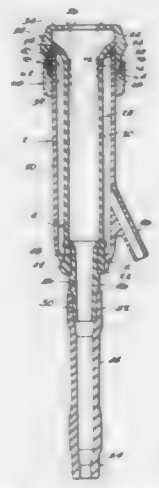
said mesh wall of each of said plurality of generally cylindrical retaining members being selected for inhibiting the movement of adult mollusks therethrough and for simultaneously enabling the movement of smaller marine life therethrough;

a plurality of fastening means for interconnecting said plurality of generally cylindrical retaining members with a mesh wall of each said plurality of retaining members directly engaging with a mesh wall of an adjacent one of said plurality of retaining members;

each of said plurality of fastening means comprising a deformable element extending through adjacent mesh walls of adjacent retaining members for securing said adjacent retaining members into an array; and

means for closing said first and second ends of each of said plurality of retaining members for retaining adult mollusks therein when said plurality of retaining members is immersed within water and for facilitating the movement of smaller marine life therethrough thereby developing a marine habitat concurrently with the growth of the mollusks.

5,007,378
MILKING MACHINE TEAT CUP ASSEMBLY
Reed A. Larson, Watertown, Wis., assignor to Hi-Life Rubber Inc., Johnson Creek, Wis.
Filed Mar. 17, 1989, Ser. No. 325,218
Int. Cl.[5] A01J *5/04*
U.S. Cl. 119—14.47 18 Claims



1. A milking machine teat cup assembly comprising:

a shell including a tubular body having an outer wall and an upper end portion terminating in a rim;

a flexible liner including a suction portion which fits inside said shell and has an outer wall, and a head portion having an opening for receiving a cow's teat and a peripheral cuff which surrounds the upper end portion of said shell and is spaced outwardly from the outer wall of said suction section to define an annular recess which receives the upper end portion of said shell and sealingly engages said rim, said cuff including an outer surface having a lower portion;

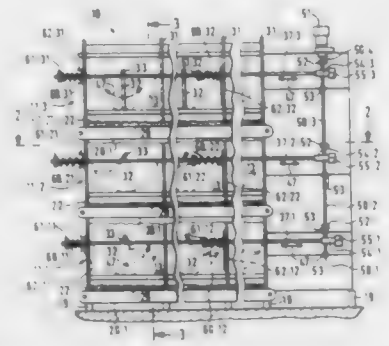
an annular sleeve surrounding said body of said shell and slidably mounted on said shell for relative axial movement between an unlocked position wherein said sleeve is axially displaced from said cuff and a locked position wherein at least a portion of said sleeve overlies at least the lower portion of said cuff to clamp said cuff into

sealing engagement with the upper end portion of said shell and to protect said cuff against impacts; and

detent means on said sleeve and said cuff for releasably holding said sleeve in the locked position against movement in an axial direction relative to said cuff.

5,007,379

AIR CIRCULATING SYSTEM FOR POULTRY HOUSING



Karl H. Lackner, Ittlingen, Fed. Rep. of Germany, assignor to Firma Salmet Gesellschaft mit Beschrankter Haftung & Co., Kommanditgesellschaft, Ittlingen, Fed. Rep. of Germany

Filed Mar. 15, 1990, Ser. No. 493,747

Claims priority, application Fed. Rep. of Germany, Mar. 15, 1989, 3908336

Int. Cl.[5] A01K *31/00*

U.S. Cl. 119—17 **14 Claims**

1. Drive mechanism for an air circulating system of a battery of poultry cages having a poultry dropping receptacle extending beneath the battery of cages, the air circulating system drying collected poultry droppings by air currents sweeping over the poultry dropping receptacle, and with the air circulating system including a plurality of air ventilator flaps longitudinally spaced from each other and supported on transverse axle means, the drive mechanism includes means for pivotably displacing the respective air ventilator flaps including traction means extending in a longitudinal direction of the battery of poultry cages and engaging the respective air ventilator flaps at a small distance from the transverse axle means, means for driving said traction means in a reciprocating fashion, and at least one spring means arranged at each of said traction means for normally biasing the respective traction means in a direction opposite to a driving direction provided by the means for driving.

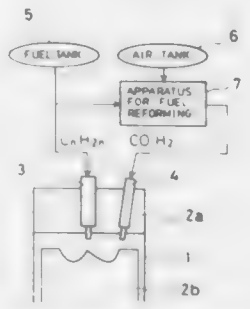
METHOD TO DECREASE BLACK SMOKE OF DIESEL



Toshiaki Kakegawa, Tsukuba, and Shoichi Furuhama, Tokyo, both of Japan, assignors to Advance Combustion Engineering Institute Co., Ltd., Tsukuba, Japan

Filed Jan. 22, 1990, Ser. No. 468,328

Int. Cl.[5] F02B *75/12*

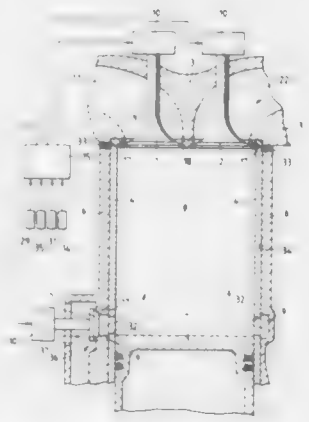
U.S. Cl. 123—1 A **4 Claims**

1. A method for decreasing black smoke of an operating diesel engine, characterized in that a fuel injection nozzle to inject the fuel into a combustion chamber in a cylinder of the diesel engine and an auxiliary injection nozzle to inject combustible gas or non-combustible gas into the combustion chamber of the cylinder are provided, and that said combustible gas

or non-combustible gas is injected into the cylinder in the latter stage of combustion.

5,007,382

CYCLE CHANGEABLE ENGINE



Hideo Kawamura, Samukawa, Japan, assignor to Isuzu Motors Limited, Tokyo, Japan

Filed Apr. 25, 1990, Ser. No. 514,445

Claims priority, application Japan, May 9, 1989, 1-114142

Int. Cl.[5] F02B *69/06;* **F01L** *9/04*

U.S. Cl. 123—21 **8 Claims**

1. A cycle changeable engine capable of changing over its operating cycle to either one of two-cycle or four-cycle operation, comprising:

a cylinder block;

cylinder liners, each being fitted into each of cylinders formed in said cylinder block;

a cylinder head disposed fixedly in said cylinder block;

first intake ports and exhaust ports, each being formed in said cylinder head;

first intake valves for a four-cycle operation, each being disposed in each said first intake port;

exhaust valves, each being disposed in each said exhaust port;

intake openings formed at lower peripheral portion of said cylinder liners;

second intake ports formed at the lower port of said cylinder block and communicating with said intake openings;

second intake valves for a two-cycle operation being disposed in each said second intake port;

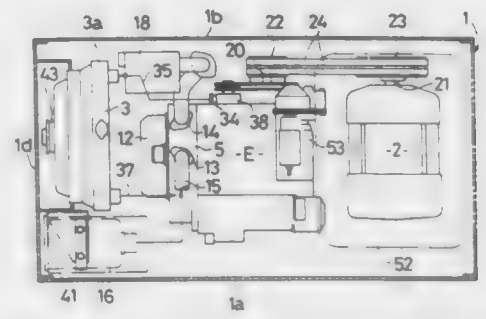
electromagnetic valve driving devices for opening and closing said first intake valves, said exhaust valves and said second intake valves, respectively, by electromagnetic force;

detection means for detecting the operational conditions of said engine, said detection means including a rotation sensor for detection of the number of revolutions of said engine; and

a controller for opening and closing either one of the groups of said first intake valves and said second intake valves and keeping the other group under the closed state in response to the detection signal by said detection means; wherein in response to the detection signal from said rotation sensor representing that the engine speed is a low speed, said first intake valves are kept closed and said second intake valves are opened and closed while said engine is operated in the two-cycle operation.

5,007,383

WATER-COOLING SYSTEM FOR A WATER-COOLED HORIZONTAL CYLINDER ENGINE



Ryoichi Ito; Koji Iwai, and Tsuyoshi Nishida, all of Sakaishi, Japan, assignors to Kubota Limited, Japan

Division of Ser. No. 139,753, Dec. 30, 1987, Pat. No. 4,883,024. This application Aug. 21, 1989, Ser. No. 396,503

Claims priority, application Japan, Jan. 23, 1987, 62-15001

Int. Cl.[5] F01P *1/02*

U.S. Cl. 123—41.49 **6 Claims**

1. A water-cooling system for a water-cooled horizontal cylinder engine, comprising:

a cylinder head provided in front of a cylinder block of the water-cooled horizontal cylinder engine;

a forwardly facing radiator, located substantially in front of and with its rear facing the cylinder head;

a radiator fan disposed to face the radiator;

a water jacket formed in the cylinder block and the cylinder head, an outlet port of the water jacket being connected to an inlet port of the radiator through a hot water pipe therebetween, and a water outlet port of the radiator being connected to an inlet port of the water jacket through a cool water pipe therebetween; and

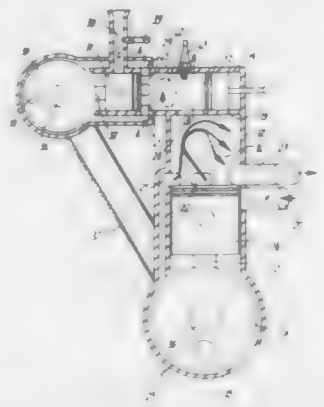
an air cleaner and a muffler provided to be located forwardly of the engine, one to the left and the other to the right thereof and opposing each other when seen from the cylinder head, the air cleaner and muffler each being disposed so as to not extend above a maximum height of said radiator, and the muffler being positioned to one side of the cylinder head and substantially between the cylinder head and the radiator.

5,007,384

L-HEAD TWO STROKE ENGINES

Gordon P. Blair, Newtownabbey, Northern Ireland, assignor to The Queen's University of Belfast, Belfast, Northern Ireland

Filed Feb. 22, 1990, Ser. No. 484,072



Claims priority, application United Kingdom, Feb. 22, 1989, 8904043

Int. Cl.[5] F02B *75/04*

U.S. Cl. 123—48 A **7 Claims**

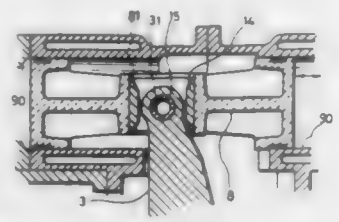
1. An L-head two stroke engine comprising a first cylinder and a second cylinder, the two cylinders being connected to one another in perpendicular relation, a first piston mounted for reciprocable movement in the first cylinder and a second piston mounted for reciprocable movement in the second

cylinder, a first crank and a second crank, a drive means drivably connecting the first and second cranks, means for supplying fuel to one of the cylinders, ignition means for igniting fuel

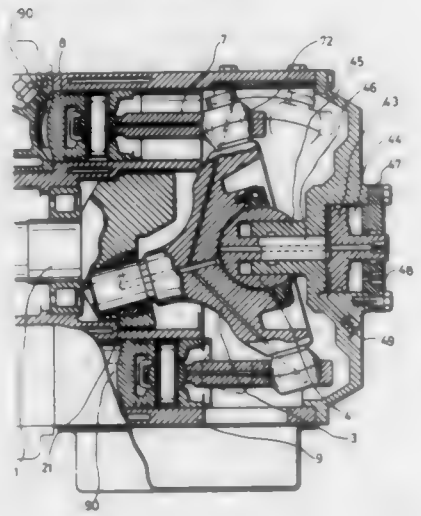
in said one cylinder and means providing a communication between the two cylinders whereby in operation the compression ratio in said one cylinder is less than that in the other cylinder.

5,007,385

CRANKLESS ENGINE



Hiromasa Kitaguchi, Chi-101, Simamachi, Komatsu-shi, Isikawa-ken, 923-03, Japan



Filed Mar. 30, 1990, Ser. No. 501,712

Claims priority, application Japan, Jul. 15, 1989, 1-183410; Feb. 6, 1990, 2-26958

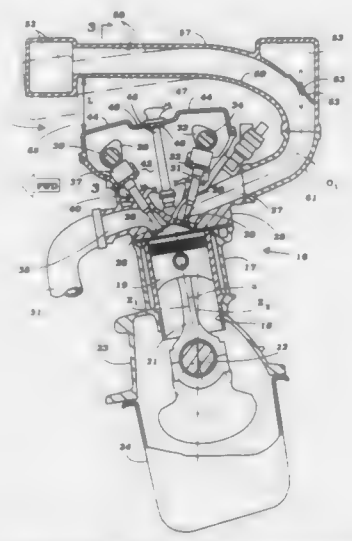
Int. Cl.[5] F02B *75/04*

U.S. Cl. 123—48 B **21 Claims**

1. A crankless engine comprising a piston which reciprocates in a cylinder and a rocking member capable of changing a rocking fulcrum, said rocking member comprising a pin portion and an outer-periphery connection both formed integrally with each other, said piston and said outer-periphery connection being interconnected through a joint, and a front end of said pin portion being pivotally connected inclinedly through a rotatably-supported rotary shaft, in which the reciprocating motion of said piston and the rotating motion of said rotary shaft are transformed from one to the other.

5,007,386

INTAKE SYSTEM FOR AUTOMOTIVE ENGINE



Takehiro Washizu, and Tsutomu Nagamatsu, both of Iwata, Japan, assignors to Yamaha Hatsudoki Kabushiki Kaisha, Iwata, Japan

Filed Feb. 22, 1990, Ser. No. 483,103

Claims priority, application Japan, Feb. 22, 1989, 1-40380

Int. Cl.[5] F02M *35/10*

U.S. Cl. 123—52 MC **16 Claims**

1. An internal combustion engine disposed transversely in an engine compartment having an air flow opening at one end thereof, a plurality of cylinders lying in a cylinder bank, each having at least one intake port facing in the same direction in said engine compartment and away from said air flow opening, and a plurality of manifold runners, each extending from a respective one of said intake ports and in the direction in said engine compartment opposite to that which said intake ports face to be at least in part over said cylinder bank toward said air flow opening, said cylinder bank being inclined from a vertical plane in said engine compartment in said opposite direction to increase the spacing between said cylinder bank and said manifold runners for air flow around said runners.

5,007,387

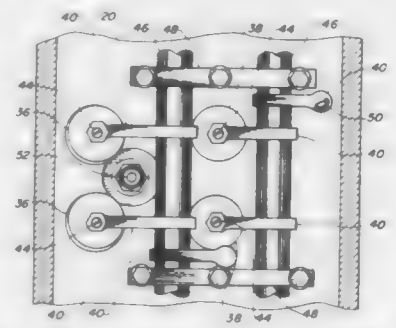
FOUR VALVE PER CYLINDER ENGINE HEAD

Masachika Arao, 21400 Lassen St., Unit G, Chatsworth, Calif. 91311

Filed Jan. 29, 1990, Ser. No. 471,366

Int. Cl.[5] F01L *1/18;* **F02P** *15/02*

U.S. Cl. 123—90.022 **4 Claims**



3. An improved head assembly for an internal combustion gasoline engine having an integral camshaft and push rod system comprising:

a head having a pair of exhaust valve ports with seats and a pair of intake valve ports with seats for each cylinder, also a plurality of push rod passages in linear alignment with the engine camshaft, and a threaded spark plug hole centrally located between the ports, the general area around the ports with the threaded hole recessed with the areas underneath and between the engine forming a combustion chamber,

a pair of exhaust valves disposed longitudinally parallel and having angularity from minus 2 to plus 2 degrees relative to said engine cylinder centerline in said engine and contiguous with the appropriate port for relieving the combustion gases on an exhaust stroke,

a pair of inlet valves disposed angularly with respect to each cylinder in said engine contiguous with the appropriate port for introducing a combustible mixture of fuel and air into the engine on a suction stroke,

a plurality of rocker arms and valve springs, the arms contacting said valves and the springs surrounding the valve stem for lifting the valves and returning them into contact

with the valve seats under the influence of the springs at the appropriate timing,

a pair of rocker arm shafts unitedly retaining the rocker arms in rotatable linear containment allowing each set of valves to react in sequence for operation of the engine, and

a plurality of push rods drivingly communicating between the engine camshaft and said rocker arms such that each pair of valves are lifted from the head in a sequence producing a cyclic action allowing the engine to operate.

HYDRAULIC VALVE LIFTER

Richard W. Seilenbinder, Hales Corners, Wis., assignor to Briggs & Stratton Corporation, Wauwatosa, Wis.

Filed Apr. 23, 1990, Ser. No. 512,767

Int. Cl.[5] F01L *1/14, 1/24*

U.S. Cl. 123—90.55 **10 Claims**

1. A hydraulic lifter for an internal combustion engine having a crankcase containing a hydraulic fluid, comprising:

an axially movable cylinder having an axial bore therein and having a lifter face that engages a cam on a camshaft;

a piston having a valve end and a base end, said piston being axially slidable within the axial bore, and the valve end of said piston engaging a valve member interconnected with an engine valve;

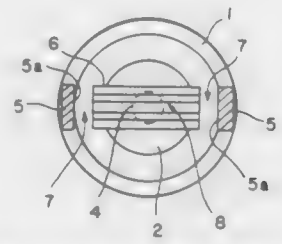
a chamber located within said axial bore and adjacent the base end of said piston;

an outer spring, disposed within said chamber that engages said piston base end; and

valve means in fluid communication with both said chamber and with said crankcase for transferring hydraulic fluid from said crankcase to said chamber in response to a pressure decrease within said chamber.

5,007,389

IGNITION PLUG FOR INTERNAL COMBUSTION ENGINES AND A PROCESS FOR IGNITING GAS MIXTURE BY THE USE THEREOF



Ryobei Kashiwara, Raitsu Ootori 106, 456-1, Ootori-kitamachi 8-cho, Sakai-shi, Osaka-fu; Hideaki Kashiwara, 3-B, 611, 151-30, Ninomaru-cho, Mukojima, Fushimi-ku, Kyoto-shi; Hidehiko Noguchi, 7-14, Taiho 3-chome, Kanan-cho, Minamikawachi-gun, Osaka-fu, and Takeaki Kashiwara, 3,37-411, Nagayoshidedo 3-chome, Hirano-ku, Osaka-shi, all of Japan

Filed Nov. 9, 1988, Ser. No. 268,788

Claims priority, application Japan, Dec. 17, 1987, 62-321045; Sep. 30, 1988, 63-248394

Int. Cl.[4] F02P *1/00;* **H01T** *13/20*

U.S. Cl. 123—169 MG **19 Claims**

1. An ignition plug for an internal combustion engine comprising;

(a) an insulating body;

(b) a high tension center electrode positioned axially within the body and having an axial end;

(c) an ignition member fixed to the axial end of said center electrode, said ignition member having at least one end facing radially outward from the center electrode and a groove having a longitudinal axis, said groove facing axially away from the center electrode;

(d) at least one ground electrode radially spaced from the end of the ignition member on the center electrode and positioned along the longitudinal axis of said groove to define a spark gap between the ground electrode and the end of the ignition device;

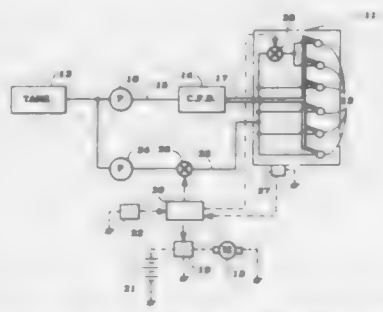
whereby a gas mixture can be ignited by a spark between the end of the ignition member and the ground electrode and whereby expanding combustion gases impinge against the ground electrode and are diverted along the longitudinal axis of the groove.

5,007,390

STARTING FUEL SUPPLYING DEVICE FOR INTERNAL COMBUSTION ENGINE

Seiichi Tanaka, and Tamotsu Suzuki, both of Hamamatsu, Japan, assignors to Sanshin Kogyo Kabushiki Kaisha, Hamamatsu, Japan

Continuation of Ser. No. 303,942, Jan. 30, 1989, abandoned. This application Aug. 6, 1990, Ser. No. 563,816



Claims priority, application Japan, Feb. 12, 1988, 63-30184

Int. Cl.[5] F02M *1/10*

U.S. Cl. 123—180 T **7 Claims**

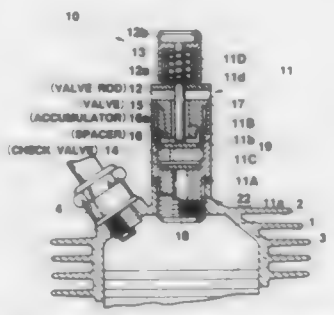
1. In an internal combustion engine having a plurality of combustion chambers and a main charge forming system for supplying a fuel air mixture to all combustion chambers of said engine, the improvement comprising means independent of said main charge forming system for supplying supplemental

fuel to said engine, and temperature responsive means for controlling the amount of supplemental fuel supplied to said

engine by controlling the number of combustion chambers to which fuel is supplied.

5,007,391

ENGINE START FACILITATING VALVE



Shigeki Nomoto, Tokyo, Japan, assignor to Komatsu Zenoah Company, Tokyo, Japan

Filed Sep. 29, 1989, Ser. No. 414,900

Claims priority, application Japan, Sep. 30, 1988, 63-127392[U]; Jul. 31, 1989, 1-90209[U]

Int. Cl.[5] F02N *17/00*

U.S. Cl. 123—182 **10 Claims**

1. An engine start facilitating valve, comprising:

(a) a valve housing attached to the engine;

(b) spacer member disposed within said valve housing and formed with at least one accumulator space for accumulating engine explosion pressure;

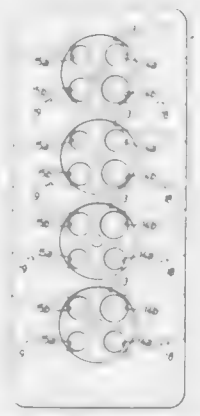
(c) a check valve member disposed within said valve housing, for opening/closing communication between an engine combustion chamber and the accumulator space;

(d) a valve member disposed within said valve housing, for opening/closing communication between the accumulator space and atmospheric pressure;

(e) a valve rod for elastically urging said valve member to open condition by a valve spring, at engine compression stroke cylinder pressure being released to atmospheric pressure through said opened check valve member and said opened valve member, at engine explosion stroke and after, cylinder pressure being accumulated in the accumulator space to close said valve member against the valve spring, at engine halt accumulated pressure being released through both said check valve member and said valve member.

5,007,392

CYLINDER HEAD STRUCTURE FOR MULTIPLE CYLINDER ENGINES



Tomonori Niizato; Katsumi Noguchi, and Kiyoshi Tsukimura, all of Saitama, Japan, assignors to Honda Giken Kogyo Kabushiki Kaisha, Tokyo, Japan

Filed Aug. 1, 1989, Ser. No. 388,259

Claims priority, application Japan, Aug. 1, 1988, 63-192377

Int. Cl.[5] F02B *15/00*

U.S. Cl. 123—193 H **8 Claims**

1. A cylinder head structure for a multiple cylinder engine, comprising, at least for each of its cylinders located at either longitudinal end of its cylinder bank:

a combustion chamber (**13**) defined by the cylinder (**1**) and a piston (**2**) received therein;

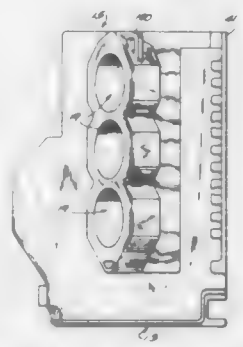
an intake passage (**18**) communicated with an intake manifold (**20**) at its one end and with said combustion chamber at its other end; and

an exhaust passage (**19**) communicated with an exhaust manifold (**21**) at its one end and with said combustion chamber at its other end;

at least one of said intake passage and said exhaust passage being curved toward a longitudinally central part of said cylinder bank as it extends from its other end to its one end, said curved passage being communicated with said combustion chamber at its other end by at least two ports (**14***a*, **14***b*, **15***a*, **15***b*) which are controlled by valves (**12***a*, **12***b*) and arranged along a longitudinal direction of said cylinder bank, and one of said ports involving a relatively larger flow rate being disposed closer to a longitudinally central part of said cylinder bank than the other port involving a relatively smaller flow rate.

5,007,393

INTEGRAL LIFTING HOOK FOR AN OUTBOARD ENGINE



George L. Broughton, Zion, Ill.; Paul W. Breckenfeld, Kenosha, Wis.; David W. Mate, McHenry; James A. Nettles, Round Lake, both of Ill., and Duane E. Rogers, Kenosha, Wis., assignors to Outboard Marine Corporation, Waukegan, Ill.

Filed May 17, 1990, Ser. No. 525,251

Int. Cl.[5] F02F *7/00*

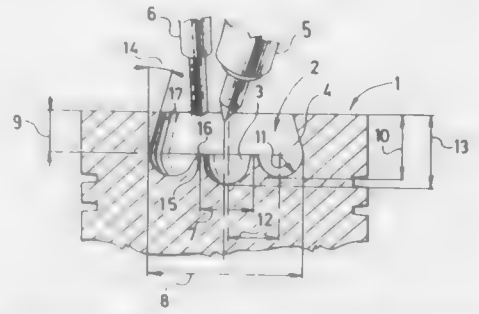
U.S. Cl. 123—195 R **12 Claims**

1. An outboard motor comprising a lower unit, a propeller shaft rotatably supported by said lower unit and adapted to support a propeller, and an internal combustion engine supported by said lower unit and drivingly connected to said propeller shaft, said internal combustion engine including an

engine block defining at least one cylinder and having a lifting hook integrally formed on said engine block.

5,007,394

COMBUSTION CHAMBER FOR COMPRESSION IGNITION INTERNAL COMBUSTION ENGINE



Jaroslav Brychta; Eduard Lutisan, and Vladimir Jirkovsky, all of Prague, Czechoslovakia, assignors to AVIA koncern, Prague, Czechoslovakia

Filed May 10, 1990, Ser. No. 521,600

Claims priority, application Czechoslovakia, May 12, 1989, 2858-89

Int. Cl.[5] F02F *3/00*

U.S. Cl. 123—279 **4 Claims**

1. A combustion chamber for a compression ignition internal combustion engine with multiport jet direct fuel injection, said chamber comprising

a hollow cavity formed in a piston head wherein said cavity is defined by a rotary side wall surface and a shaped bottom;

said shaped bottom of the combustion chamber in the piston head having a peripheral rotary surface and an internal rotary surface;

said peripheral rotary surface being separated from said internal rotary surface by a barrier of circular plan;

said barrier having a top, said piston head having a planar surface, said rotary surfaces each having diameters, distances from said planar surfaces being referred to as depths, the following ratios being adhered to:

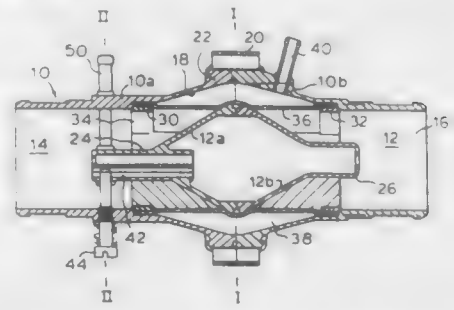
the ratio between the depth of the top of the barrier and the maximum depth of the peripheral rotary surface being in the range from 0.4 to 0.7;

the ratio between the maximum diameter of the internal rotary surface and the maximum diameter of the peripheral rotary surface being in the range from 0.25 to 0.45; and

the ratio between the maximum depth of the internal rotary surface and the maximum depth of the peripheral rotary surface being in the range 0.85 to 1.15.

5,007,395

THROTTLE VALVE FOR AN INTERNAL COMBUSTION ENGINE



Robert Wakeling, Feering, England, assignor to Ford Motor Company, Dearborn, Mich.

PCT Filed Jul. 7, 1988, Ser. No. 340,721, filed as PCT/GB88/536 on Mar. 9, 1989, published as WO89/00639 on Jan. 26, 1989

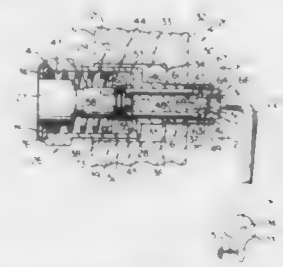
Claims priority, application United Kingdom, Jul. 10, 1987, 8716352

Int. Cl.[5] F02D *9/18*; **F02M** *9/10*; **F16K** *31/126*

U.S. Cl. 123—337 **2 Claims**

1. A throttle valve for an internal combustion engine in which a flow path is defined between a central core (**12**) including a by-pass passage (**42**) to supply air when the engine is idling, and a tube (**36**) having a resiliently flexible wall, which tube (**36**) separates the flow path from an adjacent working fluid chamber (**38**), whereby changes in the pressure within the chamber (**38**) cause deformation of the tube wall resulting in changes in the tube cross-section between a wide open throttle position and a valve closed position, the flexible walled tube (**36**) being designed to take up a valve closed position when the pressures on its opposite sides are equal, characterised in that the flexible walled tube (**36**) is uniformly cylindrical in its relaxed state.

5,007,396



THROTTLE VALVE ADJUSTMENT CONSTRUCTION, THROTTLE VALVE ADJUSTMENT UNIT THEREFOR AND METHODS OF MAKING THE SAME

Carl A. Wellenkotter, Rochester, Mich., and David E. Counts, Louisville, Tenn., assignors to Robertshaw Controls Company, Richmond, Va.

Filed Nov. 13, 1989, Ser. No. 434,231

Int. Cl.[5] F02M *3/05*

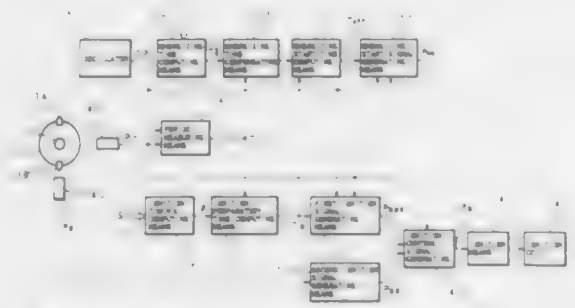
U.S. Cl. 123—339 **12 Claims**

1. In a throttle valve adjustment construction comprising a support means, a throttle valve adjustment arm movably carried by said support means and having moving means for tending to move said arm in one direction to a closed throttle condition thereof, and a temperature operated throttle valve adjustment means carried by said support means and being operatively associated with said arm to adjust the position of said arm at said throttle closed condition thereof, said throttle valve adjustment means comprising a temperature responsive device that comprises a piston member and a cylinder member that are adapted to provide relative movement therebetween when said device senses certain temperatures, said throttle valve adjustment means having a movable stop member opera-

tively associated with said temperature responsive device to be positioned thereby in various positions thereof in relation to the temperature being sensed by said device, said adjustment arm being adapted to be moved by said moving means into abutting relation with said stop member in said various positions thereof when said arm is in said throttle closed condition thereof, said throttle valve adjustment means comprising a housing means carrying said temperature responsive device and said movable stop member, said support means carrying said housing means, the improvement wherein said housing means has a stop surface against which said arm is adapted to abut when said arm is in said throttle closed condition thereof and said temperature responsive device has moved said movable stop member in one direction beyond a certain position thereof.

5,007,397

IGNITION TIMING CONTROL DEVICE



Masahiro Akasu, Himeji, Japan, assignor to Mitsubishi Denki K.K., Tokyo, Japan

Filed Mar. 7, 1989, Ser. No. 320,128

Claims priority, application Japan, Mar. 7, 1988, 63-54303; Mar. 7, 1988, 63-54304; Mar. 7, 1988, 63-54305

Int. Cl.[5] F02P *5/15*

U.S. Cl. 123—422 **20 Claims**

1 An ignition timing control device comprising,

a first position detecting means for detecting the first crank angle position of an engine,

a second position detecting means for detecting the second crank angle position different in angle from said first crank angle position,

a revolution period measuring means for measuring the engine revolution period in reference to at least one of said first and second crank angle positions,

an energizing time computing means for computing an energizing time used to increase the primary current of an ignition coil of said engine to a specified rate,

an ignition timing computing means for computing the ignition timing corresponding to the current running condition of the engine,

an ignition stand-by time computing means for computing stand-by time for ignition after detection of the first crank angle position in reference to both said revolution period and said ignition time,

an energizing preparatory time computing means for computing preparatory time for energizing the ignition coil after detection of the first crank angle position in reference to both said ignition stand-by time and said energizing time for the ignition coil,

an energizing preparatory time compensating means for estimating the subsequent running condition of the engine and compensating said computed energizing preparatory time according to said estimated subsequent running condition of the engine,

an energizing start command generating means for producing a command signal for commencement of energizing the ignition coil when the energizing preparatory time from the detection of the first crank angle position has expired,

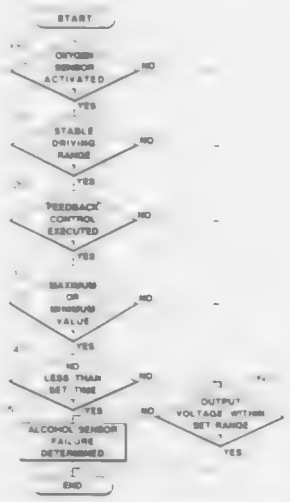
first ignition command generating means for producing a command signal for interrupting energizing the ignition coil when the ignition stand-by time from the detection of the first crank angle position has expired,

second ignition command generating means for producing a command signal for interrupting energizing the ignition coil on detection of the second crank angle position, and

an ignition control means for starting energizing the ignition coil upon output of the said energizing start command and interrupting energizing the ignition coil according to any one of said first and second ignition commands outputted earlier;

wherein the energizing preparatory time compensating means compensates the energizing preparatory time in reference to the estimated engine revolution period.

5,007,398



ALCOHOL SENSOR FAILURE DETECTION SYSTEM FOR INTERNAL COMBUSTION ENGINE

Masuo Kashiwabara, Gunma, Japan, assignor to Japan Electronic Control Systems Co., Ltd., Isezaki, Japan

Filed Apr. 12, 1990, Ser. No. 507,835

Int. Cl.[5] F02D *41/22*

U.S. Cl. 123—479 **8 Claims**

1. An alcohol sensor failure detection system for an internal combustion engine, comprising:

air/fuel mixture induction means for receiving an intake air and a fuel to form an air/fuel mixture to be fed into an engine combustion chamber;

fuel supply means for supplying a controlled amount of the fuel into said induction means;

an alcohol sensor associated with said fuel supply means for producing a first signal indicative of alcohol concentration contained in the fuel to be fed into said induction means from said fuel supply means;

sensor means for producing a second signal indicative of an air/fuel ratio of the air/fuel mixture;

first means for deriving a first amount of the fuel to be fed into said induction means from said fuel supply means, said first amount derived based on said first signal and predetermined other signals indicative of respective engine operating conditions;

second means for deriving a correction coefficient variable between predetermined maximum and minimum values depending on said second signal, said correction coefficient being derived through a FEEDBACK control which is executed in a predetermined engine driving range such that the air /fuel ratio of the air/fuel mixture is maintained at a target value in said predetermined engine operating range with a second amount of the fuel derived by third means which corrects said first amount with said correction coefficient, said second amount of the fuel being fed into said induction means from said fuel supply means;

fourth means for determining whether said FEEDBACK control is executed;

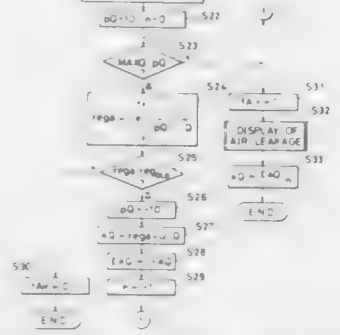
fifth means, in response to a positive decision of said fourth means, for determining whether said correction coefficient is said predetermined maximum or minimum value;

sixth means, in respone to a positive decision of said fifth means, for measuring a time in which said correction coeffient is retained to said predetermined maximum or minimum value;

seventh means for determining a failure of the alcohol sensor when said measured time is no less than a predetermined value.

5,007,399

METHOD AND APPARATUS FOR SELF-DIAGNOSIS OF AIR LEAKAGE IN CONTROL SYSTEM OF INTERNAL COMBUSTION ENGINE



Shinpei Nakaniwa, Isesaki, Japan, assignor to Japan Electronic Control Systems Co., Ltd., Isesaki, Japan

Filed May 25, 1990, Ser. No. 528,615

Claims priority, application Japan, May 25, 1989, 1-130025

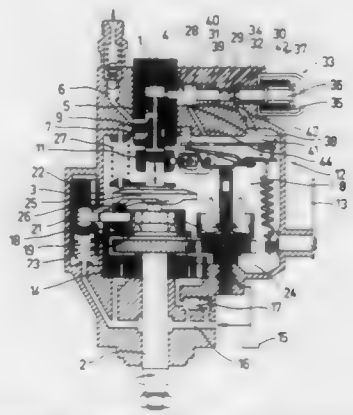
Int. Cl.[5] F02M *51/00*

U.S. Cl. 123—489 **6 Claims**

1. A method for the self-diagnosis of the leakage of air in a control system of an internal combustion engine, in which a flow quantity of air sucked in the internal combustion engine is detected and an engine control quantity including at least a quantity of a fuel to be supplied into the engine is set based on the detected air flow quantity, said method comprising setting an air-fuel ratio correction value for correcting the fuel supply quantity set based on the detected value of the sucked air flow quantity so that the air-fuel ratio in an air-fuel mixture sucked into the engine, which is detected through the detection of an exhaust component of the engine, is brought close to a target air-fuel ratio, wherein when there is observed a tendency that the proportion of the correction of the fuel supply quantity by the set air-fuel ratio correction value increases in a correction-increasing direction in a driving region having a smaller sucked air flow quantity, it is judged that the leakage of air into the suction system of the engine occurs.

5,007,400

HYDRAULIC CONTROL DEVICE FOR FUEL INJECTION SYSTEMS OF INTERNAL COMBUSTION ENGINES



Rudolf Babitzka, Kirchberg-Neuhof, Fed. Rep. of Germany, assignor to Robert Bosch GmbH, Stuttgart, Fed. Rep. of Germany

Filed Mar. 24, 1989, Ser. No. 328,396

Claims priority, application Fed. Rep. of Germany, Jun. 11, 1988, 3819996

Int. Cl.[5] F02M *37/04*

U.S. Cl. 123—506 **17 Claims**

1. A hydraulic control for fuel injection systems of internal combustion engines; comprising,

a piston cylinder;

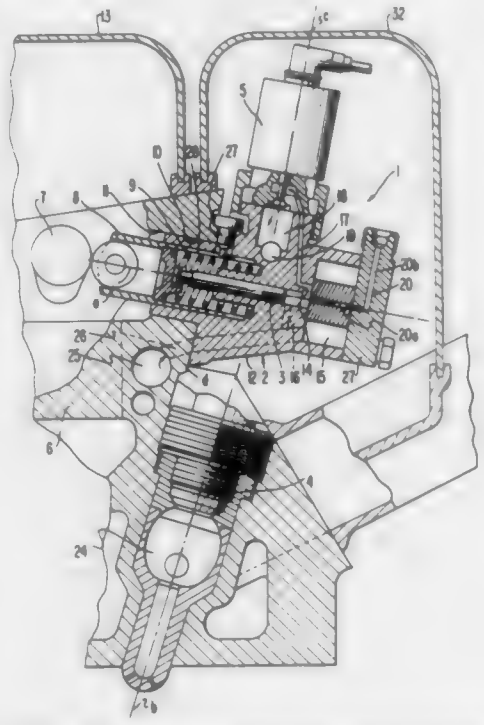
a pump piston in said piston cylinder, a pump piston work chamber (**4**) formed by said pump piston and said piston cylinder;

a stepped control piston (**29**) having a large diameter end (**39**) having a first control face (**31**) and a smaller diameter end having a smaller second control face (**32**) guided axially displaceably and radially sealingly in a corresponding stepped housing bore (**30**) forming a control chamber (**40**) and a closable work chamber (**42**), said first control face (**31**), can be acted upon by fluid from said piston work chamber present in said control chamber (**40**) against a pressure acting on said second control face in said closable work chamber (**42**) defined by said housing bore (**30**) and by said second control face (**32**) embodied by said smaller diameter face end (**32**) of the control piston (**29**) remote from the larger diameter first control face (**31**); a rear side of said larger diameter end of said stepped control piston being subjected to a fluid therein and a biasing force,

a controllable outflow relief conduit (**38**) extending from said closable work chamber (**42**) to a fluid-filled suction chamber (**8**); said controllable outflow conduit including a valve seat (**37**) with a predetermined maximum opening cross-section;

a control valve (**33**) operative relative to said valve seat (**37**) for a fuel flow control between said closable work chamber and said suction chamber, said control valve thereby controlling a movement of said control piston under action of fuel pressure in said control chamber and thereby controlling a take-off fuel quantity out of the pump work chamber via a relief conduit (**44**);

said control valve (**33**) having a movable valve element when closed having an end with a functional face (**43**) exposed to a pressure in said closable work chamber (**42**), said pressure acting in the opening direction of the movable valve element and being delimited by said maximum opening cross section; and



a ratio of said first control face (**31**) to that of said second working face (**32**) is equal to or smaller than a ratio of said second working face (**32**) to said functional face (**43**) of said movable valve element.

5,007,401

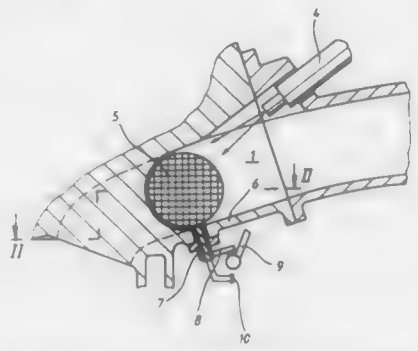
MAGNETIC VALVE CONTROLLED INJECTION DEVICE

Michael Grohn, Waiblingen-Hegnach; Mario Mürwald, Kernen; Frank Thoma, and Karlheinz Hoffmann, both of Stuttgart, all of Fed. Rep. of Germany, assignors to Daimler-Benz AG, Fed. Rep. of Germany

Filed Sep. 30, 1987, Ser. No. 102,711
Claims priority, application Fed. Rep. of Germany, Sep. 30, 1986, 3633136
Int. Cl.[5] F02M 37/04
U.S. Cl. 123—509 18 Claims

1. A magnetic valve controlled fuel injection device comprising:

a fuel pump in a pump casing; and



a fuel nozzle for internal combustion engines; a mounting means hole for the fuel pump casing in a cylinder head of the engine; a guide fuel pump piston means in the casing displaceable longitudinally thereof by a camshaft means via a drive element, supported from the cylinder head side; said pump piston means shutting off a control hole emerging in a pump working space; a second mounting hole means provided in the cylinder head for the fuel nozzle; pressure conduit means starting from the pump working space and leading to the fuel nozzle and to a magnetic valve means controlling the beginning of pumping and the end of pumping as a function of operating parameters of the internal combustion engine; the magnetic valve means forming a structural unit jointly with at least one of the fuel pump and the fuel nozzle; the first mounting hole means for the pump being provided in the cylinder head; the pump being located separately from the fuel nozzle and connected to the fuel nozzle by a relatively short exposed pressure pipe means; the first mounting hole means for the pump allowing for unencumbered removal of the pump from the camshaft means; the fuel nozzle being independently fastened to the cylinder head by said second hole mounting means to be removable towards the outside of the engine; and a portion of the casing, facing away from the drive element and the magnetic valve means being both located outside the space enclosed by the cylinder head and a cylinder head cover.

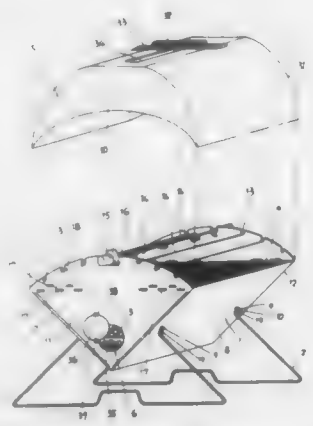
5,007,402

INTAKE SYSTEM FOR A MIXTURE-COMPRESSING INTERNAL-COMBUSTION ENGINE

Dieter Scherenberg, Stuttgart, Fed. Rep. of Germany, assignor to Daimler-Benz AG, Fed. Rep. of Germany

Filed Jun. 28, 1990, Ser. No. 544,833
Claims priority, application Fed. Rep. of Germany, Jul. 1, 1989, 3921739
Int. Cl.[5] F02M 31/00
U.S. Cl. 123—549 12 Claims

11. A method of operating an intake system for a mixture-compressing internal combustion engine, having an electrically heatable heating element of flat form which is arranged in the intake channel downstream of a fuel-injection nozzle and transversely relative to the direction of flow and which is intended for heating the fuel/air mixture, wherein the heating element is made rotatable in such a way that, above a specific engine cooling-water temperature, it can be transferred from its transverse working position into a position of rest lying in the direction of flow,



said method including controlling the position of the heating element as a function of the engine cooling water temperature.

5,007,403

FAN-SHAPED BARBECUE KETTLE

Ming-Tang Chen, No. 23-4, Alley 21, Lane 205, Yong Xing Road, Dali, Taichung, Taiwan

Filed Jul. 25, 1990, Ser. No. 557,041
Int. Cl.[5] F24B 3/00
U.S. Cl. 126—25 R 7 Claims

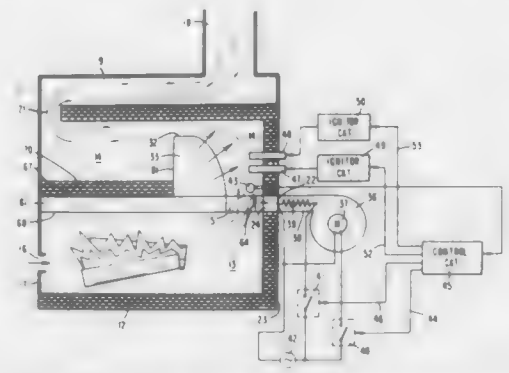
1. A fan-shaped barbecue kettle, comprising:

a kettle shell, which is a hollow body having fan-shaped end walls with a pair of legs connected to two side walls and either of whose fan-shaped end walls has a convexly arc upper rim wherein a few recesses are provided in an opposing manner to support the ends of a barbecue spit and there is provided a fixed hole in the vicinity of a central recess to which a motor may be secured to drive a barbecue spit to turn; a groove created by some inwardly extending convex points on either of the fan-shaped end walls to allow lateral insertion thereto of a roasting grill to take position at a height about equal to the height of said side walls; there being provided an air inlet in the lower half central portion of either fan wall;

said pair of legs bent to be triangle-like without a head angle and having two L-ends which can get caught and connected to said kettle shell's two side walls;

a roasting grill, comprising two separable roasting grills, each being formed of two narrower roasting grills pivoted together, respectively inserted in said groove of the fan-shaped end wall from along the kettle shell's side wall to make out a plane roasting grill;

a lid, which is shaped in conformance to the kettle shell's upper configuration and has two side plates concavely arc-shaped, and the top center of which is provided with a handhold which is pivotedly connected to a connection piece of an air-outlet flute provided at the same location, so that turning said handhold may control said air-outlet flute to open or close;



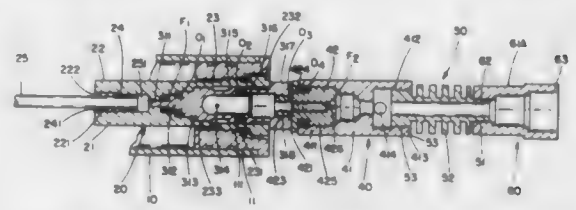
an air inlet which comprises a hole and a slightly larger adapted cover, the hole being provided in a lower half of either fan-shaped end wall within the contact with a charcoal support grill while the cover is provided with two lugs, one said lug being riveted above the hole whereby the degree of opening of the hole is controlled by moving the cover via the other lug.

5,007,404

WOODSTOVE FOR HEATED AIR FORCED INTO A SECONDARY COMBUSTION CHAMBER AND METHOD OF OPERATING SAME

Robert E. Hall, Cary, N.C.; Graig A. Spolek, Portland, Oreg.; John H. Wasser, Raleigh, and Nelson L. Butts, Hillsborough, both of N.C., assignors to The United States of America as represented by the Administrator of the U.S. Environmental Protection Agency, Washington, D.C.

Filed Jun. 26, 1990, Ser. No. 543,312
Int. Cl.[5] F24C 1/14
U.S. Cl. 126—77 43 Claims



1. A woodstove comprising a primary combustion chamber for receiving a load of wood fuel, a secondary combustion chamber in fluid flow relation with the primary chamber, fan means for forcing air from outside the woodstove into the secondary chamber, the air from outside the woodstove forced into the secondary chamber being heated prior to entering the secondary chamber, and means for controlling the fan means in response to the temperature of gases in the secondary chamber.

5,007,405

SOLDERING TOOL

David Hsu, 801, No. 125, Sec. 3 Roosevelt Rd., Taipei, Taiwan

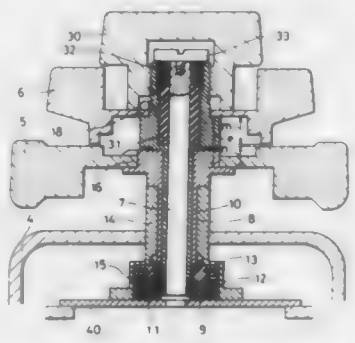
Filed Apr. 24, 1990, Ser. No. 513,617
Int. Cl.[5] B23K 3/02
U.S. Cl. 126—414 10 Claims

1. A gas powered soldering tool comprising a cylindrical gas tank (10) at the rear end thereof, said gas tank having at the rear end thereof a gas intake rod (25), for the storage of fuel gas and serving as a tool holder, and having a soldering tip (61B) at the front end thereof, a rear barrel assembly (20) and a front barrel assembly (40), said rear barrel assembly and said front barrel assembly containing the pressure regulation means and switching means (317), said rear barrel being held firmly at the front end thereof to said gas tank, said rear barrel assembly and said front barrel assembly being connected by a connector (42), said connector being part of said front barrel assembly, the major part of said rear barrel assembly being disposed within said gas tank, said rear barrel assembly having a channel (221) in the interior thereof for communication with said gas intake rod, a valve assembly (30) between said rear barrel assembly and said front barrel assembly, first threading means (233, 313) for connecting the front end of said rear barrel assembly to said valve assembly, said valve assembly comprising at the rear end thereof a stem (31), a needle valve (311) projecting to the rear from said stem, a gas inlet orifice (314) in said stem, and switching means (317) at the front end of said valve assembly, said stem being hollow from said gas inlet orifice to the front end of said valve assembly to provide a passage for communication with said front barrel assembly, said front barrel assembly having a nipple (422) at the rear end thereof which provides a passage (424) and a nozzle (426) in front of said passage, second threading means (318, 423) for connecting said front barrel assembly to said nipple, said front barrel assembly being provided with air inlet orifices (414) and serving as a chamber for mixing air with said gas exiting from said nozzle, a cooling fin unit (50) disposed in front of said front barrel assembly, third threading means (413, 53) connecting said cooling fin unit with said front barrel assembly, a passage (50) provided within said cooling fin unit extending to the soldering tip, whereby a gas route is completed from said intake rod, through said rear end passage (221) of said rear barrel assembly, said needle valve, said gas inlet hole (314), through said valve, the said nozzle, said air-gas mixing space (414), leading within said passage of the fin unit to the fuel tip.

5,007,406

BENDING CONTROL DEVICE OF ENDOSCOPE

Nagashige Takahashi, and Teruo Ouchi, both of Tokyo, Japan, assignors to Asahi Kogaku Kogyo Kabushiki Kaisha, Tokyo, Japan



Filed Oct. 30, 1989, Ser. No. 429,006
Claims priority, application Japan, Nov. 4, 1988, 63-280061; Nov. 4, 1988, 63-280062
Int. Cl.[5] A61B 1/00
U.S. Cl. 128—4 15 Claims

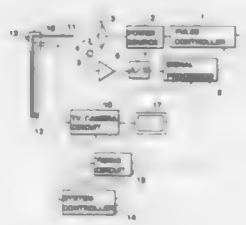
1. A bending control device of an endoscope for bending a bendable portion, formed at the distal end of an insert part of the endoscope, by manual operation of a control part connected to the proximal end of said insert part, comprising:

an up and down bending control knob rotatably and detachably provided on said control part to control ending of

said bendable portion in upward and downward directions;

a right and left bending control knob rotatably and detachably provided on said control part, in coaxially superposed relation to said up and down bending control knob,

to control ending of said bendable portion in rightward and leftward directions; and



a single attaching and removing means for manually attaching and removing both of said bending control knobs to and from said control part.

ENDOSCOPE HAVING PICTURE IMAGE FREEZE DEVICE

Katsuya Kikuchi, Tochigi, Japan, assignor to Kabushiki Kaisha Toshiba, Kawasaki, Japan

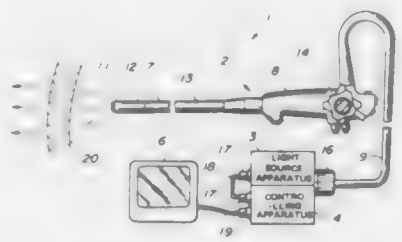
Filed Aug. 23, 1989, Ser. No. 397,784
Claims priority, application Japan, Aug. 23, 1988, 63-207436
Int. Cl.[5] A61B 1/04, 1/06
U.S. Cl. 128—6 15 Claims

1. An endoscope including a scope, comprising:

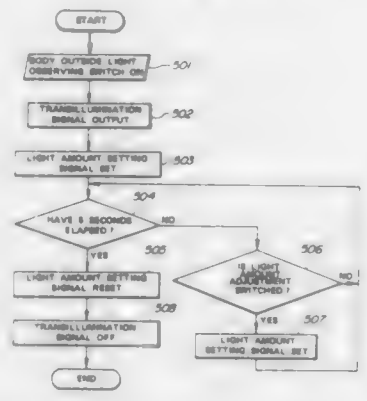
light source means for emitting at least one light pulse in a boundary portion of adjacent first and second fields;

means for obtaining photoelectrically a detection signal from the light pulse;

means for calculating a difference between first and second field illuminances of the light pulse from the detection signal; and



means for controlling the light source means depending on the difference, to reduce the difference to at least a predetermined value.



5,007,408

ENDOSCOPE LIGHT SOURCE APPARATUS

Shouichi Ieoka, Hachioji, Japan, assignor to Olympus Optical Co., Ltd., Tokyo, Japan

Filed Nov. 7, 1989, Ser. No. 432,642
Claims priority, application Japan, Mar. 16, 1989, 64-65056; Oct. 12, 1989, 64-267183
Int. Cl.[5] A61B 1/06
U.S. Cl. 128—6 34 Claims

1. An endoscope apparatus comprising:

an endoscope provided with an insertable part tip part to be inserted into a body cavity and having an observing window for observing an object to be imaged and an illuminating window for emitting an illuminating light to illuminate said object;

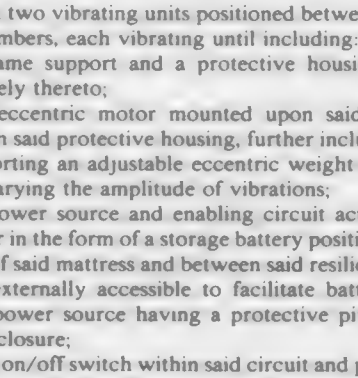
a light source apparatus including an illuminating light feeding means for generating an illuminating light to be fed to said endoscope and a light amount increasing means for increasing for a preset time the light amount of the illuminating light generated by said illuminating light feeding means when a body outside light observing signal is input for confirming from outside the body a position within the body cavity of said endoscope tip part; and

a body outside light observing signal generating means for generating said body outside light observing signal.

5,007,409

MEDICAL SPECULUM BLADE SHEATH

Susan G. Pope, 6025 Bruns Ct., Oakland, Calif. 94611



Filed Oct. 12, 1989, Ser. No. 420,759
Int. Cl.[5] A61B 1/32
U.S. Cl. 128—17 3 Claims

1. A sheath for the blade of a medical speculum having upper and lower elongated metal blades adjustably coupled together at the proximal or rear end, each blade having a substantially semicircular cross section terminating at a distal end, said sheath comprising:

a soft resilient material having a semicircular cross section with a convex first surface and concave second surface separated to form an arcuate longitudinal pocket between an open first end and a closed distal end adapted to receive the speculum blade;

a solid tip on said resilient material, said tip extending past the distal end of said pocket and tapered to a thin soft edge;

a finger tab of material extending lengthwise from said first convex surface of said resilient material at said open first end; and

a vent hole between said arcuate pocket and at least one surface of said sheath adjacent the closed distal end thereof to facilitate installation and removal of said sheath from a speculum blade.

5,007,410

VIBRATING MATTRESS

Sabrena R. DeLaney, 200 Hampstead Ave., 206-C, Savannah, Ga. 31405

Filed Nov. 20, 1989, Ser. No. 440,059
Int. Cl.[5] A61H 1/00
U.S. Cl. 128—33 2 Claims

1. In a mattress of the type adapted for imparting vibrations to a reclining human, the combination comprising:

(a) top and bottom resilient members sandwiched upon each other;

(b) at least two vibrating units positioned between said resilient members, each vibrating until including:

(i) a frame support and a protective housing mounted securely thereto;

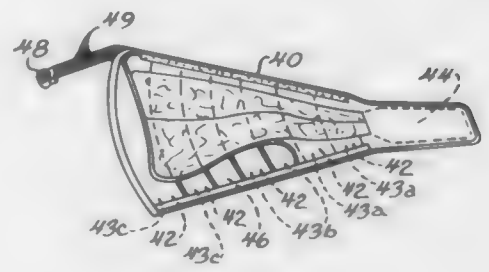
(ii) an eccentric motor mounted upon said frame and within said protective housing, further including a shaft supporting an adjustable eccentric weight as a control for varying the amplitude of vibrations;

(iii) a power source and enabling circuit activating said motor in the form of a storage battery positioned on one side of said mattress and between said resilient members and externally accessible to facilitate battery charge, said power source having a protective pivoted cover with closure;

(iv) and on/off switch within said circuit and presented on one side of said resilient members, so as to be externally actuable;

(v) a safety light mounted adjacent each on/off switch, so as to enable monitoring and operation of each said vibrating unit;

(vi) a pivotable protective cover with closure for each said switch; and



(c) a resonating means in the form of a variable resistor positioned in said enabling circuit, so as to vary the frequency vibration of each said vibrating unit.

DEVICE FOR APPLYING COMPRESSIVE PRESSURES AGAINST A PATIENT'S LIMB

John F. Dye, Bridgewater, Mass., assignor to The Kendall Company, Mansfield, Mass.

Filed Apr. 12, 1989, Ser. No. 336,984
Int. Cl.[5] A61H 9/00
U.S. Cl. 128—64 29 Claims

1. A device for applying compressive pressures against a patient's limb during periodic compression cycles comprising:

a sleeve for applying pressure against a length of a patient's limb, said sleeve having a plurality of chambers arranged longitudinally along the sleeve;

means for intermittently inflating each of said chambers to provide a predetermined pressure during periodic compression cycles; and

means for deflating said chambers to establish a base static pressure after each said compression cycle.

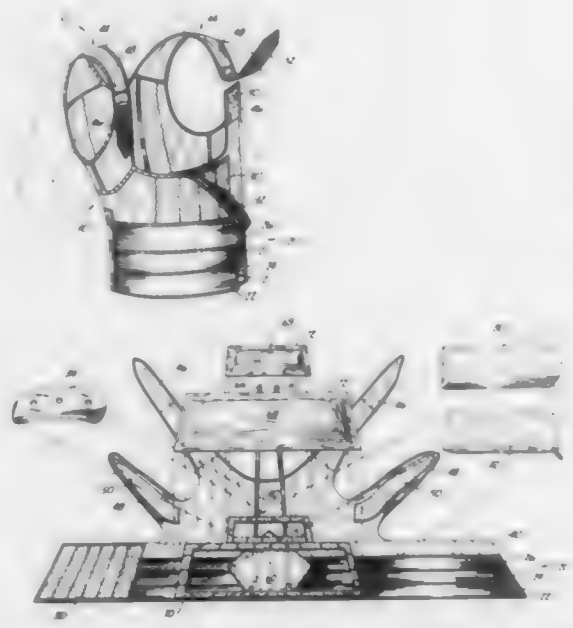
5,007,412

BACK SUPPORT VEST

Terry L. DeWall, 6110 N. 100th Plz., Omaha, Nebr. 68134

Filed Jun. 11, 1990, Ser. No. 535,686
Int. Cl.[5] A61F 5/02
U.S. Cl. 128—78 8 Claims

1. A back support vest, comprising:



a lower back supporting section including an elastic material disposed to encircle a human body in the lumbar and lumbosacral region

an upper back support section having front and rear lateral portions and including a non-elastic material attached to and extending above said lower section and disposed to encircle the body in the thoracolumbar and thoracic region and a common means for releasably securing the ends of both the upper and lower sections includes overlapping ends attached with a hook and loop type fastener; wherein said fastener extends over the entire opposing surfaces of the overlapping ends of the upper and lower sections;

a pair of shoulder straps disposed to join front and rear lateral portions of the upper section; and,

a reinforced section including multiple layers of non elastic material attached to said vest and disposed to span the lower section and the upper section, said reinforced sec-

tion being centered on and extending across the dorsolumbar region and extending upwardly therefrom, and.

vertical supports attached to the rear of said vest and disposed to span the lower section and the upper section in spaced parallel relationship to the spine.

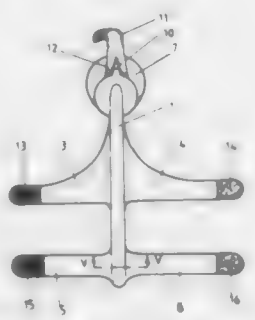
SUPPORTING DEVICE FOR USE IN FIRST AID TO PERSONS INJURED IN ACCIDENTS OR THE LIKE

Halldis Aalvik Thune, Loveien 30, 3500 Honefoss, Norway



PCT No. PCT/NO86/00031, § 371 Date Dec. 11, 1986, § 102(e) Date Dec. 11, 1986, PCT Pub. No. WO86/05968, PCT Pub. Date Oct. 23, 1986

PCT Filed Apr. 17, 1986, Ser. No. 9,327

Claims priority, application Norway, Apr. 18, 1985, 851560; Nov. 22, 1985, 854673

Int. Cl.[5] A61F *5/02*

U.S. Cl. 128—78 **6 Claims**

1. A supporting device for use in administering first aid to a person injured in an accident, particularly to a person having a back and/or neck injury, said device comprising:

a main member to be positioned centrally along the back of an injured person, said main member having formed therein an elongated pocket opening upwardly in the normal position of use;

fastening members extending from said main member at positions to be mounted around the abdominal and chest area of the injured person and around the head or neck of the injured person;

said main member and said fastening members being formed of flexible material; and

an elongated supporting member in the form of a substantially flat metal rod accommodated in said pocket of said main member in a manner such that said metal rod may be selectively manually pulled from and pushed into said pocket, said metal rod having a length sufficient to support the back and neck of the injured person when said metal rod is within said pocket

SPINE STRETCHER AND ALIGNER

Charles D. Sexton, 944 Waialae Cir., NE., Palm Bay, Fla. 32905

Filed Aug. 1, 1989, Ser. No. 387,729

Int. Cl.[5] A61F *5/02*

U.S. Cl. 128—78 **11 Claims**

1 A spine stretcher and aligner comprising

a base,

a first resilient member extending above said base, said first member having a first arcuate upper edge extending substantially the length of said member and extending upwardly of said base;

a second resilient member extending above said base, said second member having a second arcuate upper edge opposed to and spaced from said first upper edge of said first member, said second arcuate upper edge having substantially the same configuration as said first arcuate upper edge;

said first and second arcuate upper edges having a curvature greater than the normal lordosis of the human spine;

said arcuate edges being configured such that the apex of said upper arcuate edges is nearest one end of said members

---

JOINT BRACE

DeLos E. Marion, deceased, late of Goodland, Ind. by Martha M. Marion, heir , assignor to John E. Garber, Indianapolis, Ind., a part interest

Filed Aug. 4, 1989, Ser. No. 389,696

Int. Cl.[5] A61F *5/00*

U.S. Cl. 128—80 C **16 Claims**

1. A brace for a human joint comprising:

bending means positionable adjacent a human joint and being operable to limit movement of said joint in certain directions but allowing pivoting action of said joint about a joint movable pivot axis, said bending means having a first end and an opposite second end and including a plurality of bendable strips extending therebetween being slidably mounted together in side by side relationship and bendable about a non-fixed strip axis;

first mounting means on said first end of said bending means operable to mount the brace on one side of said human joint and limit relative motion between said first end and said one side; and,

second mounting means on said second end of said bending means operable to mount the brace on the other side of

said human joint and limit relative motion between said second end and said other side.

THERAPEUTIC ANKLE SUPPORT SYSTEM

Paul W. Burns, 36 Greco La., Warwick, R.I. 02886, and Gary Burns, 512 Old Baptist Rd., North Kingstown, R.I. 02852

Filed Apr. 12, 1990, Ser. No. 507,915

Int. Cl.[5] A61F *3/00*

U.S. Cl. 128—80 H **5 Claims**

1 Orthopedic splint comprising a pair of rigid arcuately shaped shells, said sheels having a pair of spaced slots at one end thereof, a first flexible foam pad insert having the shape of the shell and substantially coextensive therewith, means securing a first said insert to each said shell, said first insert having first surface fastener patches thereon, a second flexible therapeutic pad insert having second surface fastener patches that releasably engage the surface fastener patches on the first insert, fastener straps for encircling the exterior of the shells when the shells are fitted about a body part.

5,007,417

ANKLE BRACE

Kelly M. Bender, Ashland, Wis., assignor to Mikros U.S.A., Inc., Ashland, Wis.

Filed Apr. 2, 1990, Ser. No. 503,056

Int. Cl.[5] A61F *3/00, 5/00, 13/06*

U.S. Cl. 128—80 H **20 Claims**

1 An ankle brace comprising:

a flexible base configured to fit around the rearward and side portions of the foot and ankle having medial and lateral forward edges positionable in straddling spaced apart relationship to the foot and ankle on medial and lateral sides thereof;

tongue means separate from the base configured to cover the front superior ankle and foot portions between the lateral and medial forward edges of the base, said tongue means having a tongue member narrower than the distance between the forward edges of the base when positioned on a foot and a first edge positionable in parellel spaced side-by-side relationship to the medial edge of the base, and a second edge positionable in parallel spaced side-by-side relationship to the lateral edge of the base when the base and tongue means are installed on a foot;

first lace fastening means including lace eyelets and a lace cooperating between the first edge of the tongue member and the medial edge of the base to fasten them together, and second lace fastening means including lace eyelets and a lace cooperating between the second edge of the tongue means and the lateral edge of the base to fasten them together and secure the tongue member and the base in encompassing relationship to a foot and ankle.

METHOD FOR DEPICTION OF MOVING PARTS IN A BODY BY NUCLEAR MAGNETIC RESONANCE EXPERIMENT

Patrick Le Roux, Gif sur Yvette, France, assignor to General Electric CGR S.A., Issy les Moulineaux, France

PCT No. PCT/FR87/00450, § 371 Date Jul. 18, 1988, § 102(e) Date Jul. 18, 1988, PCT Pub. No. WO88/04046, PCT Pub. Date Jun. 2, 1988
PCT Filed Nov. 13, 1987, Ser. No. 246,666
Claims priority, application France, Nov. 21, 1986, 86 16259
Int. Cl.[5] A61B 5/055
U.S. Cl. 128—653 OAF 2 Claims

1. A method for depicting, in an image, moving parts in a body by nuclear magnetic resonance experiment comprising the steps of:

subjecting a part of said body firstly, to an orienting magnetic field and, secondly, while maintaining said orienting field, subjecting said part to several excitation sequences each of which includes, a first main step followed by a second main step, itself followed by a period of time during which it may be assumed that the equilibrium of magnetic moments is re-established.

said first main step including:

flipping an initial orientation of magnetic moments of said body by means of a first radiofrequency electromagnetic excitation comprising two successive excitation pulses,

applying said two successive pulses to make said orientation of said magnetic moments of said body flip by two equal and mutually opposite flipping angles, with respect to said initial orientation of said moments,

applying a bipolar field gradient pulse between said two successive excitation pulses,

applying first field gradient pulses after said excitation to induce, in a first free precession signal resulting from a free precession of said magnetic moments, first dephasings for discriminating contributions of each part of the body,

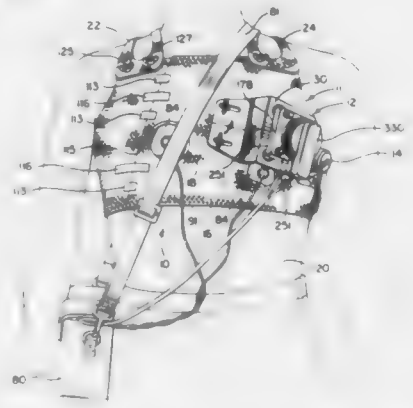
said first field gradient pulses including a gradient echo type pulse,

measuring and processing said first free precession signal, to represent said moving parts of the body,

said second main step beginning, after the first free precession signal is measured, said second main step includes the body being subjected to a second radiofrequency excitation to again cause the flipping with a flipping angle of the magnetic moments,

applying second field gradient pulses after said second excitation to induce, in a second free precession signal resulting from said free precession of magnetic moments, dephasing for discriminating contributions of each part of the body,

measuring and processing said second free precession signal, to also represent moving parts of the body,



and further processing together the first and second processed free precession signal in order to depict a pure speed or a pure density image.

AMBULATORY PHYSIOLOGICAL EVALUATION SYSTEM INCLUDING CARDIAC MONITORING

Arata Suzuki, Ramsey, N.J.; William T. Tyberg, Springvalley, N.Y.; George Banks, Emerson, and Marcia Suzuki, Ramsey, both of N.J., assignors to Capintec, Inc., Ramsey, N.J.

Continuation-in-part of Ser. No. 46,854, May 7, 1987, Pat. No. 4,920,969, which is a division of Ser. No. 785,549, Oct. 8, 1985, abandoned. This application Sep. 15, 1987, Ser. No. 96,521
Int. Cl.[5] A61B 5/04
U.S. Cl. 128—659 9 Claims

1. A vest for use in an ambulatory physiological evaluation system, said vest comprising:

a flexible, planar vest member to be worn about the torso of a patient, said member including an enlarged chest area that covers the chest of the wearer, a pair of strips disposed on opposite sides of said chest area, each of said strips passing below one of the arms of the patient and lying against the back of the patient;

fist securing means at the end of each strip for joining the strips to arrange said member about the torso in a snug fit so that the member remains relatively stationary relative to the torso during movement of the patient;

a pair of planar elongated straps, each of said straps spanning across one of the shoulders of said patient, one end of each strap terminating in means for movably mounted said strap to said chest area, the other end of each strap terminating in means for securing said strap to one of said strips of said vest member; quick release means dividing the vest top to bottom in a first area of the vest for covering the right side of a wearer's chest; and

mounting means on a second area of the vest for apparatus to be used in said evaluation system, said mounting means being located on a second area of the vest for covering a left part of the wearer's chest.

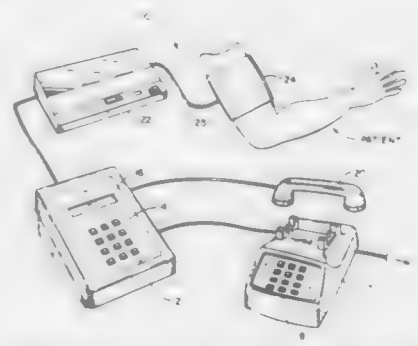
U.S. Cl. 128—660.04 6 Claims

1. An apparatus for the examination of a body of living tissues, the apparatus comprising means for illuminating the body of living tissues with infra-red containing electromagnetic radiation, means for receiving electromagnetic radiation which is transmitted through the body of living tissues, means for producing an image of the received radiation, means for applying ultrasound to a region of the body of living tissues,

means for receiving reflected ultrasonic signals from the region, characterised by means for producing a signal which is representative of the velocity of blood flow in the region and



means for generating from the signal a graphical representation which provides an indication of blood flow velocity in the region.

INTERFACE USING 12-DIGIT KEYPAD FOR PROGRAMMING PARAMETERS IN AMBULATORY BLOOD PRESSURE MONITOR

James E. Treatch, Phoenix, and James R. Mikesell, Scottsdale, both of Ariz., assignors to PulseTrend, Inc., Phoenix, Ariz.

Continuation-in-part of Ser. No. 98,550, Aug. 21, 1987, Pat. No. 4,830,018. This application Apr. 11, 1989, Ser. No. 336,244
Int. Cl.[4] A61B 5/022
U.S. Cl. 128—677 4 Claims

1. In a user interactive data entry and data downloading system including a control unit having a stored program microcomputer, a prompt display and a 12-character telephone keypad, and a communication link to an ambulatory patient monitor, the ambulatory patient monitor including a stored program microcomputer, a method for directing user selection of blood pressure test parameters for transfer to the ambulatory patient monitor, the method comprising the steps of:

initially entering an idle routine from which any one of a plurality of menu items can be entered by selection of a predetermined key of the keypad, the menu items including a subroutine for assembling a set of blood pressure test parameters,

displaying on the prompt display indication of execution of the idle routine,

monitoring the keypad for selection of a key,

entering a subroutine upon selection of a key associated with the subroutine,

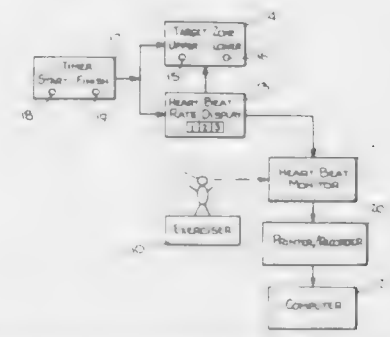
displaying on the prompt display indication of selection of the subroutine;

the step of displaying indication of entry of a subroutine including upon entry of the subroutine for assembling blood pressure test parameters, directing, through further visual prompts on the prompt display, selection by the user of blood pressure test parameters through the keypad to establish a blood pressure test regimen;

determining the reasonableness of the selected blood pressure test parameters upon selection;

rejecting a selected blood pressure test parameter if unreasonable and directing, through visual prompts, selection of a new blood pressure test parameter;

transferring the selected blood pressure test parameters to the ambulatory patient unit after completion of the set of blood pressure test parameters; and



exiting the assembly subroutine and returning to the idle state after completing transfer of the blood pressure test parameters to the ambulatory patient unit.

RHYTHMIC BIOFEEDBACK TECHNIQUE

Irving I. Dardik, R.D. 1, Box 253 Hillcrest Dr., Great Meadows, N.J. 07838

Filed Nov. 5, 1986, Ser. No. 927,176
Int. Cl.[4] A61B 5/04
U.S. Cl. 128—696 5 Claims

1. A rhythmic biofeedback technique for inducing relaxation to counteract the adverse physiological and psychological effect of chronic stress on an individual of a given age and physical condition, the technique comprising the steps of:

A. electronically monitoring the heart beat of an individual being treated and displaying the prevailing rate to him as he undergoes a rhythmic conditioning session constituted by successive exercise-relaxation cycles extending for a predetermined period, each cycle having a duration which is a small fraction of said period;

B. electronically producing a first indication when the prevailing rate reaches a peak representing a predetermined safe upper limit and electronically producing a second indication when the prevailing rate reaches a predetermined acceptable lower limit, said predetermined upper and lower limits defining a target heart rate zone for the particular individual being treated, the boundaries of this zone being a function of the individual's age and physical condition; and

C. in the course of each cycle of the conditioning session requiring the individual to operate within said target zone by raising his level of exertion, as indicated by said first indication, to a peak representing said safe upper limit, following which he is required to reduce his exertion until he reaches said acceptable lower limit as indicated by the second indication at which a recovery-relaxation response takes place

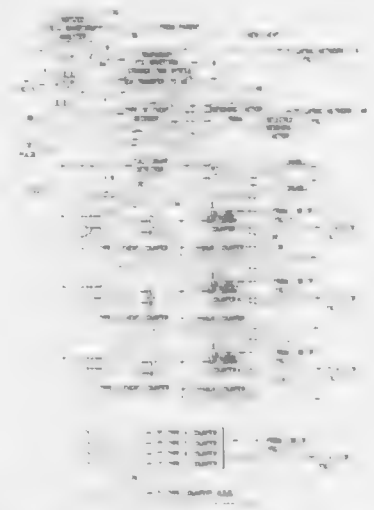
APPARATUS AND METHOD FOR UPDATED RECORDING OF IRREGULARITIES IN AN ELECTROCARDIOGRAM WAVEFORM

Robert F. Donehoo, III, Huntsville, Ala., assignor to Care Systems, Inc., Huntsville, Ala.



Filed May 3, 1988, Ser. No. 189,833
Int. Cl.[4] A61B 5/04
U.S. Cl. 128—696 20 Claims

1. A system for storing, on an updated priority basis, seg-

ments of an electrocardiogram (ECG) waveform from a patient containing at least one of a plurality of selected abnormal cardiac events, hereinafter referred to as event, said updated priority basis determined by selected characteristics comprising the ECG segment containing a new event not fully processed and stored by said system, type of the new event, age (A) of prior stored, like type events as the new event, weighing factor (WF) of the new event, and total number (T) of like type events stored prior to storing the new event, and comprising:

first memory storage means disposed for temporarily storing the characteristics of each said new event, and for maintaining a current total (T) of each different selected type of said event stored prior to storing the new event, and for incrementing said T of like type, prior stored said events as said new event by one;

second memory storage means comprising N memory blocks (MB's) for storing, where n is a positive integer, and on said updated priority basis upon occurrence of

each said new event, the characteristics of N events each stored in a different memory block;

first logic means responsive to said first memory storage means and operative on said second memory storage means for determining a highest product of (A)×(WF)×(T) in each said MB, said highest product identifying the memory block of said N memory blocks containing a lowest priority type of said event (LPEMB) and for decrementing by one the value of T contained in each said N memory block containing the like type of event as contained in said LPEMB; and

second logic means responsive to the decrementing of T by said first logic means for entering the characteristics of the new event in said LPEMB, replacing the characteristics of a prior stored said event in said LPEMB with the characteristics of the new event, and to increment by one the T in each said MB containing the like type of event as the type of new event now entered into the LPEMB.

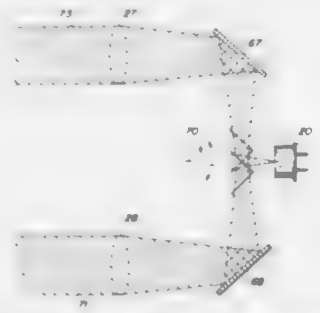
5,007,432

RADIATION DETECTION METHOD AND APPARATUS

Hans J. Keller, Staefa, and Walter A. Kuster, Tuggen, both of Switzerland, assignors to Eltec Instruments, Inc., Daytona Beach, Fla.

Continuation of Ser. No. 42,709, Apr. 27, 1987, abandoned. This application Jul. 10, 1989, Ser. No. 377,725

Int. Cl.[5] A61B *5/00*



U.S. Cl. 128—736 **17 Claims**

1. A medical diagnostic apparatus for detecting the temperature differential between two sites on the surface of a person's body comprising:

a single thermal radiation detector;

a plurality of lenses arranged to respectively receive thermal radiation from different sites on the person's body along different optical paths and to focus the received radiation onto the single detector;

means for alternately interrupting the flow of thermal radiation from the different sites to the detector so that the thermal radiation from not more than one of the sites is received by the detector at any time;

means for converting the received thermal radiation from each site to corresponding temperature indicative signals;

means for averaging the temperature indicative signals derived from each corresponding site to determine the surface temperature of each site; and wherein

the plurality of lenses are concentric and lie in a common plane.

CATHETER TIP ATTITUDE CONTROLLING GUIDE WIRE

A. Thomas Doyle, Mountain View; William S. Tremulis, Redwood City, and Colleen L. McQueen, Santa Clara, all of Calif., assignors to Advanced Cardiovascular Systems, Inc., Santa Clara, Calif.

Filed Feb. 7, 1989, Ser. No. 307,606

Int. Cl.[5] A61B *6/00*

U.S. Cl. 128—772 **21 Claims**

1 A guidewire which is adapted to control the attitude of the distal tip of a catheter slidably mounted thereover comprising

(a) an elongated shaft having a proximal portion, a distal portion with a distal tip and an intermediate portion between the proximal and distal portions; and

(b) the intermediate portion of the elongated shaft having a plurality of permanent bends along the length thereof spaced proximally at least 1.5 cm from the distal tip of the distal portion so that, upon the longitudinal movement of a catheter over the guidewire, the attitude of the distal tip of the catheter is thereby controlled

CONNECTOR FOR MULTICONDUCTOR PACING LEADS

Phong D. Doan, Shoreview; James E. Upton, New Brighton; Douglas N. Hess, Maple Grove; Wayne R. Bass, Coon Rapids, and Keith A. Ufford, Maple Grove, all of Minn., assignors to Medtronic, Inc., Minneapolis, Minn.

Division of Ser. No. 198,540, May 25, 1988, Pat. No. 4,922,607. This application Apr. 23, 1990, Ser. No. 513,461

Int. Cl.[5] A61N *1/05*

U.S. Cl. 128—784 **7 Claims**

1 A connector pin assembly, comprising.

an elongated conductive connector pin having a proximal end and a distal end;

a first insulative sheath coaxially mounted around said connector pin, said first insulative sheath terminating proximal to the distal end of said connector pin.

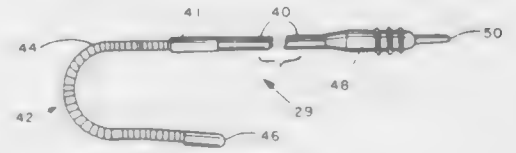
first connector ring mounted around said first insulative sheath, said first connector ring having a proximal end a distal end, the distal end of said first connector ring terminating proximal to the distal end of said connector pin.

a first conductive extension electrically and mechanically coupled to the distal end of said connector ring and extending distally therefrom;

a first electrical conductor coupled to the distal end of said connector pin; and

a second conductor electrically and mechanically coupled to the distal end of said extension.

5,007,436



CARDIOVERSION AND DEFIBRILLATION LEAD SYSTEM

Karel F. A. A. Smits, Oirsbeek, Netherlands, assignor to Medtronic, Inc., Minneapolis, Minn.

Division of Ser. No. 408,466, Sep. 18, 1989, abandoned, which is a continuation of Ser. No. 220,642, Jul. 18, 1988, abandoned, which is a division of Ser. No. 925,030, Oct. 30, 1986, Pat. No. 4,744,952, which is a division of Ser. No. 746,694, Jun. 20, 1985, Pat. No. 4,641,656. This application Mar. 26, 1990, Ser. No. 498,873

Int. Cl.[5] A61N *1/05*

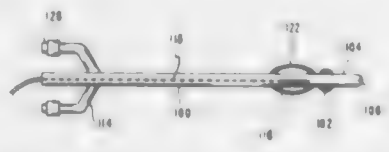
U.S. Cl. 128—786 **7 Claims**

1 An implantable lead, comprising

a connector assembly, including at least one electrical connector;

an elongated lead body having a proximal end and a distal end, said proximal end of said lead body mounted to said connector assembly, said lead body including a first segment having a generally straight configuration extending from said connector assembly to a first point, and a second, curved segment extending distal to said first point, said lead body including a first elongated electrode, exposed to the exterior of said lead body at least from said

first point to the distal end of said elongated lead body, and wherein said lead body also includes an elongated insulative sheath extending from said first electrode to said connector assembly; and



a conductor extending from said first electrode to said connector assembly, mounted within said elongated insulative sheath.

5,007,437

CATHETERS FOR TREATING PROSTATE DISEASE

Fred Sterzer, Princeton, N.J., assignor to MMTC, Inc., Princeton, N.J.

Continuation of Ser. No. 367,718, Jun. 16, 1989, abandoned.
This application Apr. 19, 1990, Ser. No. 512,520
Int. Cl.[5] A61N *5/02*
U.S. Cl. 428—786 15 Claims

1. In a catheter adapted to be inserted into an orifice of a male patient for treating prostate disease, wherein said catheter comprises means including microwave antenna means for irradiating said patient's prostate with a given distribution of microwave field intensity, thereby to heat tissue of said patient to a temperature which tends to vary as a direct function of microwave power and as an inverse function of the distance of that tissue to said microwave antenna means, and wherein the maximum microwave power to be employed is limited to an amount at which the temperature of the patient's heated tissue most proximate to said microwave antenna means does not exceed a given safe maximum temperature; the improvement wherein said catheter further comprises

an inflatable balloon inside of which said microwave antenna means is situated, said balloon being structured to have a cross-section which is expandable in size from a first value no larger than the cross-section of said orifice when said balloon is deflated to a second value substantially larger than the cross-section of said orifice when said balloon is inflated to a given pressure, said given pressure being sufficient to squeeze and compress tissue of said patient adjacent said balloon and permit the size of said balloon cross-section to be expanded to its second value;

whereby said catheter may be (1) inserted into said orifice while in a deflated state and positioned therein at a location at which both said balloon and said microwave antenna means are in cooperative relationship with said patient's prostate for effecting the irradiation of said patient's prostate with said given distribution of microwave field intensity when said catheter is fully inserted into said orifice, and (2) said balloon may be inflated to said given pressure when said catheter is fully inserted for expanding the size of its cross-section to said second value, resulting in both prostate tissue and that non-prostate tissue situated between said inflated balloon and said prostate tissue being squeezed and compressed so as thereby to increase the minimum distance between said microwave antenna means situated inside of said balloon and heated tissue of said patient; and

means for inflating said balloon to said given pressure;

whereby the maximum microwave power may be increased without exceeding said given maximum safe temperature and the temperature differential between the heated prostate tissue more proximate to said microwave antenna means and the heated prostate tissue more distal to said microwave antenna means is reduced.

METHOD OF FABRICATING AN ALL-TOBACCO CIGARETTE CONTROLLING TAR DELIVERY AND AN ALL-TOBACCO CIGARETTE

Richard D. Chumney, Jr., Mechanicsville, Va., assignor to The American Tobacco Company, New York, N.Y.

Division of Ser. No. 861,169, May 9, 1986, Pat. No. 4,726,385.
This application Nov. 17, 1987, Ser. No. 121,840
Int. Cl.[5] A24D *3/06*
U.S. Cl. 131—331 13 Claims

1. A method of fabricating an all-tobacco cigarette having a tobacco lighted-end column and a tobacco tip-end column, each tandemly-arranged, comprising the steps of:

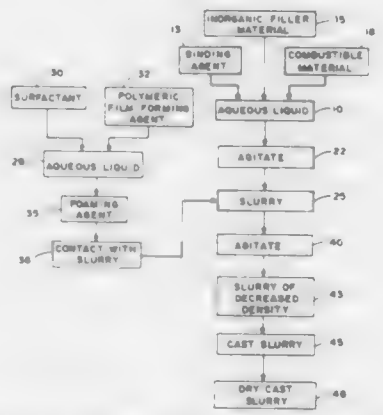
(a) selecting the length of the tip-end column for a cigarette of particular length and controlling the type and compaction of tobacco in such column;

(b) fabricating the lighted-end tobacco column;

(c) fabricating the tip-end tobacco column to consist of at least about 20% expanded tobacco with the remainder unexpanded tobacco

(d) placing a paper wrapper having ventilation holes of predetermined size and number formed therein over said tip-end column, and

(e) assembling the tip-end and lighted-end tobacco columns into a cigarette,



whereby a cigarette of acceptable overall resistance to draw and desired "tar" delivery can be attained.

ELECTRIC NAIL POLISH REMOVER

Michael D. Goldstein, P.O. Box 391, Gladwyne, Pa. 1[illegible]35

Filed Dec. 29, 1989, Ser. No. 459,250
Int. Cl.[5] A45D *29/05*
U.S. Cl. 132—73.6 7 Claims

1. A fingernail polish removal apparatus comprising,

a lower housing mounted overlying an upper housing, and

motor means selectively actuatable mounted within the lower housing medially thereof and including a rotatable shaft projecting into the upper housing from the lower housing, and

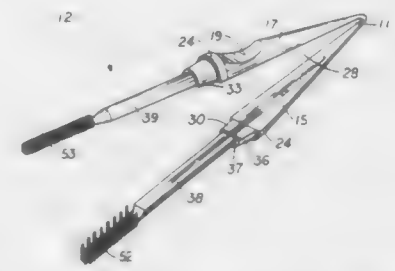
a series of five fingernail positions formed within the upper housing, and

elongate cleaning means directed surroundingly about each position in operative association with the shaft for contact and cleaning of a fingernail of an associated finger directed into each position, and

wherein the five fingernail positions defined by four finger positions and one thumb position, and a lid is removably mounted to the upper end of the upper housing including an individual opening coaxially aligned with each finger position and thumb position, and

wherein the upper and lower housing are of circular configuration and coaxially aligned relative to one another, and

wherein the four finger positions are positioned in a semi-circular array within a semi-cylindrical portion of the upper housing with the thumb position oriented through a diameter bisecting the semi-circular array of the four finger positions, the thumb position including an actuator switch abutment at a lower terminal end of the thumb position for actuation of the motor means and the shaft, wherein the actuator switch is mounted within the lower housing underlying a flexible membrane mounted in a floor portion of the upper housing, and



wherein the shaft includes a splined upper portion in engagement with a toothed inner face of the elongate cleaning means, and the elongate cleaning means is defined by an endless serpentine belt, the serpentine belt further including a sponge face opposed to the toothed face directed interiorly of each finger and thumb position.

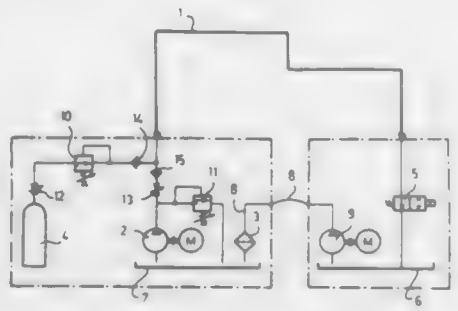
APPARATUS FOR FLUSHING SMALL-DIAMETER HYDRAULIC PIPE SYSTEMS AND THE LIKE

Göran Sundholm, Magisterviägen 34 B, SF-02700 Grankulla, Finland



PCT No. PCT/FI87/00138, § 371 Date Feb. 28, 1989, § 102(e) Date Feb. 28, 1989, PCT Pub. No. WO88/03065, PCT Pub. Date May 5, 1988

PCT Filed Oct. 20, 1987, Ser. No. 326,542

Claims priority, application Finland, Oct. 23, 1986, 864289; Jan. 12, 1987, 870102

Int. Cl.[5] **B08B** *3/10*

U.S. Cl. 134—102 **8 Claims**

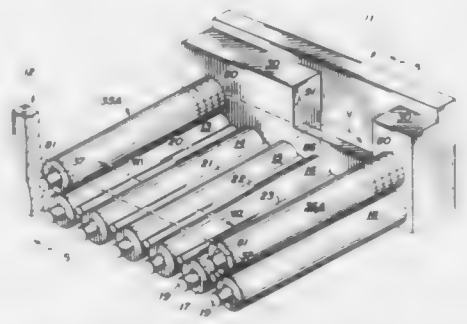
1. An apparatus for flushing at least a portion of a hydraulic pipe system, comprising a hydraulic pump means for flushing a liquid through the pipe system, and filter means together forming a flushing circuit comprising:

means for coupling a flushing circuit to a pipe system;

means for feeding a gas into the flushing liquid arranged in combination with the hydraulic pump means, and

the flushing circuit including valve means arranged to at first be closed when the pipe system has been filled with flushing liquid and gas, means for compressing the gas entrained in the pipe system, and said valve means thereafter being opened for expanding the compressed gas, in order to create a forceful flushing pulse through the pipe system.

5,007,445



DYNAMIC FLOOD CONVEYOR WITH WEIR

Don P. Pender, Tempe, Ariz., assignor to Advanced Systems Incorporated, Phoenix, Ariz.

Filed Feb. 26, 1990, Ser. No. 485,167

Int. Cl.[5] **B08B** *3/04*

U.S. Cl. 134—122 R **3 Claims**

1. A dynamic flood conveyor for processing the upper surface of a circuit board substrate by moving the substrate through a body of fluid, said substrate having an upper surface, said conveyor including

(a) a pair of upstanding spaced apart side walls;

(b) generally horizontally oriented adjacent parallel support rollers for supporting and transporting said circuit board substrate, said support rollers

(i) including at least first and second end rollers,

(ii) each spanning the space between said side walls,

(iii) each having first and second ends each rotatably mounted in one of said walls, and

(iv) each having a cylindrical outer surface spanning the space between said side walls, each of the uppermost portions of said cylindrical surfaces of said rollers generally lying in and defining a common generally horizontal imaginary plane;

(c) means for rotating each of said support rollers in a common direction;

(d) fluid containment means extending above said horizontal plane and spanning the space between said side walls;

(e) an upper fluid containment roller spaced apart from said fluid containment means, spanning the space between said side walls, positioned above and generally parallel to said end roller, and including

(i) a horizontally oriented shaft,

(ii) a pair of ends each rotatably mounted in one of said side walls,

(iii) a plurality of cylindrical segments slidably contacting one another and rotatably mounted on said shaft, each of said segments having an aperture formed therethrough which is shaped and dimensioned to permit said segments to be vertically displaced with respect to said shaft and said end roller, said segments extending from one of said side walls to the other of said side walls and positioned above and generally parallel to said end roller and continuously contacting at least one of a second contact pair, said second contact pair comprising

said cylindrical outer surface of said end roller, and

the upper surface of said circuit board substrate passing between said fluid containment roller and said end roller,

selected ones of said segments remaining in contact with said end roller simultaneously with the remaining others of said segments being upwardly displaced with respect to said selected ones of said segments on contacting the upper surface of said circuit board substrate passing between said fluid containment roller and said end roller while moving toward said fluid containment means;

(f) a reservoir of fluid in said flood conveyor, said fluid reservoir contacting said fluid containment roller and fluid containment means and generally extending

(i) above said support rollers,

(ii) between and contacting said fluid containment roller and fluid containment means, and

(iii) above said imaginary plane,

(g) means for injecting fluid into said reservoir;

said fluid containment roller and fluid containment means acting as dams to retain fluid in said reservoir; and,

said upward displacement of said remaining others of said selected ones of said segments of said fluid containment roller minimizing the fluid escaping from said reservoir over said end roller when said circuit board substrate passes between said fluid containment roller and said end roller into said reservoir.

TEMPERATURE ACTUATED FLOW CONTROL DEVICE

Lee A. Grove, Elkhart, Ind., assignor to Remote Controls, Inc., Mishawaka, Ind.

Continuation-in-part of Ser. No. 427,255, Oct. 25, 1989, Pat. No. 4,947,886, Continuation-in-part of Ser. No. 341,474, Apr. 21, 1989, Pat. No. 4,884,595. This application Jun. 1, 1990, Ser. No. 532,064

Int. Cl.[5] **F16K** *11/18, 31/64;* **F16L** *55/14*

U.S. Cl. 137—72 **31 Claims**

15. A flow control device, comprising:

a valve having a valve body with a fluid-holding chamber therein;

inlet means opening into the chamber for supplying a fluid flow into the chamber under a positive pressure;

outlet means opening into the chamber and having an outlet opening in the body;

a collapsible tubing having one end sealingly attached to the outlet opening and an opposite end extending into the chamber, the opposite end having an inlet;

a piston moveably mounted in the chamber in spaced relation to the inlet of the collapsible tubing for insertion into and withdrawal from the inlet;

a shaft having a cam mounted thereon having a first position where it biases the piston into the inlet of the collapsible tubing to block fluid flow from the chamber through the outlet means wherein insertion of the piston into the collapsible tubing causes a pressure decrease in the collapsible tubing downstream of the inlet wherein the fluid pressure in the fluid chamber causes a portion of the collapsible tubing downstream of its inlet to collapse around the piston, the collapse of the collapsible tubing around the piston cooperating in conjunction with the piston to block fluid flow from the chamber through the outlet means, the cam having a second position where it permits the piston to be biased out of the inlet of the collapsible tubing by bias means for biasing the piton out of the inlet to unblock fluid flow from the chamber through the outlet means;

second bias means for rotating the shaft from a first position to a second position to rotate the cam from its first position to its second position;

a temperature sensitive link mechanically coupling the shaft to the body to prevent the shaft from rotating when the temperature to which the flow control device is exposed is less than a predetermined temperature, the link decoupling the shaft and body when the temperature to which the flow control device is exposed reaches or exceeds the predetermined temperature which permits the shaft to be rotated by the second biasing means to its second position to pen the valve by permitting the collapsible tubing to uncollapse.

1. An apparatus with a re-setting action, for producing a signal for triggering off at least one safety measure on an installation including at least a pneumatic feed in the event of a drop in the pressure of said pneumatic feed, comprising:

a body having a first orifice for connection to the pneumatic feed;

an internal chamber in the body;

a first duct in the body communicating the first orifice with the chamber;

a second duct communicating with said chamber;

means connected to the chamber for establishing a signal in a first state when the pressure, of the feed is higher than a threshold and in a second state when said pressure falls below said threshold, the signal in its first state being the presence of a pressure in the second duct and in its second state being the absence of pressure in the second duct, the means for establishing the signal comprising: a first seat through which the first duct opens into the chamber; a third duct communicating the chamber with an exhaust orifice of the body; a second seat through which the third duct opens into the chamber, the second seat being of larger diameter than the first seat; a valve member movable in the chamber between a first position in which it is applied against the first seat and a second position in which it is applied against the second seat; and a resilient return member operatively disposed between the body and the valve member to urge the valve member towards its first position under a force of an intensity corresponding to said threshold;

means for regulating the value of said threshold; and

a voluntary re-setting means comprising an actuating mem-

ber which is accessible from the exterior of the body, and a thrust means disposed in opposite operative relationship to the resilient return member with respect to the valve member between the latter and the actuating member, the thrust means being displaceable in said body with a movement of an amplitude which is at least equal to the value of the displacement of the valve member when it moves from one of the seats to the other.

FILLING DEVICE FOR LIQUID FILLED TIRES

Harvey A. Olinger, Huntington Beach, Calif., assignor to Advanced Commercial Products, Inc., Santa Ana, Calif.

Filed Feb. 9, 1990, Ser. No. 477,757
Int. Cl.[5] F16K *24/00;* **B65B** *31/04*
U.S. Cl. 137—223 **14 Claims**

1. A filling device for filling tires or tubes having a conventional tire valve member, said device being adapted for filling said tires or tubes with liquid, after removal of the valve stem assembly of said valve member, said device comprising.

a barrel means;

bore means axially extending through said barrel means, said bore means including first and second aligned bore portions of different sizes;

means on said first bore portion for attachment tot he end of said tire valve member;

air vent means in fluid flow communication between the interior of said first bore portion and the outer atmosphere;

tube means in fluid flow communication with said second bore portion and having an end extending beyond the terminal end of said first bore portion a distance sufficient for cooperative engagement with said tire valve member when said filling device is attached to said tire valve member;

fitting means coupled to the other end of said barrel means for attachment to pressurized source of liquid, the parts of said filling device being configured, dimensioned and arranged that pressurized liquid flowing through said fitting means flows through said tube means into the tire, while air escaping from the tire enters into said first bore portion for discharge through said vent means.

DEFLATOR

Anthony J. Marrone, II, 91-413B, Eva Beach Rd., Eva Beach, Hi. 96706

Filed Jan. 2, 1990, Ser. No. 459,685
Int. Cl.[5] F16K *15/18, 31/44*
U.S. Cl. 137—223 **4 Claims**

1. A deflating tool, for use in conjunction with cut-check valves, being constructed of suitable rigid material having a slot in its body of suitable length and width which tapers from the perimeter of the tool at a suitable fixed rate so as to accommodate the stem of the cut-check valve at its widest part and squeeze the valve stem, without damaging it, as the slot is moved passed the stem, so that the stem deforms a sufficient amount to open the cut-check valve, said surface of the deflating tool slot being smoothly finished so as not to damage the valve stem.

5,007,450

ADD-ON LIQUID OVERFLOW SHUT-OFF VALVE FOR TANK

Franklyn P. Babb, and Matthew T. Babb, both of 1666 S. Santa Fe, Vista, Calif. 92084

Continuation-in-part of Ser. No. 538,524, Jun. 15, 1990, abandoned. This application Sep. 10, 1990, Ser. No. 579,539
Int. Cl.[5] F16K *43/00, 31/32, 33/00*
U.S. Cl. 137—315 **24 Claims**

1. An add-on liquid overflow shut-off valve for a tank comprising:

(a) A valve body, a moveable float spaced-apart therefrom and a connecting arm extending therebetween, all adapted for insertion and removal as one integral, portable unit through a standard tank lid opening for suspension below said opening so that said float is responsive to the liquid level in the tank, said valve body including a flanged portion extending exterior of the tank lid opening to receive connections from a pneumatic source and to a pneumatic driven pump;

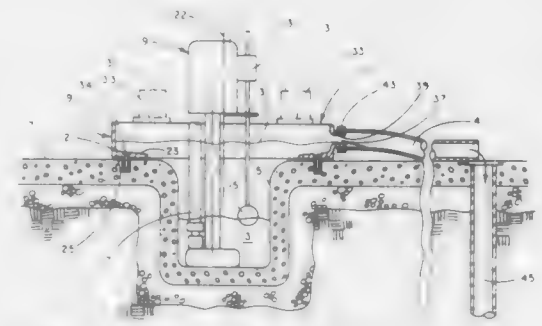
(b) pneumatic ingress and egress means formed in said top flanged portion of said valve body in spaced-apart relation for passing only gas through said valve;

(c) spaced-apart first and second pneumatic passageways formed interior of said valve body extending respectively from said ingress means and said egress means;

(d) a third pneumatic passageway formed interior of said body interconnecting said first and second passageways to allow a flow of gas therethrough;

(e) a shaft pivotally received in said body, interrupting said third pneumatic passageway, having a fourth pneumatic passageway formed therethrough for pneumatic alignment with said third pneumatic passageway when the liquid is below a predetermined level in the tank, said shaft having one end thereof extending outside said valve body for connection to said arm;

(f) said connecting arm causing rotation of said shaft as a function of said float movement on top of the liquid in the tank, to align said fourth pneumatic passageway with said third pneumatic passageway when the liquid is below the predetermined level, to allow gas to flow from said ingress means through said first, second, third, and fourth pneumatic passageways to said egress means to drive the pump and continue to deliver liquid into the tank, and then to rotate into a position wherein said fourth pneumatic passageway rotates out of alignment with said third pneumatic passageway shutting off the gas flow to the pump when the liquid reaches the predetermined level, said valve body, float and connecting arm able to be withdrawn as a unit from the filled tank through the tank opening for immediate insertion into another tank for subsequent use; and,



(g) means for connecting said valve body to an electrical ground.

5,007,451

SUMP PROTECTION SYSTEM

Andrew Bralich, 2485 W. 9th St., Oshkosh, Wis. 54904

Filed May 30, 1989, Ser. No. 358,132
Int. Cl.[5] E02D *19/06;* **F04B** *49/04*
U.S. Cl. 137—362 **2 Claims**

1. A sump protection system comprising:

a. an uncovered retainer comprising:

i. a tube having a central axis and a predetermined diameter and a predetermined height, the diameter being approximately nine times greater than the height, the tube having an exposed top end and a lower end;

ii. an annular flange extending radially from the tube lower end, the flange having an inner diameter sufficient to surround a sump in a building floor and being detached therefrom, the flange having upper and bottom surfaces; and

iii. a spout formed in the tube;

b. seal means bonded to the flange bottom surface and contactable with the building floor for cooperating with the tube and flange to confine any water rising above the sump to be confined within the retainer; and

c. hose means clamped to the spout for directing any water within the retainer to a selected location therefrom,

so that the building portions in the vicinity of the sump are protected against any water overflowing from the sump.

5,007,452

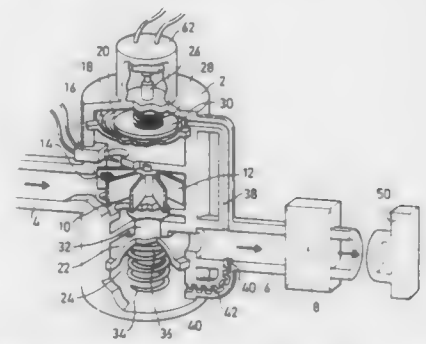
BOWL FILL FOR A TANK VALVE

Bruce A. Antunez, 1143 Indian Springs, Glendora, Calif. 91740

Filed Mar. 22, 1989, Ser. No. 326,916
Int. Cl.[5] F16K *31/18, 33/00*
U.S. Cl. 137—441 **5 Claims**

1. In combination with a tank valve for refilling a toilet tank and simultaneously supplying water to a toilet bowl, said tank valve having a riser, a valve mounted to said riser said valve having a body, a valving chamber in the body, an inlet valve entering said valving chamber from the riser, and a downwardly directed outlet port from said valving chamber, the improvement comprising:

a cuff surrounding said riser, said cuff having a bottom with an aperture to pass the riser, and a peripheral sidewall extending upwardly from the bottom with an upper edge spaced by a gap from the body through which water



discharged form the outlet port into said cuff flows into the toilet tank, a fill port through said cuff for connection to a hose through which water from the cuff flows to the toilet bowl simultaneously with flow through the gap to the toilet tank, said sidewall selectively being so proportioned and arranged that the flow through the gap and through the fill port are suitably proportioned for both purposes.

5,007,453

FLUID FLOW CONTROL DEVICE

Yehuda Berkowitz; Gavriel M. Hi, both of Edmond Fleg str. 48, and Yehuda Mizrahi, Stella Maris Road 30, all of Haifa, Israel

Filed Apr. 2, 1990, Ser. No. 502,892
Claims priority, application Israel, Apr. 19, 1989, 90041
Int. Cl.[5] F16K *17/34*
U.S. Cl. 137—458 **16 Claims**

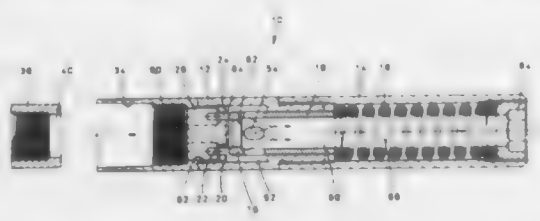
1. A flow control device insertable into a pressurized fluid line upstream of a fluid utilization device, comprising:

a housing containing an inlet port connectable to the fluid line, and an outlet port connectable to the utilization device;

a normally-open valve connected to the outlet port;

an electrical control system for closing said valve upon the occurrence of a predetermined condition;

a power supply for supplying electrical power to said electrical control system;



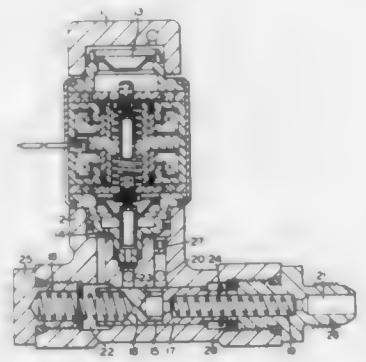
an electrical switch which is normally open to disconnect said power supply from the electrical control system;
and a flow sensor for sensing the flow of fluid through said outlet port and effective, when significant fluid flow is sensed, to close said electrical switch and thereby to connect said power supply to the electrical control system; said flow sensor comprising:
a displaceable diaphragm in said housing and defining a control chamber with a portion of the housing;
biassing means for biassing said diaphragm in the direction of expanding said control chamber;
a fluid connection from said outlet port to said control chamber to lower the pressure therein upon the significant flow of fluid through said outlet port, and thereby to displace said diaphragm in the direction of contracting said control chamber;
and a switch actuator movable by said diaphragm, when moved to contract said chamber, to close said switch and thereby to connect the power supply to the electrical control system;
said housing including a main chamber, and a liquid metering device in said main chamber controlling said electrical control system to close said valve when a predetermined quantity of fluid has flowed through said main chamber or when the fluid is flowing through said main chamber at an excessive rate.

5,007,454

FLUID CONTROL VALVE WITH TUBULAR POPPET

Leighton Lee, II, Guilford, Conn., assignor to The Lee Company, Westbrook, Conn.

Filed Sep. 21, 1989, Ser. No. 410,653
Int. Cl.[5] F16K *15/08*
U.S. Cl. 137—508 **20 Claims**



1. A fluid control valve comprising;
(A) housing means for forming a generally axially extending body defining an axially extending flow path;
(B) dual concentric valve seat means comprising opposing inside and outside valve seat means which define an opening comprising a section of the flow path through the valve;
(C) generally sleeve-like poppet means slidably received within said body, said poppet means having an upstream end equal to or greater than the opening in transverse aspect, having inside and outside surfaces and an axially extending flow passage defined by the inside surface of at least one orifice through the poppet wall for providing fluid communication between the exterior of said poppet means and the flow passage within the poppet means and being sealingly engageable with said valve seat means to prevent the flow of fluid through the opening and being axially displacable from said valve seat means to permit the flow of fluid through the opening and the fluid media passes through either the gap between the inside surface of the upstream end of said poppet means and the inside valve seat means or the gap between the outside surface of the upstream end of said poppet means and the outside valve seat means and thence into the poppet flow passage; and
(D) biasing means for biasing said poppet means against said valve seat means in a first upstream axial direction so that said poppet means sealingly engages said valve seat means unless and until the force exerted against said poppet by the pressure of the fluid media in the second downstream axial direction exceeds the opposing force exerted against the poppet by the biasing means axially displacing said poppet from said valve seat means in said second axial direction and allowing flow through the valve.

5,007,455

PILOT-OPERATED HYDRAULIC ANTILOCK MODULATOR

Michael J. Hawker, Lincoln, United Kingdom, assignor to Clayton Dewandre Co., Ltd., Lincoln, United Kingdom

Filed Feb. 15, 1989, Ser. No. 311,319
Claims priority, application United Kingdom, Feb. 15, 1988, 8803434
Int. Cl.[5] F15B *13/043*
U.S. Cl. 137—5[illegible].16 **43 Claims**

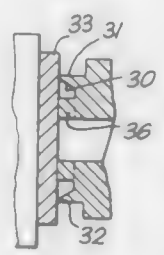
1. A pilot-operated hydraulic modulator which includes a provision for each of a supply, a delivery and an exhaust flow of fluid, said pilot-operated hydraulic modulator comprising
(a) a housing member;
(b) a main piston means disposed for reciprocal movement within said housing member;
(c) a means for producing a pressure balance across said main piston means;
(d) an auxiliary piston means disposed for reciprocal movement within said housing member, said auxiliary piston means moves in response to a predetermined movement of said main piston means;
(e) an inlet valve means operable in response to said reciprocal movement of one of said main piston means and said auxiliary piston means for controlling fluid communication between a supply and a delivery fluid communication port;
(f) an exhaust valve means operable in response to said reciprocal movement by an opposite one of said main piston means and said auxiliary piston means for controlling fluid communication between said delivery and an exhaust fluid communication port;
(g) biasing means engageable with said auxiliary piston means for urging said auxiliary piston means in a predetermined direction;
(h) means for supplying a pilot signal pressure to said main piston means, said main piston means moving in response to said pilot signal pressure and during at least a portion of its movement said main piston means controls movement of said auxiliary piston means away from a stopped position toward which said auxiliary piston means is biased; and
(i) a biasing means engageable with said main piston means for urging said main piston means in a predetermined direction toward said auxiliary piston means.

5,007,456

CLOSING ARRANGEMENT FOR DUCTS HAVING LARGE CROSS-SECTIONAL AREAS, PARTICULARLY FLUE GAS DUCTS

Volker von Erichsen, Recklinghausen, Fed. Rep. of Germany, assignor to Stober & Morlock Wärmekraft Gesellschaft mbH

Filed Oct. 20, 1989, Ser. No. 424,596
Claims priority, application Fed. Rep. of Germany, Oct. 27, 1988, 3836861
Int. Cl.[5] F16K *11/16*
U.S. Cl. 137—601 **3 Claims**



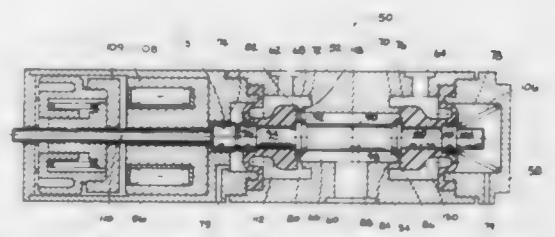
1. A closing arrangement for ducts defined by walls and having large cross-sectional areas, particularly flue gas ducts for power plants, the arrangement comprising at least two flaps which are mounted on at least one flap shaft and are arranged in one of the ducts and within the duct walls, lever arrangements comprising crank arms and tightening arms for swinging the flaps between an open position and a closed position being connected to the flaps, at least one drive shaft being connected to the lever arrangements, wherein the drive shaft extends transversely of the at least one flap shaft, wherein the flaps each have a central longitudinal axis, the flap shaft being arranged centrally in the longitudinal axis of each flap and the tightening arm of each lever arrangement acting on the flap eccentrically relative to the longitudinal axis, the arrangement further comprising a joint lever having first and second ends, the first end of the joint lever being rigidly connected to the centrally located longitudinal axis of each flap, the joint lever being arranged at an angle relative to the flap, wherein the second end of the joint lever is connected to the tightening arm in an articulated manner.

5,007,457

PNEUMATIC OSCILLATORS

Norman S. Jones, Stanbridge, England, assignor to Instruments and Movements Limited, London, England

Continuation of Ser. No. 352,962, May 17, 1990, abandoned. This application Jul. 20, 1990, Ser. No. 556,303
Claims priority, application United Kingdom, May 20, 1988, 8812004
Int. Cl.[5] F16K *1/32*
U.S. Cl. 137—624.14 **7 Claims**



1. A pneumatic oscillator comprising a reciprocable piston or equivalent operating a poppet valve arrangement including a port to control a gas flow path from a gas source to a gas outlet, said poppet valve arrangement biassed to the path-closing condition with feedback of gas pressure at said gas outlet to supplement the bias in opposition to source pressure at the poppet valve, said poppet valve arrangement having a sealing lip providing for sharp definition of a line of contact on a resilient facing to define a switching control area, and stop means adapted to limit penetration of the facing by the lip in the flow path-closing condition, said stop means being positioned to engage said resilient facing downstream of said switching control area.

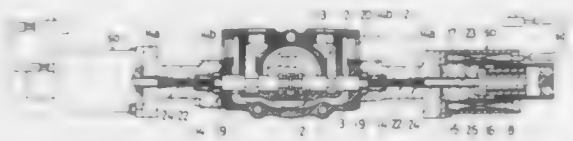
5,007,458

POPPET DIAPHRAGM VALVE

Jerald J. Marcus, Otsego, and John F. Berninger, Portage, both of Mich., assignors to Parker Hannifin Corporation, Cleveland, Ohio

Filed Apr. 23, 1990, Ser. No. 514,913
Int. Cl.[5] F16K *31/06, 11/02*
U.S. Cl. 137—625.5 **13 Claims**

1. A fluid valve for directing fluid flow therethrough, comprising:
a valve body;
said body including:
a first chamber;
first inlet means for introducing fluid into said first chamber;
a second chamber, said second chamber having a first side and an opposed second side;
first outlet means for delivering fluid from said first side of said second chamber,
first fluid passage means extending between said first and second chambers, said first fluid passage means including a first opening into said first side of said second chamber;
a stem mounted for axial movement on said valve body, said stem movable between a first position and a second position, said stem including a first reduced portion;
movement means for selectively moving said stem between said first and second positions;
a first poppet diaphragm mounted on said stem for movement therewith in said second chamber, said poppet diaphragm including:
a first resilient body portion, said first body portion including a first hole therethrough, said first reduced portion of said stem extending through said first hole, said first body portion adjacent said stem abutting said first reduced portion whereby said first body portion is fixed on said stem; said first body portion further having a first face adjacent said first opening, said first face adapted for blocking said first opening when said stem is in the first position, and said first face disposed of said first opening when said stem is in the second position;
a flexible first web portion, said web portion extending outward of said first body portion to first peripheral portions, said first peripheral portions of said web engaging said valve body, said first poppet diaphragm maintaining said first side of said second chamber in fluid tight relation with said first opening and said first outlet means;
whereby movement of said stem between said first and



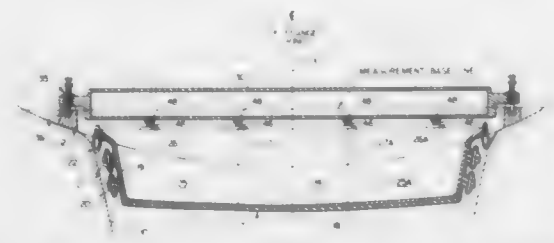
second positions selectively places said first inlet and first outlet in fluid communication.

5,007,459

HYDRAULIC CONTROL SYSTEM

Masaharu Asaoka, Saitama, Japan, assignor to Kayaba Industry Co. Ltd., Japan

Filed May 29, 1990, Ser. No. 529,923
Claims priority, application Japan, May 30, 1989, 1-62764[U]
Int. Cl.[5] F15B *13/044*
U.S. Cl. 137—625.65 3 Claims



1. A hydraulic control system comprising:
a valve body;
a solenoid provided on one side of said valve body and including a movable core;
a push rod arranged so as to be moved with said movable core of said solenoid;
a spool arranged in said valve body and positioned opposite to the distal end of said push rod;
said spool being positionally changed depending upon an excitation current of said solenoid;
an accessory port formed on one side of said valve body for mounting an accessory component therethrough on said valve body;
a cap member detachably interposedly arranged between said valve body and said solenoid, said cap member abutting said one side of said valve body and having a diameter sufficiently smaller than said valve body so as to not obstruct said accessory port; and
a push bar insertedly arranged in said cap member so as to permit said push rod to be contacted at the distal end thereof through said push bar with said spool.

5,007,460

ADJUSTABLE NOZZLE DAM ASSEMBLY AND METHOD OF INSTALLING SAME

Louis J. Zezza, Brookfield, and Frank Fiorelli, Danbury, both of Conn., assignors to Nuclear Energy Services, Inc., Danbury, Conn.

Filed Apr. 3, 1989, Ser. No. 331,794
Int. Cl.[5] F16L *55/12*
U.S. Cl. 138—89 15 Claims

1. In a nozzle dam assembly for use in nozzles having nominally varying longitudinal profiles flaring to circular wall openings about which are fixed flange rings of nominally varying eccentricity relative to such openings, said assembly including a circular dam adapted to face into and seal the associated nozzle adjacent its opening and a support frame abutting the backside of the dam and adapted to be removably affixed across the associated ring, the improvement which comprises adjustment means for selectively locating said dam at its optimum sealing position within the nozzle notwithstanding the particular nozzle profile and the particular eccentricity of the ring relative to the opening comprising
(a) adjustable hanger bars adapted to rest slideably on the ring while supporting the dam in selected depth positions along the nozzle axis,
(b) adjustable abutments on the frame restraining the dam against outward movement along the nozzle axis from the selected depth position determined by the hanger bars but permitting movement of the dam in a plane perpendicular to the nozzle axis,
(c) adjustable plates supporting the hanger bars and dam in selected vertical positions perpendicular to the nozzle axis, and
(d) pins adapted to be affixed to the ring and support the adjustable plates and bars and dam in selected horizontal positions perpendicular to the nozzle axis.

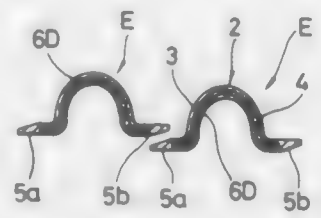
5,007,461

METHOD FOR THE CLEANING OF THE INTERIOR OF INSTALLED CONDUITS

Werner Naf, Richterswil, Switzerland, assignor to interTechno AG, Richterswil, Switzerland

Filed Jun. 7, 1988, Ser. No. 203,695
Claims priority, application Switzerland, Jul. 9, 1987, 2604/87; Feb. 2, 1988, 346/88
Int. Cl.[5] F16L *55/18*
U.S. Cl. 138—97 6 Claims

1. A method of repairing, cleaning and coating the inside of an installed conduit, comprising the steps of:
drying the inside of a conduit to be coated by flow-through of pre-dried compressed air,
flowing-through the inside of said conduit a mixture of compressed air and particles of an abrasive medium with a mean exterior diameter of >0.8 mm and a specific weight of >3.0 g cm^{-3} in an amount of >1.0 g m^{-3}, said mixture flowing through said conduit with a mean speed of >10 m s^{-1} to remove materials adhering to the inside wall of said conduit,
cleaning said conduit by flowing-through pre-dried and preheated compressed air until the outside temperature of the line is $>40°$ C. to remove any remaining materials which have been removed from the inside wall of said conduit, and
subsequently coating the inside of the conduit by means of blowing in and blowing around an adhesive resin by means of compressed air, said adhesive resin being a solvent-free, self-setting resin with at least 5% by weight of inorganic oxidic adhesives with a mean diameter of <0.08 mm.



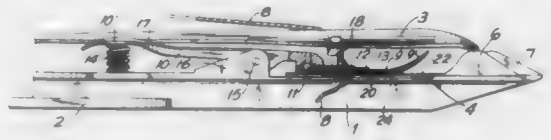
5,007,462

SYNTHETIC RESIN UNDERGROUND PIPE HAVING HIGH PRESSURE-WITHSTANDING CAPABILITY

Shiro Kanao, No. 9-18, Nanpeidai 4-chome, Takatsuki-shi, Osaka, Japan

Continuation of Ser. No. 227,413, Jun. 29, 1988, abandoned, which is a continuation of Ser. No. 127,543, Dec. 1, 1987, abandoned, which is a continuation of Ser. No. 831,893, Feb. 24, 1986, abandoned. This application May 9, 1990, Ser. No. 520,990
Claims priority, application Japan, Feb. 25, 1985, 60-26173[U]; Aug. 9, 1985, 60-23193; Aug. 9, 1985, 60-123191[U]; Aug. 9, 1985, 60-123192; Dec. 12, 1985, 60-191581[U]
Int. Cl.[5] F16L *11/11*
U.S. Cl. 138—154 7 Claims

1. A synthetic resin pipe for underground use, comprising:
an integral, pipe wall corrugation helically wound to form a pipe, said corrugation having an outwardly projecting portion and flange portions on opposing sides of said projecting portion, adjacent flange portions being connected together to form a pipe having a helical trough portion adjacent said projecting portion; and
a thin metal plate reinforcing member disposed within said outwardly projecting portion of said helically disposed corrugation, said reinforcing member being made of one of steel and iron so as to increase both the internal and external pressure withstanding capabilities of said pipe, wherein said metal plate is embedded within synthetic resin such that the synthetic resin ; completely surrounds and covers the complete surface of said thin metal plate reinforcing member to prevent water condensation



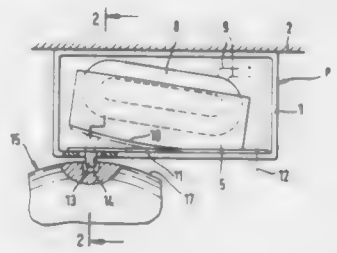
thereon and rusting thereof during underground use of said pipe,
wherein said reinforcing member is generally U-shaped defining a bight, legs and free ends, and the legs open toward the interior of said pipe and said free ends project laterally in a longitudinal direction of said pipe into a portion of each of said flanged portions so as to be partially disposed within said trough portion along the entire length of said pipe.

5,007,463

WEFT CLAMPING SYSTEM FOR INSERTER RAPIER

Luciano Corain; Gianni Maitan, both of Vicenza; Renato Perlini, Verona, and Mario Bacchetti, Padua, all of Italy, assignors to Nuovopignone-Industrie Meccaniche e Fonderia, S.p.A., Florence, Italy

Filed Aug. 3, 1989, Ser. No. 389,305
Claims priority, application Italy, Aug. 19, 1988, 21718 A/88
Int. Cl.[5] D03D *47/20*
U.S. Cl. 139—448 4 Claims



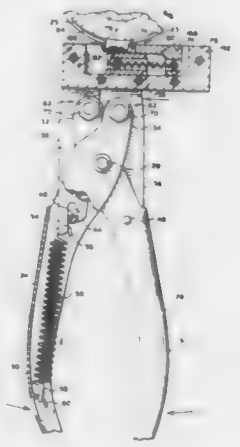
1. A Weft inserter rapier for shuttleless wearing looms comprising a weft clamping and retaining system, said weft clamping and retaining system having an elastic clamping foot which is urged by a spring-loaded lever with which said clamping foot is linked against a horizontal clamping plane provided along an external edge of a body of the rapier, in which said elastic clamping foot has a cross-section which has a substantially reverse-"U"-shape, said substantially reverse "U" shape cross-section defining side walls in which each of both of the side walls are spaced apart from each other and are urged against adjacent metal blades which are supported on said horizontal clamping plane through a support made of an elastomeric material.

5,007,464

ELECTROMAGNETIC WEFT BRAKE

Joannes J. H. M. Gorris, Eindhoven, Netherlands, assignor to Sulzer Brothers Limited, Winterthur, Switzerland

Filed May 15, 1989, Ser. No. 352,168
Claims priority, application Switzerland, May 20, 1988, 01934/88
Int. Cl.[5] D03D *47/36*
U.S. Cl. 139—455 17 Claims



1. In combination,
a winding drum for a loom for receiving yarn windings thereon; and
an electromagnetic device for limiting delivery of yarn windings from said drum, said device having at least one pole piece having an abutment surface thereon; a winding for conducting an electrical current therethrough to generate an electromagnetic force in said pole piece; and a spring strip fixedly mounted at one end relative to said pole piece and having a free end portion extending in spaced opposed relation to said abutment surface, said free end portion of said spring strip being movable between an extended position spaced from said abutment surface to limit delivery of yarn windings from said drum and a retracted position against said abutment surface in dependence on said electromagnetic force to allow delivery of yarn windings from said drum, at least one of said abutment surface and said end portion of said spring strip being curved.

5,007,465

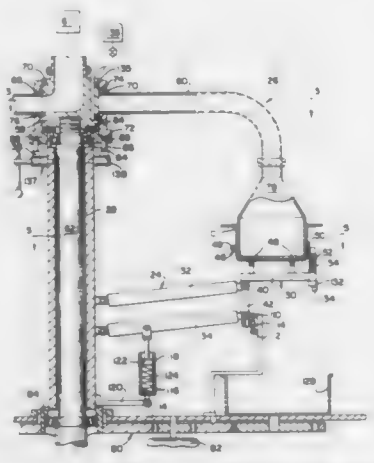
HAND OPERATED BAND BENDING TOOL

David W. Tonkiss, Glendale, Calif., assignor to Joslyn Corporation, Chicago, Ill.

Filed Dec. 6, 1989, Ser. No. 446,938
Int. Cl.[5] B21F *15/06*
U.S. Cl. 140—150 19 Claims

1. A band finishing tool for bending a free end of a band extending from one side of a buckle over the buckle, said buckle formed with a slot defining internal edges, comprising:
means for holding said internal edges of the buckle and

allowing said free end to be bent over the buckle and contact the band on the other side of the buckle; and



means for bending said free end over said buckle to be in contact with said band on said other side of the buckle.

5,007,466

METHOD AND APPARATUS FOR FILLING ICE CREAM CONTAINERS

Martin J. Mueller, Palm Harbor, Fla.; Martin Mueller, Wonder Lake, Ill., and Michael A. Weingandt, Duneden, Fla., assignors to Osgood Industries, Inc., Oldsmar, Fla.

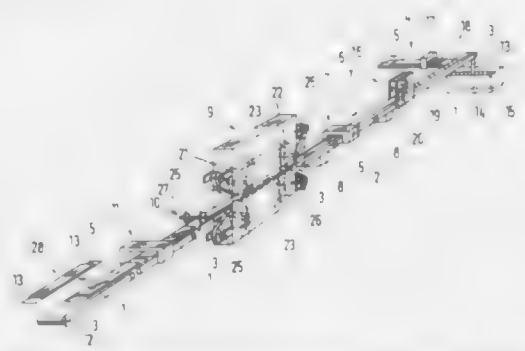
Filed Jul. 19, 1989, Ser. No. 381,858
Int. Cl.[5] B65B *3/34*
U.S. Cl. 141—1 24 Claims

1. An apparatus for filling containers with ice cream, said filling apparatus comprising:

means for continually moving at least one ice cream container along a predetermined path of travel;

means for filling said container with ice cream as the container continually moves along a segmented portion of its predetermined path of travel, said filling means comprising ice cream distribution means connected to a source of ice cream and defining an ice cream outlet, and conduit means movable relative to said ice cream outlet for delivering ice cream from said outlet to said container, said conduit means comprising at least one ice cream conduit having an inlet end which is moved into and out of fluid communication with said ice cream outlet, with ice cream passing through said conduit so long as the outlet end of the conduit and said ice cream outlet are joined in fluid communication relative to each other; and

means for controlling the speed of movement of said conduit means relative to said outlet and of said container as it moves relative to said outlet along at least said segmented portion of its travel thereby affecting the volume of ice cream filled into said container by increasing the speed of movement to reduce the filling of said container, and by decreasing the speed of movement to increase the filling of said container,



said controlling means comprising variable speed drive means for driving said container moving means and said conduit means in concert with each other relative to said ice cream outlet, and means for monitoring the quantity of ice cream with which said container is filled relative to a predetermined value, and for controlling the speed of said drive means to promote accuracy during filling of said containers.

METHOD AND APPARATUS FOR PRODUCING CATHODES FOR DRY-CELL BATTERIES, ESPECIALLY LITHIUM BATTERIES

Josef Nelles, Meschede, Fed. Rep. of Germany, assignor to Accumulatorenwerke Hoppecke Carl Zoellner & Sohn GmbH & Co. KG, Brilon, Fed. Rep. of Germany

Filed Sep. 26, 1989, Ser. No. 412,666
Claims priority, application Fed. Rep. of Germany, Jun. 29, 1989, 3921288
Int. Cl.[5] H01M *4/72, 4/82*
U.S. Cl. 141—1.1 7 Claims

1. In a method of producing cathodes for dry-cell batteries, especially lithium batteries, including pasting a pasty cathode material on a metallic carrier material and subsequently compressing said cathode material therewith, and finally welding a current shunting to an end of said carrier material, the improvement comprising the steps of:

continuously unrolling a strip-like carrier material from a supply roll;

automatically feeding a dosed quantity of said pasty cathode material to said carrier material and subsequently pasting this cathode material onto said carrier material;

while continuously transporting said pasted carrier material further, automatically compressing same;

while still continuously transporting said pasted carrier material further, cutting same at a cut location to form predetermined cathode lengths;

finally automatically connecting said current shunting to said carrier material, with the further improvement of:

between said pasting and compressing steps, removing cathode material from said pasted carrier material, in conformity with the cathode length, in the vicinity of a given cut location to expose said carrier material to form a later contact location for said current shunting.

FLUID DISPENSING NOZZLE CONSTRUCTION HAVING A DIAPHRAGM SUBASSEMBLY THEREIN AND METHODS OF MAKING THE SAME

Paul R. Wilder, Hamilton, and James E. Kesterman, Cincinnati, both of Ohio, assignors to Dover Corporation, New York, N.Y.

Filed Nov. 19, 1987, Ser. No. 123,042
Int. Cl.[5] B65B *1/30*
U.S. Cl. 141—209 8 Claims

1. A fluid dispensing nozzle comprising

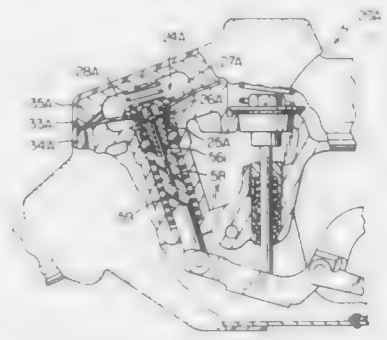
a main valve,

lever means for controlling said main valve, and

automatic shut off means for disposing said lever means in an "on" condition or an "off" condition,

said shut off means including

a diaphragm assembly comprising



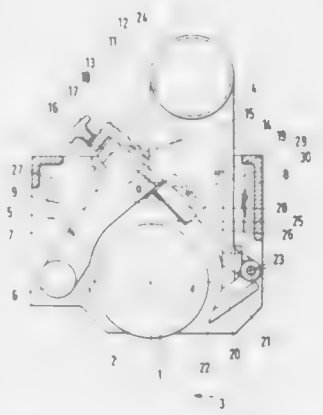
a diaphragm having an upper and lower surface,

a pin and

means for mounting the diaphragm on the upper end of the pin comprising first and second clamping elements between which a central portion of the diaphragm is clamped,

characterized in that

the first and second clamping elements are telescoped to a



clamping position and have, respectively, cooperating snap fit connecting surfaces which are readily assembled to mount the diaphragm on the pin and which require destruction of at least one of the elements to remove the diaphragm from the pin.

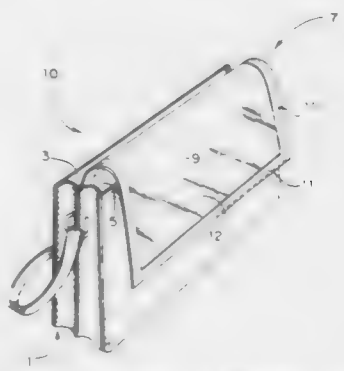
5,007,469

PRESSING APPARATUS FOR A PROCESSING MACHINE

Heiner Englert, Lauda-Königshofen, and Bernhard Martin, Tauberbischofsheim, both of Fed. Rep. of Germany, assignors to Michael Weinig Aktiengesellschaft, Tauberbischofsheim, Fed. Rep. of Germany

Filed Oct. 6, 1989, Ser. No. 418,022
Claims priority, application Fed. Rep. of Germany, Oct. 7, 1988, 8812623[U]
Int. Cl.[5] B27G *19/00*
U.S. Cl. 144—252 R 20 Claims

1. In a pressing apparatus for a processing machine, including at least one adjustable pressing element that is provided for a workpiece which is to be processed and that is associated with a processing tool, the improvement comprising:



means for adjusting said pressing element relative to said processing tool at an angle to a direction of transport of said workpiece through said machine

5,007,470

PURSE WITH REMINDER DEVICE

Carol A. Freeman, 16000 Pemberville Rd., Pemberville, Ohio 43450

Filed Apr. 27, 1990, Ser. No. 515,186
Int. Cl.[5] A45C *1/02, 15/02*
U.S. Cl. 150—114 3 Claims

1. An improved purse having a reminder device incorporated therewith comprising:

(a) a purse having at least one compartment with an access opening;

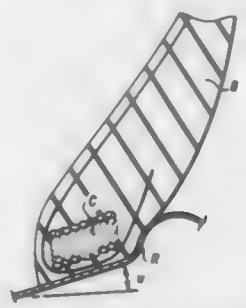
(b) a flap having means for attachment to said purse, such that said flap is moveable to a position in overlying relation to said access opening;

(c) said flap including:

(i) a transparent portion;

(ii) a backing portion; and

(iii) means to removably attach at least a portion of said transparent portion to said backing portion, said transparent portion and said backing portion forming a chamber viewable through said transparent portion when said flap is in said position;



(d) said chamber receiving a reminder message facing said transparent portion.

5,007,471

BEADS OF PNEUMATIC TIRES FOR VEHICLE WHEELS

Luigi Maiocchi, Vernate fraz. Moncucco, Italy, assignor to Pirelli Coordinamento Pneumatici S.p.A., Italy

Filed Apr. 19, 1988, Ser. No. 183,639
Claims priority, application Italy, Apr. 28, 1987, 20293 A/87
Int. Cl.[5] B60C *15/04*
U.S. Cl. 152—540 30 Claims

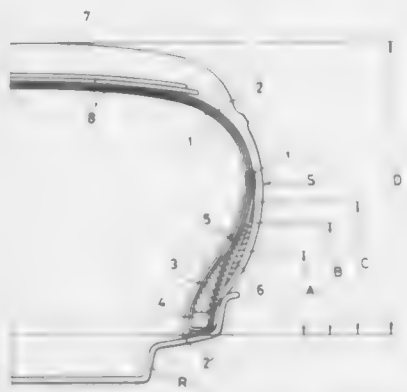
1. A pneumatic tire for vehicle wheels comprising

two beads each reinforced with a circumferentially inextensible metal bead core ring package having a cross section generally in the shape of a parallelogram and having generally axially extending bases inclined at a predetermined angle with respect to the axis of rotation of the tire,

each said bead core comprising a plurality of radially superimposed coils of straps arranged side-by-side and radially offset with respect to one another.

each of said coils being straps having a cross section including two axially extending rectilinear and parallel opposite sides, their corresponding extremities at one side of such section being connected by a profile symmetric to the corresponding profile at the other side of the section with respect to a pre-established straight line "r" perpendicular to said pair of parallel sides,

the distance from said line "r" varying along the profile in such a way to include, along its length, at least one inversion in the trend of the values of said varying distance,



the side-by-side contact among said straps along their corresponding profiles determing their reciprocal radially offset position and the degree of said inclination of the parallelogram base.

5,007,472

PNEUMATIC RADIAL TIRE WITH IMPROVED BEAD STRUCTURE

Tetsuya Kuze; Takashi Yamashita, and Toshihiko Suzuki, all of Hiratsuka, Japan, assignors to The Yokohama Rubber Co., Ltd., Tokyo, Japan

Filed Apr. 25, 1990, Ser. No. 514,641
Claims priority, application Japan, Apr. 26, 1989, 1-104533
Int. Cl.[5] B60C *15/06, 13/00, 15/00*
U.S. Cl. 152—546 4 Claims

1. Pneumatic radial tire characterized in that carcass layers of two-ply structure consisting of an inner carcass layer and an outer carcass layer is disposed;

said inner carcass layer is turned up from inside to outside around each bead core in such a manner as to wrap a bead filler therein;

a steel cord reinforcing layer is disposed outside said turnup portion of the inner carcass layer;

said outer carcass layer is disposed in such a manner that it covers the outside of said steel cord reinforcing layer and its tip extends to at least near said bead core;

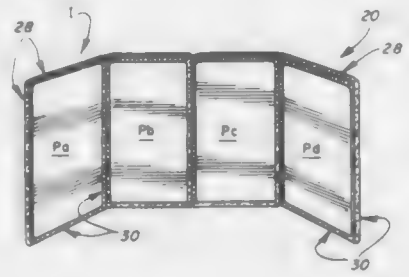
a second filler is disposed outside said outer carcass layer;

said second filler has a hardness below that of said bead filler and within the range of 70 to 93 in terms of JIS hardness;

the cord angle of said steel cord reinforcing layer is from 15° to 30° to a tire circumferential direction; and

the height B of the steel cord reinforcing layer from a bead base to its upper end is specified by the following relationship, where; the height of said bead filler from said bead base to its upper is A, the height of said second filler from said bead base to its upper end C and a sectional height of said tire D:

$$0.2\,D < B < 0.5\,D \quad (1)$$



$$C > B > A \quad (2)$$

5,007,473

PORTABLE PARTITION SYSTEM

David P. Evensen, Wheeling, Ill., assignor to Nimlock Company, Niles, Ill.

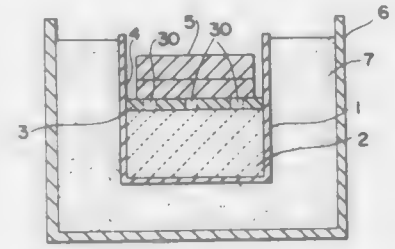
Continuation of application Ser. No. 388,662 filed Aug. 2, 1989 abandoned. This application Aug. 20, 1990, Ser. No. 569,511
Int. Cl.[5] A47G *5/00*
U.S. Cl. 160—135 4 Claims

1. A portable partition system comprising only a plurality of planar, substantially inflexible, independent, lightweight, self-contained display panel components adapted to assume either an operative or inoperative mode, at least one panel component having a multilateral peripheral configuration including spaced substantially parallel front and back sides having corresponding upright peripheral segments thereof cooperating to form a recessed pocket extending substantially the full height of the panel component, and an elongate support member of one piece construction formed of substantially rigid material, said support member including an inner portion fixedly accommodated within the elongate pocket and substantially occupying same and an outer portion integral with said inner portion and protruding from an open side of said pocket, said outer portion having a substantially convex exterior surface on which is mounted a first attaching means, said outer portion and first attaching means extending substantially the full length and width of the pocket; a second panel component having an elongate exterior surface portion on which is mounted a second attaching means; when in an operative mode, said one panel component assuming an upright abutting relation with said second panel component whereby the first attaching means thereof is pressed against the second attaching means of the second panel component effecting a frictional interconnection therebetween, said abutting panel components while interconnected forming an upright partition and being adapted to assume any selected upright relative angular position, and when in an inoperative mode, said panel components being disconnected and independent of one another and being adapted to assume a compact portable unit wherein the independent panel components are arranged in stacked relation with planar surfaces of the stacked panel components being in proximate, superposed face to face relation.

5,007,474

METHOD OF PROVIDING A GATING MEANS, AND PRODUCTS PRODUCED THEREBY

Ralph A. Langensiepen, Newark, Del.; Michael K. Aghajanian, Bel Air, Md., and Robert J. Wiener, Newark, Del., assignors to Lanxide Technology Company, LP, Newark, Del.



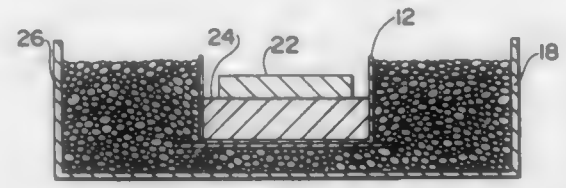
Filed Nov. 10, 1988, Ser. No. 269,315
Int. Cl.[4] B22D *19/14*
U.S. Cl. 164—97 43 Claims

1. A method for making a metal matrix composite, comprising:

providing a substantially non-reactive filler;

providing a source of molten matrix metal;

interposing a gating means for controlling the flow of molten matrix metal into said filler, said gating means being located between said source of molten matrix metal and said filler; and



spontaneously infiltrating through said gating means at least a portion of the filler with molten matrix metal.

5,007,475

METHOD FOR FORMING METAL MATRIX COMPOSITE BODIES CONTAINING THREE-DIMENSIONALLY INTERCONNECTED CO-MATRICES AND PRODUCTS PRODUCED THEREBY

Christopher R. Kennedy, Newark, Del., and Michael K. Aghajanian, Bel Air, Md., assignors to Lanxide Technology Company, LP, Newark, Del.

Filed Nov. 10, 1988, Ser. No. 269,369
Int. Cl.[5] B22D *19/14*
U.S. Cl. 164—97 42 Claims

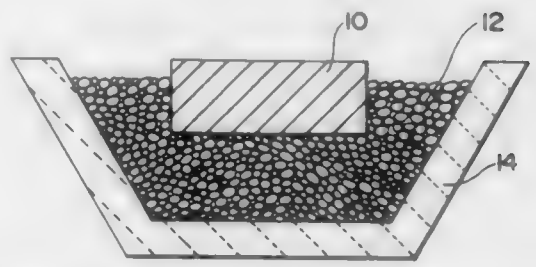
1. A method for making a metal matrix composite, comprising:

providing a substantially non-reactive three-dimensionally interconnected material;

providing at least one substantially non-reactive filler within at least a portion of said three-dimensionally interconnected material; and

spontaneously infiltrating molten matrix metal into at least a portion of the three-dimensionally interconnected material containing said substantially non-reactive filler.

5,007,476



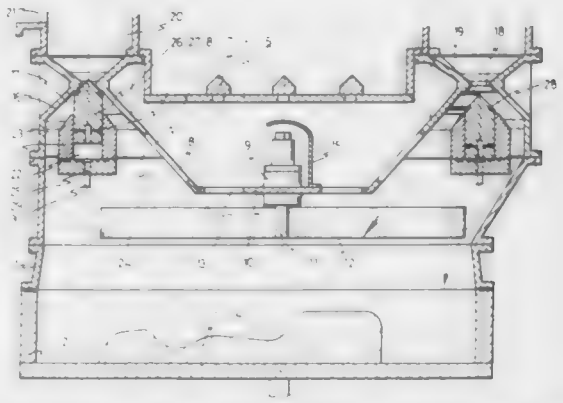
METHOD OF FORMING METAL MATRIX COMPOSITE BODIES BY UTILIZING A CRUSHED POLYCRYSTALLINE OXIDATION REACTION PRODUCT AS A FILLER, AND PRODUCTS PRODUCED THEREBY

Marc S. Newkirk, Newark, Del., and Michael K. Aghajanian, Bel Air, Md., assignors to Lanxide Technology Company, LP, Newark, Del.

Filed Nov. 10, 1988, Ser. No. 269,306
Int. Cl.[4] B22D *19/14*
U.S. Cl. 164—97 44 Claims

1. A method for making a metal matrix composite, comprising:

providing a permeable mass of filler comprising a comminuted oxidation reaction product; and



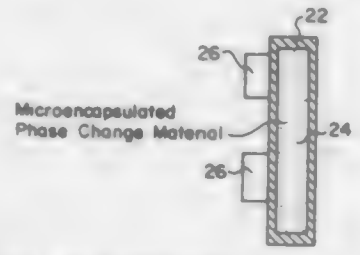
spontaneously infiltrating at least a portion of the permeable mass with a molten matrix metal.

5,007,477

AIR IMPACT SAND-BOX MOULDING MACHINE

Agustin A. Erana, Zorrostea, 4 Poligono Ind. Ali-Gobeo, 01010 Vitoria Alava, Spain

Filed Apr. 3, 1990, Ser. No. 503,611
Claims priority, application Spain, Apr. 6, 1989, 8901201
Int. Cl.[5] B22C *15/00*
U.S. Cl. 164—169 5 Claims



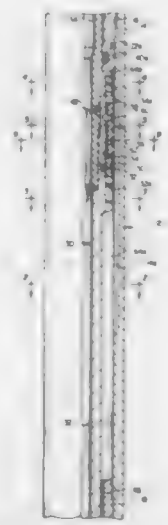
1. In an air impact sand-box moulding machine comprising a machine body, a sand-supplying hopper, a compacting chamber for compacting sand on a model positioned within a moulding box, a frame connected to said body and coupled to a mouth of said box wherein compacting is carried out by sudden pnuematic discharge from a boiler and wherein a valve means is provided including a plunger which is maintained in a closed position due to pressure of the boiler when blast air is not released, the improvement comprising a motor positioned in an upper area of said compacting chamber, said motor including a vertical shaft coaxial with a central axis of said sand-supplying hopper and rotary vanes attached to said shaft and positioned right above said frame which forms with said box said compacting chamber so that said vanes, upon rotation thereof, evenly spread out sand reaching said compacting chamber within said chamber, a metering hatch positioned inside said hopper above said motor, a support plate provided at a mouth of said hopper and supporting said motor, said support plate having apertures for permitting sand to fall therethrough into said compacting chamber, said support plate being provided with a protective plate integrally connected thereto to protect said motor from the sand falling into said compacting chamber upon opening of said metering hatch.

5,007,478

MICROENCAPSULATED PHASE CHANGE MATERIAL SLURRY HEAT SINKS

Subrata Sengupta, Coral Gables, Fla., assignor to University of Miami, Coral Gables, Fla.

Filed May 26, 1989, Ser. No. 357,719
Int. Cl.[5] F28D *20/00*; H01L *23/44, 23/473*
U.S. Cl. 165—10 20 Claims



1. A heat sink device comprising
a sealed container, and
a slurry of a microencapsulated phase change material and a fluid sealed within said container, said slurry being free flowing within said container.

5,007,479

HYDRAULIC UP-DOWN WELL JAR AND METHOD OF OPERATING SAME

Charles W. Pleasants, Carrollton, and Keith W. Scott, Farmersville, both of Tex., assignors to Otis Engineering Corporation, Dallas, Tex.

Continuation of Ser. No. 269,996, Nov. 14, 1988, abandoned.
This application Oct. 11, 1989, Ser. No. 423,483
Int. Cl.[5] E21B *31/113*
U.S. Cl. 166—178 11 Claims

1. A hydraulic jar connected in a string of components for use in a wellbore, said jar comprising:
a. an inner mandrel assembly;
b. an outer housing assembly extending around said inner mandrel assembly in a coaxial relation thereto;
c. means respectively connecting said mandrel assembly and said housing assembly to two of said components;
d. a fluid chamber defined between said mandrel assembly and said housing assembly;
e. means for forming a restricted flow passage in said fluid chamber for dividing said chamber into two sections in fluid flow communication with said passage;
f. one of said assemblies being movable relative to the other from a cocked position to a jarring position to vary the volume of each chamber section and force the fluid to flow from one of said chamber sections, through said flow passage and to the other chamber section;
g. means responsive to said one assembly moving relative to the other assembly a predetermined distance from said cocked position for increasing the size of said flow passage and therefore the rate of said fluid flow and the rate of movement of said one assembly towards said jarring position, and
h. means for providing a high impact load to one of said components in response to said one assembly reaching said jarring position;
i said means for increasing the size of said flow passage being adjustable between a first position and a second position without changing said connection between said assemblies and said components to permit said impact loading in opposite directions, respectively.

8. A method for operating a hydraulic jar connected in a string of components in a wellbore, said method comprising the steps of:
a. connecting a mandrel assembly and a housing assembly to two of said components, respectively;
b. forming a fluid chamber between said mandrel assembly and said housing assembly;
c. forming a restricted flow passage in said chamber to divide said chamber into two sections in fluid flow communication;
d. moving one of said assemblies relative to the other in one direction from a cocked position to a jarring position to vary the volume of each chamber section and force the fluid to flow through said flow passage from one of said chamber sections to the other;
e. increasing the size of said flow passage during said step of moving to increase the rate of said fluid flow and the rate of movement of said one assembly;
f. providing a high impact load to one of said components connected to said jar in response to said one assembly reaching said jarring position; and
g. adjusting the axial position of said groove without changing said connection between said assemblies and said components to permit said impact loading by movement of said one assembly in a direction opposite said one direction.

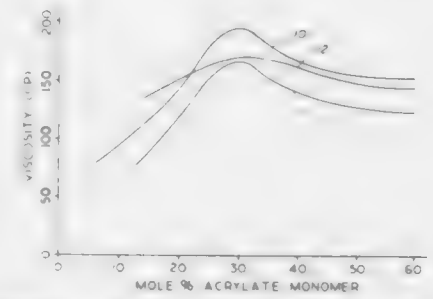
5,007,480

USE OF MANGANESE OXIDE IN DRILLING MUD AND OIL WELL CEMENT SLURRIES

Sverre Anderssen, Kristiansand, Norway, assignor to Elkem a/s, Norway

Filed Feb. 24, 1989, Ser. No. 315,466
Claims priority, application Norway, Mar. 8, 1988, 881017
Int. Cl.[5] C09K *7/04*; E21B *21/00, 33/14*
U.S. Cl. 166—292 28 Claims

1. An oil well cement slurry comprising cement, water, and a manganomanganic oxide particulate material, the material containing at least about 90% by weight of manganomanganic oxide, the material having a density between about 4.50 and about 4.75 g/cm^3 and a particle size of at least about 98% below about 10 μm.



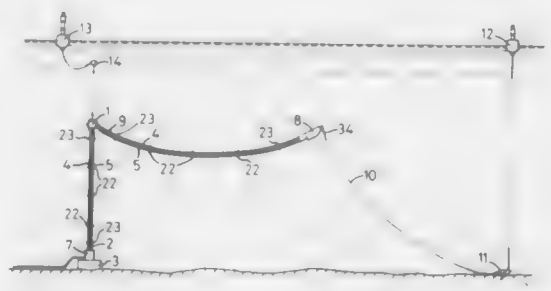
13. An oil well drilling mud comprising water and a weighted component, the weighted component having as an essential ingredient therein a manganomanganic oxide particulate material, the material containing at least about 90% by weight of manganomanganic oxide, the material having a density between about 4.50 and about 4.75 g/cm^3 and a particle size of at least about 98% below about 10 μm.

5,007,481

METHOD OF TREATING SUBTERRANEAN FORMATIONS USING A NON-DAMAGING FRACTURING FLUID

Dennis A. Williams, Houston; Roger L. Horton, Kingwood; John C. Newlove, Kingwood, and Robert E. Chumley, Kingwood, all of Tex., assignors to Exxon Chemical Patents, Inc., Linden, N.J.

Filed Feb. 2, 1990, Ser. No. 473,863
Int. Cl.[5] E21B *43/267*
U.S. Cl. 166—300 12 Claims



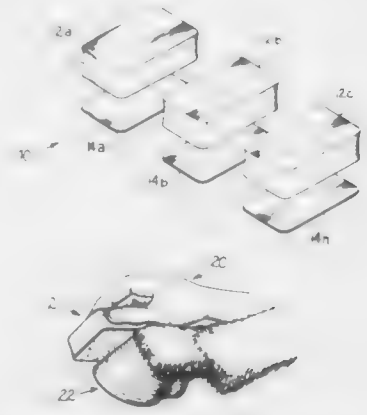
1. A process for fracturing a subterranean formation wherein an aqueous fracturing fluid is injected through a well and into the formation at a pressure and rate sufficient to form a fracture therein, the improvement wherein the aqueous fracturing fluid includes
(a) an effective amount of a copolymer of acrylamide and potassium acrylate crosslinked with a titanium or zirconium compound, the acrylamide comprises from 60 to 78 mole % of the copolymer and the potassium acrylate comprises 22 to 40 mole % of the copolymer and the concentration of the crosslinked copolymer being sufficient to provide the aqueous fracturing fluid with a viscosity of between 20 cp and 1,000 cp at 170 sec^{-1} at a temperature of at least 200° F.; and
(b) an effective amount of an oxidative gel breaker capable of degrading the copolymer after about 2 hours.

5,007,482

OFFSHORE OIL PRODUCTION SYSTEM

Donald G. W. Forsyth; Robert W. Marshall, and Alan M. Thompson, all of Glaslow, Scotland, assignors to British Petroleum Co. p.l.c., London, England

Filed Mar. 9, 1990, Ser. No. 490,879
Claims priority, application United Kingdom, Mar. 9, 1989, 8905364
Int. Cl.[5] E21B *43/01*
U.S. Cl. 166—345 17 Claims



1. A swivel-less offshore oil production and mooring system comprising:
(a) a subsea base located on the sea bed associated with
(b) a subsea connector, adpated for connecting a subsea well head production system to a production riser,
(c) a subsea restraining buoy located at a position below the sea surface but above the sea bed,
(d) a buoyant riser endpiece adapted for a swivel-less connection to a loading vessel, located in its rest position at a position below the sea surface but above the sea bed, and anchorable to the sea bed,
(e) a flexible lower support line pivotally connecting the restraining buoy to the subsea base,
(f) a flexible upper support line pivotally connecting the restraining buoy to the riser endpiece, and
(g) a flexible production riser connected to the subsea connector and supported by the lower support line, the subsea restraining buoy and the upper support line and connected to the riser endpiece.

5,007,483

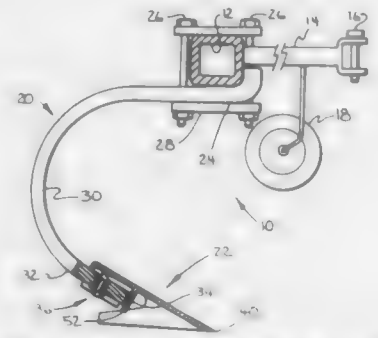
HOOF-BUFFING TOOL KIT FOR FARRIERS

Douglas K. McGuire, 39609 Luckiamute Rd., Philomath, Oreg. 97370

Filed Feb. 3, 1988, Ser. No. 151,764
Int. Cl.[5] A01L *11/00*
U.S. Cl. 168—48.1 3 Claims

2. A kit of buffing tools for imparting a gloss to the curved exterior surface of horses' hooves, comprising:
a. a multiplicity of substantially rectangular blocks, each block being:
1. fabricated of a resilient material; and
2. of a size to be gripped comfortably by a user's hand; and having
A. at least two principal faces with substantially planar surfaces hereon:
B. each of said planar surfaces:
I. having removably affixed thereto a different one of several grades of abrasive material;
b. said multiplicity of blocks collectively:
1. representing a progression, from coarser to finer, of said several grades of said abrasive material; and
2. imparting said gloss to said hooves when applied thereto, in order of said progression, in a buffing procedure.

5,007,484



METHOD AND APPARATUS FOR CHANGING CULTIVATOR PLOW BLADES

Greg N. Johanson, R.R. 2, Box 122, Elmore, Minn. 56027

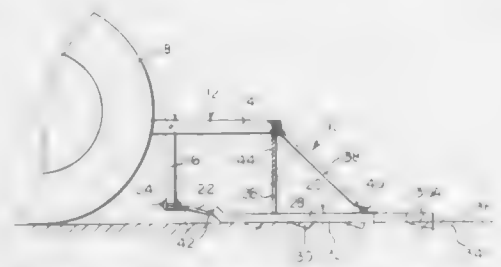
Filed Oct. 30, 1989, Ser. No. 428,988
Int. Cl.[5] A01B *39/22*
U.S. Cl. 172—1 11 Claims

6. A plow blade comprising
(a) a longitudinal plate having a soil cutting leading edge;
(b) a downward projecting blade stop on an underside of the plate providing means for receiving a portion of the working forces from an abutment on a cultivator shank, said stop being spaced rearward of said leading edge;
(c) clip means on a back side of the plate separate from and

spaced rearwardly of said blade stop for slip fit upon the leading end of a cultivator shank; and

(d) downward facing lock means on said plate back side and spaced rearward of said blade stop, for engaging a blade lock on the cultivator shank and for locking the blade upon the shank.

5,007,485



EARTH CRUST BREAKER

Robert J. Moss, Rte. #1, Box 8G, Hoxie, Kans. 67740

Filed Oct. 16, 1989, Ser. No. 421,666

Int. Cl.[5] A01B *31/00*

U.S. Cl. 172—500 **4 Claims**

1. An earth crust breaker drawn by a tool bar having a horizontal member and a vertical member on a tractor comprising:

(a) an elongated U-shaped frame having an angular upwardly extending front end attached to the bottom of the vertical member of the tool bar;

(b) a pair of spaced apart posts, each extending vertically from one side of said frame to the free end of the horizontal member of the tool bar wherein a flexible rubber tarpaulin strap extending diagonally from the free end of the horizontal member to the rear end of said frame to hold up the rear end and prevent said frame from flexing down when it is out of the ground and turning around;

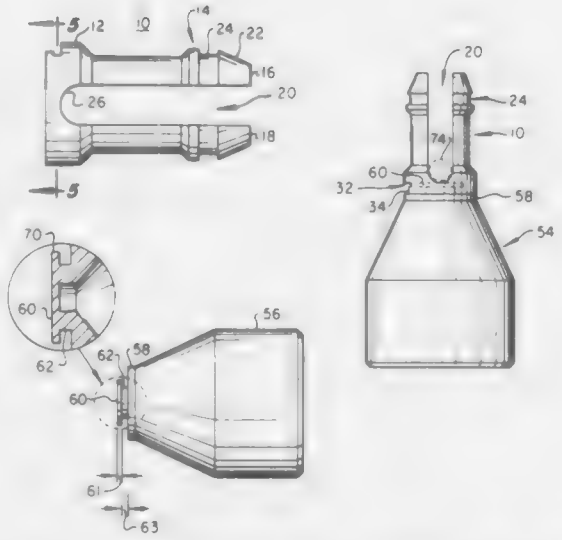
(c) a plurality of specifically placed knife blades extending from the bottom of said frame and fixed movably thereon to penetrate the ground and make slices into the crust thereby chopping it up; and

(d) a double hinge provided on the front end of said frame which allows said frame to flex and adjust to the unevenness of the ground and also helps shed any trash the frame encounters.

5,007,486

PERFORATING GUN ASSEMBLY AND UNIVERSAL PERFORATING CHARGE CLIP APPARATUS

Thomas D. Ricles, Houston, Tex., assignor to Dresser Industries, Inc., Dallas, Tex.



Filed Feb. 2, 1990, Ser. No. 473,729

Int. Cl.[5] E21B *43/117*

U.S. Cl. 175—4.6 **17 Claims**

1. In a perforating gun assembly for use in perforating a casing located down hole in a bore hole, said gun assembly including a cylindrical carrier housing, and a plurality of first ports formed in the housing through which a jet from a shaped charge can emerge, a firing cord for the shaped charge, the shaped charge having a flat washer-type collar at one end, and a plurality of second ports formed in the housing, an improved clip for holding the charge comprising:

a body portion;

a slot therein for receiving the flat washer-type collar of the shaped charge to hold the shaped charge;

a retainer on the body portion for extending through a said second port in the housing a support the shaped charge, and

an opening in the retainer for trapping and positioning the firing cord against the charge for proper firing operation.

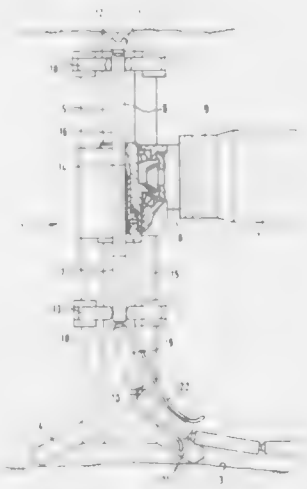
5,007,487

METHOD AND APPARATUS FOR MAKING DRILL HOLES UNDER SPATIALLY RESTRICTED CONDITIONS

Olof Dahle, Reken, and Manfred Fischbach, Hattingen, both of Fed. Rep. of Germany, assignors to Bergwerksverband GmbH and Hebezeug & Fischbach GmbH, both of, Fed. Rep. of Germany

Filed Feb. 12, 1990, Ser. No. 479,366

Claims priority, application Fed. Rep. of Germany, Feb. 25, 1989, 3905999



Int. Cl.[5] E21B *17/04*

U.S. Cl. 175—57 **10 Claims**

1. A drilling apparatus for drilling straight holes under spatially restricted conditions which comprises:

a longitudinally extending cradle; a fixed front clamping tong mounted on said cradle adapted to clamp a drill rod; a fixed rear clamping tong mounted on said cradle adapted to clamp a drill rod; a movable drive clamping tong mounted on said cradle intermediate said front and rear clamping tongs adapted to clamp and drive a drill rod; drive means for rotating and advancing said drive clamping tong to thereby rotate and advance a drill rod; a drill rod having a plurality of hollow segments; interlock means at each end of said segments for interlocking adjacent segments to form a straight rigid drill rod when said adjacent segments are brought into engagement with each other; a flexible member which passes through each of said segments such that said segments are movable longitudinally along said flexible member between a first position in which two adjacent segments are interlocked to form a straight rigid drill rod portion and a second position in which adjacent segments are spaced from each other to enable said flexible member to bend and said spaced segments to move along a curved defined by said flexible member.

10. A method of drilling bore holes utilizing a drill hole apparatus having a longitudinally extending cradle, a fixed front clamping tong mounted on said cradle adapted to clamp a drill rod, a fixed rear clamping tong mounted on said cradle adapted to clamp a drill rod, a movable drive clamping tong mounted on said cradle intermediate said front and rear clamping tongs adapted to clamp and drive a drill rod, drive means for rotating and advancing said drive clamping tong to thereby rotate and advance a drill rod, wherein said drill rod has a plurality of hollow segments, interlock means at each end of said segment for interlocking adjacent segments to form a

straight rigid drill rod when said adjacent segments are brought into engagement with each other, and a flexible member which passes through each of said segments such that said segments are movable longitudinally along said flexible member between a first position in which two adjacent segments are interlocked to form a straight rigid drill rod portion and a second position in which adjacent segments are spaced from each other to enable said spaced segments to move along a curve defined by said flexible member comprising the steps of:

opening said front clamping tong;

closing the rear clamping tong;

moving the drive clamping tong to a position adjacent said rear clamping tool;

closing said drive clamping tong;

opening said rear clamping tong;

operating said drive means to interlock adjacent drill rod segments, rotate said drill rod and move said drive clamping tong and said drill rod upwardly toward said front clamping tong.

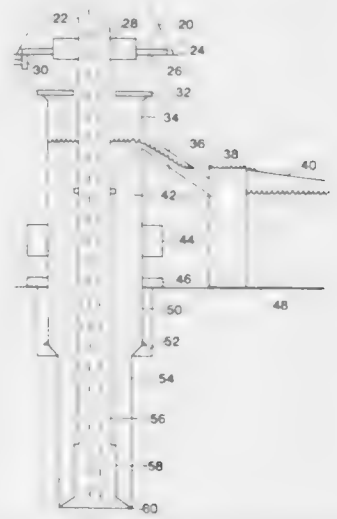
DRILLING NIPPLE GAS TRAP

William S. Donovan, Littleton, Colo., assignor to Donovan Brothers Incorporated, Littleton, Colo.

Filed May 16, 1990, Ser. No. 524,163



Int. Cl.[5] E21B *21/00*

U.S. Cl. 175—59 **15 Claims**

1. A device for gathering gas which evolves from the drilling mud exiting a well bore, comprising:

a gas sampling tube located such that entrained gas which evolves into the atmosphere as the drilling mud exists a well bore impinges upon an inlet of said sampling tube;

a means which creates a lower pressure at the inlet of said sampling tube than the atmosphere about said sampling

tube causing said gas to enter said sampling tube and flow to gas analyzers.

5,007,489

DRILLING FLUID METHODS AND COMPOSITION

Dorothy P. Enright; William M. Dye; F. Martin Smith, and Alphonse C. Perricone, all of Houston, Tex., assignors to Baker Hughes Incorporated, Houston, Tex.

Filed Apr. 27, 1990, Ser. No. 515,573

Int. Cl.[5] E21B *2/00*; **C09K** *7/00*

U.S. Cl. 175—65 **53 Claims**

1. A method for the prevention of balling of formation cuttings upon the surface of drilling equipment used in conjunction with the drilling, completion or workover of a subterranean well, comprising the steps of:

(1) preparing an aqueous system;

(2) adding to said system a composition comprising:

(a) a non-water soluble polyglycol having a molecular weight of from between about 1,200 and about 10,000;

(b) a surfactant having a hydrophilic/hydrophobic balance of about 4 or more; and

(c) a hydrotrope;

(3) forming an oil-in-water emulsion of said composition within said system by shearing of said system;

(4) introducing the emulsified system into the well for circulation through and out of said well; and

(5) contacting the surface of said drilling equipment with the composition to provide a non-aqueous interface between the equipment surface and the aqueous system.

5,007,490

PROGRESSIVE CAVITY DRIVE TRAIN WITH ELASTOMERIC JOINT ASSEMBLY FOR USE IN DOWNHOLE DRILLING

Russell D. Ide, P.O. Box 744, 641 Arnold Rd., Coventry, R.I. 02816

Filed Jun. 20, 1990, Ser. No. 540,682

Int. Cl.[5] E21B *4/02*

U.S. Cl. 175—107 **24 Claims**

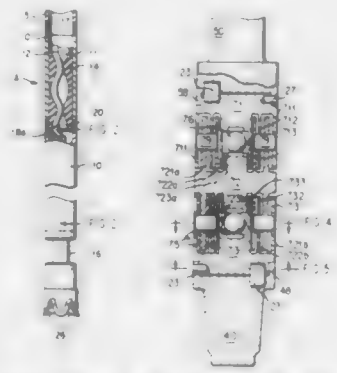
1. A downhole drilling apparatus which includes a progressive cavity drive train comprising:

a housing structure;

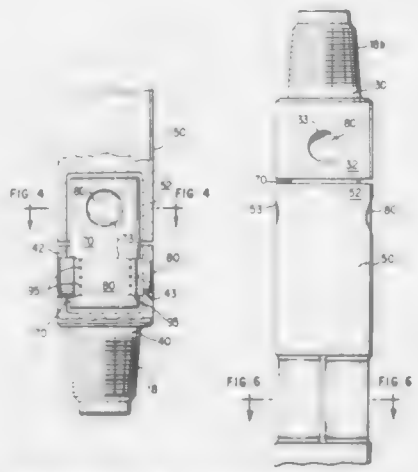
a stator, the stator having a longitudinal axis;

a rotor having a true center, the rotor being located within the stator;

the stator and the rotor each having coacting helical lobes which are in contact with one another at any transverse



section, the stator having one more helical lobe than the rotor such that a plurality of cavities are defined between the rotor and the stator, and the rotor being adapted to rotate within the stator such that the true center of the rotor orbits the axis of the stator, the orbit having a predetermined radius and the orbiting motion of the rotor causing a progression of the cavities in the direction of the axis of the stator;



a first stub shaft having a longitudinal axis and first and second longitudinal ends, the first end of the first stub shaft being connected to and movable with the rotor;

a first joint assembly fixed to the second end of the first stub shaft; the joint assembly comprising first, second and third longitudinally arranged joint portions, the first portion and the second portion being coupled through an elastomer so as to be pivotable with respect to one another, the second portion being coupled to the third portion through an elastomer so as to be pivotable with respect to one another, the first portion of the first joint assembly being fixed to the first stub shaft;

an intermediate shaft having first and second ends, the first end being fixed to the third portion of the first joint assembly;

a second joint assembly, the second joint assembly comprising first, second and third longitudinally arranged joint portions, the first portion and the second portion being coupled through an elastomer so as to be pivotable with respect to one another, the second portion being coupled

to the third portion through an elastomer so as to be pivotable with respect to one another, the first portion of the second joint assembly being fixed to the second end of the intermediate shaft;

a second stub shaft having a longitudinal axis which is substantially colinear with the axis of the stator and first and second longitudinal ends, the second stub shaft being rotatably mounted about its longitudinal axis within the housing structure, the first end of the second stub shaft being fixed to the second end of the intermediate shaft, the second end of the second stub shaft being connected to a drill bit drive shaft, and

whereby the first and second stub shafts are coupled such that in response to the flow of fluid through the stator the first stub shaft can rotate about its axis and orbit about the axis of the second stub shaft at the same time the second stub shaft rotates about its longitudinal axis so as to cause rotation of the drill bit drive shaft.

22. A coupling comprising: a first stub shaft having first and second longitudinal ends; a second stub shaft having first and second longitudinal ends and an intermediate shaft having first and second longitudinal ends; the second longitudinal end of the first stub shaft being pivotably connected to the first longitudinal end of the intermediate shaft and the first longitudinal end of the second stub shaft being pivotably connected to the second longitudinal end of the intermediate shaft; and

wherein the pivotable connection between the first stub shaft and the intermediate shaft and the second stub shaft and the intermediate shaft is provided by a joint assembly which includes a plurality of concentric annular extensions secured to each of the second end of the first stub shaft, the first end of the second stub shaft and the first and second ends of the intermediate shaft, the concentric annular extensions formed on the stub shafts being spaced so as to fit within spaces between the concentric annular extensions formed on the intermediate shaft such that the annular extensions on the stub shafts can be interleaved with the annular extensions on the intermediate shaft, the joint assemblies further comprising an elastomeric layer extending between and bonded to the interleaved annular extensions of the stub shafts and the intermediate shaft, the elastomeric layer being flexible in shear so as to allow pivoting of the stub shafts with respect to the intermediate shaft.

DOWNHOLE DRILLING APPARATUS PROGRESSIVE CAVITY DRIVE TRAIN WITH SEALED COUPLING

Russell D. Ide, P.O. Box 744, 641 Arnold Rd., Coventry, R.I. 02816

Filed Jun. 20, 1990, Ser. No. 540,692
Int. Cl.[5] E21B *4/02*; **F01C** *1/10*; **F16D** *3/02*, *3/16*
U.S. Cl. 175—107 **12 Claims**

1. A progressive cavity drive train comprising:

a housing structure;

a stator, the stator having a longitudinal axis;

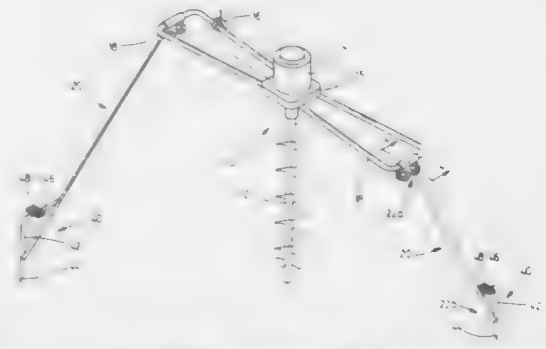
a rotor having a true center, the rotor being located within the stator,

the stator and the rotor each having coacting helical lobes which are in contact with one another at any transverse section, the stator having one more helical lobe than the rotor such that a plurality of cavities are defined between the rotor and the stator, and the rotor being adapted to rotate within the stator such that the true center of the rotor orbits the axis of the stator, the orbit having a predetermined radius and the orbit causing a progression of the cavities in the direction of the axis of the stator;

a first stub shaft having a longitudinal axis and first and second longitudinal ends, the first end of the first stub shaft being connected to and movable with the rotor, the second end of the first stub shaft comprising a yoke;

a second stub shaft having first and second longitudinal ends and a longitudinal axis which is substantially colinear with the axis of the stator, the second stub shaft being rotatably mounted about its longitudinal axis within the housing structure, the second end of the second stub shaft comprising a yoke;

a sealed universal joint assembly coupling the yoke formed on the first stub shaft to the yoke formed on the second stub shaft, the sealed universal joint including at least two transverse cylindrical bores and one cylindrical pivot pin extending through each of the cylindrical bores such that an annular space is formed between the outer surface of each of the cylindrical pivot pin and the inner surface of the cylindrical bore through which it extends, a plurality of rollers provided in the annular space and an elastomer encasing the rollers and substantially filling the annular space so as to isolate the rollers from the universal joint's environment; and



whereby the sealed universal joint couples the first and second stub shafts such that the first stub shaft can rotate about its axis and orbit about the axis of the second stub shaft at the same time the second stub shaft rotates about its longitudinal axis.

SAFETY STABILIZER FOR AUGER

Patrick C. P. Giroux, 902 Port Union Road, West Hill, Ontario M1C 2L9, Canada

Filed May 1, 1990, Ser. No. 517,341
Claims priority, application Canada, May 1, 1989, 599194
Int. Cl.[5] E21B *7/20*
U.S. Cl. 175—170 **8 Claims**

1. A safety stabiliser apparatus for an auger of the type having an auger screw, an engine and drive mechanism mounting on top the auger for operating said screw, and at least two handle means extending to either side of said engine, said stabiliser apparatus, in turn, comprising:

rotatable and swingable upper joint means and means for attaching same to respective said handle means;

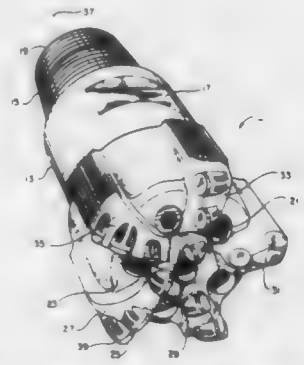
support leg assemblies connected to respective said joint means, each said assembly including a leg member having an upper end and a lower end, and,

anchor means at the lower end of each said leg member adapted to securely engage the ground, said anchor means rotatable and swingable relative to the ground, said upper joint means and said anchor means thereby permitting movement of said leg member about both a vertical axis and a horizontal axis relative to said handle means, and relative to the ground, thereby to allow said handle means on said auger to descend towards the level of the ground and to rotate relative to the axis of said auger while said anchor means remains anchored in position on the ground.

5,007,493

DRILL BIT HAVING IMPROVED CUTTING ELEMENT RETENTION SYSTEM

Robert B. Coolidge, Spring, and David M. Nguyen, Houston, both of Tex., assignors to Dresser Industries, Inc., Dallas, Tex.



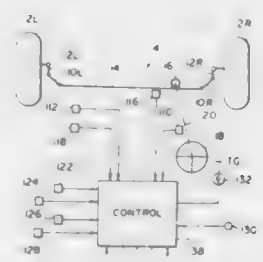
Filed Feb. 23, 1990, Ser. No. 484,406
Int. Cl.[5] E21B *10/46*
U.S. Cl. 175—329 **12 Claims**

12. A drill bit having an improved cutting element retention system for drilling a well borehole having a bottom, the bit comprising:

a bit body having a connecting end for engaging the mating connecting end of a pipe string used to support the bit within the well bore, the bit body having an opposite end which defines a bit face;

a plurality of fixed cutter cutting elements secured on the bit face, each fixed cutter cutting element having a mounting body with a leading face and a layer of superhard material carried on the leading face of the mounting body to define a cutting face for the cutting element; and

at least one trough formed in the mounting body on the bit face behind the cutting ace of each cutter cutting element,



each trough being sized and shaped whereby each cutting element has a characteristic wear flat bearing created by contact between the cutting element and the borehole bottom, the surface area of the wear flat bearing area of each cutting element retention system approaching a constant cross-sectional area throughout the entire cutting element usage.

5,007,494

REAR WHEEL TURNING SYSTEM

Hiroshi Ohmura; Satoru Tanabe; Junji Yoshioka, and Hirotaka Kanazawa, all of Hiroshima, Japan, assignors to Mazda Motor Corporation, Hiroshima, Japan

Filed May 30, 1989, Ser. No. 358,020
Claims priority, application Japan, May 30, 1988, 63-132260; Nov. 18, 1988, 63-292187
Int. Cl.[5] B62D *5/04*
U.S. Cl. 180—79.1 **10 Claims**

1. A rear wheel turning system for a vehicle comprising:

a rear wheel turning member which is connected to rear wheels of the vehicle and turns the rear wheels,

an electric motor which is operatively connected to the rear wheel turning member by way of a driving force transmitting system and to a steering wheel and displaces the rear wheel turning member, thereby causing the rear wheels to turn in response to an operation of the steering wheel,

a rear-wheel-neutralizing means which urges the rear wheel

turning member to a neutral position in which the rear wheels are held in a straight-ahead position, and

a pair of clutch mechanisms which are provided in series in a driving path of the driving force transmitting system between the electric motor and the rear wheel turning member and are adapted such that they disconnect the latter from the former, which permits the latter to return to the neutral position under the force of the rear-wheel-neutralizing means,

wherein said driving force transmitting system comprises a worm gear mechanism provided on an output shaft of the electric motor and a rack-and-pinion mechanism provided on the rear wheel turning member, and said clutch mechanisms are provided between the worm gear mechanism and the rack-and-pinion mechanism

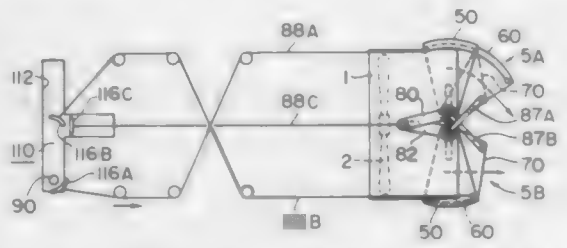
5,007,495

PROPULSIVE AIR STREAM DEFLECTING APPARATUS FOR AIR CUSHION VEHICLE



Ryuichi Yoshida, Takarazuka; Tetsushi Yamamura, Takasago, and Koji Kadota, Kobe, all of Japan, assignors to Kawasaki Jukogyo Kabushiki Kaisha, Hyogo, Japan

Filed Nov. 15, 1989, Ser. No. 436,784

Claims priority, application Japan, Nov. 16, 1988, 63-148499[U]

Int. Cl.[5] **B60V** *1/14*

U.S. Cl. 180—117 **6 Claims**

1 A propulsive air stream deflecting apparatus of an air cushion vehicle including a hull, said apparatus comprising:

an air duct mounted on the hull and having a longitudinal axis, the air duct having a rear open end;

a propeller fan installed within said duct for producing a propulsive air stream flowing through the air duct out said rear open end to provide thrust to the hull,

a pair of deflecting assemblies mounted to said duct,

each of said deflecting assemblies including a plurality of deflecting members each having a substantially arcuate deflecting wall, said deflecting members being nestable one within the other along the deflecting walls thereof,

vertically extending pivots mounting said deflecting assemblies, respectively, to said duct at the rear open end thereof in positions that are symmetrical with respect to said longitudinal axis,

the arcuate deflecting walls of the deflecting members of each respective one of the deflecting assemblies being concave toward the vertically extending pivot mounting said respective one of the deflecting assembles to the duct,

the deflecting members of each respective one of the deflecting assemblies being pivotal, about the pivot mounting said respective one of the deflecting assemblies to the duct, between a retracted nested state and a final telescopically extended state;

said duct having first guide means for supporting and guiding said vertically extending pivots in a manner in which the pivots are movable toward and away from one another, laterally with respect to the longitudinal axis of said duct, between respective laterally inward and outward positions; and

control means, operatively connected to said deflecting assemblies and to said pivots, for positioning the deflecting members in both of said deflecting assemblies in said nested retracted state while positioning said pivots at said laterally inward positions to maintain the arcuate deflecting walls of the deflecting members of said deflecting assemblies out of the path of the stream of air flowing from the rear open end of said duct such that a propulsion thrust state is provided in which a forward thrust on the hull is generated by said propeller fan,

for maintaining said pivots at said laterally inward positions while selectively moving the deflecting members of either one of said deflecting assemblies from said nested retracted state toward said final telescopically extended state to move the arcuate deflecting walls of the selected one of said deflecting assemblies into the path of the stream of air flowing from the rear open end of said duct such that a steering state is provided in which a sidewards thrust on the hull is generated by said propeller fan, and

for moving the deflecting members of both of said deflecting assemblies toward said final telescopically extended state while moving said vertically extended pivots from said laterally inward toward said laterally outward positions to cover the rear open end of said deflecting duct while locating terminal ends of the deflecting assemblies to the outside of said air duct such that a steering state is provided in which the arcuate deflecting walls guide the air flowing from the rear open end of said duct toward the front of the vehicle whereby a rearward thrust on the hull is generated by said propeller fan,

said control means comprising a first linkage linking said vertically extending pivots to one another, said first linkage being articulatable between a folded state which locates the pivots at said laterally inward positions and an extended state which locates the pivots at said laterally outward positions, a second linkage linking a most telescopically extendable one of the plurality of deflecting members of one of said deflecting assemblies to the vertically extending pivot mounting the other of said deflecting assemblies to the hull and linking a most telescopically extendable one of the plurality of deflecting members of said other of said deflecting assemblies to the vertically extending pivot mounting said one of the deflecting assemblies to the hull such that when said vertically extending pivots are in said laterally outermost positions, the second linkage places the deflecting members of each of said deflecting assemblies in said final telescopically extended state, and an actuator selectively operable to telescopically extend the deflecting members of either of said deflecting assemblies from said retracted nested state toward said final telescopically extended state and operable to articulate said first linkage between the folded state and the extended state thereof.

5,007,496

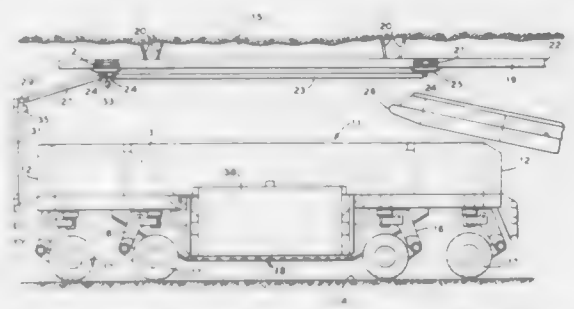
AUTOMATED UNDERGROUND HAULAGE TRUCK

Brian T. Whitten; Pierre Veraart; Andrew Kwasniewski, and Kurt Vollenwyder, all of Kingston, Canada, assignors to Inco Limited, Toronto, Canada

Continuation of Ser. No. 189,040, May 2, 1988, abandoned. This application Jan. 18, 1990, Ser. No. 466,867

Int. Cl.[5] **E01B** *25/28*

U.S. Cl. 180—131 **12 Claims**



1 A system for guiding a steerable, self-propelled generally rectangular vehicle along a non-tracked route comprising:

a a substantially continuous, elongated guide means fixed along said route in a substantially constant relationship to the ideal path of said vehicle, said vehicle being longitudinally symmetrical and having interlinked front and rear wheels arranged to pivot in mirror image with respect to the vertical transverse plane at body center of said vehicle on axes which, when extended, intersect on an extension of said central transverse plane of said vehicle;

b a draw bar swivelly connected at one end to said vehicle and swivelly connected at an opposite end to one end of a spacer bar, said spacer bar having opposed ends which are connected to said guide means for movement therealong;

c first detection means for sensing the angle between said drawbar and a longitudinal reference line of said vehicle and second detection means for sensing the angle between said spacer bar and said drawbar;

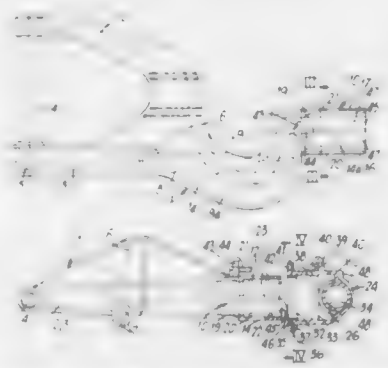
d means responsive to the output of said at least two detection means to determine any directional and lateral posi-

tional error of said vehicle with respect to said guide means and to program sequence of steering maneuvers to correct any said error; and

e steering means connected with said interlinked front and rear wheels adapted to carry out said programmed sequence of steering maneuvers.

5,007,497

ARM SUPPORT DEVICE FOR A ROTATING ELEMENT



Daniel Trema, Bezons, France, assignor to Elf France, Courbevoie, France

Filed Mar. 2, 1989, Ser. No. 317,921

Claims priority, application France, Mar. 14, 1988, 88 03280

Int. Cl.[5] **B62K** *25/20;* **B62M** *9/16*

U.S. Cl. 180—219 **8 Claims**

1. A single swinging suspension rear arm for the driving wheel of a motorcycle comprising:

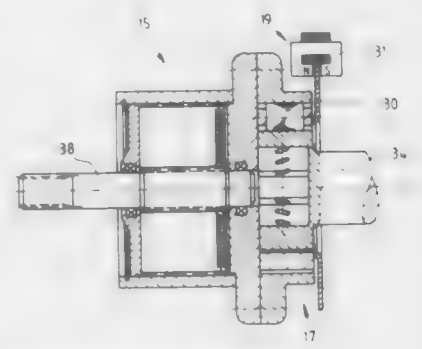
a free end portion adapted to have a rotary axle maintained thereon in a rigid and adjustable manner, and comprising axial outside polygonally disposed bearing surfaces;

a bracket piece removably and adjustably mounted on the free end portion of the arm and adapted to receive the rotary axle, said bracket piece comprising an inner wall having transversely positioned bearing faces adapted to contact the corresponding axial outside bearing faces of the free end portion of the arm when the bracket piece is mounted thereon, and at least one slot axially disposed in said inner wall at a position opposed to one of said inner wall bearing faces, said bracket piece adapted to move axially along the arm; and

screw means adapted to radially close the slot thereby preventing further movement of the bracket piece along said arm.

5,007,498

DRIVING ASSEMBLY



Helmut Wiese, Neunkirchen-Seelscheid, and Paul-Erich Schönenbrücher, Much-Kranüchel, both of Fed. Rep. of Germany, assignors to Viscodrive GmbH, Lohmar, Fed. Rep. of Germany

Filed Aug. 29, 1989, Ser. No. 399,823

Claims priority, application Fed. Rep. of Germany, Sep. 6, 1988, 3830199

Int. Cl.[5] **B60K** *23/08*

U.S. Cl. 280—248 **12 Claims**

1. A driving assembly, comprising:

a drive member;

a driven member;

a viscous shear coupling; and

a clutch between the drive member and the viscous shear coupling, the clutch comprising a drive part connected to the drive member and a driven part connected to the viscous shear coupling, torque-transmitting elements between said parts, a control member interposed between said parts and with which said elements are engaged, a brake comprising a first member connected to the control member and a second non-rotatable member, said first and second members being permanently held out of contact, means selectively operable to apply said brake to brake said control member independently of said drive part and said driven part such that at all times if the driven part overruns the drive part, the clutch transmits no torque, while if the drive part overruns the driven part, torque is transmitted from the drive part to the driven part by said torque-transmitting elements when the brake is applied to brake the control member but the clutch transmits no torque from the drive part to the driven part when the said control member is not braked.

5,007,499

SILENCER FOR A CENTRIFUGAL COMPRESSOR

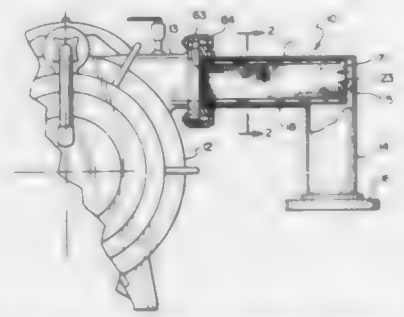
Charles E. Ebbing, Fayetteville, and Donald G. Neville, Syracuse, both of N.Y., assignors to Carrier Corporation, Syracuse, N.Y.

Filed Feb. 23, 1990, Ser. No. 483,618

Int. Cl.[5] **F01N** *1/24*

U.S. Cl. 181—258 **16 Claims**

1. An improved silencer device having a sound absorptive material and adapted for placement in a discharge line of a centrifugal compressor comprising:



a sound attenuation frame for mounting in said discharge line of the compressor;

at least one pad of absorptive material installed in said frame, said material being of a brittle nature and thus susceptible, if not protected, of having parts thereof broken off by movement of said material within the discharge line;

a cloth enclosure disposed within said sound attenuation frame and around said at least one pad of material to allow a transmission of sound therethrough but to generally inhibit a direct impingement of a compressed gas on said pad, said cloth enclosure being composed of a fine weave

material consisting of fibers which resist brittle fracture/-failure; and

a metal screen placed adjacent said cloth enclosure and

secured within said sound attenuation frame for containing said at least one pad of absorptive material in said cloth enclosure and for further protecting said pad from impingement by compressed fluid thereon

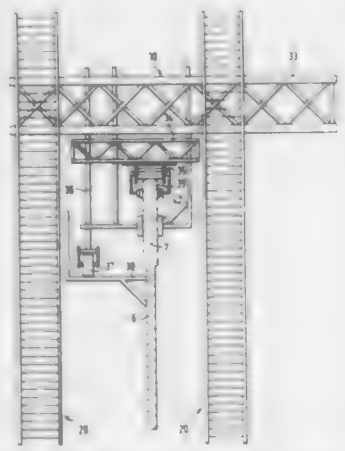
DEVICE FOR THE MAINTENANCE OF LARGE-CAPACITY CONTAINERS



Harald Klänne, Berlin, Fed. Rep. of Germany, assignor to ISB Generalunternehmen fur Industriespezialbau, Berlin, Fed. Rep. of Germany

Filed Jan. 5, 1989, Ser. No. 293,632

Claims priority, application Fed. Rep. of Germany, Jan. 6, 1988, 3800344; Sep. 8, 1988, 3830589

Int. Cl.[5] E04G *3/10, 3/14*

U.S. Cl. 182—38 **12 Claims**

1. A device for the maintenance of a large-capacity container having a substantially round cross section and an upper edge, comprising:

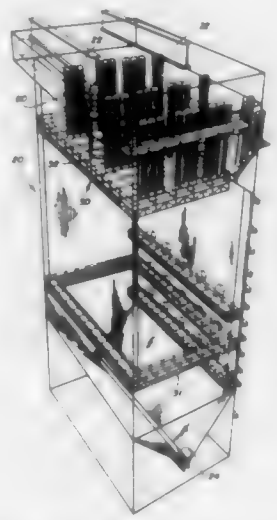
a scaffolding structure for accommodating a plurality of working platforms along a wall, said scaffolding structure being fulcrumed swingably around a vertical centerline which forms an axis of symmetry of the large-capacity container as a rotational axis, the scaffolding structure being movably placeable on an area of the upper container edge, the scaffolding structure comprising:

(a) a pivot which is centrally mountable on a roof of the container;

(b) a plurality of pivoting swivel arms for extending radially outwardly from the pivot mounting and having free ends for protruding beyond the container wall; and

(c) ladder lattices fastenable to the free ends of the swivel arms.

5,007,501



APPARATUS FOR FACILITATING THE INTERNAL INSPECTION AND REPAIR OF LARGE PRESSURE VESSELS

Peter J. Baston, 1450 Meadowood Village Dr., Ft. Worth, Tex. 76120

Filed Sep. 1, 1989, Ser. No. 402,836

Int. Cl.[5] E04G *3/10, 3/14*

U.S. Cl. 182—128 **15 Claims**

1. An apparatus having particular utility in serving as a work platform within a large pressure vessel such as a boiler-furnace for generating steam, such pressure vessels being of the type commonly found in power plants for generating electricity, and such pressure vessels having a top and a bottom and a plurality of side walls, and having a relatively small access hole near the bottom, and the size of the access hole being large enough so that a workman may crawl therethrough in order to gain entrance to the pressure vessel, comprising the combination of:

a. a plurality of metal trusses, each of which has a relatively short height and a length such that the trusses can be individually inserted through a relatively small access hole that is routinely provided near the bottom of a pressure vessel to admit workmen, and the trusses being configured for connection with each other in an end-to-end manner in directions that are both parallel and perpendicular to the length direction of a given truss;

b. a plurality of thin deck members configured to rest on top of the trusses to create a work platform when the trusses are oriented in a generally horizontal working position within the pressure vessel;

c. means for structurally connecting the trusses and deck members together inside the pressure vessel without the use of any tools; and

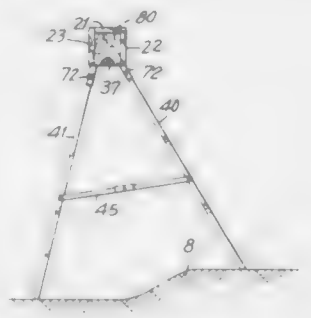
d. cable means for selectively raising and lowering the work platform within the pressure vessel, including a plurality of steel cables adapted to be temporarily suspended from the top of the pressure vessel.

5,007,502

SELF-LEVELING SAW HORSE

Alan F. Shapiro, 24A McClellan St., Amherst, Mass. 01002, assignor to Alan F. Shapiro, Amherst, Mass. and David Edwardson, New York, N.Y.

Filed Jul. 16, 1990, Ser. No. 552,826



Int. Cl.[5] B27B *21/00;* **B25H** *1/06*

U.S. Cl. 182—155 **23 Claims**

1. A saw horse, comprising:

a trestle, including a substantially flat surface for supporting weight and a downwardly opening box formed with two side walls, running substantially the entire length of the trestle and two end walls connecting the side walls;

two pairs of legs adapted to rotate from a closed position in which each of the legs is contained within the box formed by the trestle and an open position where each of the legs is in a generally vertical orientation, each leg having an enlarged opening proximate its upper end in the open position, a support surface at its lower end in the open position and first, second and third working surfaces for leveling the pairs of legs, stably supporting weight on the trestle and enabling rotation of the legs about the enlarged opening from the closed position to the open position and vice versa, respectively;

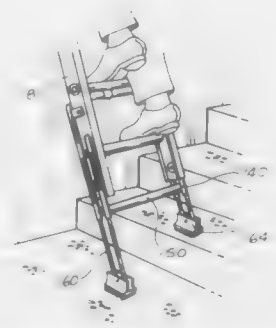
a first rod coupled between the side walls proximate a first end wall and extending through the openings in both legs forming one of the pairs of the legs; and

a second rod coupled between the side walls proximate the second end wall and extending through the openings in both legs forming the second of the pairs of legs;

the first operating surface on each leg of a pair of legs being in contact with the first operating surface of the other leg of its pair and the second surfaces of each leg of a pair being in contact with the underside of the top surface of the trestle when the sawhorse is in the open position;

whereby exerting pressure on the top surface of the trestle causes sliding adjustment of the first operating surfaces of each pair to level the trestle and stably support the saw horse on uneven surfaces.

5,007,503



LADDER LEVELLING DEVICE WITH LOCKING MEANS

Walter Sturm, 81 Benchlands Drive, Cochrane, Alberta, Canada T0L 0W1

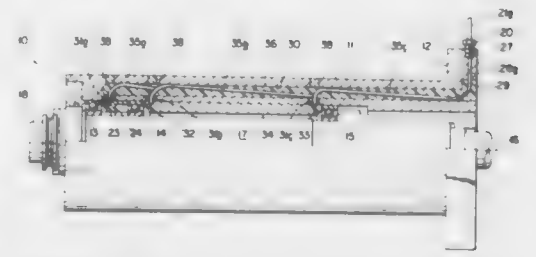
Filed Jul. 19, 1990, Ser. No. 554,430

Int. Cl.[5] E06C *7/44*

U.S. Cl. 182—202 **8 Claims**

1. A device for adapting the length of a pair of legs to the unevenness of a surface, said device comprising a pair of vertically reciprocally extendable legs, each extendable leg guidable mounted in a tubular member attached to said pair of legs, said tubular member in the shape of a downwardly open U, a longitudinally slidable chain like connecting element accommodated in said tubular member, said connecting element being connected at its each end to one of said pair of extendable legs, said connecting element comprising a flexible core having thereon a plurality of spheres, each of said spheres separated by a spacer, said tubular member including coextensive locking means through which said connecting element passes, said locking means having a passage substantially in line with said tubular member and a chamber having a plurality of socket means adapted to releasably receive said sphere on said connecting elements, said chamber being positioned on substantially the same place as said passage, whereby weight on said extendable legs forces said connecting element to extend into said chamber wherein said spheres are received in said socket means and retained therein until weight is removed from both of said legs.

5,007,504



LUBRICATION APPARATUS AND METHOD

Raymond L. Hallbach, Simpsonville, S.C., assignor to Cincinnati Milacron Inc., Cincinnati, Ohio

Filed Apr. 10, 1990, Ser. No. 507,080

Int. Cl.[5] F16N *21/00*

U.S. Cl. 184—8 **8 Claims**

1. A lubrication apparatus for a machine, comprising:

an elongate bearing support member having an axis defined along its length;

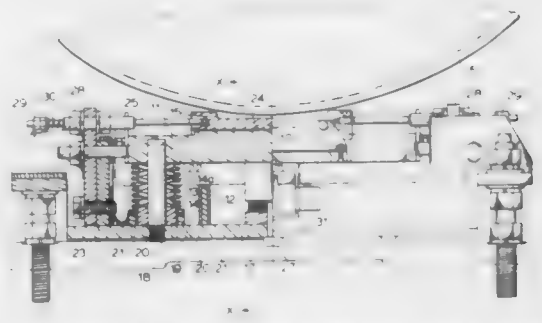
an air stream and lubricant supply site proximal one end of said support member;

a rotary bearing spaced along said axis from said one end;

a conduit extending between said supply site and said bearing, within an elongate hole in a wall of said support, said conduit having at least one bend; and

means for affixing said conduit in position with said support, said conduit providing a smooth, non-linear transition path for conveying an air stream and lubricant from said supply site to said bearing.

5,007,505



ELEVATOR TRACTION SHEAVE BRAKE

Robert Lindegger, Scarborough, Canada, assignor to Northern Elevator Limited, Ontario, Canada

Filed Mar. 19, 1990, Ser. No. 495,138

Int. Cl.[5] B66B *5/16*

U.S. Cl. 187—89 **28 Claims**

1. An elevator traction sheave brake for use on a counterbalanced elevator comprising:

(a) a horizontally disposed supporting member mounted to a fixed carriage and located either above or below a traction sheave along the projection of a substantially vertical diameter of the traction sheave, adjacent a rim of the traction sheave and between hoist ropes, the supporting member being adapted to be moved in substantially vertical directions towards or away from the rim of the traction sheave;

(b) a horizontally disposed friction member adjacent to the supporting member in between the supporting member and the traction sheave mounted to the fixed carriage, adapted to be moved in substantially vertical directions either towards or away from the rim of the traction sheave in conjunction with the supporting member and adapted to be moved in substantially horizontal directions substantially parallel to the planes of the faces of the traction sheave independently of the supporting member and having a means for braking which uses friction to produce a dynamic retarding torque and a static holding torque when compressed against the traction sheave;

(c) at least one positioning member adapted to move both the supporting member and the friction member in conjunction in a substantially vertical direction towards the rim of the traction sheave thereby bringing the braking means into contact with the traction sheave at a preset initial braking position so that further rotation of the traction sheave tends to draw the braking means back towards the projection of the substantially vertical diameter of the traction sheave;

(d) at least one biasing member adapted to resist movement of the braking means away from the traction sheave following initial contact of the braking means with the traction sheave; and

(e) fixed means for controlling the movement of the friction member in the substantially horizontal directions to provide a preset braking profile.

5,007,506

ELEVATOR REMOTE-CONTROL METHOD

Shigehiko Suzuki, and Kenzo Tachino, both of Inazawa, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Japan

Filed Mar. 20, 1990, Ser. No. 496,222
Claims priority, application Japan, May 18, 1989, 1-122789
Int. Cl.[5] B66B *3/00*
U.S. Cl. 187—101 **4 Claims**

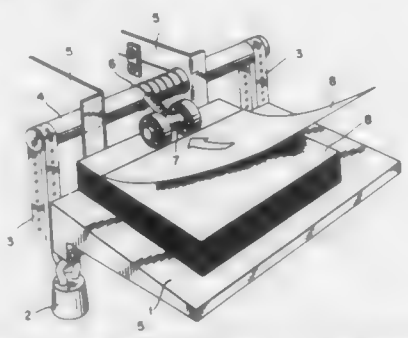
1. In an elevator remote-control method for an elevator control system having an elevator control circuit which controls a service situation of an elevator and which performs maintenance control for the elevator, and a remote monitoring center which is connected to the elevator control circuit through a telephone circuit and which monitors the service situation of the elevator,

wherein when the elevator control circuit has received a maintenance command for maintenance control from the remote monitoring center, said control circuit performs maintenance control of the elevator and executes a maintenance control program stored therein;

an elevator remote-control method comprising,

when said elevator control circuit has received said maintenance command,

executing a call-back program which comprises a ring-off processing step of disconnecting said telephone circuit, and a reconnection step of dialing said remote monitoring center to reconnect said telephone circuit,



whereupon said control circuit executes any program of the maintenance control program conforming to the maintenance command.

5,007,507

METHOD OF, AND A DEVICE FOR, CONTROLLING THE ROTATION OF AN ELEMENT ABOUT AN AXIS OF MEANS OF A WRAP SPRING

Jeichienus A. van der Werff, Montfoort, Netherlands, assignor to Hadewe B. V., Drachten, Netherlands

Filed Jun. 7, 1989, Ser. No. 362,501
Claims priority, application Netherlands, Jun. 7, 1988, 8801461
Int. Cl.[5] F16D *51/04;* **B65H** *31/10, 1/10*
U.S. Cl. 188—77 W **13 Claims**

1. A device for controlling the rotation of an element about an axis, comprising:

means for exerting a continuous torque on the element; and

means for selectively precluding rotation of the element, said rotation precluding means including

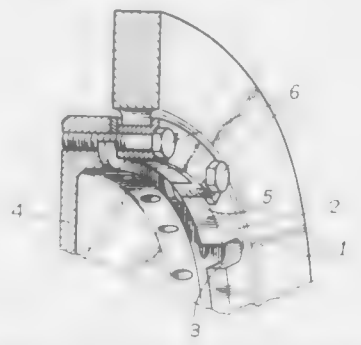
a wrap spring wrapped around the element, one end of said wrap spring being anchored

a control member attached to an other end of said wrap spring such that said wrap spring is wrapped tightly about the element to preclude rotation of the element when said control member is in a first position, and said wrap spring is wrapped loosely about the element so that the element may rotate under said continuous torque when said control member is out of said first position, rotation of the element under said continuous torque causing said control member to return to said first position to thereby preclude further rotation of the element.

5,007,508

FRICTION SYSTEM USING REFRACTORY COMPOSITE MATERIALS

Alain Lacombe, Pessac, France, assignor to Societe Europeenne de Propulsion, Suresness, France



Continuation of Ser. No. 248,319, Sep. 16, 1988, abandoned, which is a continuation of Ser. No. 10,321, Feb. 3, 1987, abandoned. This application Mar. 1, 1990, Ser. No. 488,481
Claims priority, application France, Feb. 5, 1986, 86 01590
Int. Cl.[5] F16D *65/12, 69/02*
U.S. Cl. 188—251 A **7 Claims**

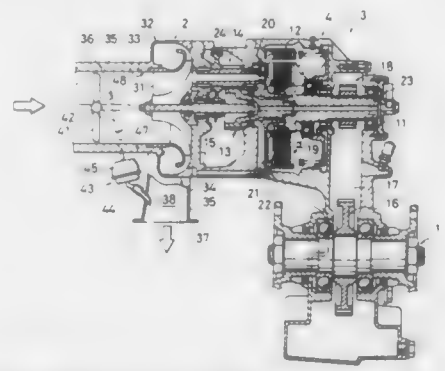
1. A friction system, comprising:

a first friction element having a first confronting surface, and

wherein said first friction element is made of a carbon-carbon composite material;

a second friction element having a second confronting surface, and wherein said second friction element is made of a multiphase composite material comprised of a fibrous reinforcement having fibers selected from the group consisting of carbon fibers and silicon carbide fibers, and a matrix having a principal phase which forms a major part

of said matrix and is comprised of silicon carbide, and a secondary phase which forms a minor part of said matrix and is comprised of a refractory material selected from the group consisting of titanium carbide, zirconium carbide, tantalum carbide, boron carbide, elemental boron, silicon nitride, boron nitride and pyrolytic carbon, and



wherein said first confronting surface of said first friction element confronts and is frictionally coupled to said second confronting surface of said second friction element.

BRAKE SYSTEM

Yoshihisa Koizumi, Fujisawa, Japan, assignor to Isuzu Motors Limited, Tokyo, Japan

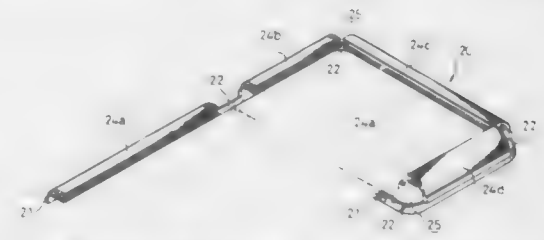
Filed Oct. 2, 1989, Ser. No. 416,084
Claims priority, application Japan, Oct. 31, 1988, 273026
Int. Cl.[4] F16D *57/06*
U.S. Cl. 188—271 **19 Claims**

1. A brake system for a vehicle, comprising:

an impeller connected to a member of a power transmission line of the vehicle for applying a brake force to said member;

means for housing the impeller, and an air passage for introducing or discharging external air to and from the impeller;

a throttle valve disposed in the air passage for adjusting the air flow rate in the air passage; and



control means for actuating the throttle valve in accordance with the air flow rate in the air passage.

FRAME ASSEMBLY FOR CASE OR SIMILAR ARTICLE

Vichai Houng, No. 198-200, Sec. 1, Kang Ning Rd., Taipei, Taiwan

Filed Jul. 26, 1990, Ser. No. 558,281
Int. Cl.[5] A45C *13/04*
U.S. Cl. 190—122 **4 Claims**

1 A frame assembly for a case or similar article comprising:

a first and a second one-piece frame each forming a closed loop and having adjacent ends, said first and second frames each being composed of a plurality of side portions interconnected by a respective curved brace portion, two said side portions and said one corresponding curved brace portion defining a corner opening, each frame having a first peripheral groove extending along an inside wall of each side portion adapted for receiving a side wall, said first frame comprising an engagement groove engageable with a tapered projection of said second frame;

a plurality of corner pieces each insertable into a corresponding corner opening of each frame; and

hinge means being disposed on a respective outer wall of said first and second frames so that said first and second frames are hingedly pivotal with respect to each other.

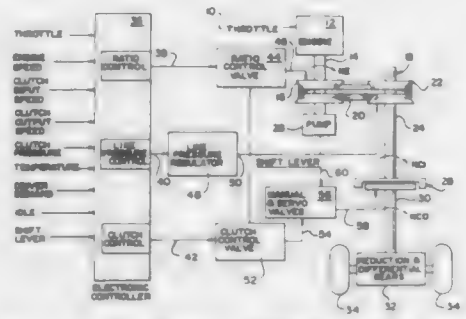
5,007,511

BI-DIRECTIONAL BACK STOPPING CLUTCH

Robert J. Ostrander, Sterling Heights, Mich., assignor to Dana Corporation, Toledo, Ohio

Filed Nov. 2, 1989, Ser. No. 430,811
Int. Cl.[5] F16D *51/12*
U.S. Cl. 192—8 R **8 Claims**

1. In a bi-directional back stopping clutch including a brake drum, a pair of adjacent brake shoes located within said brake drum, said adjacent shoes defining two spaced openings therebetween, a pair of output pins having first ends located in said spaced openings and having second ends, an output member having a pair of spaced openings receiving said second pin ends, and means for applying a driving torque through said shoes and said pins to said output member, said pins skewing in response to a predetermined back driving torque on said output member to move said brake shoes in contact with said brake drum, the improvement wherein each pin has a first rounded surface located at the point of contact with said output member opening, a second rounded surface located at the point of contact with one of said shoes as said pin becomes skewed, and a third rounded surface located at the point of contact with the other of said shoes as said pin becomes skewed, and wherein said rounded surfaces are spaced to provide a predetermined leverage ratio β/α, wherein β equals the distance in the direction of the axis of such pin between said



first and second rounded surfaces and α equals the axial distance on such pin between said second and third rounded surfaces, said pin having a smaller diameter at the location of said first rounded surface than at the locations of said second and third rounded surfaces.

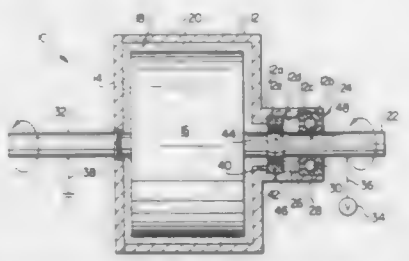
TECHNIQUE FOR CLUTCH CONTROL IN CONTINUOUSLY VARIABLE TRANSMISSION SYSTEMS

Werner P. Petzold, Harwood Heights, Ill., assignor to Borg-Warner Automotive, Inc., Sterling Heights, Mich.

Filed Aug. 31, 1989, Ser. No. 402,052
Int. Cl.[5] B60K *41/22*
U.S. Cl. 192—3.51 23 Claims

1. In a continuously variable transmission system for providing torque transfer in a vehicle having a fluid actuated clutch apparatus and operable in a plurality of operating modes including a forward mode and a reverse mode, a clutch control system for regulating fluid flow for controlling torque transfer by said fluid actuated clutch apparatus, comprising:

means for sensing the vehicle operating mode, and



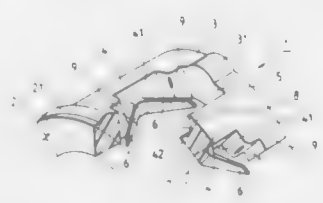
means responsive to said means for sensing the vehicle operating mode for supplying a first set of parameters for controlling fluid flow to said fluid actuated clutch apparatus in response to a sensing of a forward mode and a second set of fluid transfer parameters for controlling fluid flow to said fluid actuated clutch apparatus in response to a sensing of a reverse mode.

5,007,513

ELECTROACTIVE FLUID TORQUE TRANSMISSION APPARATUS WITH FERROFLUID SEAL

J. David Carlson, Cary, N.C., assignor to Lord Corporation, Erie, Pa.

Filed Apr. 3, 1990, Ser. No. 503,831
Int. Cl.[5] F16D *37/02*; F16J *15/40*
U.S. Cl. 192—21.5 24 Claims



1. Apparatus for controlling the transmission of force, said apparatus comprising first and second members adapted for relative movement, said first member defining a chamber and having a circular opening, said second member extending within said chamber in a spaced relation to said first member, an electroactive fluid disposed in the space between said members, a shaft extending from said second member and through said opening, the diameter of said shaft being less than the diameter of said opening to define an annular space, means for applying an electric field between said members and to said fluid for transmitting forces between said members by said fluid according to the strength of said electric field, a ferrofluid disposed in said annular space and immiscible with said electroactive fluid, and magnetic circuit means for applying a concentrated magnetic field in said annular space and to said ferrofluid to maintain said ferrofluid in said annular space as a seal.

5,007,514

RETAINER FOR ONE-WAY CLUTCH

Tsuneichi Hattori, Fukuoka, and Kazuo Iga, Nara, both of Japan, assignors to Koyo Seiko Co., Ltd., Osaka, Japan

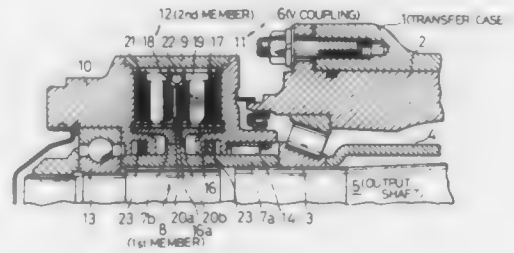
Filed Feb. 20, 1990, Ser. No. 483,202
Claims priority, application Japan, Feb. 22, 1989, 1-20126[U]
Int. Cl.[5] F16D *3/34*
U.S. Cl. 192—45 6 Claims

1. A retainer for a one-way clutch, said retainer being made of a synthetic resin and including a pair of axially spaced annular portions having a circular periphery and a plurality of parallel column portions each having first and second sides, said annular portions and said column portions being integrally molded from said resin and cooperating to define roller pockets between adjacent column portions, said column portions extending between and coupling said annular portions to each other and being disposed at equal angular intervals along the circular periphery of said annular portions, and, two elastic finger members integrally extending into a roller pocket in cantilever manner from adjacent proximal ends at said first side of each of said column portions and flaring outwardly to terminate at spaced distal ends, said distal ends of said elastic finger members being positioned to engage a roller in the roller pocket to urge the engaged roller toward the second side of a second column defining a second side of the roller pocket, said second side of each of said column portions including an inner projecting part and an outer projecting part projecting toward the first side of the next adjacent column portion, wherein the width of each of said elastic finger members gradually decreases from the proximal end thereof toward the distal tip thereof, and wherein the first side of each of said column portions includes stops for limiting the elastic deformation of said elastic finger members toward said first side.

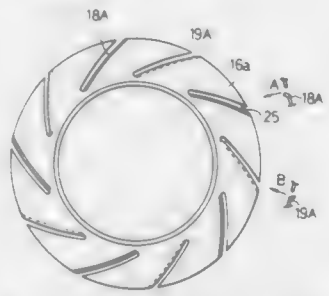
5,007,515

VISCOUS COUPLING APPARATUS

Minoru Shimizu, Tochigi, Japan, assignor to Tochigifujisangyo Kabushiki Kaisha, Japan



Filed Jan. 3, 1989, Ser. No. 292,839
Claims priority, application Japan, Jan. 12, 1988, 63-3147
Int. Cl.[5] F16D *35/00*
U.S. Cl. 192—58 A 5 Claims

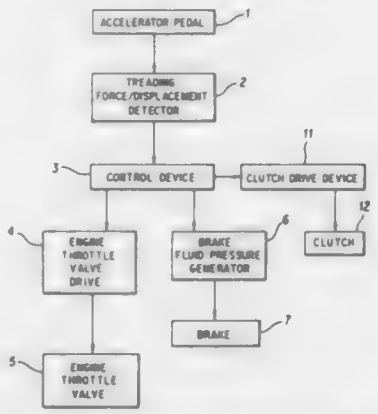


1. A viscous coupling apparatus for transmitting torque from a first rotary member to a second rotary member, comprising

(a) a working chamber formed between the first and second rotary members and filled with a viscous fluid;

(b) a series of first annular resistance plates fixedly arranged at axially spaced intervals on an outer circumferential surface of the first rotary member within the working chamber; and

(c) a series of second annular resistance plates alternating with said first resistance plates and also fixedly arranged at axially spaced intervals on an inner circumferential surface of the second rotary member within the working chamber, one of the annular resistance plates of one of said series being formed with a plurality of vortically shaped blades protruding from both side surfaces thereof at the same angular positions, said one resistance plate being located at a central position within the working chamber to agitate the viscous fluid within the working chamber.



5,007,516

MOTOR VEHICLE BRAKING APPARATUS USING ACCELERATOR PEDAL

Nagao Miyazaki, Osaka-sayama, Japan, assignor to Japan Electronics Industry, Limited, Osaka, Japan

Filed Aug. 30, 1989, Ser. No. 400,614
Claims priority, application Japan, Oct. 11, 1988, 63-133227; Apr. 15, 1989, 1-96027
Int. Cl.[5] B60K *41/28*
U.S. Cl. 192—0.072 11 Claims

1. A motor vehicle braking apparatus for a vehicle having brakes operated by pressure of a brake fluid, an engine throttle valve and an accelerator pedal comprising: a treading force/-displacement detector for detecting a treading force/displacement of the accelerator pedal of the vehicle; and a control device for controlling the engine throttle valve opening degree and the brakes,

said control device being arranged such that:

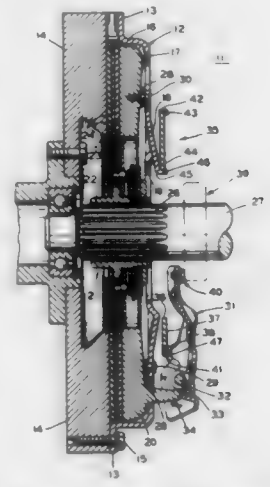
(i) the accelerator pedal serves as a normal accelerator pedal for increasing the opening area of the engine throttle valve with increase in accelerator pedal treading force/displacement detected value;

(ii) the engine throttle valve is closed when the detector detects a treading force/displacement exceeding a first predetermined treading force/displacement value;

(iii) when the detector detects a treading force/displacement value greater than a second predetermined treading force/displacement value which is greater than said first predetermined treading force/displacement value, the brake fluid pressure is increased or decreased according to the size of the detected treading force/displacement value;

(iv) the brake fluid pressure is released when the treading force/displacement is smaller than said second predetermined treading force/displacement value;

(v) the accelerator pedal is restored to serve as a normal accelerator pedal when the treading force/displacement is smaller than a third predetermined treading force/displacement value near zero, after the throttle valve has been closed in response to the detection of said first value; and



(vi) the engine throttle valve is held closed until the accelerator pedal is so restored to serve as a normal accelerator pedal, following said closing of the throttle valve.

5,007,517

ADJUSTABLE HYSTERESIS DAMPER

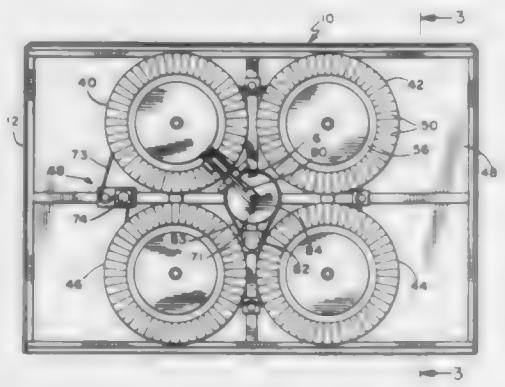
Richard A. Flotow, Butler, Ind., assignor to Dana Corporation, Toledo, Ohio

Filed Dec. 27, 1989, Ser. No. 457,373
Int. Cl.[5] F16D *3/14*
U.S. Cl. 192—106.1 14 Claims

1. A clutch driven disc assembly comprising:

a hub;

a facing and disc subassembly mounted on and rotatable relative to said hub; and



adjustment means mounted on said hub and abutting said subassembly for applying an axial load to said subassembly, said adjustment means threadably engaging said hub for selectively adjusting the axial load.

5,007,518

APPARATUS FOR RENTING ARTICLES

Theodore J. Crooks, La Mesa; Terry L. Zentz, and Matthew G. Morris, both of San Diego, all of Calif., assignors to Sam Crivello, San Diego, Calif.

Filed Feb. 13, 1989, Ser. No. 309,353
Int. Cl.[5] G07F *7/00, 11/52*
U.S. Cl. 194—212 **12 Claims**

4. A videotape rental machine, comprising:

an outer housing;

storage means within the housing having locations for storing a plurality of videocassettes comprising:

a plurality of rotatable drums arranged in a single plane parallel to the front wall of the housing and rotatably mounted on the rear wall of the housing, each drum having a plurality of videocassette storage compartments around its outer periphery;

transport means for retrieving selected videotapes from their storage locations and delivering them to customers, and for retrieving returned videotapes from the customers and returning them to the associated storage locations comprising

a rotatable picker assembly rotatable in a plane parallel to the front faces of the drums and between the drums and the front wall of the housing between said delivery position and a plurality of pickup positions including a pickup position aligned with a home position corresponding to a storage compartment position on each of the drums; and

drive means for rotating said picker assembly back and forth between said pickup positions and said delivery position and rotating said drums to position predetermined storage compartments at said pickup position; and

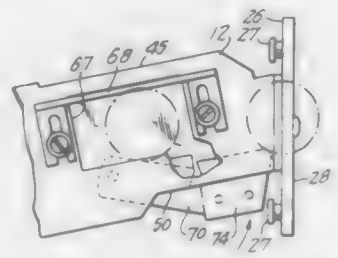
control means for controlling operation of said transport means, comprising:

means responsive to entry of a selection code on a selection device to control said transport means to retrieve the selected videotape from its storage location and deliver it to a customer; and

a memory for storing data associating each storage location with a selection code representing a videotape to be stored at that location; the housing having a front panel comprising:

an array of separate display areas each containing pictorial indicia representing a particular videotape stored in the machine and the selection code associated with said particular videotape;

a selection device adjacent to said display area array and associated with said control means for allowing a customer to select a videotape on the selection code associated with that videotape on the selection device; and



delivery means for delivering videocassettes to customers and receiving returned videocassettes.

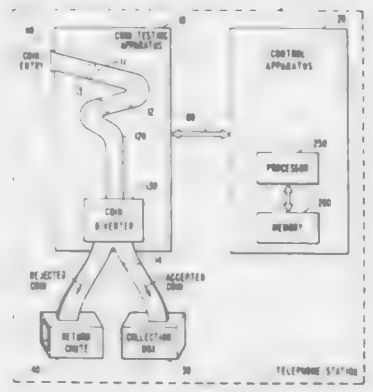
5,007,519

COIN DROP CONSTRUCTION

Leonard Mercurio, Dix Hills, N.Y., assignor to Set-O-Matic Sales Corp., Cedarhurst, N.Y.

Filed Jan. 22, 1990, Ser. No. 468,006
Int. Cl.[5] G07F *5/16;* **G07D** *5/04*
U.S. Cl. 194—230 **7 Claims**

1. An improved coin drop construction suitable for replacing the coin slide elements of a coin collector box forming part of a coin operated appliance comprising: a front mounting plate adapted to overlie an opening in said appliance, and a coin guide element carried by an inner surface of said mounting plate and serving to guide inserted coins to said collection box, said guide element including first and second plates interconnected in spaced parallel relation to define an elongated coin channel therebetween, said mounting plate having a coin receiving opening communicating with said channel; a first coin blocking means pivotally mounted between said plates at a first end thereof, said means including a first end located in the area of said coin receiving opening, and having an upper longitudinal edge surface forming a path for conducting a coin therealong; an elongated track member in fixed relation between said plates and having an upper surface forming a continuation of said upper edge of said first coin blocking means when at a lower limit of its path of travel, resilient means bearing upon said first coin blocking means to at least partially block said opening, insertion of a coin through said opening serving to momentarily displace said first coin blocking means downwardly to permit passage of said coin, release of said coin permitting said first coin blocking means to return to its initial position, in which said upper edge is positioned above said upper surface, and said coin is rolled over said edge under the action of gravity to a second end of said track member; a second coin blocking means positioned at said second end of said track member, said second coin blocking means including a pivotally mounted plate forming a continuation of said upper surface of said track member in the presence of an underweight coin, and being pivotally displaced under the weight of a properly weighted coin to allow said coin to fall into said coin collection box.



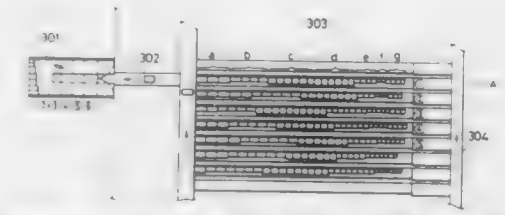
5,007,520

MICROPROCESSOR-CONTROLLED APPARATUS ADAPTABLE TO ENVIRONMENTAL CHANGES

Dawn E. Harris, Indianapolis, and William H. Orr, Carmel, both of Ind., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed Jun. 20, 1989, Ser. No. 368,619
Int. Cl.[5] G07D *5/08*
U.S. Cl. 194—317 **12 Claims**

8. A microprocessor-controlled electronic coin chute (ECC) having memory means storing coin acceptability criteria within a stored program for use in determining coin denomination, the ECC including first and second oscillators, each having a different resonant frequency that changes in response to the presence of a coin, coin denomination measurements being limited to the measurement of the frequencies of said first and second oscillators, the ECC further including means for changing coin acceptability criteria in accordance with changes in an environmentally-dependent parameter by modifying the stored program in accordance with the frequency of each oscillator measured when the coin is not in the presence



of the oscillating circuits, said parameter being related to the frequency of the oscillating circuits.

5,007,521

METHOD FOR MERGING GOODS AND APPARATUS THEREFOR

Nobuhiro Tanaka, Miyashiromachi, Japan, assignor to Kao Corporation, Tokyo, Japan

Continuation of Ser. No. 344,497, Apr. 27, 1989, abandoned, which is a continuation of Ser. No. 78,394, Jul. 24, 1987, abandoned. This application Jul. 23, 1990, Ser. No. 555,782
Claims priority, application Japan, Jul. 24, 1986, 61-174265; Jul. 24, 1986, 61-174266; Jul. 24, 1986, 61-174267
Int. Cl.[5] B65G *1/00*
U.S. Cl. 198—347.4 **5 Claims**

1. A method of merging goods in a physical distribution system prior to sorting and diverting said goods, comprising the steps of:

(a) picking a unit of goods according to predetermined batch picking data;

(b) counting a number of goods in each unit;

(c) storing goods as a unit, wherein one unit is stored on a single one of a plurality of storage lines;

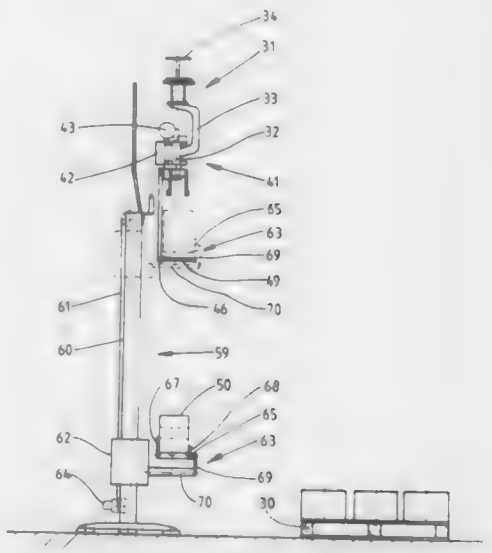
(d) merging units of goods from each of said plurality of storage lines by changing a speed of carrying out goods from each of said plurality of storage lines according to a size of goods arranged thereon; and

(e) sorting said goods into a plurality of groups based on predetermined dimension data.

5,007,522

APPARATUS FOR TRANSPORTING PACKAGING MATERIAL TO A PACKAGING MACHINE

Heinz Focke, and Oskar Balmer, both of Verden, Fed. Rep. of Germany, assignors to Focke & Co., (GmbH & Co.), Verden, Fed. Rep. of Germany



Filed May 31, 1989, Ser. No. 359,302
Claims priority, application Fed. Rep. of Germany, Jun. 18, 1988, 3820735; Aug. 17, 1988, 3827917
Int. Cl.[5] B65G *47/36*
U.S. Cl. 198—468.8 **9 Claims**

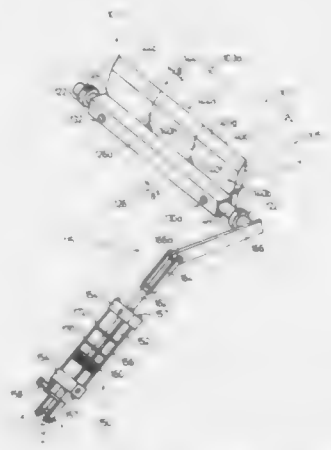
1. An apparatus for transporting packaging material, especially reels of web-shaped packaging material, from a stock to at least one reception station in a region of at least one of a plurality of packaging machines, said apparatus comprising:

a plurality of material conveyors (41) which are movable along a conveyor track extending above the packaging machines and each of which has a material holder (44) with rigid immovable supporting members (48, 49) for the positive reception of reels (26, 27, 28) of different sizes, the reels resting with their circumferential surface (50) on said supporting members (48, 49); and

at least one transfer conveyor in the region of a feed station (38, 39, 40) and at least one transfer conveyor in the region of a discharge station (71), and each having a material carrier (63, 75) which is movable upwardly and downwardly for receiving or transferring a reel from or to a material conveyor (41);

said material carrier (63, 75) being arranged in the region of the conveyor track of said material conveyor (41), and the design of said material carrier (63, 75) being matched to the design of said supporting members of said material holder (44), such that supporting members (48, 49), located in the path of upward movement of said material carrier, and said material carrier (63, 75) pass one another

during an upward movement of said material carrier, while at the same time a reel is transferred by one transfer conveyor lifting it off the other, wherein said material holder (44) comprises rigid supporting struts (45, 46) and at least two spaced-apart supporting members designed as unidirectional supporting spars (48, 49) having free ends, each of said supporting spars (48, 49) projecting from a respective supporting strut (45, 46) such that the free ends of said supporting spars are approximately parallel to one another, said supporting spars projecting approximately perpendicular to a direction of movement of said material conveyors (41), wherein said material carrier (63, 75) has supporting rods (65, 66; 76, 77) which pass said supporting spars of said material holder (44) during the upward movement of said material carrier, and wherein said supporting rods of said material carrier (63, 75) are spaced at a sufficiently different distance that a pair of them can move through the space between said supporting spars of said material holder (44), and



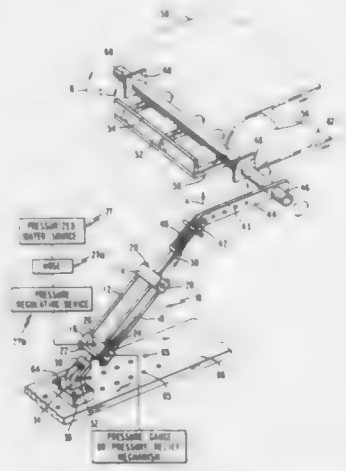
further wherein after a reel is transferred from the material holder (44) to the material conveyor (41), the reel moves along the material conveyor (41) and then the material carrier (63,75) moves downwards.

5,007,523

CONVEYOR BELT SCRAPER MECHANISMS

Allen J. Morefield, P.O. Box 534, Tazewell, Va. 24651

Continuation-in-part of Ser. No. 232,663, Aug. 16, 1988, abandoned. This application Mar. 30, 1990, Ser. No. 503,439
Int. Cl.[5] B65G *45/00*
U.S. Cl. 198—497 12 Claims



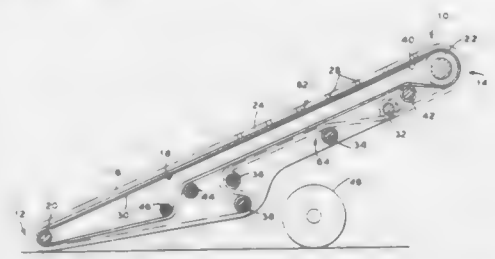
1. A conveyor belt scraping assembly comprising:
a) a support shaft means;
b) individual scraper elements detachably mounted to the support shaft means; and
c) means for moving the individual scraper elements into and out of contact with the conveyor belt wherein said individual scraper elements are formed of resilient material, at least one of said scraper elements adapted to contact center portions of the conveyor belt being formed of a material having a hardness greater than the hardness of the material forming adjacent ones of said scraper elements adapted to contact side portions of conveyor belt.

5,007,524

APPARATUS AND METHOD FOR SAFELY ACTUATING A BELT SCRAPER MECHANISM WITH PRESSURIZED WATER

Allen J. Morefield, P.O. Box 534, Tazewell, Va. 24651

Continuation of Ser. No. 232,663, Jul. 16, 1988, abandoned. This application Jul. 30, 1990, Ser. No. 560,258
Int. Cl.[5] B65G *45/00*
U.S. Cl. 198—499 20 Claims



12. Apparatus for cleaning a moving conveyor belt, comprising:
a belt cleaning mechanism powered by pressurized water for safely actuating the belt cleaning mechanism;
cylinder means for receiving said pressurized water at a pressure sufficient to move a piston slidingly guided within the cylinder means and connected to a force transmitting connecting rod;
means for connecting said connecting rod to said belt cleaning mechanism to actuate a scraper thereof into a belt cleaning position to scrape the moving belt with a controllable scraping action, wherein said piston and cylinder arrangement includes a pair of end blocks respectively at opposite ends of the cylinder and a plurality of tension rods extending between the end blocks along the sides of the cylinder and means for applying a predetermined force to the end blocks through the tension rods to close off opposite ends of the cylinder, at least said end blocks, cylinder and said piston having materials having water contacting surfaces which are non-corrodible by water.

5,007,525

BELT AND CHAIN FLIGHT CONVEYOR

Richard Crawshay, North Vancouver, Canada, assignor to Inco limited, Toronto, Canada

Filed Aug. 21, 1989, Ser. No. 396,277
Claims priority, application Canada, Oct. 21, 1988, 580997
Int. Cl.[5] B65G *15/44*
U.S. Cl. 198—690.2 6 Claims

1. A conveying apparatus, the apparatus comprising an endless conveyor having a proximal end and a distal end, the endless conveyor being a transporting leg and a returning leg, the endless conveyor including a belt conveyor and a chain flight conveyor rotating about a pair of opposed sprocketless drums disposed at the proximal end and the distal end, the chain flight conveyor parallel to and in superimposed contact with the belt conveyor for a substantial distance along the transporting leg, the width of the belt conveyor being wider than the chain flight conveyor, means for supporting the endless conveyor, and means for causing the endless conveyor to travel in a predetermined direction.

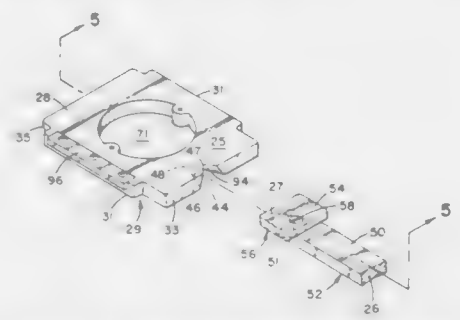
CONVEYOR CURVE AND LIVE ROLLER, LINE SHAFT CONVEYOR SYSTEM INCORPORATING SAME

Francis P. Fazzina, Grand Rapids, and Guy G. Hollister, Spring Lake, both of Mich., assignors to ERMANCO Incorporated, Spring Lake, Mich.

Filed Oct. 5, 1989, Ser. No. 417,290
Int. Cl.[5] B65G *13/02*
U.S. Cl. 198—787 24 Claims

1. A curve for a live roller, line shaft conveyor system, said curve comprising:
a first segment of driven conveyor rollers, said first segment associated with a first drive shaft for driving said first segment of driven conveyor rollers, said first drive shaft extending transversely beneath said first segment;
a second segment of driven conveyor rollers, said second segment associated with a second drive shaft for driving said second segment of driven conveyor rollers, said second drive shaft extending transversely beneath said second segment;

a curve segment of driven conveyor rollers extending beneath and connecting said first segment and said second segment;
a drive disc for driving said curve segment of driven rollers, said drive disc having an annular lip associated therewith and including an edge member thereon, said edge member being positioned against the bottom surfaces of said curve segment of driven rollers to rotate said driven rollers in said curve segment when said drive disc is rotated;



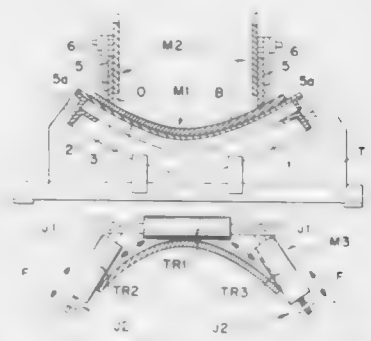
said drive disc being positioned for rotation within a horizontal plane and supported therein by at least one idler wheel and a drive wheel, said idler wheel and said drive wheel retaining said edge member against the bottom surface of said driven rollers in said curve segment to drive said rollers when said drive disc is rotated within said horizontal plane.

5,007,527

PALLET HAVING A SIDEWALL COMPRISING AN ARCUATE SURFACE

William D. Ach, Brooklyn Park; Edmund J. Anderson, Minneapolis; Lynn B. Behrends, Delano; Wayne P. Desrude, Brooklyn Park, and Gene J. Klos, Minnetonka, all of Minn., assignors to Honeywell Inc., Minneapolis, Minn.

Continuation-in-part of Ser. No. 179,417, Apr. 8, 1988, abandoned. This application Feb. 28, 1989, Ser. No. 316,513
The portion of the term of this patent subsequent to May 29, 2007, has been disclaimed.
Int. Cl.[5] B65G *47/00*
U.S. Cl. 198—803.01 6 Claims



1. A pallet for carrying a workpiece around a corner portion of a transfer mechanism in a predetermined pallet orientation, said pallet comprising:
(a) a first sidewall having arcuate groove means having a first arcuate surface for cooperating with a curved guide rail at a corner of a pallet transfer mechanism; and
(b) a second sidewall substantially opposite said first sidewall including at least one receiving cavity extending inwardly from said second sidewall angularly downwardly to define a tapered notch forming part of said second sidewall for receiving a tapered end of an engaging bar;
(c) said at least one cavity being configured for imparting vertical and horizontal lift upon engagement with an engaging bar end, said at least one cavity having a generally triangular cross section, a rounded top wall and downwardly dependent side walls, said top wall sloping downwardly from an opening of the at least one cavity to the back of the at least one cavity such that the triangular cross section decreases in area from the opening of the at least one cavity to the back of the at least one cavity.

5,007,528

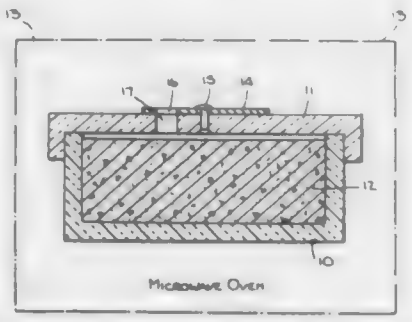
BELT CONVEYOR SUPPORTING ARRANGEMENT

Nagahama Hideharu, Hyogo, Japan, assignor to Yoko Co., Ltd., Hyogo, Japan

Filed Jun. 5, 1989, Ser. No. 361,365
Claims priority, application Japan, Jun. 5, 1988, 63-074917[U]
Int. Cl.[5] B65G *15/08*
U.S. Cl. 198—823 9 Claims

1. A supporting arrangement for a conveyor belt movable in a running direction, the arrangement being positioned where bulk materials are transferred from one of a chute and feeder and comprising:
a supporting frame extending in the running direction of the belt, said supporting frame has an arc shape in cross section and said supporting frame extends in the running direction;
a cushioning device mounted on the supporting frame for absorbing impact of bulk materials dropped onto the conveyor belt, said cushioning device comprising a resilient plate mounted on the frame in an arc trough shape generally conforming to the arc shape of the frame; and
a backing contact top plate having a lubricated contact surface for smoothly supporting the conveyor belt, said backing plate being mounted on the resilient plate of the cushioning device in an arc trough shape corresponding to the shape of the plate, the contact surface of said backing plate being provided with a plurality of generally parallel channels having sidewalls and a bottom surface, said channels extend in the running direction of the belt, said channels reducing contact area between the belt and the backing plate and upon movement of the belt in the running direction, an air flow is generated in the channels along the running direction of the belt.

5,007,529



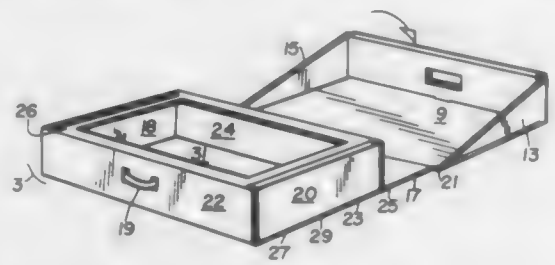
MICROWAVE-HEATABLE AIR-FRESHENER PACKAGE

Donald Spector, 380 Mountain Rd., Union City, N.J. 07087

Filed Dec. 18, 1989, Ser. No. 452,052
Int. Cl.[5] A61L *9/02*; A24F *25/00*; F16G *13/00, 11/00*
U.S. Cl. 206—0.5 7 Claims

1. An air-freshener package activated by microwave energy, said package comprising:
(a) a rigid container whose walls are formed of thermal insulation material having dielectric properties permeable to microwave energy, and having a vent therein; and
(b) a porous pad of dielectric material permeable to microwave energy housed in the container and impregnated with a liquid fragrance which is responsive to microwave energy whereby when the package is irradiated in a microwave over for a relatively short period of time, the liquid fragrance is heated to an elevated temperature to generate an aromatic vapor which when the package is thereafter removed from the oven and placed in a room, is

discharged through the vent into the atmosphere, the thermally insulated container maintaining said liquid fra-



grance at said elevated temperature for a prolonged period after the package is removed from the oven.

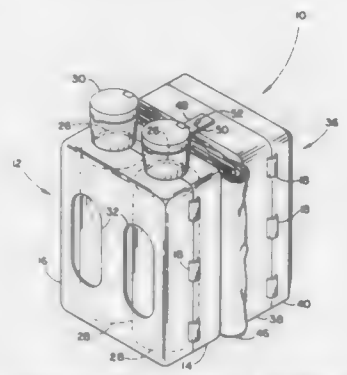
SINGLE PIECE DISPOSABLE CAT LITTER BOX

Donald Weismantel, 621 Hapsfield Apt. 106, Buffalo Grove, Ill. 60089

Filed Feb. 23, 1990, Ser. No. 483,763
Int. Cl.[5] B65D *5/20, 5/44*
U.S. Cl. 206—45.210 **2 Claims**



1. A container comprising:
a cover portion comprising an upper surface and a pair of side surfaces projecting downwardly from said upper surface, said upper surface having a rear edge and a forward edge;
a main box portion comprising a front wall, a rear wall, a pair of side walls, each of said walls of said main box portion having an upper surface and a lower surface, said walls defining therebetween a storage volume;
a hinge-member portion having a first end connected to said rear edge of said upper surface of said cover portion, and a second end connected to said lower portion of said front wall of said main box portion;
said cover portion also comprising a front wall, said pair of side surfaces of said cover portion being substantially triangular in shape, each said side surface becoming narrower in height in a direction from said front wall of said cover portion toward said rear edge of said upper surface of said cover portion;
said hinge-member portion comprising a first section, a second section, and a third section, a first fold line between said first and second sections, and a second fold line between said second and third sections; said hinge-member portion being connected to said lower surface of said front wall of said main box portion by said first section, and said hinge-member portion being connected to said upper surface of said cover portion by said third section; said first and third section being pivotally connected to said main box portion and said cover portion, respectively, whereby said hinge-member portion may folded in upon itself for placing the main box portion into the interior of the cover portion after the cover portion has been removed from its closing state on the main box portion;
said main box portion also comprising a lower wall, the upper surface portions of said walls of said main box portion defining an annular shroud;
the container being made of one-piece of flexible material, said cover portion, said main box portion, and said hinge-member portion being formed integrally together;
a third fold line at said first end of said hinge-member portion for pivotally connecting said hinge-member portion to said main box portion, and a fourth fold line at said second end of hinge-member portion for pivotally connecting said hinge-member to said cover portion; whereby said cover portion and said main box portion is pivotal relative to said hinge-member portion.

5,007,531

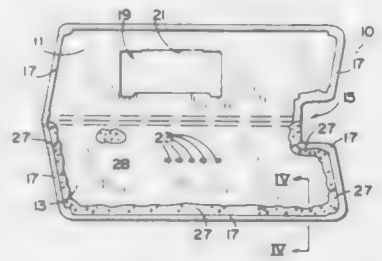
SHOWER KIT

Jimi Lighten, 5311 College Oaks Dr., No. 20, Sacramento, Calif. 95841

Filed Dec. 22, 1989, Ser. No. 455,[illegible]3
Int. Cl.[5] A47K *5/08*
U.S. Cl. 206—77.1 **20 Claims**

1. A article carrying kit comprising, in combination:
a. a first container comprising a mating pair of shells defining a cavity;
b. a second container, similar in size to the first, also comprising a mating pair of shells defining a cavity;
c. at least one flexible member joining said first and second containers such that one of said containers may be folded over the other while leaving sufficient space therebetween for a folded face cloth; and,
d. means for releasably binding said containers to one another while maintaining said space therebetween.

12. A shower kit of flexible, water-impervious material comprising, in combination:
a. a first container comprising a mating pair of shells having a hinge along one of their mating edges, said shells defining a cavity when mated;
b. a second container, similar in size to the first, also comprising a mating pair of shells having a hinge along one of their mating edges, said shells defining a cavity when mated;
c. at least one flexible strap joining said first and second containers such that one of said containers may be folded over the other while leaving sufficient space therebetween for a folded face cloth; and,
d. means for releasably binding said containers to one another while maintaining said space therebetween.



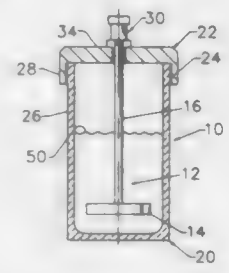
20. A shower kit of flexible, water-impervious material and of one-piece construction comprising, in combination:
a. a first container comprising a mating pair of shells, said shells defining a cavity when mated, said shells having at least one aperture defined by their mating edges through which the neck of a liquid-retaining receptacle may project, and one of said shells defining an access hole through which a liquid-containing receptacle may be manipulated;
b. a second container, similar in size to the first, also comprising a mating pair of shells, said shells defining a cavity when mated;
c. at least one flexible strap joining said first and second containers such that one of said containers may be folded over the other while leaving sufficient space therebetween for a folded face cloth; and,
d. means for releasably binding said containers to one another while maintaining said space therebetween.

5,007,532

VISOR AND METHOD FOR MAKING THE SAME

Patrick W. Binish, Holland, Mich., assignor to Prince Corporation, Holland, Mich.

Filed Nov. 20, 1989, Ser. No. 439,451
Int. Cl.[5] B60J *3/02*
U.S. Cl. 296—97.1 **42 Claims**



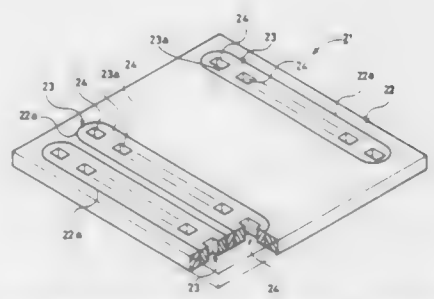
1. An automobile type visor comprising:
a self-supporting relatively thin wall member which is folded to form the core of said visor, said core having abutting edge portions;
a decorative material for covering the outside of said core and having an edge portion turned over the edges of said core into the interior of said core;
a layer of adhesive within and near said abutting edges of said core for holding said core closed and for adhering to said decorative material.

5,007,533

WET BLADE RAZOR STORAGE APPARATUS

Ahnal A. Purohit, Lisle, Ill., assignor to Anshal, Inc., Darien, Ill.

Filed Mar. 19, 1990, Ser. No. 495,471
Int. Cl.[5] B65D *81/22, 81/24*
U.S. Cl. 206—208 **11 Claims**



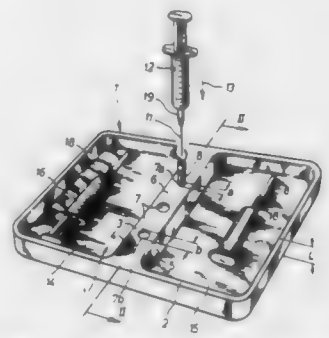
1. Apparatus for storing, during nonuse, a wet razor having a blade and a handle cantilevered away from the blade, comprising the combination of
an open-top vessel;
closure means for the vessel;
razor holding means in the vessel operable to releasably hold the razor blade within the vessel spaced below the closure means therefor;
the combination including said vessel being filled with mineral oil to a level above the blade to have the blade submerged in said mineral oil; and
a hygroscopic material contained in the vessel with the mineral oil.

5,007,534

RETAINER FOR CHIP-TYPE ELECTRONIC PARTS

Kuniaki Tamaki; Norio Sakai, and Kenji Minowa, all of Nagaokakyo, Japan, assignors to Murata Manufacturing Co., Ltd., Japan

Filed Sep. 27, 1989, Ser. No. 413,334
Claims priority, application Japan, Sep. 27, 1988, 63-242988
Int. Cl.[5] B65D *73/00*
U.S. Cl. 206—329 **4 Claims**



1. A retainer for chip-type electronic parts, comprising
a frame made substantially of rigid material and having a plurality of interior openings defining respective inner walls;
a plurality of respective retainer plate means disposed within said interior openings and having outer edges fixed to said inner walls;
each said retainer plate means comprising an elastic retainer plate having a plurality of retaining holes formed therein, said retaining holes being sized for receiving said chip-type electronic parts, and having inner surfaces which exert an elastic retaining force on said chip-type electronic parts held therein;
each said elastic retainer plate being made substantially completely of elastic material, and having substantially only such elastic material interposed between said retaining holes.

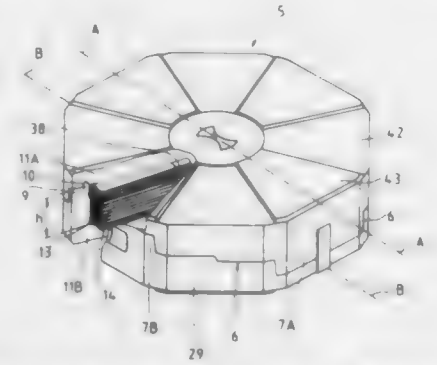
5,007,535

SYRINGE TRAY

Curt T. Meseke, Leer/Ostfriesl.; Winfried Winkler, Aachen, and Renate Hilbig, Hamm, all of Fed. Rep. of Germany, assignors to Hammerlit GmbH, Leer/Ostfriesland, Fed. Rep. of Germany

Filed Sep. 26, 1989, Ser. No. 412,813
Claims priority, application Fed. Rep. of Germany, Sep. 26, 1988, 8812156[U]; Jul. 13, 1989, 3923119; Aug. 23, 1989, 8910067[U]
Int. Cl.[5] B65D *83/10*
U.S. Cl. 206—366 **18 Claims**

1. A syringe tray for depositing and transporting medical syringes having a hypodermic needle and a cap therefor, including a tray base and further comprising:
means associated with said tray base and including hole



means, with said caps being adapted to be disposed in said hole means in a predetermined manner, said means associated with said tray base comprising at least one raised portion that is in the form of a ridge that extends upwardly from the plane of said tray base and includes a wall that is remoted from said tray base and is provided with said hole means, said ridge having two ends and increasing in width from one end to the other, said hole means being successively disposed holes that increase in diameter from said one end of said ridge to the other, with said increase in width of said ridge corresponding to said increase in diameter of said holes.

5,007,536

PACKAGING CONTAINER FOR A PLURALITY OF RECORDING MEDIA IN THE FORM OF A CIRCLE

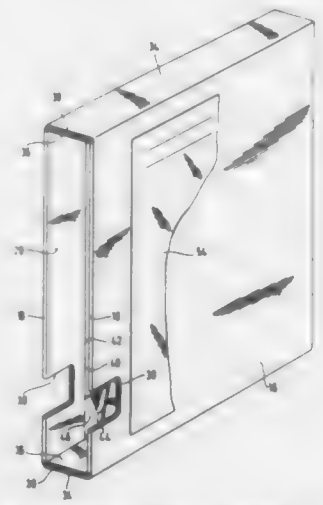
Dietmar Huebner, Oberkirch; Peter Nagel, Willstaett; Ekkehard Hirschberg, Weinheim; Klaus Schoettle, Heidelberg, and Bozidar Pavelka, Willstaett, all of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany

Filed Jan. 25, 1990, Ser. No. 470,379
Int. Cl.[5] B65D *85/67*
U.S. Cl. 206—394 14 Claims

1. A packaging container for a plurality of recording media which, at least after having been wound into roll form, have the shape of flat annular disks and are axially stacked on top of each other between two identical end members each having a skirt portion such that said members when assembled with said skirt portions in mutually abutting relationship, envelop the stack of recording media in the form of a box, said disk-shaped recording media being centered within said box by a central holder provided in each said end member,

said skirt portion having a multitude of teeth extending in a continuous zigzag pattern around the circumference of the skirt portion, the teeth of said two members tightly interfitting upon assembly of the box and the height of the largest tooth corresponding roughly to the internal height of the container, and

said members also having a transverse system of teeth extending radially of the container,



such that the separation line between the two end members is greatly lengthened and both the stability of the container and its protection against the penetration of dust are substantially increased.

5,007,537

SLEEVE FOR A PHOTOPRINT CASSETTE

Peter Ackeret, Kusnacht, Switzerland, assignor to Licinvest AG, Chur, Switzerland

PCT No. PCT/EP87/00374, § 371 Date Jun. 7, 1988, § 102(e) Date Jun. 7, 1988, PCT Pub. No. WO88/00721, PCT Pub. Date Jan. 28, 1988
PCT Filed Jul. 11, 1987, Ser. No. 196,215
Claims priority, application Fed. Rep. of Germany, Jul. 18, 1986, 3624263; Sep. 13, 1986, 3631212
Int. Cl.[5] B65D *85/48*
U.S. Cl. 206—455 62 Claims

1. A sleeve for a picture cassette, including a first large side wall, a second large side wall parallel to said first large side wall, a narrow top wall, a narrow bottom wall parallel to said narrow top wall, and a rear wall, said large side walls being interconnected by said top, bottom, and rear walls, front-defining edges of said large side walls and of said top and bottom walls remote from said rear wall defining an open front, one of said large side walls comprising a pocket for holding a flat object, said pocket including a first inner wall portion separating said pocket from a cassette-receiving space, a free edge of said first inner wall portion defining an access opening for free insertion and removal of said flat object into and from said pocket via said open front, said pocket and said access opening extending substantially over an inner height of said sleeve between said top and bottom walls, said first inner wall portion being connected to a flap along a folding line perpendicular to said rear wall, said flap being folded about said folding line so as to lie parallel to an adjacent one of said top, bottom, and side walls and mounted to keep said first inner wall portion in a position substantially parallel to said one large side wall.

5,007,538

INTERLEAVED SPIRAL WRAPPING OF FOAM PRODUCT AND STRETCH FILM FOR PACKAGING CARBONLESS PAPER ROLLS

Roger J. Mushinski; Charles E. Lewis, and Lawrence J. Casey, all of Appleton, Wis., assignors to Appleton Papers Inc., Appleton, Wis.

Division of Ser. No. 21,919, Mar. 4, 1987, Pat. No. 4,884,385.
This application Jun. 20, 1989, Ser. No. 369,533
The portion of the term of this patent subsequent to Jun. 26, 2007, has been disclaimed.
Int. Cl.[5] B65D *81/14, 85/66*
U.S. Cl. 206—523 2 Claims

1. A foam wrap package for protecting a roll of carbonless paper, comprising:

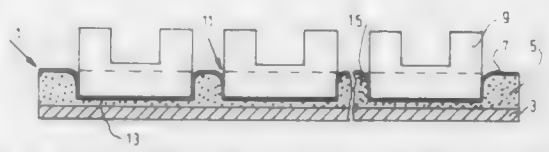
interleaved foam and film wrapped under tension around the outer periphery of roll of paper, said interleaved foam and film overlapping edges of and conforming to said roll, said film including a leading edge;

means for attaching said leading film edge to said roll;

first and second end pieces secured to flat side walls of said roll of paper; and

means for holding said first and second end pieces flush to said flat side walls;

said film being supplied from a single source of film and said foam being supplied from a single source of foam wherein the interleaved layers of foam and film are positioned on said roll of carbonless paper with said film overlapping said foam, said film being stretch film and said foam being a polyolefin packaging foam wherein the foam and film are interleaved to provide three wraps of foam about the periphery of said roll of carbonless paper whereby said foam wrap package may be handled without damaging said roll of carbonless paper.

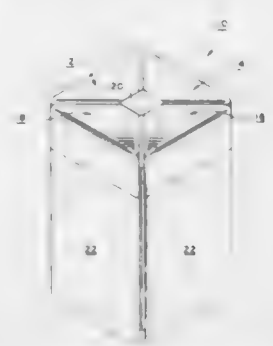


5,007,539

PACKAGE AND PACKING BODY FOR SMALL COMPONENTS

Hans-Werner Rüter, Klein Nordende, Fed. Rep. of Germany, assignor to U.S. Philips Corporation, New York, N.Y.

Continuation of Ser. No. 369,569, Jun. 21, 1989, abandoned, which is a division of Ser. No. 298,191, Jan. 13, 1989, Pat. No. 4,860,521, which is a continuation of Ser. No. 83,545, Aug. 6, 1987, abandoned. This application Apr. 9, 1990, Ser. No. 506,496
Claims priority, application Fed. Rep. of Germany, Aug. 7, 1986, 3626765
Int. Cl.[5] B65D *81/02;* B65B *15/04*
U.S. Cl. 206—524 5 Claims



1. A package with small components including a packing body having a multi-layer construction which comprises a substantially rigid base plate and a thermoplastically deformable elastic carrier layer which is fixedly connected to the base plate and which has compartments, each compartment holding an associated small component and corresponding to the shape of its associated small component whereby each such small component is firmly held in place, said package being made in accordance with a method comprising a heating said carrier layer between a temperature in the range of 70° to 180° C., placing a small component on said carrier layer and applying pressure to said small component to press it into said heated carrier layer toward said base plate which forms its associated compartment in said carrier layer, said compartment thereby corresponding to the shape of its associated small component, said carrier possessing the specific property that when said pressure is applied in a prescribed manner the bottom of said compartment immediately adjacent said base plate remains substantially undeformed during the formation of said compartment in said carrier layer.

5,007,540

PERSONAL CARE PACKAGE

John C. Beasley, Dallas, Tex., and Pierre F. Dinand, Levallois, France, assignors to Stuart Jacobson Associates, Inc., Dallas, Tex.

Continuation of Ser. No. 179,236, Apr. 8, 1988, abandoned. This application Apr. 17, 1990, Ser. No. 511,974
Int. Cl.[5] B65D *69/00, 21/00*
U.S. Cl. 206—581 5 Claims

1. A package of personal care items, comprising:

a plurality of selectively shaped individual containers from which contained personal care commodities can be dispensed;

each of said containers, in section, having a geometrical configuration selected to cooperate with the others of said containers, on being juxtaposed, to effect an arrangement in which said containers, when collectively assembled, complementarily interfit with one another; and

attachment means comprising complementary hook and loop strips on the confronting surfaces of the containers to releasably retain said containers in said juxtaposed relationship.

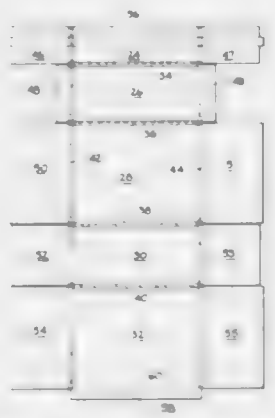
5,007,541

CARTON FOR GRANULAR MATERIALS

Charles L. Gunn, Lawrenceburg, Ind.; Harold Davis, Reading, Ohio; Milton D. Spahni, Jr., Harrison, Ohio, and Ronald H. Wanless, Lebanon, Ohio, assignors to The Procter & Gamble Company, Cincinnati, Ohio

Filed Mar. 16, 1990, Ser. No. 495,258
Int. Cl.[5] B65D *5/54*
U.S. Cl. 206—611 20 Claims

1. A side fill container for housing granular materials comprising:



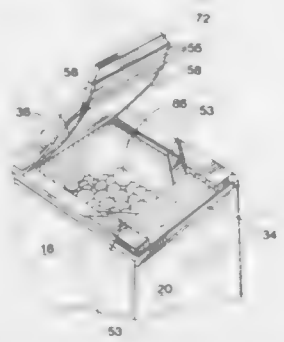
(a) an enclosure including a top wall and a bottom wall opposing each other, a front wall and a back wall opposing each other, and two end walls opposing each other, wherein:

(b) each of the end walls further comprises two main layers attached to each other in face to face relation and having a top edge, a third layer attached in face to face relation to the main layers, and a fourth layer having a horizontal tear strip therein, the fourth layer being attached to the main layers below the tear strip;

(c) the front wall further comprises an inner layer having a top edge and an outer layer, the outer layer having a horizontal tear strip therein which connects with the tear strips of the end walls forming one continuous tear strip, the inner and outer layers being attached to each other below the tear strip;

(d) an ear being attached to each of the end walls above the tear strip and further being attached to the top wall, the

ear holding the top wall against the top edge of the main layers; and



(e) a glue flap being attached to the top edge of the inner layer of the front wall via a perforated score line, the glue flap also being attached to the top wall.

5,007,542

RECLOSEABLE CARTON WITH POURING SPOUT

Harry I. Roccaforte, 3929 Forest Ave., Western Springs, Ill. 60558

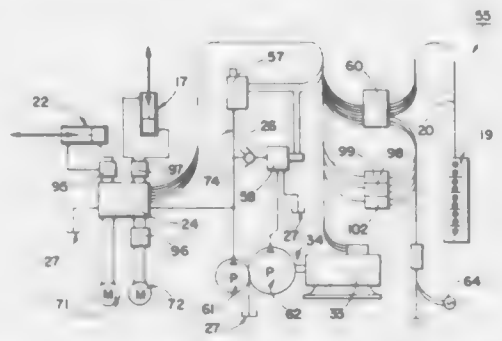
Filed Aug. 14, 1990, Ser. No. 567,320
Int. Cl.[5] B65D *5/70*
U.S. Cl. 206—621.6 **14 Claims**

1. A recloseable pouring spout structure for a wall of a carton comprising:

an outer wall panel having inner and outer surfaces and a leader tab therein defined by a pair of parallel tear lines of substantially equal length formed by intermittent cuts through the outer wall panel, each tear line having a first end and a second end, said leader tab further having a finger edge connecting the first ends of said tear lines;

first and second tear areas of substantially equal length formed in said outer wall panel, each said tear area having a first end that adjoins one of the second ends of one of the tear lines and a second end, each said tear area being defined by a partial cut in the inner surface of the outer wall panel and a partial cut in the outer surface of said outer wall panel substantially parallel to and displaced from the partial cut in the inner surface, each of said tear areas extending from its first end to its second end in a direction generally the same as the direction in which the tear lines extend;

an inner wall panel having inner and outer surfaces and a spout opening therethrough with a lead edge, said outer surface of the inner wall panel lying against and affixed to the inner surface of the outer wall panel by adhesive means that substantially encircles the spout opening and extends across the inner surface of the outer wall panel at the leader tab, such that the spout opening is located substantially between the first and second tear areas; and



a plurality of parallel, transverse, delamination ribs formed by partial cuts in the outer surface of the inner wall panel adjacent the lead edge of the spout opening, said transverse delamination ribs being located below the inner surface of the leader tab, such that said transverse delamination rib partial cuts are oriented substantially at right angles to the direction of extent of the tear lines and extend substantially between the tear lines and such that the outer surface of at least one of the transverse delamination ribs is affixed to the inner surface of the leader tab by said adhesive means.

5,007,543

CRANE APPARATUS

Mack A. Cooke, 910 Neal St., Greensboro, N.C. 27403

Filed Aug. 21, 1989, Ser. No. 396,077
Int. Cl.[5] B66C *13/40*
U.S. Cl. 212—160 **5 Claims**

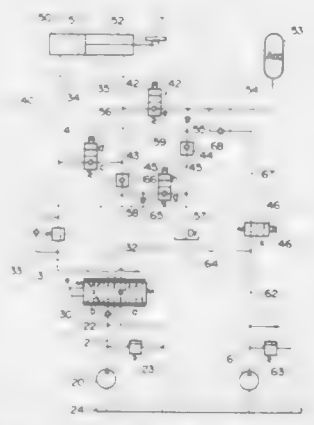
1. In a crane apparatus having a base, a turret rotatably mounted on said base for movement about a vertical axis, a hydraulic actuator for rotating said base, a boom with an inside extendable segment and a outside segment, a hydraulic actuator for moving said inside extendable segment relative to said outside segment, means for mounting said boom on said turret, a winch with a lead line, means mounting said winch and said lead line on said boom, a hydraulic actuator for driving said winch, a hydraulic source and circuit therefor, a high volume pump and a low volume pump connected to said hydraulic source, means for driving said pumps, a directional control valve assembly for directing hydraulic fluid from said pumps to said hydraulic actuators, the improvement comprising:

a pendant control device, an electrical cord with first and second ends, said cord being connected to said device at one of said ends and removably connected to said base at the other one of said ends, said device including a plurality of parallel connected two-stage switches for controlling said hydraulic actuators, each of said switches when actuated to a first stage being operative to drive a respective hydraulic actuator at a low speed and when actuated to a second stage being operative to drive a respective hydraulic actuator at a high speed relative to said low speed;

a normally open electrically operated pump unloading valve connected to said high volume pump and a normally closed pressure switch connected in series with said electrically operated unloading valve;

each of said two-stage switches when actuated to said first stage being operative to place said directional control valve assembly in fluid communication with only said low volume pump to drive a selected hydraulic actuator at said low speed;

each of said two-stage switches when actuated to said second stage being operative to close said unloading valve to place said directional control valve assembly in fluid communication with said high volume pump whereby said low volume pump and said high volume pump are concurrently operated to supply fluid to a selected hydraulic actuator to drive it at said high speed; and



said pressure switch being operative to open said unloading valve in response to a predetermined pressure in said hydraulic circuit when a hydraulic actuator is driven at high speed to prevent the stalling of said means for driving said pumps.

5,007,544

MECHANISM FOR SUPPRESSING DISPLACEMENT OF TRAVELLING CRANE

Yoshimi Saotome, Takasago; Kiyotsuna Kuchiki, and Norihiko Hayashi, both of Kakogawa, all of Japan, assignors to Kabushiki Kaisha Kobe Seiko Sho, Kobe, Japan

Filed Apr. 6, 1990, Ser. No. 505,401
Claims priority, application Japan, Sep. 9, 1989, 1-234055
Int. Cl.[5] B66C *23/26, 13/06;* **F16D** *31/62*
U.S. Cl. 212—265 **4 Claims**

1. A mechanism for suppressing the displacement of a travelling crane, including:

a wheeled supported car body; a boom pivotally supported on said car body;

a hydraulic cylinder with first and second oil chambers for raising and lowering said boom, said hydraulic cylinder being connected between said body of the travelling crane and the boom;

a main hydraulic pump;

a direction control valve for controlling oil from said main hydraulic pump selectively with respect to said first oil chamber which functions to maintain the load of said hydraulic cylinder and to said second oil chamber located on the side opposite to said first oil chamber;

a displacement suppressing accumulator connected between said cylinder and said direction control valve;

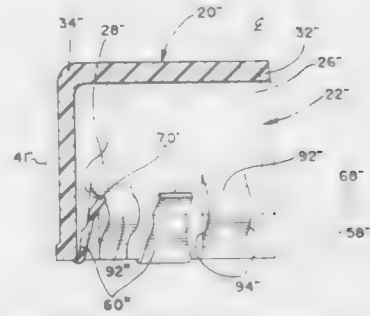
a mode change-over valve mechanism selectively operable in either a crane travelling mode position in second oil chambers and said accumulator being in fluid communication with one another and a crane operation mode position in which said communication is cut off and pressure oil is supplied to or discharged from said first and second oil chambers independently;

a mode selection switch for selecting a mode position for said mode change-over valve mechanism;

a boom position detecting means;

an auxiliary pressure oil source;

a change-over valve for controlling said auxiliary pressure oil source, said change-over being selectively shiftable between a first position in which said auxiliary pressure oil source is in communication with said first oil chamber of said cylinder and to a second position to which said communication is cut off; and



a control means operable to shift said change-over valve to said first position to supply a predetermined amount of oil to said first oil chamber of said cylinder from said auxiliary pressure oil source when said mode selection switch is in the crane travelling mode position and a detected value by said boom position detecting means is smaller than a predetermined lower limit value of a selected boom travelling range.

5,007,545

REMOVAL RESISTANT MEMBER

Leo R. Imbery, Jr., Crystal Lake, Ill., assignor to Seaquist Closures, Crystal Lake, Ill.

Filed Mar. 15, 1990, Ser. No. 494,238
Int. Cl.[5] B65D *47/02*
U.S. Cl. 215—14 **1 Claim**

1. A mounting member for being mounted to a container that has an exterior surface portion and an annular bead projecting from the circumference of said surface portion, said mounting member comprising:

a skirt for being disposed around said container exterior surface portion with at least a first annular section of the skirt extending axially on one side of said container annular bead, said first annular section of said skirt defining a plurality of circumferentially spaced-apart inwardly convex lugs for engaging said annular bead of said container;

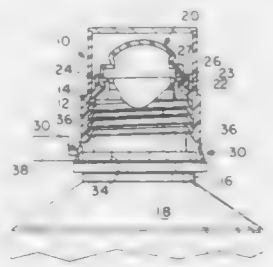
extension means for extending from the peripheral edge of said first annular section;

first flexible connecting means for connecting said extension means to said skirt first annular section at a first bend region to accommodate radially inward movement of said extension means to an orientation generally alongside said skirt first annular section;

a plurality of circumferentially spaced tabs each extending from and radially inwardly of said extension means; and

second flexible connecting means for connecting each said tab to said extension means at a second bend region to accommodate radially inward pivoting of each said tab toward said container when sufficient relative axial displacement is effected between said mounting member and container to engage said container annular bead with the distal end of said tab and thereby resist further axial displacement.

5,007,546



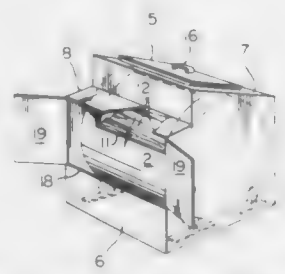
BOTTLE CAPS

Howard Rose, St. Helen's, and Ian G. C. McAffer, Westerham, both of Great Britain, assignors to Waverley Pharmaceuticals Limited, Great Britain

Filed Mar. 14, 1989, Ser. No. 322,901
Claims priority, application United Kingdom, Jul. 14, 1987, 8716514
Int. Cl.[5] B65D *1/02*
U.S. Cl. 215—32 **10 Claims**

1. A bottle cap for use with moulded plastics bottles which have an integral flanged seal over the aperture of the threaded neck, a frangible membrane joining the seal to the neck, the cap having a complementary screw-thread to that of the neck and at least two inwardly projecting resilient members located above the screw-thread such that, when the cap is screwed onto the bottle, the members pass around the seal with resilient deformation and, on unscrewing the cap, engage the flanged

seal in a lifting action, characterized in that at least one of the inwardly projecting members comprises an upwardly directed blade, adapted to engage an undersurface of the flanged seal,



such that upon unscrewing of the cap, said upwardly directed blade will cut into the undersurface while lifting the flanged seal to provide an efficient severance of the seal from the bottle neck.

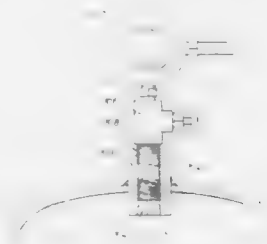
5,007,547

MULTI-PORT CONTAINER

Seguard Corbett, 2nd Floor, 839 - 5th Avenue S.W., Calgary, Alberta, Canada T2P 3C8

Filed Jun. 2, 1989, Ser. No. 360,525
Int. Cl.[5] B65D *88/54*
U.S. Cl. 220–581 **12 Claims**

1. A multi-port container comprising housing means; first and second openings in separate walls of said housing means permitting access to the interior thereof; drum means for receiving material in said container; a third opening in said drum means for loading said drum means or removing material therefrom; and roller means supporting said drum means for rotation in said housing means, whereby said drum means can be rotated to align said third opening with said first or second opening to permit loading and unloading of said drum means at different locations on said housing means.



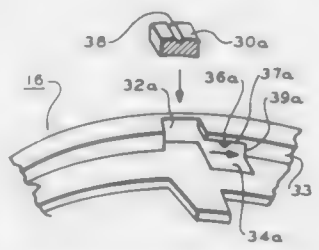
5,007,548

GAS CYLINDER SAFETY DEVICE

Larry S. Corley, Houston, Tex., assignor to Shell Oil Company, Houston, Tex.

Filed Jul. 26, 1990, Ser. No. 557,819
Int. Cl.[5] F16K *17/00*
U.S. Cl. 220—3 **12 Claims**

1. In a pressure vessel capable of storing fluids under pressure comprising a shell and a channel formed through the shell for fluid to flow into or out of the vessel wherein unrestricted flow out of the vessel through the channel could exert a force on the vessel which exceeds the empty weight of the vessel, the improvement being a means internal to the vessel to restrict flow through the channel from the vessel, the means to restrict



the flow being effective to limit the force exerted on the vessel to less than that exerted by gravity on the pressure vessel.

5,007,549

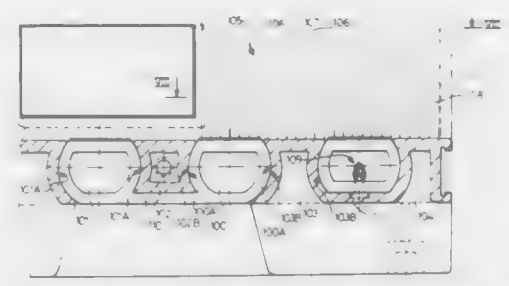
ELECTRICAL OUTLET BOXES AND COVERS THEREFOR

Eugene J. Suk, Pittsburgh, Pa., assignor to Industries, Inc., Livingston, N.J.

Continuation of Ser. No. 347,180, May 4, 1989, abandoned. This application Jun. 8, 1990, Ser. No. 535,290
Int. Cl.[5] H02G *3/14*
U.S. Cl. 220—3.8 **10 Claims**

1. An apparatus for covering an electrical outlet box, comprising:

a ring, said ring being capable of being fitted within the interior of said electrical outlet box, said electrical outlet box having a diameter, and said ring including an inner wall and an outer wall, wherein said inner wall includes at least one first groove means, said at least one first groove means being bounded by at least one wall portion, said at least one wall portion having at least one protruding portion extending from said at least one wall portion; and



a cover, said cover including a top portion, said top portion having a diameter greater than that of said electrical outlet box and of said ring, and a downwardly depending circular portion, said downwardly depending circular portion including at least one tab means projecting from said downwardly depending circular portion, said at least one tab means including at least one second groove means, said at least one tab means capable of being received by said at least one first groove means, said at least one tab means capable of interlocking with said at least one first groove means and said at least one second groove means capable of mating and interlocking with said at least one protruding portion upon rotation of said cover relative to said ring, thereby enabling said downwardly depending circular portion to mate with said ring.

CONTAINER

Jean-Pierre Avot, les Loges en Josas, France, assignor to Sonabat-Chantal - a French Society, de Bretagne, France

Filed Aug. 15, 1989, Ser. No. 393,939
Claims priority, application France, Aug. 16, 1988, 88 10920
Int. Cl.[5] B65D *6/16*
U.S. Cl. 220—8 **3 Claims**

1. A container of adjustable width including a base, a back, a front edge and two side walls,

Said container formed by two elements (1, 2) each including one of said side walls (3, 13) bounded by part of the back (4, 14) and part of the base (5, 15),

the back parts (4, 14) and the base parts (5, 15) of the two elements (1, 2) overlapping each other telescopically to enable the width (L) of the container to be adjusted by the movement of the two elements (1, 2) towards or away from each other,

the base parts (5, 15) and the back parts (4, 14) of each element (1, 2) formed with fingers leaving intervals between them, the fingers and intervals having similar configuration in cross-section so that the shape of the fingers correspond to the shape of the intervals,

the fingers of one of said elements (1, 2) sliding into the intervals between the fingers of the other of said elements (2, 1), wherein

the fingers of the one element have rounded convex sides and flat upper surfaces, while the fingers of the other element have rounded concave sides and flat upper and lower surfaces, the contact between the concave and convex surfaces provides an interlocking engagement of the elements that restricts movement perpendicular to the telescopic movement.

RECEPTACLES DESIGNED TO ENABLE THEIR JUXTAPOSITION

Stefan Baroï, 40, Chemin de la Chevillarde, 1208 Geneva, Switzerland

PCT No. PCT/CH88/00030, § 371 Date Sep. 27, 1988, § 102(e) Date Sep. 27, 1988, PCT Pub. No. WO88/06132, PCT Pub. Date Aug. 25, 1988
PCT Filed Feb. 8, 1988, Ser. No. 278,941
Claims priority, application France, Feb. 12, 1987, 87 02176
Int. Cl.[5] B65D *21/02*
U.S. Cl. 220—23.4 **16 Claims**

1. Juxtaposable containers, each consisting of a hollow modular cell comprising at least one neck and at least one recess serving as a receptacle for an identical neck of another cell, each modular cell being connectable to at least one other modular cell, wherein each neck and each recess are equipped with matching snapping means, and wherein these means are activated as a result of the engagement of a neck of one cell into a recess of the juxtaposed cell, wherein the modular cells are cubic, wherein at least one face is equipped with a neck (2, 2', 2''), and wherein at least one other face is equipped with a recess (3, 3', 3''), the outer dimensions of the necks corresponding to the inner dimensions of the recesses, and the necks and recesses being concentric with the geometrical center of the faces of the cube which are equipped with them, wherein the neck (2, 2', 2'') and the recesses (3, 3', 3'') are truncated cones, and wherein the height (h) of the necks is identical to the depth (h') of the recesses, wherein the generatrix (a) of the cone in

which the necks (2, 2', 2'') and the recesses (3, 3', 3'') are inscribed forms an angle of 45° with the axis of symmetry (XX, YY) with which they are concentric, wherein the faces (10) of each container are joined by means of a bevel (p), and wherein a generatrix (a) of each neck (2, 2', 2'') is inscribed in the geometrical plane of each bevel

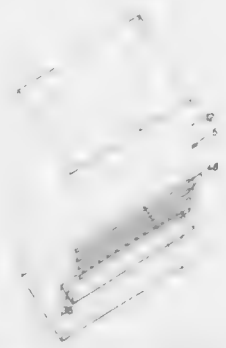
SERVING BAR AND CONTAINER FOR FOOD

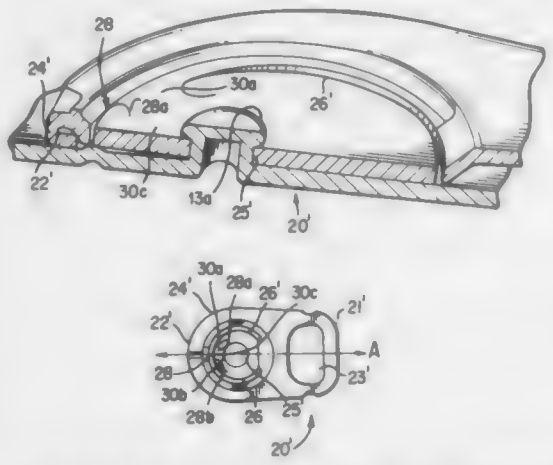
Daniel E. Sage, Dayton, and James C. Patrick, Jr., Troy, both of Ohio, assignors to Ponderosa Corporation, Dayton, Ohio

Filed Dec. 11, 1987, Ser. No. 131,567
Int. Cl.[4] A47F *5/00*
U.S. Cl. 220—23.83 **11 Claims**



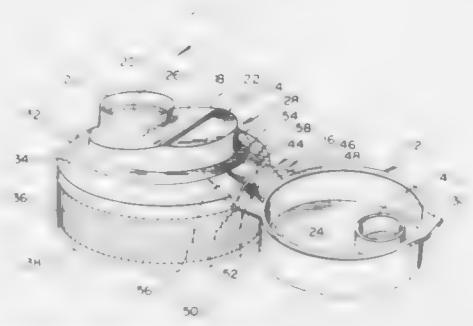
1. A container for food adapted for being seated, with similar containers, in a serving bar having a substantially rectangular opening for receiving said containers and a substantially rectangular upper edge at the periphery of the opening, opposing edges of said upper edge supporting said container and one edge being higher than the other to elevate one end of said container, said container comprising:

a pan having a bottom, a first and second set of opposing sidewalls extending therefrom to an opening and defining a compartment for holding the food, and lips extending outwardly from said sidewalls of said first set for engaging the edges of the serving bar; and,



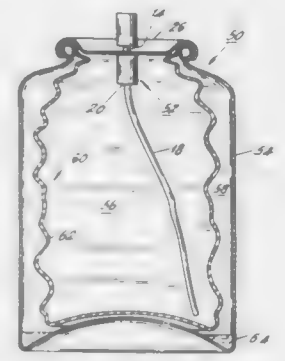
a first cover engageable with the periphery of one end of said pan adjacent said opening for closing a portion of said opening adjacent the elevated end of said pan; said first cover comprising a body engageable with the periphery of one end of said pan, a flange extending generally perpendicularly from one end of said body and latchable with either one of said lips of said pan, and a ledge extending generally perpendicularly from the other end of said body in a direction opposite to that of said flange of said first cover.

5,007,553
CONTAINER FOR A PAINT BRUSH
Lee J. Curtis, 74 Patshull Road, London NW5 2LD, England
Filed Jan. 4, 1990, Ser. No. 461,052
Claims priority, application United Kingdom, Jan. 13, 1989, 8900773
Int. Cl.[5] A45D *44/18*; **B65D** *25/00*; **A47L** *13/56*
U.S. Cl. 220—90 **7 Claims**



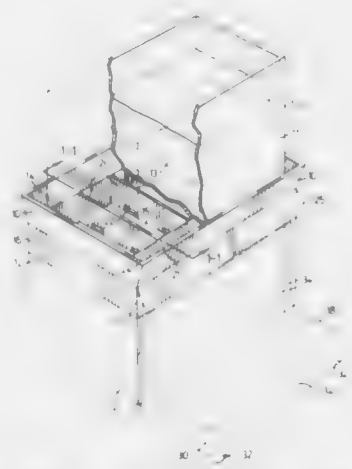
1. A container for a paint brush, which container comprises a body and a lid, the body having a base and a walled portion which upstands from the base, the lid having an aperture through which a handle of the paint brush passes and slits which extend from the aperture and which enable parts of the lid defining the aperture to grip the handle of the paint brush adjacent the aperture whereby, when the lid is on the body, the handle of the paint brush can extend beyond the lid and a brush part of the paint brush can be suspended in the body above the base of the body, the walled portion of the body having an inwardly projecting integrally formed shelf on which to rest the paint brush inside the body when the lid is not on the body, and the walled portion of the body also having integrally formed ribs which extend parallel to the base and which are for facilitating wiping excess paint from the paint brush.

5,007,554
CONTAINER LIFT TAB
Charles Hannon, 27 Sargent Rd., Scarsdale, N.Y. 10583, and Leonard J. Vallender, Valhalla, N.Y., assignors to Charles Hannon, Scarsdale, N.Y.
Filed Apr. 25, 1989, Ser. No. 343,046
Int. Cl.[5] B65D *41/32*
U.S. Cl. 220—269 **11 Claims**



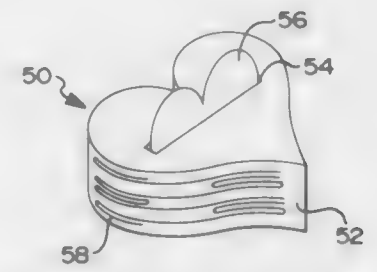
1. A lift tab, for fulcrum opening of a top of metal container, comprising an elongated metal member having means for fixed engagement of a portion of the tab to the metal container top, wherein with said tab being fixedly engaged to said container top, said tab comprises first and second ends located on opposite sides of the fixed engagement portion, with the second end adapted to partially overlap a weakened section of the container top, and said tab further comprising a fulcrum pivoting area between the fixed engagement portion and the second end, whereby elevation of the first end causes the tab to swivel through the pivoting area with the second end being forced into pushing engagement with the weakened section of the container top thereby causing the weakened section to tear open, characterized in that the tab further comprises means to permit increased elevation of the first end of the tab to a predetermined height without concomitant increase in lifting force, said means comprising a secondary fulcrum operably positioned between the fulcrum pivoting area and the second end, with said secondary fulcrum intersecting a longitudinal axis between said first end and said second end, and which longitudinal axis passes through the position at which said tab is fixedly engaged to said container top, wherein the secondary fulcrum initially operates until the pre-determined height is reached and whereby the tab further includes secondary fulcrum limiting means which limits further operation of the fulcrum pivoting area for causing the tearing open of the weakened section of the container top, wherein the means to permit increased elevation comprises a lanced line positioned between the fulcrum pivoting area and the second end, with the lanced line intersecting said longitudinal axis.

5,007,555
BIASED HINGE CAP
James M. Beck, Carol Stream, Ill., assignor to Creative Packaging Corp., Wheeling, Ill.
Filed Dec. 19, 1989, Ser. No. 452,427
Int. Cl.[5] B65D *47/08*
U.S. Cl. 220—339 **16 Claims**



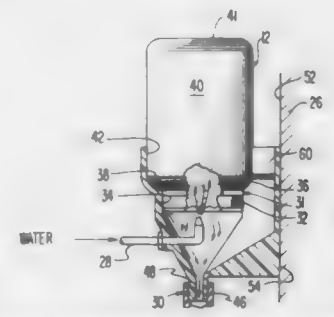
1. A hinge closure comprising:
a cap body portion adapted to be secured to a container having a dispensing opening therein, said cap body portion including a top portion raised above a shoulder and including a periphery therearound, said cap body including a mating portion;
a lid hinged to said cap body by a solid one-piece unitary hinge member integrally formed between said cap body and said lid, said hinge member being attached on one side directly to said lid and on an opposite side to said cap body by a film hinge and including a central planar portion; and
said hinge member including a side shoulder depending from either side of said central planar portion of said hinge member when said lid is in its opened position and being attached on one end directly to said lid and on an opposite end to said cap body by said film hinge so that a snap is provided in said side shoulders during operation of said hinge member and said side shoulders mate with said mating portion of said cap body in a closed position of said lid.

5,007,556
METERING DISPENSER
Myron J. Lover, Mountainside, N.J., assignor to Block Drug Company, Inc., Jersey City, N.J.
Filed Apr. 18, 1990, Ser. No. 510,681
Int. Cl.[5] B65D *83/14*
U.S. Cl. 222—386.5 **10 Claims**



1. A dispenser, comprising:
(A) a container for containing fluid to be dispensed;
(B) a metering valve connected to said container, said metering valve comprising:
(a) a metering chamber;
(b) a valved inlet for introducing a metered dose of the fluid into said metering chamber when said valved inlet is open; and
(c) a valved outlet for dispensing the metered dose from said metering chamber when said valved inlet is closed; and
(C) a barrier for pressurizing the fluid so that substantially no vapor or gas remains within said metering chamber when said valved inlet is open.

5,007,557
SPILL CONTAINER WITH UNFOLDING FLEXIBLE COMPARTMENT
James Spence, 310 Blantyre Avenue, Scarborough, Ontario, Canada M1N 2S7
Filed Mar. 19, 1990, Ser. No. 495,806
Int. Cl.[5] B65D *25/02*
U.S. Cl. 220—571 **19 Claims**



1. A spill container adapted for use in conjunction with a leak susceptible fluid container, said spill container comprising a receptacle for receiving leaking fluid, and a foldably flexible water-proof compartment openly connected to the receptacle for receiving a flow of fluid therefrom, the receptacle comprising a containing wall defining a hollow fluid-trapping vessel, a first opening for receiving leaking fluid, and a second opening connecting the receptacle to the flexible water-proof compartment, the flexible water-proof compartment comprising a base portion, a side wall portion and a third opening sealably continuous with the second opening, said flexibly water-proof compartment storable in a retracted fluid-receiving position adjacent to the receptacle and unfoldably responsive without human intervention to a fluid pressure exerted through the second opening by a fluid column in the receptacle, whereby said spill container is adapted to extend to accommodate an accidental leak of volume exceeding the fluid volume of the receptacle without spillover from the receptacle.

5,007,558
ORNAMENTALLY-SHAPED, INTERFOLDED PAPER PRODUCTS
Joyce Allen, 17671 Rowe, Detroit, Mich. 48205, and Kathy M. Bonner, 17679 Rowe, Detroit, Mich. 48205
Filed May 13, 1988, Ser. No. 193,570
Int. Cl.[5] B65H *1/00*
U.S. Cl. 221—48 **4 Claims**

1. A dispenser for interfolded tissue product comprising:
a sheet material assembly of discrete, ornamentally-shaped forms consisting of a non-polygonal perimeter and including at least one curvilinear portion with interfolded webs including half-web folds which are interfolded with themselves and with previous, upstream folded webs, and packed in a box dispenser having a single opening therein for pop-up removal of individual discrete sheets of ornamentally-shaped tissue paper,
said box dispenser having a like shape to the shape of the ornamentally-shaped forms contained therein.

5,007,559
METHOD AND APPARATUS FOR DISPENSING A PARTICULATE MATERIAL
Cecil B. Young, 7411 Rhondda Dr., Lorton, Va. 22079
Continuation of Ser. No. 887,593, Jul. 21, 1986, abandoned. This application Jun. 1, 1989, Ser. No. 361,692
Int. Cl.[5] B67B *7/00*
U.S. Cl. 222—1 **20 Claims**

1. A method for dispensing detergent to a washing machine comprising:
(a) forming a container from plastic material with a shoulder

and a neck portion integral therewith prior to insertion of detergent therein;

(b) placing the detergent in particulate form within a container, said container having a mouth for receiving the detergent;

(c) covering the container mouth with a cover material which is impermeable to particulate matter while permitting passage of water, said covering step being made prior to delivery of said container to said washing machine;

(d) said washing machine having an exterior portion and an interior portion, said washing machine having an inlet connected to said interior portion for receiving the detergent, said inlet being in communication with a fixed receptacle facing upwardly, said receptacle having a complementary portion for engaging said container mouth;

(e) delivering said container to the vicinity of said washing machine;

(f) arranging said container with respect to said receptacle to form a closed path between the container and said inlet, said particulate matter being supported above the inlet by said cover material, within the container and exposed to said inlet;

(g) subjecting said particulate material while supported within said container above said inlet to controlled amounts of fluid to dissolve particulate material in the vicinity of the container mouth sufficiently to permit passage of detergent through said cover material and to said inlet; and

(h) the step of subjecting said particulate material while supported within said container above and said inlet including spraying fluid from a position exterior to said container through said cover material to said mouth of said container to dissolve material in the vicinity of the mouth in the lower portion of the container while detergent in the upper part of the container remains substantially dry.

9. A container for dispensing detergent in particulate form for use with a washing machine having a complementary receptacle comprising:

(a) a hollow body portion containing particulate detergent therein;

(b) said container having a shoulder portion and a neck portion integral therewith, said shoulder portion and said neck shaped to cooperate with said receptacle to form a substantially closed path therebetween;

(c) a mouth connected to said neck portion to permit access to the interior of the container; and

(d) said mouth being covered by a cover material impervious to the particulate detergent while being pervious to a fluid sprayed through said cover from a position exterior of said container for dissolving said detergent sufficiently to pass through said cover of the wire mesh, said cover material being fixed to said container independently of said receptacle.

BEER DISPENSING AND MONITORING METHOD AND APPARATUS

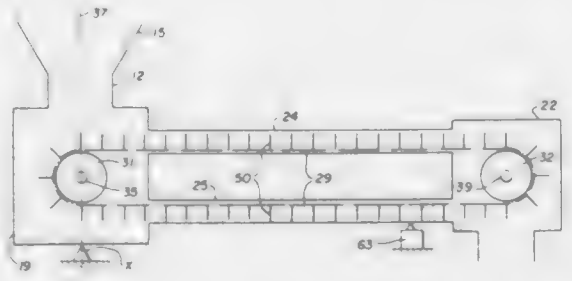
John J. Sassak, 36855 Schoolcraft, Livonia, Mich. 48150

Filed Mar. 1, 1989, Ser. No. 317,584
Int. Cl.[5] B67D *5/08*
U.S. Cl. 222—1 **16 Claims**

1. A method for delivering liquid beer to a container such that a head of foam is disposed in the container, comprising the steps of:

delivering a first part of the liquid beer at a non-foaming temperature to a dispensing location;

delivering a second part of the liquid beer at a greater, foaming temperature to the dispensing location;



dispensing the first and second parts of the liquid beer to the container such that a head of foam forms on the liquid beer in the container.

5,007,561

NON-FLOODING SET RATE FEEDER

Richard C. Wahl, Essex Falls, and Ralph J. Winters, Nutley, both of N.J., assignors to Vibra Screw, Incoporated, Totowa, N.J.

Continuation of Ser. No. 13,943, Feb. 12, 1987, abandoned. This application Feb. 2, 1990, Ser. No. 474,216
Int. Cl.[5] B67D *5/08*
U.S. Cl. 222—55 **17 Claims**

1. Apparatus mounted for pivotal movement about an horizontal axis for feeding fluid-like particulate material comprising:

a substantially enclosed trough housing having side walls and a bottom wall to contain and support said material, said trough housing having an inlet spaced above said bottom wall for receiving said material from a supply means, said inlet and said trough housing including said side walls being symmetrical about a vertical axis of symmetry so that material entering and contained and enclosed by said trough housing will be uniformly distributed on said bottom wall and within said trough housing side walls about said axis of symmetry,

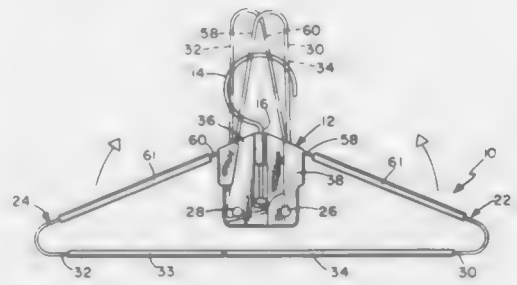
an outlet means having an exit opening for discharging the material,

a first tube member interconnecting said trough housing and said outlet means,

a series of connected pusher means movable into said trough housing and through said material contained in said enclosed trough housing and out of said trough housing into said first tube member for moving material in a uniform quantity from said trough means to said outlet means,

a variable speed control motor coupled to said pusher means through a first pulley,

displacement means for measuring a displacement from the horizontal of said apparatus and for producing an output signal corresponding to said displacement, and



control means responding to said output signal for regulating the speed of said motor.

5,007,562

COLLAPSIBLE CLOTHES HANGER

Joyce Brink, and James E. Brink, both of 1142 Bobolink Dr., Vista, Calif. 92083

Filed Jul. 10, 1989, Ser. No. 377,279
Int. Cl.[5] A47G *25/42, 25/40, 25/16*
U.S. Cl. 223—89 **14 Claims**

12. A collapsible clothes hanger, comprising:

a central support bracket;

a suspending member extending in a first direction from the support bracket for suspending the hanger from a support;

first and second hanger arms pivotally mounted on said support bracket for movement between a first, extended position in which they extend in generally opposite directions away from said support bracket and angled downwardly relative to said suspending member, and a second, collapsed position in which they extend generally parallel to one another upwardly in said first direction from said support bracket in the same direction as said suspending member;

said support bracket including releasable retaining means for releasably retaining portions of said hanger arms in both said extended and collapsed positions; and

said support bracket having oppositely directed channels comprising said releasable retaining means for receiving portions of said hanger arms in both said positions, said hanger arm portions being a snap fit in said channels.

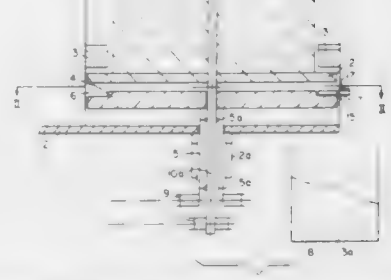
5,007,563

DISPENSING HEAD FOR AN ADDITIVE PRODUCT FOR MOUNTING ON A RECEPTACLE AND A RECEPTACLE EQUIPPED WITH SUCH A HEAD

Vincent de Laforcade, Clamart, France, assignor to L'Oreal, Paris, France

Filed Nov. 7, 1989, Ser. No. 432,854
Claims priority, application France, Nov. 9, 1988, 8814644
Int. Cl.[5] B67D *5/56;* **B65D** *25/40*
U.S. Cl. 222—145 **12 Claims**

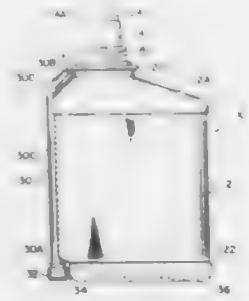
1. A dispensing head for an additive with the head having means for attachment to an outlet of a container for a product of the type that is dispensed in the form of a foam or a paste, said head having first wall means defining a central conduit having at one end said means for attachment, second wall means disposed about said first wall means to define a chamber for the additive, aperture means for dispensing the additive from said chamber, said aperture means disposed on a top wall of said chamber opposite to said end of said conduit, said chamber having an opening in communication with said central conduit, tube means slidably disposed relative to said central conduit and movable between a storage position wherein said opening of said chamber is closed by said tube means, and



another position, wherein said opening of said chamber is unobstructed.

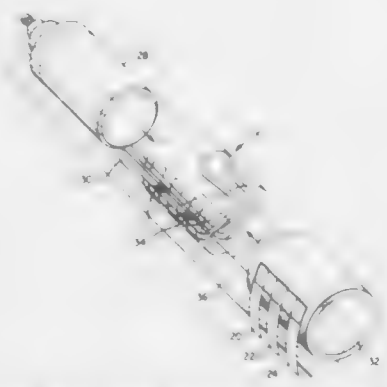
5,007,564

DOSING OR FEEDING APPARATUS FOR PRECISELY FEEDING LOOSE BULK MATERIAL



Matthias Beth, Griesheim; Hansgeorg Binz, Eschborn, and Ludger Toerner, Eppertshausen, all of Fed. Rep. of Germany, assignors to Carl Schenck AG, Darmstadt, Fed. Rep. of Germany

Filed May 25, 1989, Ser. No. 357,311
Claims priority, application Fed. Rep. of Germany, May 30, 1988, 3818338
Int. Cl.[5] G01F *13/00*
U.S. Cl. 222—217 **16 Claims**

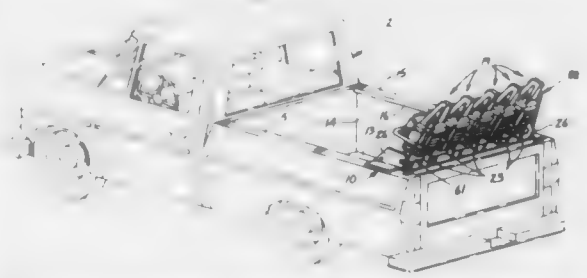


1. A dosing or feeding apparatus for feeding precisely measured portions of loose bulk material, especially powdered or fine grained material, comprising a cylindrical container for storing said bulk material, rotating turntable means arranged for substantially closing a bottom end of said cylindrical container, said turntable means comprising a discharge groove having a defined vertical cross-sectional groove area, said discharge groove being arranged around said turntable next to its circumference, said discharge groove opening radially outwardly, drive means arranged for rotating said turntable means, a discharge opening in said container, and stripper means reaching into said discharge groove through said discharge opening, said stripper means being so dimensioned and positioned that said stripper means substantially completely cover said vertical cross-sectional groove area for stripping said precisely measured portions of bulk material out of said groove through said discharge opening with each revolution of said turntable.

5,007,565
INTEGRAL VENT TUBE
Simon J. Richter, Marietta, Ga., and Frank G. Hohmann, Deville, N.J., assignors to The Coca-Cola Company, Atlanta, Ga.
Continuation of Ser. No. 623,192, Jun. 21, 1984, abandoned.
This application Jan. 13, 1987, Ser. No. 2,991
Int. Cl.[5] B67D 3/00
U.S. Cl. 222—481 38 Claims

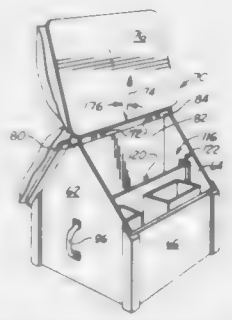
1. A disposable package for dispensing liquids with a controlled rate of flow comprising:
a container having a base end and a discharge end opposite thereto, sidewalls extending from said base end toward said discharge end and a neck connecting the sidewalls to the discharge end and defining a discharge opening through which liquids may be dispensed; and
a flow rate control tube having an openable, sealed end and an open end, the tube having the openable, sealed end thereof disposed in the container base end and a major portion extending substantially longitudinally of said container on the outside of said sidewalls, said tube having a minor portion connecting said major portion to said open end of said tube at the container neck, said open end communicating through said neck with the inside of said container, said major portion of said tube having a predetermined inside diameter, permitting the free flow of air therethrough, and said minor portion of said tube having an inside diameter which gradually decreases toward the open end of said tube to limit the size of any air bubbles which might be formed and minimize liquid pressure and flow rate fluctuations.

5,007,566
WATER BOTTLE INSULATOR
Larry D. Fick, Dallas, Tex., assignor to New Visions Corporation, Dallas, Tex.
Filed Aug. 24, 1989, Ser. No. 398,009
Int. Cl.[5] B62J 7/00
U.S. Cl. 224—32 R 17 Claims



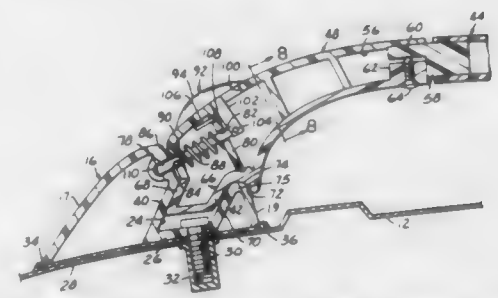
1. A bicycle water bottle insulator, comprising:
a substantially cylindrical sidewall sized to be fit around a bicycle water bottle cage and having an insulating layer;
a bottom having an insulating layer and a peripheral margin, a bottom margin of said cylindrical sidewall affixed to said peripheral margin, said cylindrical sidewall having a top margin opposed to said bottom margin;
said cylindrical sidewall having a slit longitudinally extending from said top margin toward said bottom margin for permitting said insulator to be fitted around a bicycle water cage and a bicycle water bottle, said bicycle water bottle cage having attachments for positioning said cage on a bicycle frame, said slit of said sidewall adapted to receive said attachments;
a plurality of transverse straps having first ends affixed to said cylindrical sidewall and spaced from each other, said straps longitudinally positioned so that when said insulator is fit around said bottle cage and said attachment bolts are received into said slit, said straps are longitudinally displaced from said attachments and are operable to be passed between said cage, second, free ends of said straps opposed to said first ends; and
means for fastening said second ends to said cylindrical sidewall operable to fasten each second end to a point across said slit from a respective first end.

5,007,567
SUPPORT RACK FOR BICYCLES AND THE LIKE
Jeffrey P. Foster, 13276 Research Blvd. #208, Austin, Tex. 78750
Filed Jun. 5, 1990, Ser. No. 533,411
Int. Cl.[5] B60D 43/00; B60R 9/00
U.S. Cl. 224—42.13 6 Claims



1. A bicycle support rack mountable on a spare tire externally mounted on a vehicle with the central axis of the tire in a generally horizontal plane, the rack comprising the combination of
a frame including means defining a generally rectangular opening having a long dimension smaller than the outer diameter of the tire and a short dimension no smaller than the axial width of the tire so that said frame can be placed over the upper portion of an externally mounted, spare tire
a support portion fixedly attached to said frame and extending therefrom so as to lie in a generally horizontal plane when said frame embraces said tire, said support portion including recess means for receiving a bicycle frame;
a support strut connected to and extending downwardly from said support portion and frame adjacent a plane containing the outer generally vertical surface of said tire;
a diagonal brace connected to and extending between said support portion and said strut;
an elongated retaining bar positionable above said bicycle frame in a generally horizontal plane with an inner end of said bar penetrating said plane containing said outer, generally vertical surface of said tire and extending to a location adjacent the wheel on which said tire is mounted; and
means for locking said bar in said position, whereby said rack cannot be removed from said tire and said bicycle cannot be removed from said rack without first disengaging said means for locking.

5,007,568
TRUCK SIDEWALL MOUNTED CHAIN SAW CARRIER
Jimmy C. Da Vault, P.O. Box 78, Colburn, Id. 83865
Filed Feb. 6, 1990, Ser. No. 475,681
Int. Cl.[5] F16M 1/00
U.S. Cl. 224—42.45 R 28 Claims



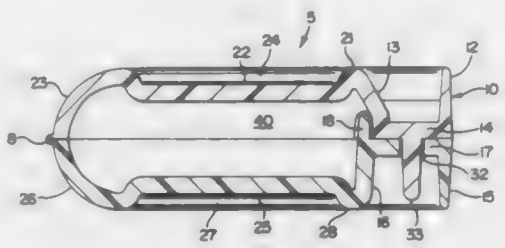
1. A truck mountable chain saw carrier, for releasably securing and supporting a chain saw in a substantially upright condition, with the chain saw having a handle enclosure, an elongated blade extending downwardly from an engine case and a plurality of saw dog points on the engine case adjacent the blade, the carrier comprising:
an elongated frame;
the frame including opposed frame ends;
upstanding frame end plates adjacent the frame ends;
the end plates including base ends and top ends;
a saw dog receiving bar extending between the end plates and having a cross sectional dimension sufficient for the saw dog bar to be received between adjacent ones of the plurality of saw dog points for supporting the saw with the blade extending downwardly therefrom;
a blade receiver spaced toward the base ends of the end plates downwardly from the saw dog receiving bar for releasably receiving the saw blade with the saw dog receiving bar received between saw dog points on the saw; and
truck mounting brackets on the frame for attaching the frame to a truck with the saw dog receiving bar and the blade receiver oriented such that a saw mounted to the carrier is supported in a substantially upright orientation by the saw dog receiving bar and with the blade projecting downwardly to the receiver.

5,007,569
BACKSEAT STORAGE CONTAINER APPARATUS
Constance K. Zarb, 4097 Hardwoods, West Bloomfield, Mich. 48033
Filed Jan. 31, 1990, Ser. No. 472,848
Int. Cl.[5] B60R 7/04
U.S. Cl. 224—275 29 Claims

18. A hand-portable lightweight storage apparatus for use by one or two persons in the backseat of an automotive vehicle, comprising:
a housing having a floor structure, a roof structure, and an outer wall structure including at least front and rear wall sections which are substantially symmetrical about a central axis of the housing extending therebetween, the floor structure and outer wall structure being configured to form an internal storage space within the housing that is accessible to persons using the storage apparatus in the backseat of the vehicle, the roof structure having at least one high portion located generally above the central axis and two inclined sections normally arranged to slop generally downwardly from such high portion, thereby providing left and right normally inclined roof sections, the two inclined roof sections being arranged to pivot independently of one another and to pivot relative to the remainder of the housing; and
means, supported at least in part by the roof structure, for cushioning heads of persons in the backseat of the automotive vehicle on either side of the apparatus and resting at least in part against the apparatus.

5,007,570
LUGGAGE RACK FOR A VEHICLE
Francis Himmel, Sterling Heights, Mich., assignor to Chrysler Corporation, Highland Park, Mich.
Filed Apr. 2, 1990, Ser. No. 502,952
Int. Cl.[5] B60R 9/04
U.S. Cl. 224—321 4 Claims

1. In a luggage rack for mounting on the roof of a vehicle, the luggage rack comprising a pair of elongated side rails, each side rail being securable to the roof of a vehicle adjacent to one side of the vehicle and extending fore and aft of the vehicle, each side rail having an elongated slot therein, a pair of stanchions, each stanchion having a tongue, the tongue of each stanchion being receivable in an elongated slot of a side rail and slidable therealong, a cross member extending between the stanchions, the improvement comprising each stanchion having a hollow interior, a locking pin within the hollow interior, the stanchion having an opening extending from the exterior thereof to the hollow interior, the locking pin slidably extending through said opening, spring means urging the locking pin in a direction to project out from the stanchion, manually engagable locking pin retraction means attached to the locking pin for drawing the locking pin against the force of the spring means into the stanchion, said manually engagable locking pin retraction means including a slide button on the exterior of the stanchion, the stanchion having a slot therethrough positioned under the slide button, a lever extending from the slide button through the slot into the stanchion hollow interior, and means pivotably connecting the lever to the locking pin whereby movement of the slide button in one direction causes retraction of the locking pin and movement of the slide button in the other direction causes extension of the locking pin, each side rail having a plurality of spaced apart pockets along the length thereof adjacent to the elongated slot, each locking pin being receivable in a pocket of a side rail to maintain the stanchions in a fixed position, the locking pins being retractable out of the pockets by the locking pin retraction means to permit sliding of



the stanchions in the elongated slots to different adjusted positions.

SPROCKET FEED STRIP REMOVER

James S. Nasby, Skokie, and Michael J. Rood, Hoffman Estates, both of Ill., assignors to Perf-Mate Company, Skokie, Ill.

Filed Aug. 29, 1988, Ser. No. 237,955
Int. Cl.[5] B26F *3/02*
U.S. Cl. 225—106 5 Claims

1. A manually operable clamp for removing a margin strip from printer paper having sprocket feed margin strips containing spaced sprocket tooth receiving openings and detachably connected to the main body of the printer paper by a tear line of perforations, comprising:

upper and lower jaws connected by a longitudinal live hinge, each said jaw having an elongated rectangular clamping surface which is matingly engageable with a corresponding opposed elongated rectangular clamping surface and on the other jaw;

one of said jaws having a portion that includes one of said clamping surfaces and has within said one clamping surface a plurality of aligned pin-receiving openings therein corresponding in size and spacing to said sprocket tooth receiving openings and said portion also having inwardly of said pin-receiving openings and parallel thereto longitudinal fence means against which the elongated edges of said margin strips abut when said sprocket tooth receiving openings therein are in registration with said pin-receiving openings;

the other jaw having a portion that includes the other of said clamping surfaces and has within said other clamping surface a plurality of aligned pins projecting therefrom corresponding in size, number and spacing to said pin-receiving openings and matingly insertable therein when said jaws are closed with said clamping surfaces engaged; and

live hinge having sufficient flexibility so as to allow sufficient shifting of said jaws relative to each other to permit said pins to enter said sprocket receiving holes in stacks of various thickness of said margin strips.

ELECTRICAL STAPLER

Lin Chung-Cheng, 2FL., No. 7-2, Lane 27, Chungshan N. Rd., Sec. 2, Taipei, Taiwan

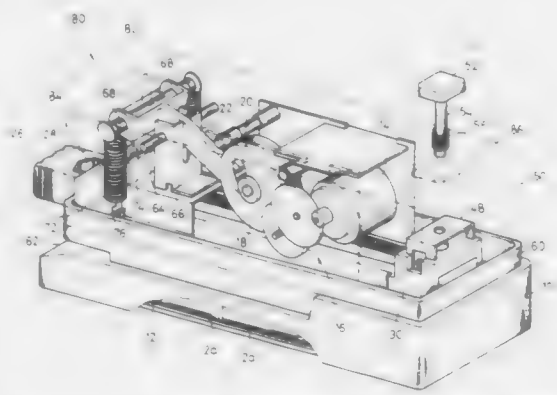
Filed Aug. 27, 1990, Ser. No. 572,425
Int. Cl.[5] B25C *5/02, 7/00;* B27F *7/79, 7/36*
U.S. Cl. 227—7 1 Claim

1. An electrical stapler comprising:

a base provided with a battery container;

a motor serving as a driving means;

a stapling mechanism wherein a Y-shaped linkage is pivoted to a fixing plate, and front end of said Y-shaped linkage is formed with a through hole, a fixing rod being inserted into said through hole, two ends of said fixing rod being respectively connected with two compression springs, other ends of said springs being mounted on a fixing member;



a gear set having several gears one of which meshes with said motor and another of which is a driven gear disk, on one side of said driven gear being disposed symmetrical biasing rods which can press one end of said Y-shaped linkage when operated;

a fine switch suitable to be pressed by said biasing rods to control opening/closing of a circuit;

a middle board fixed on said base to form a stapling groove therebetween;

a magazine portion having a staple groove rear end of which is disposed an arch hook and an engaging recess;

a slide groove a rear vertical wall of which is formed with two opposite slide channels, a transverse movable rod being disposed in and between said slide channels, a fixing rod being disposed at rear end of said slide groove, a pressing plate being disposed under said fixing rod, a buffer pad being disposed between said pressing board and fixing rod, a restoring spring being fitted on said fixing rod, one end of said restoring spring being extended to lower portion of said movable rod, the other end of said restoring spring being engaged with said middle board so that said movable rod can be restored to its original position, a through hole being formed on upper surface of rear end of said slide groove;

a magazine means formed by said magazine portion and slide groove;

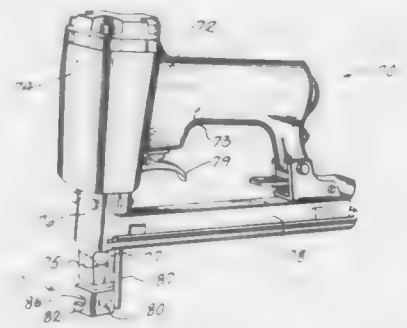
a -shaped plate going through said through hole of said slide groove to abut against said movable rod;

an upper cover covering said base and having a hole corresponding to said -shaped plate;

a pressing button having a lower shaft rod, a spring being fitted on said shaft rod, lower end of said shaft rod being extended through said hole of said upper cover to abut against said -shaped plate; and

a limit switch disposed in said base and slightly protruding beyond said stapling groove; whereby when said limit switch is touched and activated by papers to be stapled, said motor will drive said gear set so as to rotate said gear disk, making said biasing rods separated from said Y-shaped linkage so that said pressing plate is no more bound and will be bounded downward by a spring to strike out a staple placed in said stapling groove, and when another biasing rod again abuts against said Y-shaped linkage and touched said fine switch, said motor stops and one stapling movement is completed.

5,007,573



STAPLE GUN SUPPORT ASSEMBLY

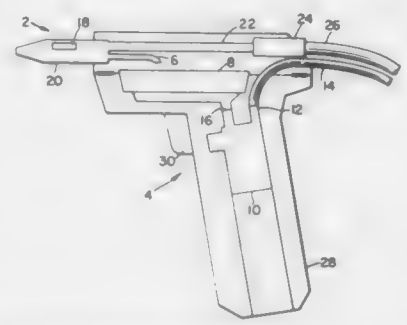
Arvo F. Uuskallio, Hartland, Wis., assignor to Briggs & Stratton Corporation, Wauwatosa, Wis.

Filed Nov. 20, 1989, Ser. No. 439,613
Int. Cl.[5] B25C *5/02*
U.S. Cl. 227—139 5 Claims

1. In a tool for applying a fastener to a mounting bracket including upper and lower spaced apart ears having aligned fastener-receiving openings formed therethrough, said tool

including a housing having a manual grip portion, fastener driving means in said housing for driving a fastener through a driveway, fastener guide means aligned with said fastener driving means having said driveway therein with an upper receiving end and a lower discharge end, and a fastener magazine defining a longitudinal axis for holdng and sequentially feeding fasteners to said fastener guide means, the improvement comprising:

positioning means on said fastener guide means including longitudinal alignment means for longitudinally aligning said driveway relative to the fastener receivng openings in the mounting bracket, and lateral alignment means for laterally aligning said driveway relative to the fastener-receiving openings in the mounting bracket; and



support means on said fastener guide means for supporting the lower ear of said bracket during a fastener driving operation.

5,007,574

DESOLDERING DEVICE

Michael Carlomagno, Redwood City; Hamid Poostpasand, and Steven James, both of Mountain View, all of Calif., assignors to Metcal, Inc., Menlo Park, Calif.

Filed Sep. 14, 1989, Ser. No. 407,115
Int. Cl.[5] B23K *3/04, 3/047*
U.S. Cl. 228—20 20 Claims

1. A desoldering tool, comprising;

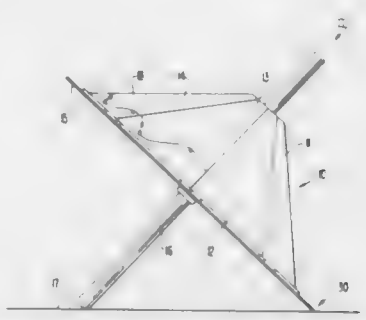
a base unit having an upper member and a lower member,

means securing said upper member to said lower member to permit movement of said upper member relative to said lower member to expose the interior of said lower member,

a solder collection chamber located in said lower member,

means for developing a partial vacuum below and above said solder collection chamber,

a cartridge having a heater and a tip with a bore therethrough, said cartridge disposed in said upper member and having a tail pipe extending from said tip to a position above said solder collection chamber, said tail pipe having a passage extending therethrough and communicating with said bore in said tip, and



a heater located at least immediately adjacent said tip.

5,007,575

DEVICE FOR PRODUCING CONE-SHAPED BODIES OF GLASS, PARTICULARLY TIFFANY-STYLE LAMPSHADES

Peter Degenhardt, Arnoldstrasse 63, D-2000, 50 Hamburg, Fed. Rep. of Germany

Filed May 24, 1989, Ser. No. 408,041
Claims priority, application Fed. Rep. of Germany, Jun. 1, 1988, 8807147[U]
Int. Cl.[5] B23K *37/04*
U.S. Cl. 228—44.3 6 Claims

1. A device for producing essentially cone-shaped bodies having flat sides composed of n attached adjoining segments, n being an integer, each segment being composed of a number of glass pieces fastened to each other, whereby boundaries of adjoining segments lie in a common plane or in a straight line, the device having a form body for the placing thereon of glass pieces that are to be soldered, said form body defining a base, a bottom plate placed at the base of the form body, and a rod arranged axially in the middle of the bottom plate and the form body, characterized by the fact that

the rod (16) is adjustably mounted relative to the form body and the bottom plate in an axial direction, said rod having a lower portion,

the bottom plate (15) is a polygon having n-sides, and

each said boundary line is diametrically opposite a side of the bottom plate,

whereby, when the lower portion of the rod (16) and any side of the bottom plate (15) are placed on a supporting surface (17), the diametrically opposite boundary line (18) of two segments of the form body (10) is adjustable to a horizontal position through axial adjustment of the rod (16).

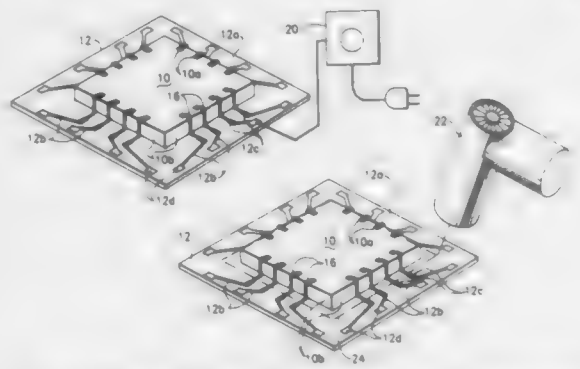
TESTABLE RIBBON BONDING METHOD AND WEDGE BONDING TOOL FOR MICROCIRCUIT DEVICE FABRICATION

Helen Congleton, Huntington Beach; Carol L. Slaton, Irvine; Angelo Koudounaris, Hermosa Beach; Gerald B. Smith, Huntington Beach, and Vicente Soto, Riverside, all of Calif., assignors to Hughes Aircraft Company, Los Angeles, Calif.

Filed Dec. 26, 1989, Ser. No. 456,446
Int. Cl.[5] B23K *101/36;* H05K *3/32;* H01L *21/603*
U.S. Cl. 228—103 17 Claims

1. A method of fabricating an electrical device, comprising the steps of:



(a) providing an electrical circuit component having a plurality of electrical contacts;

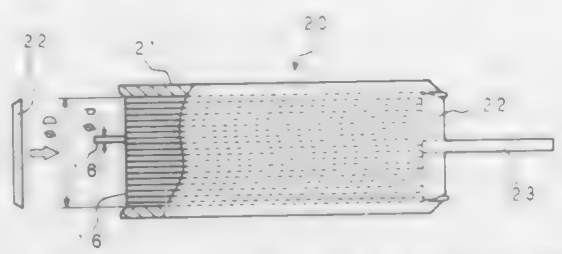
(b) providing a temporary substrate having a plurality of electrical contacts conjugate to the contacts of the component respectively;

(c) removably fixing the component to the temporary substrate with the respective contacts in mutual alignment;

(d) electrically connecting the contacts of the component to the respective contacts of the temporary substrate with lead wires in such a manner that portions of the lead wires connected to the component will substantially retain their shapes relative to the component after the lead wires are

severed from the temporary substrate near points of connection of the lead wires to the contacts of the temporary substrate;

(e) severing the lead wires near said points of connection, leaving said portions thereof extending outwardly from the component; and



(f) removing the component from the temporary substrate

5,007,577

MULTIPLE-COKE COMPLEX MATERIAL AND METHOD OF MANUFACTURING THE SAME

Kazuyuki Nakasuji; Chihiro Hayashi, both of Osaka, and Yoshiyuki Suzushima, Suita, all of Japan, assignors to Sumitomo Metal Industries Ltd. and Sumitomo Special Metals Co., Ltd., both of Osaka, Japan

Filed Nov. 21, 1989, Ser. No. 439,534
Claims priority, application Japan, Nov. 22, 1988, 63-295264
Int. Cl.[5] B23K *20/04*
U.S. Cl. 228—265 14 Claims

1. A method of manufacturing multiple-core complex material comprising:

a first step of preparing a multiple-layer clad complex core member with a circular cross section;

a second step of densely filling a plurality of said complex core members into a metallic casing where the ratio of inner diameter (D) of said metallic casing to the outer diameter (d) of said complex core member D/d is not less than 12, and of evacuating said metallic casing to form a multiple-core complex billet;

a third step of heating said complex billet; and

a fourth step of diffusion bonding to bond the core members to each other by a hot working at a reduction of area being not less than 20%.

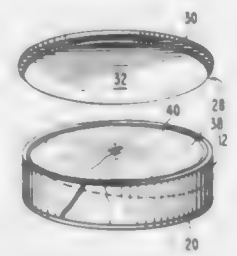
5,007,578

WRAP-AROUND BODY WITH PROMOTIONAL FLAP EXTENSION

Ronald A. Simone, #261 - 3424 Vintage Dr., Modesto, Calif. 95356

Filed Aug. 6, 1990, Ser. No. 562,845
Int. Cl.[5] B65D *3/28*
U.S. Cl. 229—1.5 B 7 Claims

1. A rolled wrap around body free of corners and formed from a blank which wraps around for more than 360° providing a main body portion and an overlap portion, and first and second spaced apart secured regions on said wrap around body wheresaid blank is secured upon itself, said first secured region defining a free end on said overlap portion, said second secured region located inwardly-away from said free end of said overlap portion, said main body portion presenting a constant wrap around surface on which to secure said first and second spaced apart region, said first secured region being releasable under force and providing a liftable flap back to said second secured region.



5,007,579

FIBERBOARD CYLINDRICAL CONTAINER WITH SPIRALLY WOUND TUBULAR BODY AND CLOSURE THEREFOR

Henry H. Thomas, Jr., 9 William St., Rumson, N.J. 07760

Filed Aug. 29, 1990, Ser. No. 574,110
Int. Cl.[5] B65D *3/10*
U.S. Cl. 229—5.5 7 Claims

1. A cylindrical container consisting of:

(a) a tubular body,

(b) a first end closure for sealing the bottom of said tubular body,

(c) said first end closure comprising a first disc having a diameter slightly greater than the diameter of said tubular body, a second slightly smaller disc, and an adhesive layer extending over the overlapping area of said discs to permanently join same together,

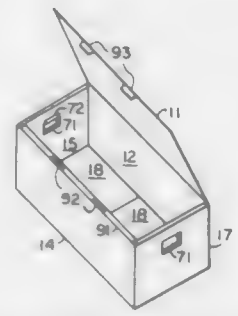
(d) said second disc being sized to create a friction fit with the interior of said tubular body,

(e) a second end closure for sealing the top of said tubular body,

(f) said second end closure comprising a first disc having a diameter slightly greater than the diameter of said tubular body, a second slightly smaller disc, and an adhesive layer extending over the overlapping area of said discs to permanently join same together,

(g) said second disc being sized to create a friction fit with the interior of said tubular body,

the invention being characterized in that



(h) said tubular body is formed from a length of spirally wound paperboard tube possessing significant axial strength to resist buckling and sufficient hoop strength to resist deformation.

5,007,580

FOLDABLE CONTAINER

Wayne P. Morrison, 950 Raco Dr., Ste. A, Lawrenceville, Ga. 30245, and Neil T. Castleberry, St. Augustine, Fla., assignors to Wayne P. Morrison, Lawrenceville, Ga.

Filed Feb. 21, 1990, Ser. No. 482,523
Int. Cl.[5] B65D *5/20*
U.S. Cl. 229—117.17 7 Claims

1. A container formed from a cut and scored foldable blank of cardboard, said blank having a longitudinal direction and a lateral direction, comprising in combination:

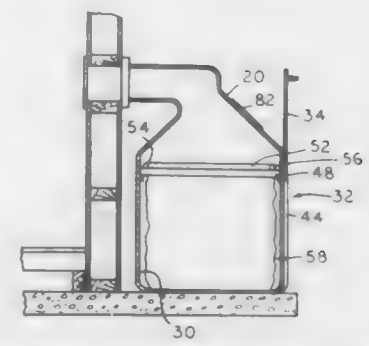
(A) a top wall, a back wall, a bottom wall and a front wall, where said top wall is connected to said back wall by a lateral score line, said back wall is connected to said bottom wall by a lateral score line, and said bottom wall is connected to said front wall by a lateral score line, where the lateral dimension of said back wall and said front wall is less than the lateral dimension of said bottom wall and said top wall;

(B) a pair of middle side walls connected to said front wall by a pair of longitudinal score lines, where the lateral dimension of said middle side walls is less than the longitudinal dimension of said bottom wall;

(C) a pair of outer side walls connected to said back wall by a pair of longitudinal score lines, where the longitudinal dimensions of said outer side walls is greater than the longitudinal dimensions of said middle side walls;

(D) a pair of inner side walls connected to said outer side walls by a pair of double score lines of non-equal length, where said inner side walls are separated from said top wall by a pair of longitudinal slits, where the lateral dimension of said inner side wall is less than the lateral dimension of said outer side walls, and where the longitudinal dimension of said inner side walls is greater than the longitudinal dimension of said middle side walls;

(E) a pair of bottom panels connected to said outer side walls by a pair of lateral score lines, and where said bottom panels are separated from said bottom wall by a pair of longitudinal slits, and where said bottom panels are separated from said middle side walls by a pair of lateral slits, and where the sum of the longitudinal dimension of both said bottom panels is less than the lateral dimension of said bottom wall, and further where the lateral dimension of said bottom panels is less than the longitudinal dimension of said bottom wall;



(F) a pair of angle slits connecting said longitudinal slits separating said top wall from said inner side walls to said longitudinal score lines connecting said back wall to said outer side walls, another pair of angle slits connecting said longitudinal score lines connecting said back wall to said outer side walls to said longitudinal slits separating said bottom wall from said bottom panels, and still a third set of angle slits connecting said longitudinal slits separating said bottom wall from said bottom panels to said longitudinal score lines connecting said front wall to said middle side walls.

5,007,581

GARBAGE COLLECTION DEVICE

Ray C. Douglas, R.R. 3 Box 34, Brodhead, Wis. 53520

Filed Jul. 5, 1989, Ser. No. 375,735
Int. Cl.[5] B65D *91/00*
U.S. Cl. 232—43.2 13 Claims

1. A garbage collection device extending through an outside wall of a dwelling for the reception therein of recyclable garbage, said device comprising:

a garbage receptacle disposed externally relative to the outside wall for the reception therein of the recyclable garbage;

cover means cooperating with said receptacle for covering said receptacle, said cover means defining a chute for the passage therethrough of the garbage;

a conduit means having a first and a second end, said first end cooperating with said chute, said conduit means extending through the outside wall of the dwelling such that when the recyclable garbage is inserted into said conduit means through said second end thereof, the recyclable garbage passes through said conduit means and said chute into said receptacle;

said receptacle including:

a housing, said housing being formed integrally with said cover means, said housing defining an unloading opening;

a door having a first and a second side and a first and a second edge, said door sealingly cooperating with said opening for permitting selective access to said receptacle for unloading thereof; and

said housing further including:

a first and a second channel member, said channel members being disposed parallel and spaced relative to each other adjacent to said first and second sides of said door for slidably receiving therein said first and second sides of said door such that when said door is disposed in a closed disposition thereof, said first and second edges of said door sealingly engage said housing, said door being guided by said channels from said closed disposition to an unloading disposition for permitting access to said receptacle.

5,007,582

REDUCED PRESSURE STEAM HEAT TREATING DEVICE

Takayuki Morii, Kako, and Hideaki Yumoto, Kakogawa, both of Japan, assignors to TLV Company, Limited, Kakogawa, Japan

Filed Nov. 22, 1989, Ser. No. 439,944
Int. Cl.[5] F24F *11/00*
U.S. Cl. 236—40 13 Claims

1. A reduced pressure steam heat treating device as comprising a pressure reducing valve having an inlet connected to a steam source and an outlet, a heat exchanger chamber having an inlet connected to the outlet of said pressure reducing valve and an outlet, an ejector having a suction chamber connected to the outlet of said heat exchanger chamber, means for feeding operation fluid to said ejector, and means for controlling the temperature of said operation fluid to control the sucking

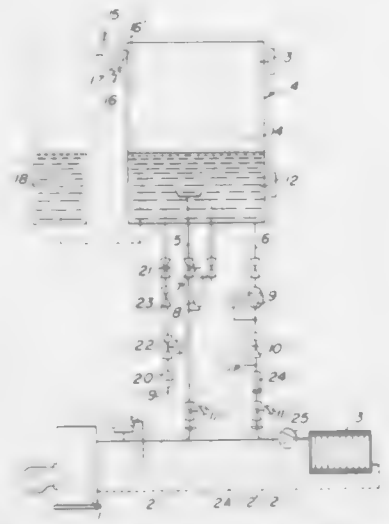
pressure of said ejector, wherein said operation fluid feeding means comprises a fluid storage tank, pumping means for forcedly feeding the operation fluid in said storage than to a

jetting nozzle of said ejector, means for returning said operation fluid from said ejector to said storage tank, and means for replenishing said fluid storage tank with operation fluid of relatively low temperature.

5,007,583

DEVICE FOR ACCOMODATING EXPANSION IN FLUID CIRCULATION SYSTEMS

Anton Schwarz, Seefeld, Austria, assignor to A. Schwarz & Co., Seefeld, Austria



PCT No. PCT/AT88/00025, § 371 Date Jan. 4, 1989, § 102(e) Date Jan. 4, 1989, PCT Pub. No. WO88/08943, PCT Pub. Date Nov. 17, 1988

PCT Filed May 4, 1988, Ser. No. 314,056

Claims priority, application Austria, May 5, 1987, 1118/87; Jun. 2, 1987, 1400/87

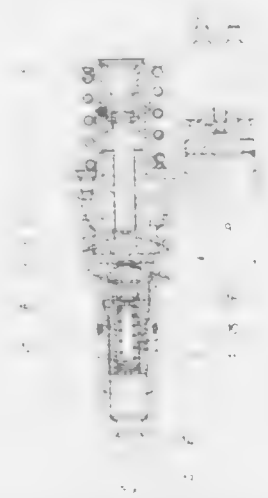
Int. Cl.[5] F24D *3/10*

U.S. Cl. 237—66 **19 Claims**

1. Device for expansion absorption in fluid circulation systems, in particular of heating or cooling installations, having at least one expansion vessel in gas exchange with the atmosphere, into which liquid from the fluid circulation system is received and from which liquid is returned to the fluid circulation system via a pressure pump, and in one conduit to the expansion vessel an overflow valve adjustable to the operating pressure of the installation is provided, a lower pressure prevailing in the expansion vessel than in the fluid circulation system, characterized in that the expansion vessel (4) is connected to the fluid circulation system via separate inflow and outflow conduits (5, 6) and that in the outflow conduit (6) from the expansion vessel (4) a continuously running forcing and circulating pump (9) is arranged.

5,007,584

FUEL INJECTION DEVICE



Francois Rossignol, Morvant, France, assignor to Robert Bosch GmbH, Stuttgart, Fed. Rep. of Germany

Filed Oct. 20, 1989, Ser. No. 424,782

Claims priority, application Fed. Rep. of Germany, Dec. 31, 1988, 3844489

Int. Cl.[5] F02M *57/00*

U.S. Cl. 239—88 **20 Claims**

1. A fuel injection device having a housing (2), a fuel pump piston (3) in a bore in said housing, a pump work chamber (6) formed by an end of said fuel pump piston (3) and said housing, a fuel injection line (15) connected to said pump work chamber and communicating with an injection nozzle (13) via an interposed closing valve (16) having a valve closing element (21) operative toward the pump work chamber and an actuating element (19), a magnetic control valve (8) connected to said pump work chamber via a first pressure line (7) to control injection, said pump work chamber being connected with a relief line (9) which supplies fuel under pressure to one side of said actuating element (19) remote from the pump work chamber of said closing valve that closes toward said pump work chamber, a fuel return connecting line (20), said fuel connecting return line being opened and closed by said actuating element (19), and said actuating element of said closing valve (16) is embodied as a differential piston (19, 24, 25), said differential piston includes a first face (18) which urges said closing valve in a closing direction said first face (18) is larger in surface area than an effective surface area of a second face of said closing element subjected to fuel pressure in the opening direction whereby said closing valve (16) is closed by fuel pressure on said first face (18).

5,007,585

ROADSIDE SPRAY APPARATUS

Johnny L. Kubacak, P.O. Box 156, 300 Christine Road, Jourdanton, Tex. 78026, and Gary D. Byrd, P.O. Box 13, Bulverde, Tex. 78163

Continuation of Ser. No. 636,066, Jul. 30, 1984, abandoned, which is a continuation of Ser. No. 348,509, Feb. 12, 1982, abandoned, which is a continuation-in-part of Ser. No. 67,552, Aug. 17, 1979, Pat. No. 4,315,602. This application Apr. 10, 1985, Ser. No. 722,411

Int. Cl.[5] B05B *1/20*

U.S. Cl. 239—176 **1 Claim**

1. The Spraying apparatus for spraying chemicals to the side of a moving vehicle in a plurality of laterally adjacent swaths comprising:

means for mounting said apparatus on a vehicle;

said apparatus including an independently movable spray head;

said spray head including a plurality of sets of spray nozzles;

the nozzles in each set being mounted on the spray head and oriented to collectively spray a predetermined width of swath at a predetermined distance from the side of the vehicle;

said nozzles in each set selected to distribute chemical spray in predetermined droplet sizes, with the sets covering the furthest swath zones delivering the larger droplet sizes and the set adjacent the vehicle delivering the smaller droplet size;

each set communicating with a chemical source through a separate control means for operating each respective set of nozzles as a unit;

said control means being selectively activated to selectively deliver chemical spray to selected sets to provide the desired spray pattern and width of coverage.

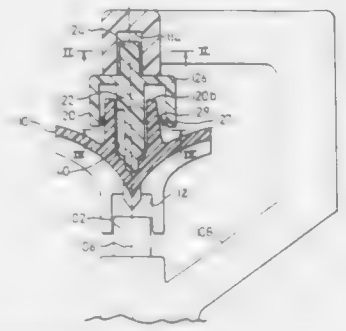
ROTARY SPRINKLERS



Amir Cohen, Tuvalium, Israel, assignor to Agroteam Consultants Ltd, Timrat and Plastro-Gvat, Kibbutz Gvat, both of, Israel

Continuation-in-part of Ser. No. 174,732, Mar. 29, 1988, Pat. No. 4,886,211. This application Aug. 29, 1989, Ser. No. 400,246

Claims priority, application Israel, May 13, 1987, 82513; Jul. 21, 1989, 91062

Int. Cl.[5] B05B *3/08*

U.S. Cl. 239—222.17 **20 Claims**

1. A rotary sprinkler comprising:

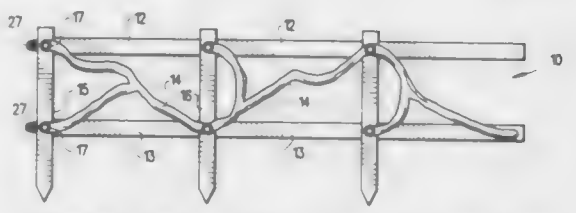
a nozzle outputting a jet axially thereof;

a rotor rotatably mounted with respect to the nozzle in alignment with the axial jet and having a surface formation impinged by the axial jet to deflect the jet laterally of the nozzle and to rotate the rotor;

and a retarding device having a first surface rotatable with the rotor with respect to the nozzle, a second surface non-rotatable with respect to the nozzle, and a viscous liquid between said first and second surfaces;

characterized in that said first surface of the retarding device is a cavity formed in a surface of the rotor opposite to that having said surface formation i pinged by the axial jet, and that said second surface of the retarding device is carried by a pin non-rotatably mounted with respect to said nozzle and disposed within said cavity; said cavity in the rotor being covered by a cover removably attached to the rotor and penetrated by said pin centrally of the cover.

5,007,587



COMBINED FENCE AND IRRIGATION SYSTEM

Allen P. Daroca, 103 Lakeland Dr., Slidell, La. 70458

Filed Dec. 12, 1989, Ser. No. 448,979

Int. Cl.[5] B05B *9/00*

U.S. Cl. 239—289 **15 Claims**

1. A combined fence and irrigation system, comprising:

a plurality of generally vertical spaced posts;

a plurality of generally horizontal rails connecting said posts;

fluid passages in said posts and said rails;

each of said posts and said rails provided with countersunk circular apertures communicating with said fluid passages;

a radial ledge formed around each of said circular apertures;

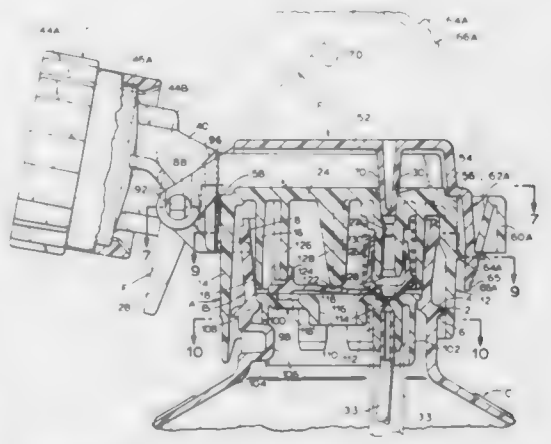
a resilient bushing in each of said circular apertures, each of said bushing having a cylindrical central portion and terminating in spaced radially extending flanges, said radial ledge received between said flanges;

a connecting tube having opposite ends provided with oppositely facing stepped diameter frusto conical ridges, said connecting tube opposite ends frictionally engaged in said bushings, forming a sealed fluid connection;

fluid connection means for connecting said fluid passages with a water supply line; and

fluid distribution means for distributing water to an area adjacent said fence.

5,007,588



ASPIRATION-TYPE SPRAYER

Ho Chow, Cliffside Park, and Joseph E. Testa, Woodcliff Lake, both of N.J., assignors to Hunter-Melnor, Inc., Memphis, Tenn.

Filed Dec. 8, 1988, Ser. No. 281,559

Int. Cl.[5] B05B *7/04*

U.S. Cl. 239—318 **III Claims**

1. A chemical sprayer comprising a container for the chemical to be sprayed, an aspiration assembly comprising a structure having an aspiration means adapted to communicate with the interior of said container and means for guiding a flow of fluid past said aspiration means and out from said structure,

means for mounting said assembly on said container, a cover receivable on said structure in an operative position, and releasable means for retaining said cover in said operative position, said cover having a part extending therefrom which, when said cover is in said operative position, engages and substantially completely seals said aspiration means so as to prevent the chemical from escaping from the container, in which said aspiration means comprises an aspiration passage having an end open toward said cover when said cover is in said operative position, said cover part then entering and blocking said aspiration passage, and in which said aspiration assembly has an air bleed passage communicating with said aspiration passage below its open end, said cover part, when said cover is in said operative position, reaching and blocking said air bleed passage.

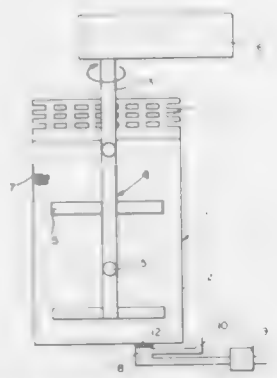
PROCESS FOR SIMULTANEOUSLY LEACHING AND FINE MILLING A SUBDIVIDED SOURCE MATERIAL



Dennis E. Evans, Rivonia, and Keith S. Liddell, Weltevreden Park, both of South Africa, assignors to Metprotech Limited, Douglas, Isle of Man

Continuation of Ser. No. 317,470, Mar. 3, 1989, abandoned, which is a continuation-in-part of Ser. No. 172,650, Mar. 24, 1988, abandoned. This application May 30, 1990, Ser. No. 529,702

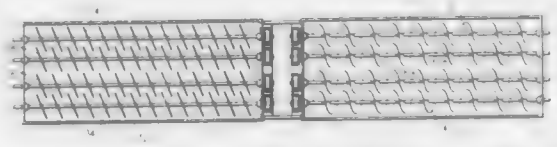
Claims priority, application South Africa, Mar. 26, 1987, 87/2229

Int. Cl.[5] **B02C** *17/16*

U.S. Cl. 241—21 **10 Claims**

1. A process for simultaneously leaching and fine milling a sub-divided source material which comprises the steps of feeding said source material substantially continuously as a slurry in a leach solution, to the grinding chamber of a stirred mill having a rotatably driven impact impeller with outwardly extending stirring arms each of which has a tip at its free end, said grinding chamber containing particulate grinding media, subjecting said source material to fine milling within said grinding chamber, and withdrawing finely milled source material from said grinding chamber together with leach solution wherein said impeller is driven at a power density in kilowatts of power input per cubic meter of grinding media of at leas 100 kW/m^3, and at an impeller speed imparting to the media particles a momentum defined by the multiple of the arm tip speed and the individual mean media particle mass of at least 0.15 gram-meters per second, and the difference between the density of the grinding media and density of said slurry of source material is at least 1 Kg/liter.

5,007,590



APPARATUS AND METHOD FOR MIXING SOLID OR SEMI-SOLID WASTES WITH ADDITIVES

Patrick D. Taylor, Rockwall, Tex., assignor to Itex Enterprises, Inc., Dallas, Tex.

Filed Jan. 23, 1990, Ser. No. 469,092

Int. Cl.[5] **B02C** *23/20*

U.S. Cl. 241—25 **16 Claims**

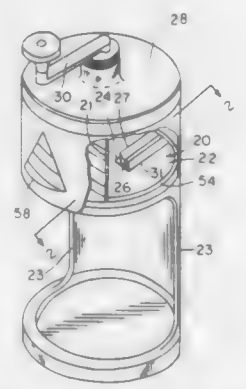
1. A method for treating solid or highly viscous semi-solid waste materials containing lumps of waste comprising the steps of:

reducing the size of the lumps in the waste material with a plurality of paddle-type chopper augers, said paddle-type chopper augers being mounted in a separator,

homogenizing the waste material by means of pin mixers, and

mixing the homogenized waste material with a predetermined amount of at least one selected additive.

5,007,591



ICE SHAVER APPARATUS

Thomas E. Daniels, Jr., 917 E. 9140 South, Sandy, Utah 84094

Filed Jan. 12, 1990, Ser. No. 465,907

Int. Cl.[5] **B02C** *18/00, 19/08*

U.S. Cl. 241—37.5 **14 Claims**

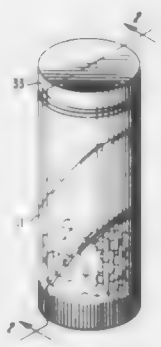
1. An improvement in ice shaving apparatus of the type including (a) an ice receiving chamber having a cylindrical, upstanding sidewall and a substantially flat floor, (b) an elongate opening in said floor, (c) an elongate blade having a knife edge projecting through said opening into said chamber, (d) a removable cover for said chamber and (e) means for moving ice placed in said chamber against said knife edge to cut shavings from said ice, said improvement comprising

an elongate, blunt, blade guard positioned adjacent to said blade, said blade guard being movably mounted beneath said opening in said floor of said chamber for movement from a recessed position in which a leading edge of said blade guard is recessed beneath the knife edge of said blade to an extending position in which the leading edge extends through said opening in said floor of said chamber to project into said chamber at least to the same distance as said knife edge of said blade projects into said chamber and to thereby provide a guard for said knife edge,

means for biasing said blade guard to its extending position; and

means for depressing said blade guard to its recessed position when said cover is positioned on said ice containing chamber.

5,007,592



DISPOSABLE PEPPERMILL

George W. Poncy, 3725 Investment La., Riviera Beach, Fla. 33404

Filed Apr. 15, 1987, Ser. No. 38,648

Int. Cl.[5] **B02C** *42/04*

U.S. Cl. 241—169.1 **4 Claims**

1. A food grinder comprising a hollow cylinder, means defining a female grinding element on one end of said hollow cylinder, a male grinding element positioned within said female grinding element, said male grinding element and female grinding element comprising means to grind food contained within said cylinder when said male element is turned within said female element, a knob rotatably mounted on the other end of said cylinder, a connecting rod connecting said male grinding element with said knob and comprising means to turn said male grinding element when said knob is rotated on said cylinder, said connecting rod being molded in one piece with said knob.

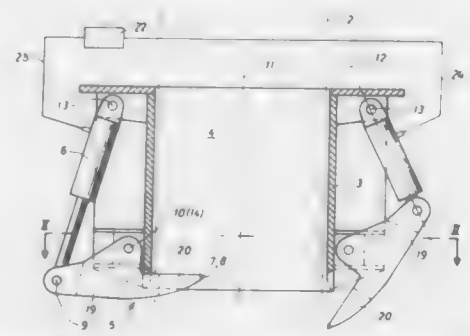
APPARATUS FOR EXPOSING THE REINFORCING BARS OF REINFORCED CONCRETE PILLARS



Zsolt Bérczes, Küsnacht, Switzerland, assignor to Diaber AG, Kuesnacht, Switzerland

Continuation of Ser. No. 336,102, Apr. 11, 1989, abandoned. This application Jul. 10, 1990, Ser. No. 550,792

Claims priority, application Switzerland, Apr. 27, 1988, 1580/88; Nov. 15, 1988, 4235/88

Int. Cl.[5] **B02C** *1/10*

U.S. Cl. 241—264 **6 Claims**

1. Apparatus for crushing a vertical reinforced concrete pillar to expose reinforcing bars contained therein, comprising:

(a) a horizontally arranged tubular frame (3) containing a central through passage for receiving the pillar in generally centered relation therein, said through passage having a vertical longitudinal axis (11);

(b) a plurality of crushing tool means connected with said frame in circumferentially spaced relation about said central through passage, each of said crushing tool means including:

(1) a chisel (5) pivotally connected intermediate its ends with said frame for pivotal movement about a horizontal pivot axis (14) normal to a vertical plane which contains said through passage longitudinal axis (11) and which bisects said pivot axis, said chisel having first and second arm portions on opposite sides of said pivot axis, said first arm portion being forked at its free end, thereby defining a pair of tine portions each having a first cutting edge (7,8) for engaging the pillar, said first cutting edges extending generally parallel with the pivot axis of said chisel;

(2) said chisel also including on each tine portion thereof a generally plate-shaped crushing member (15 spaced from an associated first cutting edge, said crushing member extending normal to said tine portion and generally normal to its associated first cutting edge, said crushing member including adjacent said first cutting edge a second cutting edge (17) inclined at an acute angle (α) relative to a line normal to its associated tine portion; and

(3) a plurality of piston and cylinder motor means (6) each pivotally connected at its ends between said frame and the free end of said second arm portion of the associated chisel for pivoting said chisels in opposite directions between crushing and disengaged positions relative to said frame, respectively, said pillar normally being centered relative to said frame when said chisels are initially pivoted in a crushing direction toward positions in which their cutting edges are in engagement with said pillar; and

(c) flow control means (22) for controlling the flow of pressure fluid to said piston and cylinder motor means in such a manner that strokes of said pistons cause the chisels to maintain the pillar in centered relation relative to said frame during pivotal movement of said chisels in the crushing direction.

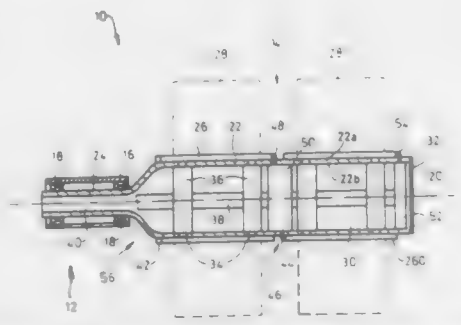
CHUCK STRUCTURE



Peter Busenhart, Winterthur; Ruedi Schneeberger, Turbenthal, both of Switzerland; Erwin Holbein, Spartanburg, S.C.; Armin Wirz, Ossingen, Switzerland; Adolf Flüeli, and Hansueli Maier, both of Winterthur, Switzerland, assignors to Rieter Machine Works, Ltd., Winterthur, Switzerland

Division of Ser. No. 279,184, Dec. 2, 1988, Pat. No. 4,953,802, which is a continuation of Ser. No. 911,816, Sep. 26, 1986, Pat. No. 4,811,910. This application Oct. 10, 1989, Ser. No. 419,603

Claims priority, application United Kingdom, Oct. 2, 1985, 8524303

Int. Cl.[5] **B65H** *54/547*

U.S. Cl. 242—46.4 **6 Claims**

1. A high speed chuck having an axis of rotation, comprising:

a first elongated tubular portion with an external circumference and possessing a length sufficient to receive a plurality of bobbin tubes for rotation about the axis of rotation to enable formation of a respective package in use on each of said plurality of bobbin tubes;

a second elongated tubular portion integral with said first elongated tubular portion and of reduced external diameter relative thereto and having an exterior;

said first elongated tubular portion and said second elongated tubular portion having a common longitudinal axis substantially coincident with said axis of rotation;

said first elongated tubular portion having substantially constant wall thickness through substantially its entire length and defining an internal chamber accommodating bobbin tube engaging means for holding each one of said plurality of bobbin tubes at said external circumference of said first elongated tubular portion for rotation about said axis of rotation and formation of the respective package;

said first elongated tubular portion possessing an end region disposed remote from said second elongated tubular portion for permitting insertion and positioning of said bobbin tube engaging means in said internal chamber of said first elongated tubular portion; and

bearing means cooperating with said second elongated tubular portion such that said first elongated tubular portion and said second elongated tubular portion are rotatable about said common longitudinal axis at a high speed for take-up of filamentary material at a speed of at least 3000 m/min.

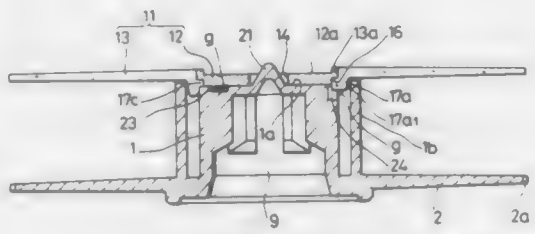
5,007,596

TAPE CASSETTE REEL HAVING AN UPPER REEL MOLDED BY DICHROMATIC MOLDING PROCESS

Yuji Iwahashi, Miyagi, Japan, assignor to Sony Corporation, Tokyo, Japan

Filed Dec. 18, 1989, Ser. No. 452,203

Claims priority, application Japan, Dec. 29, 1988, 63-331502



Int. Cl.[5] **B65H** *75/14*

U.S. Cl. 242—71.800 **4 Claims**

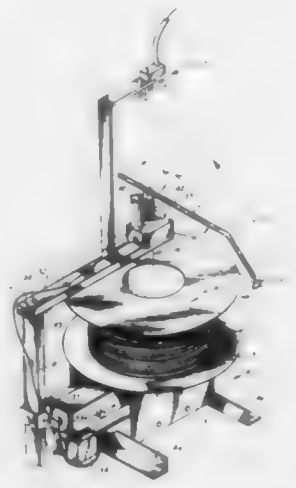
1. A tape cassette reel comprising:

(a) an integrally formed lower flange portion and reel hub, the reel hub having an end face, and

(b) an upper flange portion having an opaque central portion, an outer peripheral flange portion and a bonding surface between them, the upper flange portion being bonded to the reel hub, and wherein a shock-absorbing rib portion is formed at a radially inner peripheral side surface

of the outer peripheral flange portion so as to abut the end face of the reel hub, and a pouring gate mark is formed on the radially inner surface side of the shock-absorbing rib portion during molding of the outer peripheral flange portion.

5,007,597



AUTOMATIC DISPENSER FOR ELONGATED FLEXIBLE COILED ELEMENTS

Johnnie L. Jones, 5650-10 Mile Rd., Rockford, Mich. 49341

Filed Jan. 31, 1989, Ser. No. 304,724

Int. Cl.[5] **B21C** *47/18;* **B65H** *49/34*

U.S. Cl. 242—82 **17 Claims**

1. An automatic dispenser for elongated flexible elements including a frame, means on said frame for supporting an elongated element carrier for rotational movement about a given axis during the removal of said element from said carrier; drive means for rotating said carrier about said axis at variable speeds; and control means for controlling the actuation and variable speed of said drive means in response to the tension exerted on said element; said control means including a rotatable means, the degree of rotation of said rotatable means determining the speed of said drive means and rotational speed of said carrier; the improvement comprising:

a first guide means mounted for rotation substantially about said given axis; said first guide means having a guide member adapted to receive therethrough and guide an elongated flexible element received from said carrier;

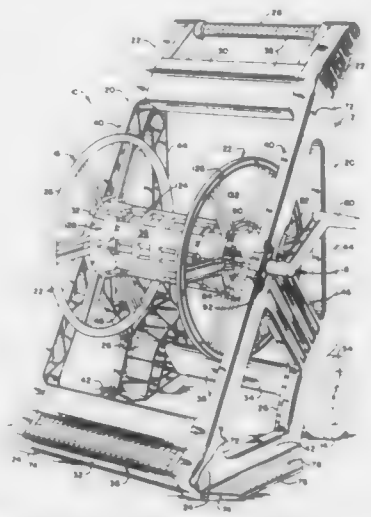
a second guide means located at a spaced position from said first guide means and adapted to receive said element after the element is passed through said first guide member; said second guide means being located with relation to said first guide means so that a tension exerted on said element after passing through said first and second guide means

induces said guide member of said first guide means to follow a circular path in one direction about said given axis, the degree of rotation of said guide member along such rotational path being proportionally dependent upon the tension exerted on the element whereby the greater the tension on said element the greater degree of rotation of said guide member;

means for biasing said guide member to rotate about said given axis in a direction along said circular path opposite to said one direction;

said first guide means being operatively connected to said rotatable means causing said control means to control the degree of rotation of said rotatable means in proportion to the tension on said element and thus control the speed of said drive means and rotational speed of said carrier in proportion to the tension on said element whereby increase of tension on said element proportionally increases the rotational speed of said carrier and decrease in the tension on said element proportionally decreases the rotational speed of said carrier.

5,007,598



HOSE REEL ASSEMBLY

Kenneth J. Spear, Vienna, W. Va., and Ronald R. Fowler, Coolville, Ohio, assignors to O. Ames Co., Parkersburg, W. Va.

Filed Oct. 25, 1989, Ser. No. 426,212

Int. Cl.[5] **B65H** *75/34*

U.S. Cl. 242—86.2 **40 Claims**

1. A portable hose reel assembly comprising

a pair of molded plastic side frames each of similar generally triangular shaped configuration providing three corner structures,

said side frames being disposed in transversely spaced parallel relation with corresponding corner structures facing one another,

a first of said three corner structures of each side frame having first socket means therein opening in a direction toward the corresponding corner structure,

a second of said three corner structures of each side frame having second socket means therein opening in a direction toward the corresponding corner structure,

transverse frame members each formed of plastic by blow molding so as to define an elongated hollow tubular central portion having closed end portions on opposite ends of said central portion,

the closed end portions of said transverse frame members being shaped to respectively fit snugly within said first and second socket means,

each closed end portion and the associated socket means having interengaging surface means operable in response to the transverse movement of the closed end portion into the associated socket means to retain the closed end portion against transverse movement out of the associated socket means so that when all of said closed end portions are retained in snugly fitting relation with the associated socket means said transverse frame members and said side frames constitute a hose reel supporting frame structure,

a third of said three corner structures of said side frames having aligned shaft receiving openings therein,

a shaft extending through said shaft receiving openings,

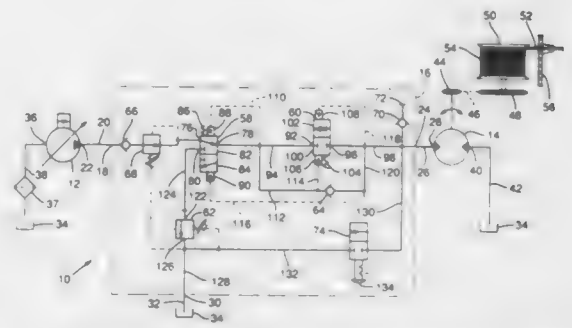
supporting wheels on said shaft for enabling the hose reel supporting frame structure to be rollingly supported for manual movement along a generally horizontally extending surface by an operator grasping a central portion of a transverse frame member associated with said first socket means,

means on said second corner structures for engaging a generally horizontally extending surface on which said supporting wheel are engaged for stably fixedly supporting said hose reel supporting frame structure on said generally horizontally extending surface,

a hose reel structure for receiving a length of hose in coiled formation thereon, and

means for rotatably supporting said hose reel structure between said side frames in a position such that said hose reel structure is disposed above a generally horizontally extending surface on which said hose reel supporting frame structure is manually moved or stably fixedly supported as aforesaid.

5,007,599



HYDRAULICALLY-ACTUATED CONTROLLER FOR REEL DRIVE

Allen P. Forsyth, Portland, Oreg., assignor to Atlas Copco Construction and Mining Holding AB, Stockholm, Sweden

Filed Jul. 28, 1989, Ser. No. 386,956

Int. Cl.[5] **B65H** *75/42*

U.S. Cl. 242—86.51 **21 Claims**

1. A hydraulic controller for use with a reel used for windably storing a flexible cable extending from the reel to a tie point to which a distal terminus of the cable is affixed, the reel paying out a required length of the cable whenever the distance between the reel and said tie point is increasing, maintaining the unwound cable extending from the reel to the tie point in a taut condition when said distance is remaining constant, and paying in the cable when said distance is decreasing, the reel powered by a hydraulic motor hydraulically coupled to a source of pressurized hydraulic fluid, the controller comprising:

a first port hydraulically coupled to the source of pressurized hydraulic fluid, a second port hydraulically coupled to the motor, and a third port hydraulically coupled to a reservoir of hydraulic fluid;

a hydraulic pressure-actuated valving means for valving the flow of hydraulic fluid from the first port to the second port and from the second port to the third port, the valving means assuming a pay-in mode when the distance between the reel and the tie point is either decreasing or

remaining constant, and a pay-out mode when said distance is increasing;

(a) in which pay-in which the valving means passing pressurized hydraulic fluid from the first port to the second port to drive the hydraulic motor to urge the reel to rotate in a pay-in direction; and

(b) in which pay-out mode the valving means occluding passage of hydraulic fluid from the first port through the valving means to the second port and passing a partially restricted flow of pressurized hydraulic fluid from the second port to the third port so as to hydraulically brake rotation of the motor when the reel is rotating in a pay-out direction;

the valving means comprises a first, a second, a third, and a fourth valve, the first, second, third, and four valves hydraulically intercoupled, wherein;

(a) the first valve is a two-position valve having an inlet port, an outlet port, and an exhaust port, the inlet port coupled to the first port of the valving means;

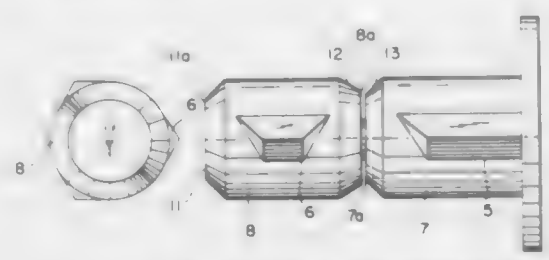
(b) the second valve is a two-position valve having an inlet port coupled to the second port of the valving means and an outlet port coupled to both the outlet port of the first valve and the second port of the valving means;

(c) the third valve is an adjustable pressure-relieving pressure-control valve having an inlet port coupled to the exhaust port of the first valve and an outlet port coupled to the third port of the valving means; and

(d) the fourth valve is a check valve having an inlet port coupled to the outlet port of the second valve and an outlet port coupled to the second port of the valving means.

5,007,600

TWO STAGE REEL MECHANISM FOR TAPE RECORDER



Satoru Koizumi, Higashihiroshima, Japan, assignor to Sharp Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 264,082, Oct. 28, 1988, abandoned, which is a division of Ser. No. 933,391, Nov. 21, 1986, Pat. No. 4,815,675. This application Jan. 25, 1990, Ser. No. 469,678

Claims priority, application Japan, Nov. 29, 1985, 60-184729; Nov. 29, 1985, 60-184730

Int. Cl.[5] **G11B** *15/32*

U.S. Cl. 242—194 **5 Claims**

1. A two stage reel mechanism of a tape recorder on which first and second compact type cassette tapes supported in a stacked arrangement by a cassette holder of said recorder can be interchangeably loaded, said first cassette tape and said second cassette tape being identical in shape and size with each other, said first cassette tape being provided with a first hub which has a plurality of first projections at an inner circumference thereof, said second cassette tape being provided with a second hub which has a plurality of second projections at an inner circumference thereof, said holder being movable toward and away from a main body of said recorder between a closed position, wherein said first and second cassette tapes can be recorded and played, and an open position, wherein said first and second cassette tapes can be inserted in and removed from said holder, said two stage reel mechanism comprising:

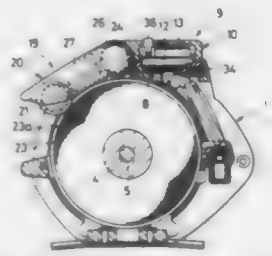
a first reel operatively connected to a reel driving means for transmitting a rotating force from the reel driving means to said first cassette tape, said first reel being provided with a plurality of first engaging members made of rigid material at its periphery for engaging in a rotating direction of said first reel with said first projections when said holder is in said closed position, said first reel being juxtapositioned to a bearing portion of a tape winding or tape feeding reel; and

a second reel, operatively connected to the reel driving means and coaxially provided with said first reel for transmitting a rotating force of the driving means to said second cassette tape, said second reel being provided with a plurality of second engaging members made of rigid material at its periphery for engaging in a rotating direction of said second reel with said second projections when said holder is in said closed position,

wherein the diameters of said first and second reels are equal, the height measured from the center of the axis of rotation of said first and second reels to the top or outermost dimension of said respective first and second engaging members is equal, at least the leading end of said second reel has a tapered portion, and said second engaging member is shaped as a prism extending along an axial direction of said second reel, including two side surfaces for abutting said second projections so as to transmit said rotating force, and having a first base portion at a leading end thereof and a second base portion at the other end thereof, said first base portion comprising a pyramid whose vertex is pointed out toward said leading end of said second reel and is situated on said second reel, said second base portion comprising a pyramid whose vertex is pointed out toward the other end of said second reel and is situated on said second reel.

5,007,601

WATER DEPTH MEASURING DEVICE FOR A FISHING REEL



Masaharu Emura, and Takehiro Kobayashi, both of Hiroshima, Japan, assignors to Ryobi Ltd., Hiroshima, Japan

Continuation of Ser. No. 399,407, Aug. 28, 1989, abandoned, which is a continuation of Ser. No. 155,849, Feb. 16, 1988, abandoned. This application Feb. 9, 1990, Ser. No. 478,020

Claims priority, application Japan, Feb. 16, 1987, 62-21617[U]

Int. Cl.[5] **A01K** *97/12*

U.S. Cl. 242—223 **8 Claims**

1. A water depth measuring device for a fishing reel comprising:

a reel body having a spool rotatably supported therein;

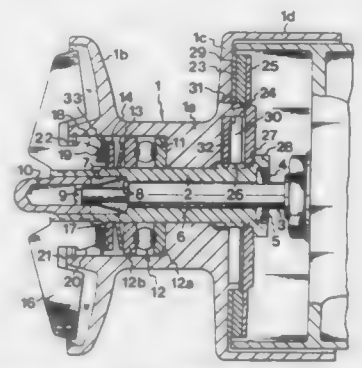
reel rotation signal generating means connected to a supporting arm rotatably mounted on said reel body, said signal generating means for generating a magnetic flux line cast signal corresponding to a case length of fishline in response to the rotation of said spool, said signal generating means including a first roller for contacting a fishline wound on said spool, a second roller having a magnet attached thereto for generating said line cast signal, and means for linking said first roller to said second roller to rotate said second roller in response to the rotation of said first roller;

a watertight compartment mounted on said reel body; and

line cast sensor means disposed in said watertight compartment and adapted to detect said magnetic flux line cast signal through a wall of said watertight compartment,

line cast indicator means connected to said sensor for indicating the length of a fishline cast from said spool.

5,007,602



CLICK MECHANISM IN A FISHING REEL

Karl L. Carlsson, Asarum, Sweden, assignor to Abu Garcia Produktion AB, Svangsta, Sweden

Filed Mar. 16, 1990, Ser. No. 494,340

Int. Cl.[5] **A01K** *89/027*

U.S. Cl. 242—246 **3 Claims**

1. A click mechanism in a fishing reel, said click mechanism being adapted to produce a click sound on relative rotation between a shaft having a first member non-rotatably connected thereto, and a second member rotatably mounted on the shaft, said mechanism comprising

a snap-action click ring provided between said first member and said second member;

first teeth formed on the side of said first member facing said snap-action click ring; and

second teeth formed on the side of said second member facing the snap-action click ring;

said snap-action click ring having a first resilient tongue and a second resilient tongue which extend in the same direction in the circumferential direction of said snap-action click ring but are outwardly bent in opposite directions in the axial direction thereof;

said first resilient tongue engaging said first teeth, and said second resilient tongue engaging said second teeth; and

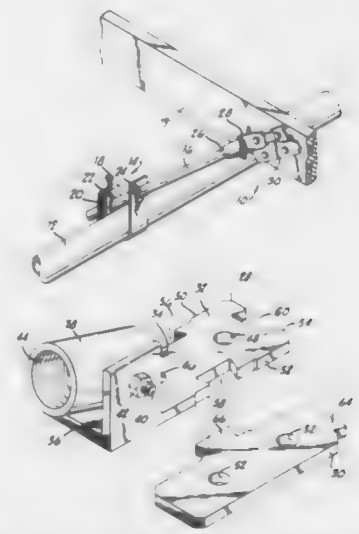
said first and said second teeth and said first and said second tongue being so designed that on rotation of said second member relative to said shaft in one direction, the second tongue snaps over said second teeth and produces a click sound, while said first tongue with respect to said one direction holds the snap-action click ring in non-rotatable engagement with said first teeth, and that on rotation of said second member relative to the shaft in the opposite direction, said second tongue with respect to said opposite direction holds the snap-action click ring in non-rotatable engagement with said second teeth, thereby entraining the snap-action click ring in the rotary motion of said second member, at the same time as said first tongue snaps over said first teeth and produces a click sound.

5,007,603

ADJUSTABLE LOAD BOLT ADAPTER BRACKET ASSEMBLY

Kraig A. Kirschner, Corona, Calif., assignor to Automated Fire Control, Incorporated, South El Monte, Calif.

Continuation-in-part of Ser. No. 537,907, Jun. 11, 1990. This application Jul. 25, 1990, Ser. No. 558,077



Int. Cl.[5] **F16L** *3/00*

U.S. Cl. 248—59 **4 Claims**

1. An adjustable bracket assembly for selective use with a varying number of fasteners to secure a bracing element to a fixed structure, said assembly comprising:

an attachment member having means thereon for engaging a bracing element and defining a flat plate portion extending from said means, said plate portion having a pair of axially aligned fastener receiving apertures therein and a locking tab securing channel formed in opposite sides and one end of said plate portion; and

an adapter plate for cooperation with said attachment member to provide additional fastener receiving apertures for the securement of the bracing element to the structure, said plate defining a plurality of axially aligned fastening

receiving apertures therein, a first locking tab extending from one end thereof and a second locking tab extending from one side thereof, one of said tabs being adapted to be received within one of said channels for interlocking said adapter plate with said attachment member in a selected disposition adjacent thereto whereby the number of available fastener receiving apertures for use in securing the bracing element to the fixed structure can be increased by the number of fastener receiving apertures in said adapter plate and the footprint defined by said attachment member and interlocked adapter plate can be varied to fit the available space on a fixed structure.

5,007,604

SIDE LOAD TYPE PIPE HANGER WITH SINGLE BOLT CLOSURE

Peter S. Richards, Issaquah, Wash., assignor to Progressive Fastening, Inc., Seattle, Wash.

Continuation of Ser. No. 730,285, May 3, 1985, abandoned. This application Nov. 9, 1988, Ser. No. 269,969

Int. Cl.[5] **F16L** *3/08*

U.S. Cl. 248—62 **11 Claims**

1. A pipe hanger, comprising:

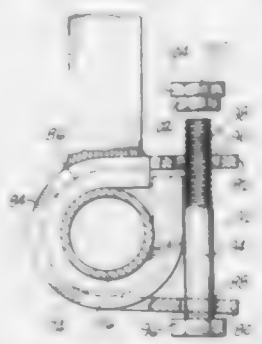
a piper receiving saddle constructed from a flat metal bar formed into a generally C-shape and comprising a first straight arm portion having an inner end, a second straight arm portion having an inner end, and an interconnecting, substantially semi-circular bight portion connected directly to the inner ends of said arm portions, said first and second arm portions each extending at a tangent from the bight portion and each having a free outer end, said outer ends defining between them a pipe avenue for accommodating a pipe which is moved sideways through said avenue into the saddle;

a support leg having an end that is butt welded to an external surface of said saddle; and

an improved system for securing a pipe within the C-shaped saddle, comprising:

a bolt comprising a rod body, an enlarged head at the first end of said rod body and a threaded end portion at the second end of said rod body,

a nut including a central opening that is threaded with threads which complement the threads on the bolt, said nut including a small size first end portion having a cross-sectional shape that is other than circular, and a large size second end portion;



a first opening in said first arm portion which is smaller in size than the head of the bolt but is larger in size than the rod body of the bolt;

a second opening in said second arm portion, said second opening being substantially larger in size than the rod body of the bolt, so that the rod body also fits loosely in said second opening, and smaller in size than the second end portion of the nut, and being sized and complementary shaped to snugly receive the small size first end portion of the nut, and hold said first end portion of the nut, and the nut itself, against turning,

whereby a pipe section can be moved sideways through said avenue between the free ends of the first and second arm portions, into said C-shaped saddle, and the bolt can be inserted threaded end portion first through the first opening, and then through the second opening, and then the nut can be applied to the bolt with its small size first end portion directed towards the second opening, and the bolt can be screwed into the nut and the nut can be moved endwise to place the small size first end portion of the nut snugly within the second opening, and the head of the bolt can be rotated for drawing the nut and bolt together and applying a clamping force on the pipe section, with the fit of the small size first end portion of the nut within the second opening serving to hold the nut against rotation while the bolt is being rotated, and with the snug engagement of the small end of the nut within the second opening, backed by the large end of the nut, resulting in the nut and bolt substantially stiffening the second arm portion as the nut and bolt assembly are drawn together, so that bending will occur within the first arm portion;

with the first opening being sized to allow sideways alignment movement of the bolt in the first opening as said first arm portion bends and the bolt becomes aligned with the nut, during tightening of the bolt within the nut; and

with the first straight arm portion bending towards the second straight arm portion when the nut and bolt assembly are drawn together.

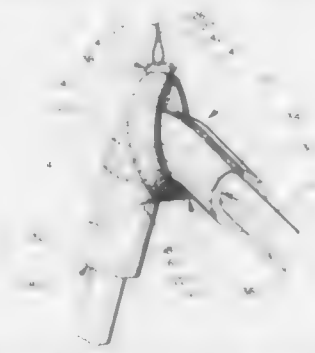
HOSE AND CABLE SUPPORT



Daniel P. Horvath, Grande Prairie, Canada, assignor to Hosehandlers International Inc., Edmonton, Canada

Filed Mar. 30, 1989, Ser. No. 330,745
Int. Cl.[5] F16L *3/00*
U.S. Cl. 248—62 10 Claims

1. An apparatus for suspending hoses or cables, comprising:

a. an elongate support of a polymer plastic material having a support surface in the shape of an arch with a vertex, depending haunches and intrados, such that a hose or cable may be supported upon the vertex and haunches of the arch, the support having a first end and a second end, the intrados being reinforced, such that the radius of the arch does not vary under the weight of the hose or cable, the support having side walls adjacent the support surface, such that the side walls form an interior channel which prevents transverse movement of the hose or cable, and

b. a strap embedded in the intrados substantially equidistant between the first end and the second end of the support, the strap having a first portion which extends from one side of the support terminating in a first end and a second portion which extends from the opposed side of the support terminating in a second end, the second portion being longer than the first portion, the first end and second end of the strap being formed in loops, such that when the second portion is placed under a hose or cable and then fed through the loop in the first portion a force exerted by a suspension line secured to the loop on the second portion will cause the second portion to pass through the loop in the first portion thereby drawing the support into a position wherein the support surface underlies the hose or cable

SUPPORT STAND FOR FOOD POUCHES

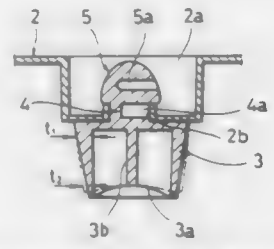
Ronald R. Allen, 211 N. Victoria; William D. McEwen, 727 Viewcrest Dr., both of Ventura, Calif. 93003

Filed Jan. 23, 1990, Ser. No. 468,611
Int. Cl.[5] A47G *23/02*
U.S. Cl. 248—152 6 Claims

1. A support stand for receiving and supporting a flexible pouch of the type used for containing dehydrated food or the like, said support stand comprising:

first and second substantially identical plate members each defining an upright side wall, and a generally rectangular base wall joined to said side wall along a bend line at a lower edge thereof and extending generally angularly with respect to said side wall;

each of said base walls defining a leading edge and trailing edge extending downwardly and outwardly from said bend line, each of said base walls further defining and elongated slot opening at the leading edge thereof and extending generally in parallel with said bend line approximately to a midpoint between the leading and trailing edges thereof;



said plate members being releasably and slidably interlocked by orienting said plate members with the leading edges of their respective base walls in facing relation and slidably fitting said base wall of each plate member into the slot formed in the base wall of the other plate member, thereby interconnecting said plate members with said base walls interlocked in a generally X-shaped profile and with said side walls projecting upwardly from said base walls in spaced and generally parallel relation to define a substantially horizontally oriented pouch-receiving trough, said plate members being slidably separable and nested one upon the other to pack in a substantially minimum profile geometry.

SUPPORT UNIT FOR HOME APPLIANCES

Tae Y. Kim, Suwon, Japan, assignor to SamSung Electronics Co., Ltd., Suwon, Rep. of Korea

Filed Aug. 30, 1989, Ser. No. 400,876
Claims priority, application Rep. of Korea, Dec. 30, 1988, 88-22121
Int. Cl.[5] F16M *11/00*
U.S. Cl. 248—188.9 32 Claims

1. A support unit of home appliances, comprising:

a supporting body on which a base plate of home appliances is fixed said supporting body having a longitudinal axis and exterior sidewalls forming an inner space, said supporting body including:

a rib formed in said inner space and extending completely radially across from oppositely disposed portions of said sidewalls of said supporting body;

a curved face formed at a bottom of the rib for adding elasticity;

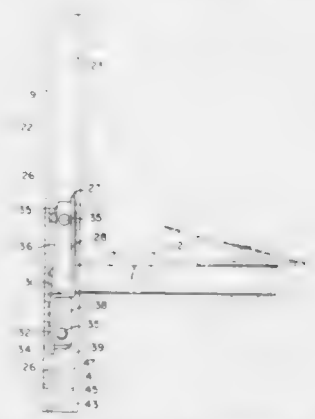
a surface thickness of said supporting body whereby the thickness of a lower surfaces thinner than that of an upper surface;

a neck having a fixing hole thereinto extending radially and substantially perpendicularly to said longitudinal axis, said fixing hole opening to the exterior of the neck, formed on the supporting body; and

an inserting protrusion having an orifice thereinto extending radially and substantially perpendicularly to said longitudinal axis, said orifice opening to the exterior of the neck.

5,007,608

TELEVISION WALL BRACKET



Joseph W. Carroll, Jr., West Chester, Pa., assignor to Kim Manufacturing Company, Downingtown, Pa.

Filed Aug. 28, 1989, Ser. No. 399,172
Int. Cl.[5] A47F *1/10*
U.S. Cl. 248—297.2 11 Claims

1. A wall bracket mounting device for attaching a television set to a wall, comprising:

an elongated bracket adapted to be mounted on a wall, the elongated bracket including a flat back plate having at least one row of locking elements formed therein and a pair of U-shaped confronting channels extending along opposite side edges thereof defining trackways of a predetermined width with a pair of vertical inner track surfaces spaced from said back plate; and

a rigid slide assembly including a rigid angled member having a rigid lower flat portion, a middle juncture position, and a rigid upper flat portion parallel to and forwardly spaced from said lower flat portion and an elongated support arm projecting outwardly from the middle juncture portion, wherein said rigid slide assembly is engageable within said pair of U-shaped confronting channels and operable between a first position wherein said upper flat portion is rotated toward the back plate with the lower flat portion rotated away and disengaged from the back plate such that the rigid slide assembly may be adjusted vertically in the elongated bracket and a second position wherein said lower flat portion of said rigid slide assembly contacts said back plate and said upper flat portion of said rigid slide assembly contacts said pair of vertical inner track surfaces so as to lock the rigid slide assembly in a predetermined position, the locking of said rigid slide assembly against vertical movement provided by the pivotal movement of said rigid slide assembly about the intersection defined by the support arm and the vertical longitudinal axis of the rigid slide assembly to enable engagement of the rigid slide assembly with the elongated bracket such that pivoting of said rigid slide assembly with respect to said elongated bracket being the only means necessary for adjusting movement of said rigid slide assembly in said elongated vertical bracket.

TIRE RETAINER FOR DOCK

Atis Bredovskis, 368 Rouge Hills Dr., West Hill, Ontario, Canada M1C 2Z5

Filed Oct. 10, 1989, Ser. No. 419,333
Int. Cl.[5] A47H *1/16*
U.S. Cl. 248—303 1 Claim

1. A tire retainer, for use in combination with a tire having walls and being U-shaped in cross-section, for the purpose of

retaining the tire between a vertical surface and the hull of a boat, said tire retainer comprising:

a hook retainer formed for securement to a dock or the like;

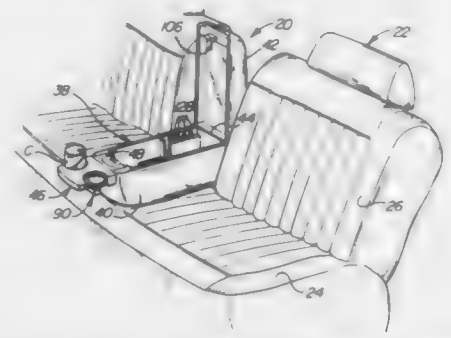
a single-piece hook and cleat assembly mounted on said hook retainer;

said hook of said single-piece hook and cleat assembly having a cradle to accept the edge of a tire wall and a free end to enter the interior space between the walls of the tire;

said cleat of said single-piece hook and cleat assembly integrally formed at the end opposite the free end of said hook for securing a rope or the like from a boat, said cleat bent sufficiently forwardly to extend over the cradle to assist in avoiding dislodgement of the tire as a result of upward forces, but not bent to an extent likely to result in damage to a boat hull; and

said tire retainer shaped to permit quick dismounting and remounting of the tire thereon, and to accommodate limited movement of the tire in response to upward forces without the tire being dislodged or the hook retainer being torn from its securement.

5,007,610



ARMREST COMPARTMENT WITH CUPHOLDER

Ned Christiansen, Three Rivers, and David Kellogg, Kalamazoo, both of Mich., assignors to Lear Seating Corporation, Southfield, Mich.

Filed Jan. 22, 1990, Ser. No. 468,079

Int. Cl.[5] **A47C** *7/62*

U.S. Cl. 248—311.2 **43 Claims**

1. A beverage container holding assembly for recessed storage in a vehicular armrest (20), said assembly comprising, girth support means (46) having a predetermined support width for surrounding and supporting the side wall of a beverage container (C) said girth support means (46) including a first articulated arm (54) moveable in a curvilinear path in response to actuation of said collapsing means (50); hinge means (48) defining a hinge axis (A) extending parallel to said support width for rotatably connecting said girth support means (46) to an armrest (20); and characterized by collapsing means (50) operatively connected to said girth support means (46) for automatically collapsing said support width to a smaller storage width in response to arcuate movement of said girth support means (46) about said hinge axis (A) to allow compact storage of said assembly in the armrest (20).

5,007,611

OPERATION MECHANISM OF LIFTER FOR AUTOMOTIVE SEAT

Shigeru Kanai, Tokyo, Japan, assignor to Tachi-S Co. Ltd., Tokyo, Japan

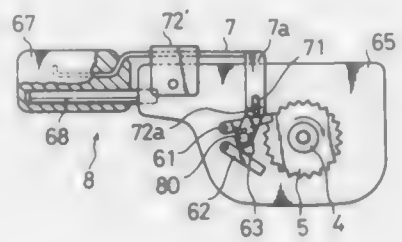
Filed Jan. 4, 1990, Ser. No. 461,086

Int. Cl.[5] **B60N** *1/02*

U.S. Cl. 248—422 **6 Claims**

1. An operation mechanism of a lifter for an automotive seat, comprising:

a drive mechanism for raising and lowering a seat frame of said seat;



a drive shaft connected with said drive mechanism;

a gear fixed on said drive shaft;

a housing which is rotatably supported on said drive shaft, said housing has an operation lever connected integrally therewith;

a pair of first and second latch pawls provided within said housing in such a manner that said first latch pawl is to be engaged with one side of said gear so as to permit said gear to rotate only in a one direction, and said second latch pawl is to be engaged with the other side of said gear so as to permit said gear to rotate only in a direction opposite to said one direction;

a cam means fixed on a shaft which is rotatably secured within said housing an arm, having a dependent leg, which is so arranged that its one end is operatively connected with said cam means whereas its other end extends towards said operation lever, and wherein there is provided a link means between said arm and said cam such that one end of said link means is fixed on said shaft while the other end of said link means is pivotally connected

with said one end of said arm, whereby forward and backward movement of said arm causes said link means to rotate in same direction about said shaft, which causes rotation of said cam means by said shaft to disengage one of said first and second latch pawls from said gear, with the other of them remaining in engagement with said gear;

an arm which is so arranged that its one end is operatively connected with said cam means whereas its the other end that extends towards said operation lever;

wherein said operation lever includes a support rod and a handle attached slidably on said support rod, such that said handle is movable along said support rod in a longitudinal direction thereof, and wherein, to said handle is connected said the other end of said arm, whereby drawing forwards and backwards said handle along said longitudinal direction of said operation lever results in actuating said cam by said arm to thereby selectively disengage one of said first and second latch pawls from said gear, and set a rotational direction of said gear to actuate said drive mechanism to effect desired one of raising and lowering motions of said seat frame.

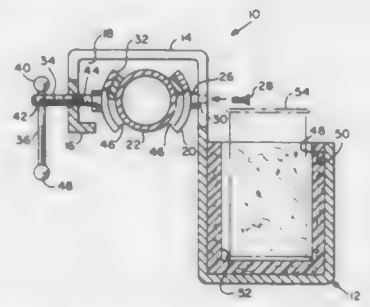
RAIL MATE

Robert A. Manfre, 389 Hendrickson Ave., Valley Stream, N.Y. 11580



Filed Apr. 23, 1990, Ser. No. 512,879

Int. Cl.[5] **F16M** *13/00*

U.S. Cl. 248—558 **6 Claims**

1. A rail mate for a boat handrail of either cylindrical or rectangular shape comprising a main body providing means for receiving and vertically stabilizing a cold beverage container and keeping said beverage container cool and for receiving and supporting food and other articles, a rail engaging clamp of inverted channel shaped integrally attached to said main body and comprising a base wall having opposite longitudinal side edges of the base wall a rail engaging lip projecting from the free end of the second side wall, parallel to the base part way towards the first side wall so that the side walls, base and lip define a rail receiving enclosure with a rail admitting mouth

formed between an adjacent free end of the lip and the first side wall, the beverage receiving and stabilizing means and the food receiving and supporting means being formed on an extension of the first side wall remote from the base wall, first and second clamp members releasably fastened to respective side walls so as to extend within the enclosure, means to advance one clamp

member relatively towards the other clamp member into cooperative clamping engagement with cylindrical boat rail of substantially smaller cross sectional size than the enclosure, whereby, after removal of the clamp members, a boat rail of rectangular shape inserted through the mouth can be received in the enclosure in a force-fit to extend along the channel engaged by all four sides thereof.

VALVE AND ACTUATOR APPARATUS ALLOWING MULTIPOSITION RELATIONSHIP

James E. Barker, Sauk Rapids, and Timothy J. Cash, Little Falls, both of Minn., assignors to General Signal Corporation, Stamford, Conn.

Filed Aug. 20, 1990, Ser. No. 569,687

Int. Cl.[5] **F16K** *5/00, 31/16*

U.S. Cl. 251—58 **30 Claims**

1. A linkarm apparatus for joining an associated valve having a rotatable mounted first shaft on which a butterfly is mounted and an associated actuator having a second shaft which reciprocally moves in a linear path, said apparatus including:

a plate having first and second means for engaging the first shaft and first and second means for engaging the second shaft, said first and second means for engaging the first shaft including means limiting engagement between said first shaft and said first and second means for engaging the first shaft to specific angular positions, said specific angular positions being rotated an angle beta from each other.

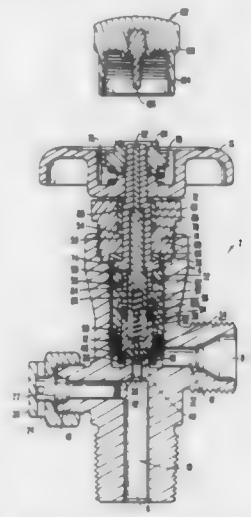
5,007,614

PRESSURE RESPONSIVE TWO-WAY SHUT-OFF VALVE

Hanford N. Lockwood, Jr., San Mateo, Calif., assignor to Hanford N. Lockwood, San Mateo, Calif.

Continuation of Ser. No. 370,219, Jun. 22, 1989, Pat. No. 4,911,403. This application Jan. 12, 1990, Ser. No. 463,747

Int. Cl.[5] **F16K** *15/18*



U.S. Cl. 251—83 **7 Claims**

1. A shut-off valve for use with high pressure gas cylinder adapted to retain a residual gas pressure in the cylinder, the valve comprising:

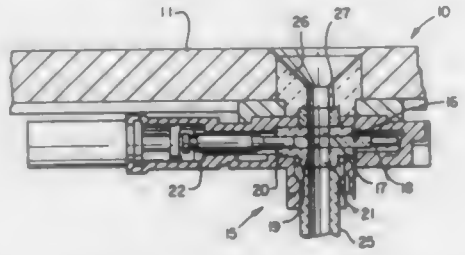
an elongated, tubular housing having a first open end defining an axial port and a second open end defining an axially oriented access opening in general axial alignment with the port, the housing further defining a generally radially oriented port in fluid communication with the axial port via a passage formed by an axial portion communicating with the axial port, a radial portion communicating with the radial port, and an intermediate chamber fluidly connecting the portions, the axial portion terminating in a valve seat defining first and second seating surfaces;

a valve plug disposed in the chamber and axially moveable between a closed position in which it is proximate the valve seat and an open position in which it is remote from the seat, the plug including a relatively hard first sealing member adapted to sealingly engage the first seating surface, for forming a high pressure seal, and a relatively soft second sealing member adapted to sealingly engage the second seating surface for forming a low pressure seal;

a valve actuator including a stem having a portion rotatably and axially substantially immoveably mounted to the housing and an axially moveable, rotatable segment threadably engaging an interior of the housing so that rotation of the portion results in an axial movement of the

segment, the stem extending from the exterior of the housing through the access opening into engagement with an end of the plug facing towards the access opening so that axial movement of the stem segment towards the valve seat moves the sealing members into sealing engagement with the corresponding seating surfaces, the segment and the plug being further constructed so that the plug can move axially relative to the segment when the segment is relatively remote from the valve seat, and spring means for resiliently urging the plug into its closed position, the spring means being constructed so that a positive pressure differential between the axial port and the radial port in excess of the residual pressure moves the plug in opposition to the spring means towards its open position; and

selective coupling means directly between the segment of the stem and the plug including an axially movable pin operable from the exterior of the housing and extending through the access opening, a coupling member activated by the pin and movable between a first position in which the segment of the stem and the plug are axially movable relative to each other and a second position in which the segment of the stem and the plug are axially immovable relative to each other and are axially movable together as unit relative to the housing, for coupling the plug, when it is in its closed position, with the segment by moving the coupling member into its second position, so that, thereaf-



ter, operation of the actuator moves the plug from its closed position to its open position even when the pressure at the radial port exceeds the pressure at the axial port.

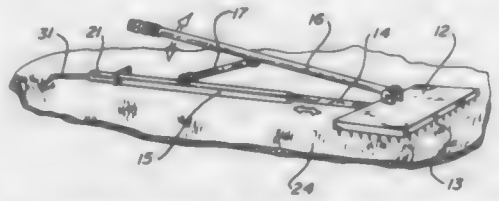
REFRACTORY SLIDE GATE ASSEMBLY AND METHOD

Mark C. Kernion, East Pittsburgh, and Ben Davies, deceased, late of Pittsburgh, both of Pa. by Evelyn Davies, executrix , assignors to Dresser Industries, Inc., Dallas, Tex.

Filed Dec. 12, 1988, Ser. No. 283,253
Int. Cl.[5] B22D *41/08*
U.S. Cl. 251—368 23 Claims

1. A valve for high temperature molten metals comprising:



A pair of plates disposed for slidable movement therebetween, each of said plates having an aperture therethrough which when in registration permit passage of molten metal therethrough and which when out of registration prevent said passage of molten metal, at least one of said plates having at least its molten metal contacting surfaces of a refractory material consisting essentially of carbon bonded magnesite.

5,007,616

CARPET STRETCHING TOOL

Kelvin M. Scarpino, 508 Douglas Dr., Denver, Colo. 80221

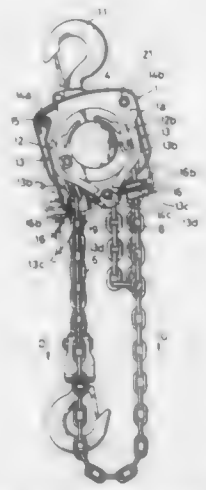
Filed Mar. 9, 1990, Ser. No. 491,165
Int. Cl.[5] B25B *25/00*
U.S. Cl. 254—212 8 Claims

1. In a carpet stretching tool including a head having a plurality of needles projecting downwardly from a bottom surface to penetrate a carpet and engage said carpet, a rod member secured to said head and projecting away from said head, a tubular member slidably telescoping over said rod member and disposed in a horizontal position, lever and link means connected to said head and tubular member to move said head away from said tubular member, an improved anchor assembly mounted at the rear end of said tubular member, said anchor assembly comprising:

a support body sized to telescopically insert into an open rear end of said tubular member, said body having an inclined socket turned at a first selected angle to the longitudinal axis of the support body,

an elongated anchor member having a straight, elongated shank portion inserted into said socket and an inclined penetrating portion with the longitudinal axis of the inclined penetrating portion turned down at a second selected angle to the longitudinal axis of said shank portion so that said inclined penetrating portion is turned down at a forwardly and downwardly inclined selected third angle to a line perpendicular to said floor surface, a free end of said inclined penetrating portion having a beveled section terminating in a point to provide a relatively blunt penetrating surface for piercing the carpet and engaging the floor surface for anchoring the rear end of said tubular member to said floor surface during the stretching of the carpet away from the anchor member upon the actuation of said lever and link means,

said first selected angle being about twelve degrees to provide a vertical distance between the bottom of said tubular member and said point which accommodates relatively thick carpets,



said second selected angle being about fifty-two degrees and said third selected angle being about twenty-six degrees to cause said beveled section and point to anchor firmly in said floor surface.

5,007,617

HAND-OPERATED CHAIN BLOCK

Yosaku Nishimura, Osaka, Japan, and Glenn S. Smith, Issaquah, Wash., assignors to Vital Kogyo Kabushiki Kaisha, Osaka, Japan

Filed Aug. 3, 1989, Ser. No. 389,602
Int. Cl.[5] B66D *1/28*
U.S. Cl. 254—372 4 Claims

1. A hand-operated chain block comprising a load sheave rotatably supported by and between a pair of side plates, a hand chain, a hand chain wheel positioned a first surface of one of said side plates facing away from said load sheave mechanically coupled to said load sheave, and enclosing means for substantially enclosing entire periphery of said hand chain wheel, wherein

said enclosing means consists of a plurality of stays, a hand chain wheel cover, a pair hand chain guide plates, and a guide plate fixing member,

said plurality of stays are mounted on said first surface of one of said side plates about said hand chain wheel, a first and a second stay are positioned above the axis of rotation of said hand chain wheel when said hand-operated chain block is suspended from above, while a third stay is positioned beneath the axis of rotation of the hand chain wheel,

said hand chain wheel cover possesses a pie-shaped section, and is mounted on said plurality of stays so as to partially cover said hand chain wheel,

each of said hand chain guide plates is mounted on one of said first and second stays and covers a portion of said hand chain wheel which is perpendicular to its axis of rotation,

each of said hand chain guide plates includes a metal plate in a folded pattern with a pivotal support portion formed at an upper end portion thereof in a curved pattern, and with a tubular hand chain guide portion formed at a lower end portion thereof,

said pivotal support portion of said hand chain guide plates encircling said first and second stays so that said hand chain guide plates are oscillatably suspended and supported by said first and second stays,

the hand chain wound on said hand chain wheel passes through said hand chain guide portion, being guided by said hand chain guide portion, and

said guide plate fixing member is mounted on said stay, so that part of the lower end portion of both hand chain guide plates may be simultaneously.

5,007,618

STANDING AND WALK STARTING APPARATUS

Fred G. Libby, R.D. #1 Box 508E, Mays Landing, N.J. 08330

Filed Feb. 20, 1990, Ser. No. 481,431
Int. Cl.[5] E04H *17/00*
U.S. Cl. 256—1 18 Claims

1. A device to aid a person to stand up from a sitting position on a seat and to start walking, the device comprising:

(a) a floor base panel comprising:

(i) a rear portion positionable proximate the rear of the seat,

(ii) two side portions, one on each side of the seat, and

(iii) a front portion of an area sufficient to allow the person to stand on in front of the seat,

(b) a pair of inclined members, one each over opposite side portions, each comprising

(i) a rear end attached proximate the rear portion of the base panel, and

(ii) a length and angle of inclination of about twenty-five to about sixty degrees upwardly from the rear to the front sufficient to position a front end of each inclined member at a height and horizontal position to allow the person to grasp the front ends to pull with the person's handsdownwardly and rearwardly against the front ends to aid in rising from the seat.

(c) support means attached between the side portions of the base panel and the inclined members to vertically support the inclined members, and

(d) stability means to prevent horizontal movement of the base panel relative to the seat

CHAIN LINK FENCE

Aldo Sibeni, 10 Executive Dr., Manhasset Hills, N.Y. 11040

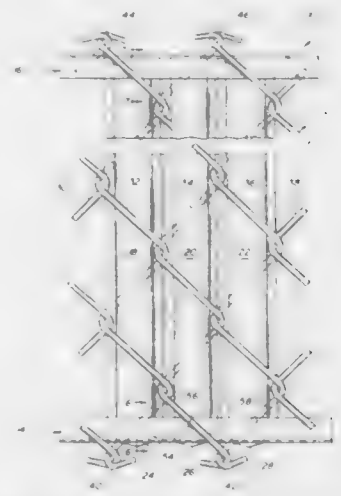
Filed Jan. 13, 1989, Ser. No. 297,182
Int. Cl.[5] B21F *27/00*
U.S. Cl. 256—34 22 Claims

1 A chain link fence assembly, comprising chain link fencing;

a bottom horizontal member engaged by the fencing;

a top horizontal member engaged by the fencing;

a plurality of horizontally spaced slats extending through spaces between the wires and connecting to the bottom horizontal member and engaging the top horizontal member;



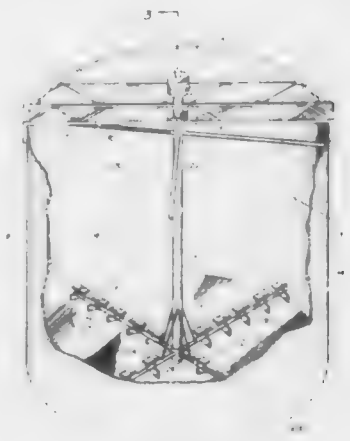
the slats having respective lock tabs formed therein and integral therewith projecting outwardly from the bottom ends thereof,

said bottom horizontal member having a plurality of horizontally spaced cutouts respectively receiving the horizontally spaced lock tabs;

wherein each lock tab has a pair of opposite recesses disposed on opposite edges thereof,

the recesses forming a pair of opposite projecting portions,

the projecting portions being flexible for insertion of the lock tab into its respective cutout and being resilient for returning to its original shape after insertion into the



cutout in order to lock the slat into the respective connecting cutout of the bottom horizontal member.

APPARATUS FOR BIOLOGICAL PROCESSING OF METAL-CONTAINING ORES

Robert C. Emmett, Jr., and Lawrence T. O'Connor, both of Salt Lake City, Utah, assignors to Envirotech Corporation, Menlo Park, Calif.

Continuation-in-part of Ser. No. 5,670, Jan. 21, 1987, which is a continuation-in-part of Ser. No. 827,324, Feb. 7, 1986, Pat. No. 4,732,608, and a continuation-in-part of Ser. No. 884,205, Jul. 10, 1986, Pat. No. 4,728,082. This application Aug. 23, 1988, Ser. No. 235,238
The portion of the term of this patent subsequent to Mar. 1, 2005, has been disclaimed.
Int. Cl.[5] C22B *3/02*
U.S. Cl. 266—160 11 Claims

9 A reactor for use in processing metal-ladened solids through use of a bioleaching process, said reactor comprising:

a containment means, having a base member, for containing a metal-bearing solids slurry,

an upright rotatable center shaft rotatably mounted within said containment means;

a plurality of radial arms mounted on said center shaft, above said base member;

a frame support stationarily mounted within said containment means elevationally above said radial arms, said frame having an open lattice configuration;

a plurality of flexible porous membrane diffusers spacedly mounted on said frame, each said diffuser having a horizontally oriented diffuser face for introducing oxygen-containing gas, in the form of bubbles, into said slurry;

a supply means mounted on said diffusers for supplying oxygen-containing gas to said diffusers; and

a plurality of rake-like members mounted on said radial arms to be rotatable therewith, said rakes being positioned below said diffusers and proximate said base member, wherein a rotation of said center shaft effects a raking action by said rake members over said base member to sweep solids which have settled on said base member from said solids slurry.

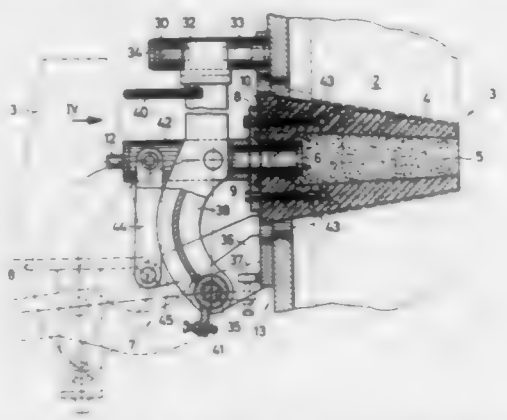
APPARATUS FOR MOUNTING A GAS WASHING SINK IN A CENTERED MANNER IN PERFORATED BRICK



Hans Rothfuss, Taunusstein; Raimund Brückner, Engenhahn-Niedernhausen; Peter Keutgen, Kreuzau; Josef Seeger, Düren; Manfred Winkelmann, Krefeld, and Herbert Metzger, Duisburg, all of Fed. Rep. of Germany, assignors to Didier-Werke AG, Wiesbaden, Fed. Rep. of Germany

Filed Sep. 28, 1989, Ser. No. 413,673

Claims priority, application Fed. Rep. of Germany, Oct. 1, 1988, 3833504

Int. Cl.[1] **C21C** *5/48*

U.S. Cl. 266—220 **66 Claims**

1. An apparatus for mounting a gas washing sink in a centered manner within an opening through a perforated brick in a wall of a metallurgical vessel, to enable gas to be introduced through the sink into molten metal within the vessel, and for removing the sink from the perforated brick, said apparatus comprising:

a support assembly to be fixedly mounted on the exterior of the wall of the metallurgical vessel adjacent the opening in the perforated brick, said support assembly including two columns having slots therethrough;

fastening means including mounting means for mounting the sink at a position centered relative to said fastening means, said fastening means being mounted with respect to said support assembly for movement relative thereto between an operating position, whereat said fastening means is centered with respect to the opening through the perforated brick and thereby the sink is pressed into the opening through the perforated brick in a centered manner, and a maintenance position, whereat the sink is withdrawn from the opening through the perforated brick, said fastening means comprising a cross member having opposite ends with bores therethrough, said columns extending through respective said bores, and said cross member being slidable in opposite directions, relative to said columns;

means, operable between said support assembly and said fastening means, for moving said fastening means and thereby the sink relative to said support assembly to said operating position, said moving means comprising wedges drivable into said slots and operable against said cross member to move said cross member to said operating position; and

withdrawal means, operable between said support assembly and said fastening means, for moving said fastening means and thereby the sink relative to said support assembly from said operating position to said maintenance position.

METHOD FOR FEEDING THE PRIMARY WEB OF A MINERAL WOOL WEB BY MEANS OF A PENDULUM CONVEYOR ONTO A RECEIVING CONVEYOR AND AN ARRANGEMENT OF SUCH A PENDULUM CONVEYOR

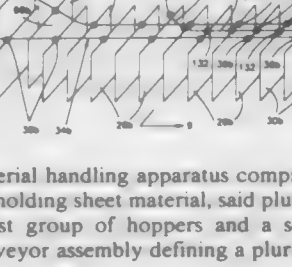
Matti Unkuri, and Tom Nurmi, both of Pargas, Finland, assignors to Oy Partek AB, Pargas, Finland

PCT No. PCT/FI87/00151, § 371 Date May 8, 1989, § 102(e) Date May 8, 1989, PCT Pub. No. WO88/03509, PCT Pub. Date May 19, 1988

PCT Filed Nov. 11, 1987, Ser. No. 354,433

Claims priority, application Finland, Nov. 12, 1986, 864613

Int. Cl.[5] **B65H** *45/10*



U.S. Cl. 270—39 **8 Claims**

1. A method for making a mineral wool web, comprising:

(a) providing a receiving conveyor having a generally horizontal, upwardly presented carrying run which advances longitudinally in a given direction;

(b) providing a pendulum-type conveyor arrangement which includes two generally vertically arranged endless conveyor belts which are disposed laterally adjacent one another, relative to said given direction, above said carrying run of said receiving conveyor, with respective carrying runs disposed in spaced, confronting relation, with the endless conveyor belts respectively entrained about respective upper and lower rollers rotating in respective directions to cause said spaced, confronting carrying runs of said endless conveyor belts to advance downwardly towards said carrying run of said receiving conveyor, whereby said pendulum-type conveyor has a carrying gap with an upper inlet end and a lower outlet end;

(c) while oscillating said pendulum-type conveyor assembly transversally of said given direction so as to reversingly sweep said outlet end of said carrying gap from adjacent one side edge of said carrying run of said receiving conveyor, to adjacent an opposite side edge of said carrying run of said receiving conveyor, continuously feeding a primary web of uncured mineral wool into said inlet end of said carrying gap between said carrying runs of said

endless conveyor belts of said pendulum-type conveyor arrangement, whereby said primary web is fed downwards by said carrying runs of endless conveyor belts and out onto said carrying run of said receiving conveyor so as to progressively provide on said carrying run of said receiving conveyor a multiple layer web of successively laid zig-zag folds of said primary webs of uncured mineral wool advancing in said given direction;

(d) During substantially all of each half cycle of oscillation of said pendulum-type conveyor assembly, in which a respective one of said endless conveyor belt leads and a respective other said endless conveyor belt trails said carrying gap, causing the respective said trailing endless conveyor belt to have said lower roller thereof disposed closer to, yet spaced above, said carrying run of said receiving conveyor than is said lower roller of the respective said leading endless conveyor belt.

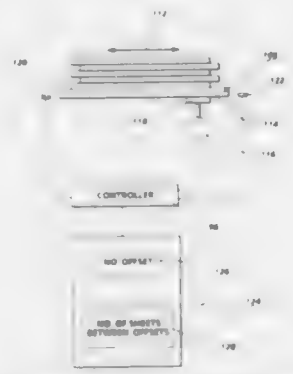
SELECTABLE SHEET OFFSETTING

Henry T. Kremers, Rochester, and Khalid M. Rabb, Webster, both of N.Y., assignors to Xerox Corporation, Stamford, Conn.

Filed Aug. 24, 1989, Ser. No. 398,858

Int. Cl.[5] **B42B** *2/00*

U.S. Cl. 270—53 **16 Claims**



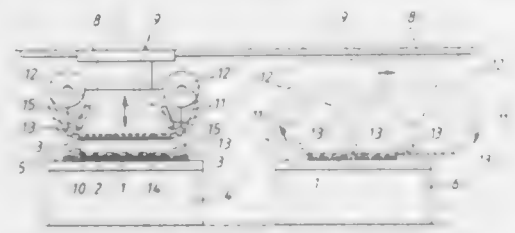
1. An apparatus for regulating offsetting stacks of sheets reproduced from at least one original document, including:

means for controlling offsetting of adjacent stacks of sheets from one another so that in one mode successive stacks of sheets are offset from one another and in another mode offsetting of the stacks of copy sheets from one another is inhibited, said controlling means includes means for selecting the number of sheets of each stack to be offset from one another;

means for receiving and supporting the sheets; and

means, responsive to said controlling means, for moving said receiving and supporting means at selected intervals to offset each stack from one another, said moving means being de-energized in response to said controlling means

inhibiting offsetting of the stacks of copy sheets from one another, wherein the sheets of each stack are uncollated



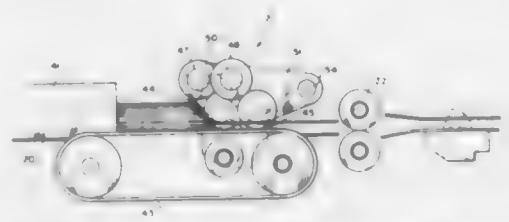
and said controlling means energizes said moving means to offset successive stacks of uncollated sheets.

5,007,626

APPARATUS FOR PICKING UP A FLAT WORK PIECE FROM AN ADHERING SUBSTRATE

Gottfried Blaimschein, Arnhalmweg 33, A-4407 Steyr, Austria

Filed Mar. 7, 1990, Ser. No. 490,054
Claims priority, application Austria, Mar. 17, 1989, 614/89
Int. Cl.[5] B65H 3/20
U.S. Cl. 271—33 10 Claims



1. An apparatus for picking up a flat work piece from a substrate to which it adheres, which comprises
(a) a pickup table having a surface for receiving the substrate carrying the flat work piece,
(b) a receiving table spaced from the pickup table and having a surface for receiving the flat work piece picked up from the substrate, and
(c) a vertically adjustable tool carrier movable between the tables and carrying a pickup device comprising
(1) a pressure platen configurated to conform to the flat work piece and having opposite ends,
(2) an adhesive strip extending over the pressure platen between the ends thereof,
(3) two guide rollers respectively recessed from the opposite ends of the pressure platen, the guide rollers being arranged to guide the adhesive strip under tension over the pressure platen, and
(4) two reeling drums receiving respective ends of the adhesive strip beyond the guide rollers and rotatable to displace the adhesive strip in an operating direction by reeling the adhesive strip on one of the drums and unreeling the same from the other drum,
(5) the tool carrier being arranged to be lowered until the adhesive strip contacts the flat work piece and then picks up the flat work piece from the substrate on the pickup table surface upon raising the tool carrier, to be moved to the receiving table with the picked-up flat work piece adhering to the adhesive strip and then to be lowered until the flat work piece rests on the receiving table surface, and the adhesive strip is displaceable parallel to the receiving table surface and in a direction opposite to the direction of the tool carrier movement whereby the adhesive strip is pulled off the flat work piece resting on the receiving table surface.

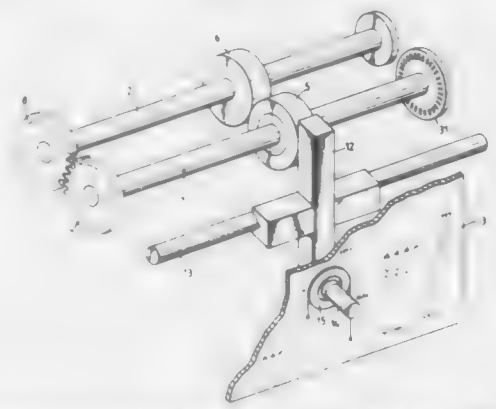
SCUFF SHEET SEPARATING DEVICE

John Giannetti, Penfield; Jerry F. Sleve, Henrietta, and Robert H. Shea, Victor, all of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

Continuation-in-part of Ser. No. 137,775, Dec. 24, 1987, Pat. No. 4,844,435. This application Jun. 15, 1989, Ser. No. 366,399
The portion of the term of this patent subsequent to Jul. 4, 2006, has been disclaimed.
Int. Cl.[5] B65H 3/04
U.S. Cl. 271—35 9 Claims

1. A sheet separating device for separating a sheet from a stack, said separating device including
feed means located in contact with the outside sheet of a received stack,
retard means positioned in contact with said feed means at the leading edge of the stack to prevent double feeding along a feed path between said retard means and said feed means,
said retard means including at least one rotatable retard member and a brake for said retard member,
the coefficients of friction of the feed means and of the retard member being greater than that of the sheets to be fed,
the brake exerting a braking force upon rotation of the retard member sufficient to prevent rotation when two or more sheets are in said path but permitting rotation when only one or no sheets are present in said path, and
a rigid pivot arm supporting said retard means, said pivot arm being pivotable about a pivot located downstream of said retard means, on the same side of the feed path as the retard means and separated from such path by a distance sufficient to cause rotation of the retard means about said pivot into a fed sheet in response to a force against the retard means parallel to the path.



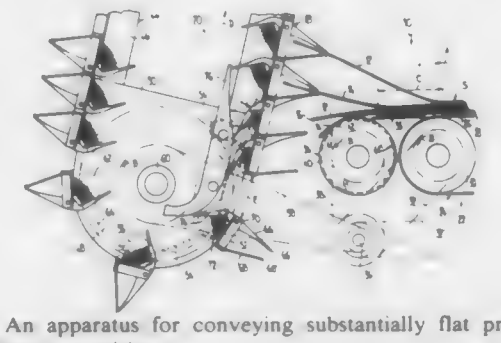
5,007,628

APPARATUS FOR SENSING SHEETS

John A. Skinner, Hampshire, England, assignor to De La Rue Systems, Ltd., United Kingdom

Filed May 26, 1989, Ser. No. 358,202
Claims priority, application United Kingdom, May 31, 1988, 8812893
Int. Cl.[5] B65H 7/02
U.S. Cl. 271—263 9 Claims

1. Apparatus for sensing the passage of sheets through a nip, said apparatus comprising:
a pair of guide members whose surfaces define said nip, said guide members being movable in a cyclic manner to advance the sheets through said nip;
sensing means for sensing the deflection of said guide members relative to one other, said sensing means including a signal generator providing a train of signals the frequency of which varies with the amount of relative deflection of said guide members, and a counter arranged to count said signals from said signal generation during an interval of predetermined length;
detecting means responsive to the output of said sensing means to establish the presence or absence of a sheet between said guide members as a function of a count supplied from said sensing means; and
said sensing means including a substantially flat coil and a core so mounted that relative displacement of said guide members by the passage of a sheet causes relative move-



ment between said core and said coil, and said coil being connected to said signal generator and effective for controlling said frequency of said signal generator in accordance with the degree of penetration of said core through said coil.

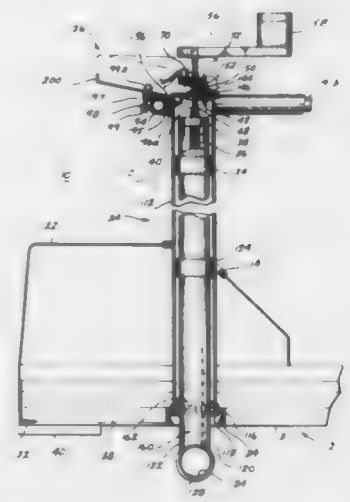
APPARATUS FOR CONVEYING SUBSTANTIALLY FLAT PRODUCTS, ESPECIALLY PRINTED PRODUCTS

Jürg Eberle, and Hans-Ulrich Stauber, both of Hinwil, Switzerland, assignors to Ferag AG, Hinwil, Switzerland

Filed Jan. 3, 1989, Ser. No. 292,989
Claims priority, application Switzerland, Jan. 8, 1988, 50/88
Int. Cl.[5] B65H 5/02
U.S. Cl. 271—277 22 Claims



1. An apparatus for conveying substantially flat printed products, comprising:
an infeed device for the infeed of products in the imbricated formation in which a pair of two superposed products are laid one on top of the other such that all like parts coincide, and in which said pair of two superposed products bear in imbricated formation upon a pair of upstream products with respect to a predetermined direction of travel of the imbricated formation;
said infeed device defining a conveying plane for the products and delivering the products to a take-over region;
a conveying device having a predetermined direction of travel;
said conveying device being provided with individually controllable grippers arranged in succession in said predetermined direction of travel of said conveying device;
said individually controllable grippers serving for engaging the infed products at leading product edges at the take-over region;
said predetermined direction of travel of the conveying device extending from an underside of the products upwardly and transversely with respect to the conveying plane of the infeed device; and
a separation device for spacing from one another at the take-over region the leading edges of the pairs of superposed products in order to introduce into each gripper a single product.

EXERCISE TREADMILL

Kenneth G. Real, Redmond, and Gary M. Bang, Edmonds, both of Wash., assignors to Precor Incorporated, Bothell, Wash.

Filed Oct. 7, 1988, Ser. No. 255,546
Int. Cl.[5] A63B 22/02
U.S. Cl. 272—69 30 Claims

1. An exercise treadmill, comprising:
(a) a frame structure;
(b) a deck for supporting an endless belt defining a running surface, the deck mounted on the frame structure;
(c) a self-contained lift mechanism extending upwardly from a forward, central portion of the frame structure to extend upwardly a substantial elevation above the running surface for raising and lowering the forward portion of the treadmill;
(d) wherein the self-contained lift mechanism comprises:
(i) an elongate outer post assembly secured to a forward, central portion of the treadmill frame structure and extending upwardly a substantial elevation above the running surface;
(ii) a ground-engaging inner post assembly telescopically disposed within the outer post assembly to extend downwardly beneath the outer post assembly; and,
(iii) means for selectively sliding the inner post assembly relative to the outer post assembly to extend the lift mechanism to raise the forward portion of the treadmill, and to retract the lift mechanism to lower the forward portion of the treadmill;
(e) means for engaging and disengaging the self-contained lift mechanism with the frame structure from the underside of the frame structure; and,
(f) means for detachably securing a lower end portion of the self-contained lift mechanism to the underside of the treadmill frame structure and means fixed to the ground engaging inner post assembly to prevent the inner post assembly from rotating relative to the treadmill frame structure while allowing the inner post assembly to raise and lower relative to the treadmill frame structure.

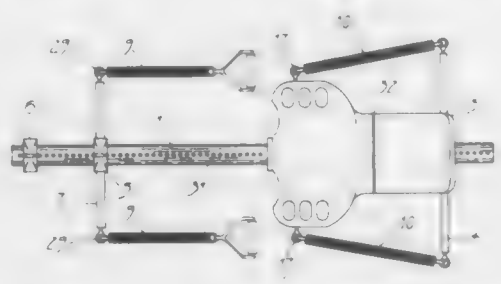
STRUCTURE OF CLIMBING EXERCISER WITH A COUNTER-WEIGHT FREEWHEEL MECHANISM

Leao Wang, No. 1, Lane 154, Charng Long Rd., Toupienkeng Taiping Hsiang, Taichung Hsien, Taiwan

Filed May 22, 1990, Ser. No. 526,590
Int. Cl.[5] A63B *23/04*
U.S. Cl. 272—70 **6 Claims**



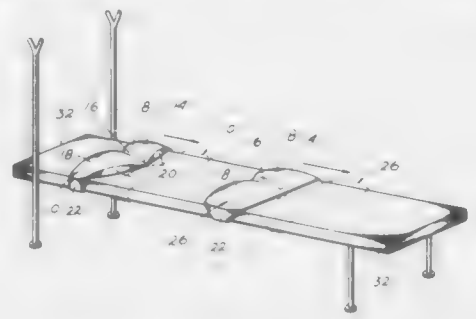
1. A climbing exerciser comprising:
(a) a generally vertical frame body
(b) first and second pedals each slidably attached to a lower portion of the frame body so as to move along a predetermined path of travel;
(c) first and second handles adapted to be gripped by the user;
(d) connecting means comprising a first rod slidably attached to the frame body and having the first handle and first pedal attached thereto; and, a second rod slidably attached to the frame body and having the second handle and second pedal attached thereto for connecting the first handle to the first pedal and the second handle to the second pedal such that movement of each pedal causes similar movement of each associated handle;
(e) a freewheel rotatably attached to the frame body; and,
(f) drive means interconnecting each pedal and the freewheel such that downward movement of each pedal along its path of travel causes rotation of the freewheel.

5,007,632

COMBINATION SIT-UP, ROWING, ARM, LEG AND FOOT EXERCISE DEVICE

William T. Wilkinson, P.O. Box 378, Chesapeake City, Md. 21915

Filed Oct. 12, 1989, Ser. No. 420,375
Int. Cl.[5] A63B *69/06, 21/04*
U.S. Cl. 272—72 **19 Claims**



1. A combination sit-up, rowing, arm, leg, foot exercise device comprising:
a center pole with front and rear ends and top and bottom surfaces having a plurality of holes along the top surface and a corresponding plurality of holes along the bottom surface;
a seat with a front edge, two side edges, rear edge, and top and bottom surfaces rigidly attached to the center pole; a seat spring catch rigidly mounted to each side edge of the seat;
a plurality of seat rocker legs attached to the bottom surface of the seat;
a plurality of telescoping legs mounted perpendicularly to the seat bottom surface;
a seat back with a bottom edge and a top edge with the bottom of the seat back mounted to the rear edge of the seat with a hinge joint;
a seat cross pole with two ends removably mounted to the top edge of the seat back;
a seat cross pole spring catch mounted to each end of the rear seat cross pole;
a plurality of sit-up assist elements with two ends each end having a hook, one hook engaging the seat catch and the other hook engaging a corresponding seat cross pole catch; a rear accessory catch rigidly mounted to the back of the seat back;
a foot cross pole bracket engaging the center pole such that the foot cross pole bracket may transverse along the center pole in the lengthwise direction;
a foot cross pole with two ends rigidly attached to the foot cross pole bracket such that the foot cross pole is perpendicular to the center pole;
a foot cross pole bracket spring catch rigidly mounted to the foot cross pole bracket;
a foot cross pole bracket lock rigidly fixing the foot cross pole bracket to the center pole using one of the holes in the top and bottom surface of the center pole;
a center foot cross pole spring catch rigidly mounted to the foot cross pole bracket;
a center foot cross pole spring catch rigidly mounted to the foot cross pole bracket;
a center pole spring catch removably mounted to the center pole using one of the plurality of holes contained in the center pole between the seat and the foot cross pole bracket;
a leg tension elements attached to the center pole spring catch and the center foot cross pole spring catch;
a plurality of foot treadles with top and bottom ends pivotably mounted to the foot cross pole;
a foot treadle spring catch mounted on the bottom end of the foot treadle;
a front leg mounted to the center pole at the front end of the center pole;
a front leg spring catch mounted to the front leg;
a plurality of foot treadle tension elements with two ends, each end having a hook, one hook engaging the front leg spring catch and the other hook engaging a foot treadle spring catch;
a plurality of rowing tension elements with two ends, one end having a hook and the other end having a handle for grasping, the hook end of the rowing tension elements engaging the corresponding foot cross pole spring catch;
a rear support bracket removably attached to the center pole;
a rear support catch and lock which secures the rear support bracket to the center pole using the holes in the center pole;
a seat support arm which attaches to the rear support catch and the rear support bracket
a plurality of seat back tension elements mounted to the seat spring catch at one end and at the other end mounted to the rear support lock and spring catch.
a body belt consisting of two sections each with two ends, one end of each section attached to the seat back and a means for coupling the other ends to one another;
a plurality of rear arm tension elements attached to the rear support lock and spring catch.

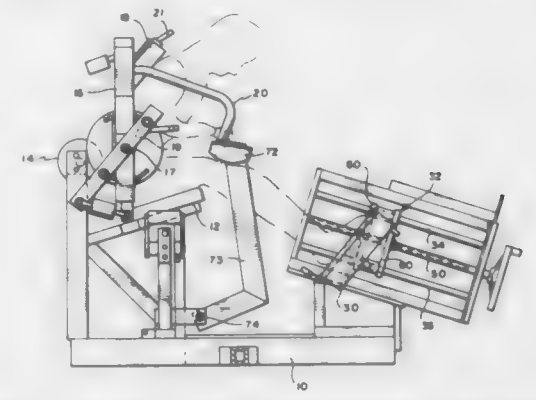
5,007,633

SPINAL COLUMN SUPPORT ATTACHMENTS FOR A WEIGHT LIFTER'S BENCH

Brett J. Lemire, 5606 Laguna Oaks Dr., Elk Grove, Calif. 95758

Filed Apr. 20, 1990, Ser. No. 512,134
Division of Ser. No. 385,380, Jul. 27, 1989, Pat. No. 4,953,857
Int. Cl.[5] A63B *21/078*
U.S. Cl. 272—123 **2 Claims**

1. In combination, a weight lifter's bench suitable for a human to lay on in a supine position to lift weights, said bench having a first and a second spinal column support pad positioned on an upper surface of said bench, each said support pad being releasably and justably affixed stationary by strapping means to said bench:
each said support pad having a bottom surface placed against said upper surface of said bench, each said support pad having a top surface oppositely disposed from said bottom surface, each said sport pad further having two ends oppositely disposed from one another, each end placed adjacent a side edge of the bench, each said support pad further having two narrow edges oppositely disposed from one another extending between said two ends of said support pad;
each said support pad having a generally centered elongated narrow groove in said top surface extending lengthwise generally from one said side edge of said support pad to said oppositely disposed side edge of said support pad, said narrow groove dividing said top surface of said support pad into two generally rounded domes, said rounded domes sized and placed to support a human on either side of the spinal column thereby stabilizing and maintaining a generally normal spinal column curvature, said narrow groove sized and placed to provide open space for receiving and generally relieving pressure on an area of the spinal column during support on either side thereof by said rounded domes, said first support pad positioned on said bench toward a head end of said bench to support a human's curvical spinal curvature, said second support pad positioned on said bench to support the human's generally normal lumbar spinal curvature simultaneous with said first support pad supporting the human's cervical spinal curvature.



5,007,634

METHOD AND APPARATUS FOR RESTRAINING THE LEGS AND PELVIS FOR EXERCISING AND/OR TESTING THE LOWER TRUNK OF THE HUMAN BODY

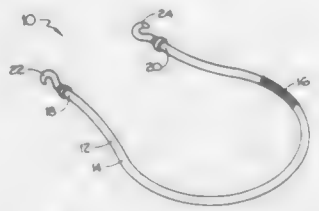
Arthur A. Jones, 1155 NE. 77th St., Ocala, Fla. 32670

Continuation-in-part of Ser. No. 60,679, Jun. 11, 1987, Pat. No. 4,836,536, Ser. No. 236,367, Aug. 25, 1988, Pat. No. 4,902,009, and Ser. No. 181,372, Apr. 14, 1988, Pat. No. 4,834,365, which is a continuation-in-part of Ser. No. 60,679, , said Ser. No. 236,367, is a continuation-in-part of Ser. No. 60,679,. This application Jun. 5, 1989, Ser. No. 361,055
Int. Cl.[5] A63B *21/00*
U.S. Cl. 272—134 **13 Claims**

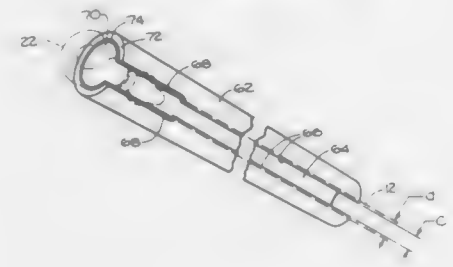
1. In combination with a machine for exercising lower trunk portions of the human body and including a seat, apparatus for restraining movement of the pelvis of a person seated on said seat, the apparatus comprising a pelvic pad located rearwardly of said seat to engage the body at the rear of the pelvis, and leg restraining apparatus for preventing movement of the pelvis comprising in combination, footrest means for supporting the feet with the legs bent at the knees and with the femurs extending downwardly and rearwardly of the seat, and a thigh restraining means movable between a first position spaced from the thighs and a second position overlying and engaging the

thighs to prevent upward movement of the legs while lower movement of the legs is prevented by said footrest means, and means mounting the footrest means for adjustable movement along a generally horizontal direction towards or away from the legs of the person to be restrained for placing the legs in a desired position to be restrained, and wherein said footrest means extends at an angle to the horizontal for supporting the feet at said angle to the horizontal.

5,007,635



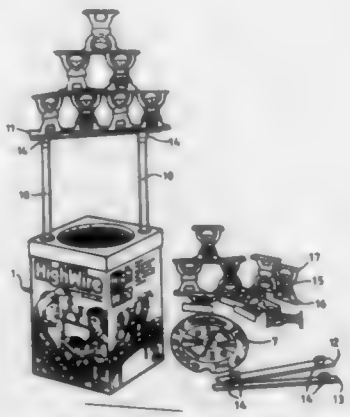
EXERCISE DEVICE



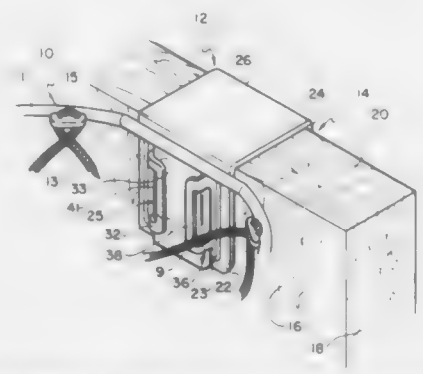
Ralph Tiller, 1534 Old Creek Ct., Cardiff, Calif. 92007

Filed Apr. 12, 1989, Ser. No. 336,720
Int. Cl.[5] A63B *21/06, 21/00*
U.S. Cl. 272—117 **14 Claims**

6. An exercise device, comprising:
an elongated elastic hollow tube having a first and second end, said hollow tube being filled with a fluid;
hook means fixedly mounted in said first and second ends for detachably securing said tube to said hook means and for sealing said fluid within said first and second ends of said tube;
said tube being filled with said fluid so that compression of one portion of said fluid filled tube results in elastic expansion of other portions of said tube; and



a substantially cylindrical hollow handle, said handle having a slot formed therein for removably receiving said first



end including said hook means into said hollow handle for holding said end of said tube within said handle.

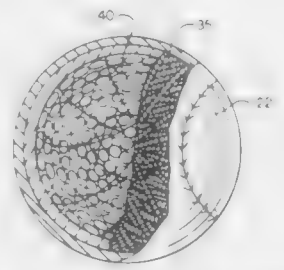
GAME APPARATUS
David A. Pagani, 10C Seaview Mansion, Discovery Bay, Lantau, Hong Kong
Filed Jan. 17, 1990, Ser. No. 466,202
Claims priority, application United Kingdom, Jan. 17, 1989, 8900991
Int. Cl.[5] A63F 7/36
U.S. Cl. 273—448 12 Claims

1. A Game Apparatus comprising a plurality of game apparatus elements, a container for the elements and a lid for the container, an upper surface of the container being provided with means for mounting at least some of the game apparatus elements upon the container so that the container functions as a base for the assembled game apparatus and the lid of the container including means for randomly choosing one of a plurality of instructions for use in playing a game with the game apparatus.

5,007,637
SELECTIVELY MOUNTABLE BASKETBALL HOOP STRUCTURE
Charles F. Foley, Charlotte, N.C., assignor to InnoLand, Inc., Pineville, N.C.
Filed Aug. 16, 1989, Ser. No. 394,640
Int. Cl.[5] A63B 63/08, 63/04
U.S. Cl. 273—1.5 R 13 Claims

1. A selectively mountable hoop structure for use in playing basketball-type games, comprising:
a hoop member defining an opening adapted for passage therethrough of a ball, said hoop member including a mounting portion; and
a bracket for selective mounting of said hoop member, said bracket being of a generally U-shape for selective alternative receipt of an exposed edge of a building door and like structural members of buildings, said bracket having means compatible with said mounting portion of said hoop member for receiving said mounting portion selectively in alternative first and second orientations relative to said bracket for selectively altering the relative verticality and horizontality of said hoop member, said mounting portion receiving means including a pair of spaced tabs projecting from said bracket and defining therebetween a first slideway for insertion of said mounting portion of said hoop member in said first orientation, said tabs having respectively aligned openings therethrough defining a second slideway for insertion of said mounting portion of said hoop member in said second orientation.



5,007,638
PITCHBACK DEVICE FOR ATHLETIC PRACTICE
Benjamin Yukl, 29308 Eddy Rd., Wickliffe, Ohio 44092
Filed Feb. 17, 1987, Ser. No. 15,422
Int. Cl.[5] A63B 69/40
U.S. Cl. 273—26 A 4 Claims

1. In a trampoline comprising

a closed, rigid planar frame having a plurality of substantially parallel and equal length frame legs extending therefrom for supporting said frame on a support surface,
said frame legs being attached to the perimeter of said frame to form the corners of a rectangular configuration, said planar frame having a resilient material within its perimeter, said material being stretched in the plane of said frame and attached thereto by elastic means to thereby form a rebound surface;
the improvement comprising support means for converting said trampoline to a ball rebound surface, said support means comprising
a support member comprising first and second parallel legs and a generally perpendicular cross leg, each of said first and second legs having a first and second end, and said first ends of said first and second legs being joined by said cross leg;
each of said first and second legs having its second end pivotally attached intermediate the ends of a respective frame leg at one end of said rectangular configuration, and
at least one elongated brace member having one of its ends pivotally attached to and intermediate the ends of a frame leg at the other end of said rectangular configuration;
said first leg of said support member having attachment means intermediate its ends for attachment of said brace member, said brace member having a plurality of attachment means along the length thereof, said attachment means on said first leg and said brace member cooperating to adjustably orient said planar frame in a plurality of inclined positions relative to a support surface, and
said support member and said brace member being pivotable into a substantially common plane beneath said planar frame such that said planar frame will be supported in a substantially horizontal position only by said frame legs.

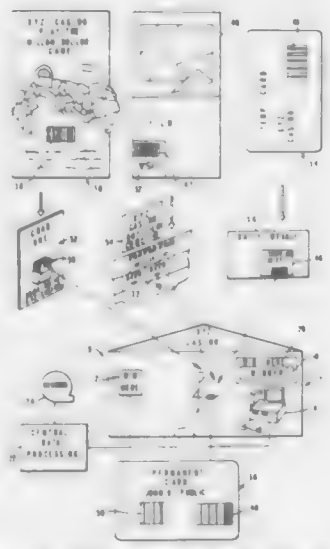
GAME BALL
Dean R. Watson, Algonquin, Ill., and Thomas E. Gallagher, IV, Colorado Springs, Colo., assignors to T. G. & Watson, Inc., Algonquin, Ill.
Filed Sep. 10, 1990, Ser. No. 580,084
Int. Cl.[5] A63B 37/06, 37/12
U.S. Cl. 273—60 R 7 Claims

1 A game ball for use in playing such games as baseball, softball or the like comprising:
a plurality of film encased bubbles arranged to form a substantially spherical object, and
an outer covering surrounding said bubbles.

5,007,640
FINGER INSERT FOR A BOWLING BALL
David A. Bernhardt, 12219 Craven, Utica, Mich. 48087
Continuation-in-part of Ser. No. 498,009, Mar. 23, 1990. This application Apr. [illegible], 1990, Ser. No. 513,[illegible]
Int. Cl.[5] A63B 43/02
U.S. Cl. 273—63 A 14 Claims

1 An insert for a finger hole in a bowling ball, comprising:
a tubular body having an outer wall surface adapted to be inserted into a finger hole of the bowling ball;
said body having an inner wall surface extending substantially coaxial to a central axis of said outer wall surface and defining first and second finger openings at opposite terminal ends of said body which are adapted to receive a bowler's fingertip therein,
ridge means for generating additional gripping force during delivery of the ball, said ridge means extending along the periphery of said inner wall surface adjacent said second finger opening;



surface means for providing greater fingertip contact area than is provided by said ridge means on a portion of said inner wall surface adjacent said first finger opening adapted for engagement with the bowler's fingertip, said surface means comprising a thickened finger pad which is a generally arcuate surface tapering from a maximum to a minimum thickness from said first finger opening toward said second finger opening, respectively, so as to blend into said inner wall surface

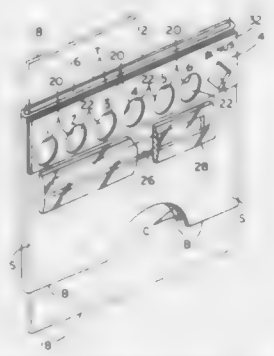
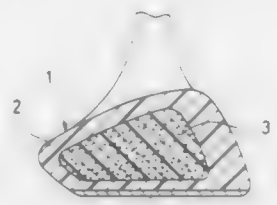
GAMING METHOD
Charles B. Seidman, Merion, Pa., assignor to Take One Marketing Group, Inc., Merion, Pa.
Filed Sep. 20, 1989, Ser. No. 410,101
Int. Cl.[4] A63B 71/00
U.S. Cl. 273—138 A 21 Claims



1. A promotional gaming method comprising the steps of
(a) distributing tokens to patrons;
(b) automatically reading a code on each of said tokens at a redemption location within an establishment upon presentation of said tokens by patrons and automatically comparing the code on each presented token with one or more predetermined winning codes;
(c) awarding prizes to only some of the patrons who present tokens bearing said code matching said one or more predetermined winning codes;
(d) said tokens including a multiplicity of tokens bearing a common machine readable code which common code matches said one or more predetermined winning codes, said step of awarding prizes including the step of randomly assigning prizes to patrons who present tokens bearing said common code, said step of randomly assigning said prizes being performed upon presentation of said

tokens, said step of randomly assigning said prizes including the step of actuating a random selection process in



response to presentation of a token bearing said common code.

1. A golf putting practice device comprising:
a base having an elongated, generally vertical, planar putter guide surface;
at least a first groove formed in an upper face of said base and extending generally perpendicular to said putter guide surface; and
a sight adjustably positionable in said groove and having a sight loop formed at a first end of a sight arm, said sight arm extending outwardly from said base in a cantilever manner to position said sight loop above a sweet spot of a golf club when a toe portion of a golf club is in abutting engagement with said planar putter guide surface of said base of said golf putting practice device.

back face marked with a fifth indicia common to all four sets of ten playing pieces; and

(d) wherein a playing piece is selectively positioned each in turn upon one of the unused playing squares on the square array front face up without matching indicia on the front face of any adjacent playing piece or adjacent border indicia, and once played each playing piece remains in place on the selected playing square for the duration of the game.

GAMING SYSTEM WITH SYSTEM BASE STATION AND GAMING BOARDS

John Richardson, San Diego, Calif., assignor to Selectro-Vision, Ltd., San Diego, Calif.

Continuation-in-part of Ser. No. 820,521, Jan. 16, 1986, Pat. No. 4,848,771. This application Mar. 28, 1989, Ser. No. 329,910

Int. Cl.[5] A63F *3/06*

U.S. Cl. 273—237 **30 Claims**

1. A method for managing money during the playing of a bingo game, including the steps of:

(a) electronically storing in a system base station the total number of bingo cards sold during the course of a gaming session comprised of a scheduled sequence of one or more successive, independent bingo games;

(b) electronically storing in a system base station the amount of all winning bingo card payouts made during said gaming session;

(c) electronically storing in a system base station a validation code which uniquely identifies each specific said gaming session;

(d) downloading said validation code and data representing at least one bingo card into at least one handset;

(e) electronically storing said validation code and said bingo card in memory means of said handset; and

(f) confirming a win condition of said handset by comparing said validation code electronically stored in said system base station with said validation code electronically stored in said handset, and producing a win indication if said validation codes are identical.

METHOD OF PLAYING A BOARD GAME OF COLLEGE SOCIAL LIFE

Keith Reed, 2211 Sweetbriar Rd., Morrisville, Pa. 18067, and Keith Coleman, 25 Spinythorn Rd., Levittown, Pa. 19506

Filed Sep. 21, 1989, Ser. No. 410,428

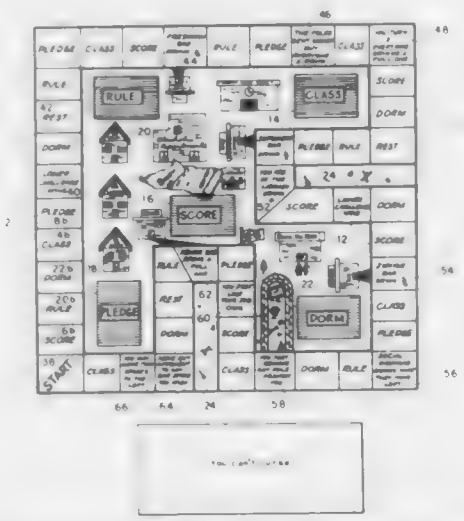
Int. Cl.[5] A63F *3/00*

U.S. Cl. 273—249 **4 Claims**

1. A method of playing a board game representing various social and/or non-academic aspects of college or university life, involving various physical interactions between the players or teams of said game and the consumption of beverages by said players or said teams of said game according to the rules of said game, comprising;

selection of a first player or team and subsequent players or teams by chance means,

said first player or team selecting a designated first playing piece,



said subsequent players or teams selecting remaining playing pieces,

said first and said subsequent players or teams placing said first and said remaining playing pieces upon the starting point of the playing path of the game board of said board game,

said first and said subsequent players or teams in turn determining subsequent positions for said playing pieces within spaces along said playing path by chance means,

following a first subset or second subset of instructions contained in said spaces as determined by said positions of said playing pieces upon said playing path,

drawing a game card of the appropriate class as determined by said class of said second subset of said instructions, if

said position of said playing piece corresponds with one of said classes of said second subset of said instructions upon said playing path, said cards containing instructions for one of the following: physical interaction between players, consumption of beverages, rules imposing a physical limitation on a player drawing the card,

performing said physical interaction between said players or said teams, said consumption of said beverages by said players or said teams as required by said instructions and/or said game card, and/or abiding by any rule provided by a rule containing game card as required and appropriate according to said position of said playing piece upon said playing path, said first subset of instructions including removing any one of said rules for a particular player or team, and

continuing said playing of said game in the above manner until the game is completed.

KIT FOR BOARD GAMES

Stanley I. Mason, Jr., 61 River Rd.; Elizabeth L. Fuller, 72 River Rd., both of Weston, Conn. 06883, and Roy E. Doty, 35 Grey Hollow Rd., Norwalk, Conn. 06850

Filed Dec. 12, 1988, Ser. No. 282,747

Int. Cl.[5] A63F *3/00*

U.S. Cl. 273—256 **3 Claims**

1. A board game kit including

movable playing pieces,

movable barriers,

a game board, said board having a circumferential track thereon, said track including pluralities of sequential spaces to receive said movable pieces, as a player moves them around said track, said sequential spaces running the width of said track, and barrier spaces running across the

width of said tracks to receive said movable barriers, said barrier spaces being spaced from one another and positioned between pairs of said pluralities of sequential spaces,

said board including at least one diametrical track interconnecting opposite sides of said circumferential tracks, said diametrical track being formed of additional said sequential spaces to receive said movable pieces, and

said movable barriers being shaped for complementary, frictional interfit with one another such that said barriers may be secured to one another end to end or stacked one above another,

whereby said one or more of said movable barriers can be positioned in a said barrier space thereby providing variable height and length deterrents to moving said movable pieces in said circumferential track while playing said game.

LACROSSE STICK

Richard B. C. Tucker, Baltimore; Jackie L. Davis, Aberdeen, and Fielding H. Lewis, Jr., Queenstown, all of Md., assignors to Wm. T. Burnett & Co., Inc., Baltimore, Md.

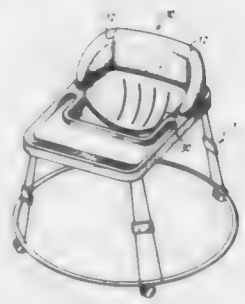
Continuation-in-part of Ser. No. 414,258, Sep. 29, 1989, Pat. No. 4,940,243. This application Jul. 10, 1990, Ser. No. 550,562

Int. Cl.[5] A63B *59/02*

U.S. Cl. 273—326 **4 Claims**

1. A head for a lacrosse stick comprising a generally V-shaped frame adapted to receive a web, said frame being defined by two side walls joined at a juncture and diverging therefrom, a transverse wall joining the ends of said side walls opposite of said juncture, and tab means positioned on at least said side walls for securement of a web onto said frame, said tab means being integrally formed with at least said side walls, and constructed and arranged to have a slot therein to permit a web string to be snapped into said tab, said slot being constructed and arranged to retain said string.

5,007,653



HEAD REST STRUCTURE FOR BABY STROLLERS

Kin K. Chen, No. 24, Lane 53, Sec. 3, Anho Rd., Tainan City, Taiwan

Filed Mar. 26, 1990, Ser. No. 498,589

Int. Cl.[5] B62B *9/00*

U.S. Cl. 280—87.051 **1 Claim**

1. In baby strollers of the type having a cushioned head rest filled with foam material, a seat back, and securing means for supporting and mounting the combination of the seat back and the cushioned head rest on a frame of the baby stroller, wherein the improvements comprise:

said cushioned head rest comprising a base part and an upper part, said upper part having substantially an inverted U-shaped cross-section providing a cavity and having a pair of side surfaces extending along said foam material which is received within said cavity and outwardly extending rim portions at the base of said side surfaces, and base part extending below and across said upper part and said rim portions being fixedly secured to the underlying portions of said base part, said seat back being secured to one of said fixedly secured rim and base portions of said cushioned head rest; and

said securing means being disposed in said cavity directly under said foam material within said cushioned head rest and said base part sealing the cavity and thereby said foam material against leakage thereunto, said securing means extending through said base part and comprising a threaded fastener for engagement with the frame of the baby stroller.

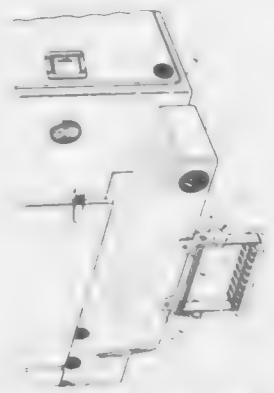
5,007,654

TRUCK STEP

Charles J. Sauber, 10 N. Sauber Rd., Virgil, Ill. 60182

Filed Jun. 29, 1989, Ser. No. 373,250

Int. Cl.[5] B60R *3/02*



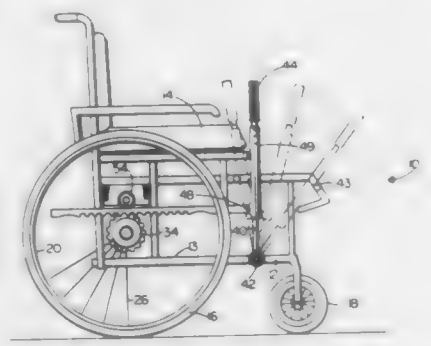
U.S. Cl. 280—166 **5 Claims**

1. For use in connection with a vehicle body structure, step means attachable to said vehicle body structure comprising:

a frame member having means for securing to the vehicle body structure, said frame member including an inverted U-shape bracket having spaced apart legs which are disposed in substantially vertical parallel planes, each leg having a substantially triangular aperture, one point of the triangular aperture extending downward with respect to the leg, and at least one leg having a V-shaped guide channel having a detent; and

a step member comprising a platform and substantially paral-

lel arms coupled to opposite sides of the platform, each said arm having an axial pin and at least one arm having a guide pin, said pins being disposed such that the guide pins are movable in the guide channels and the axial pins are received in the apertures and define a rotational axis of the step member, said axial pins being movable in the apertures to shift the rotational axis of the step member, said axis having a first position such that the axial pins are



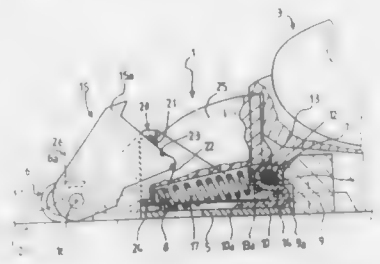
seated in the downwardly extending points of the apertures and the guide pins are engaged in the detent under the force of gravity and the platform is rigidly coupled to the frame member so that the platform may be used as a step, and a second position such that the axial pins are not seated in the downwardly extending points of the apertures and the guide pins are movable in the guide channel whereby the step member may be swung forwardly or rearwardly upon contact with an obstruction.

5,007,655

VARIABLE SPEED LEVER PROPELLED WHEELCHAIR

Mark Hanna, 2813 Bunch Walnuts Rd., Chesapeake, Va. 23322

Filed Jan. 5, 1990, Ser. No. 461,425
Int. Cl.[5] B62M *1//16*
U.S. Cl. 280—250.1 **13 Claims**



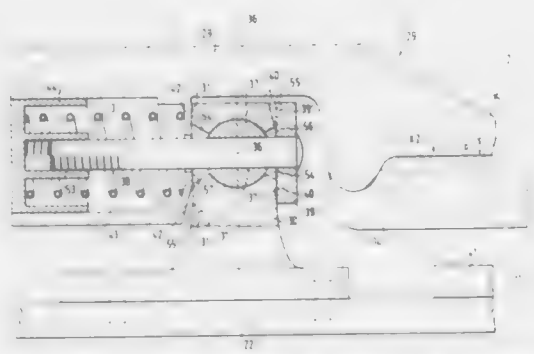
1. A manually-propelled device comprising:
a frame having a seat for supporting an individual;
means supporting said frame for locomotion of said device including a pair of wheels carried by said frame adjacent opposite sides thereof;
means for mounting said wheels for rotation relative to said frame; and
means carried by said frame and operable by the individual seated in the device for propelling said device in a forward direction, including at least one lever pivotally connected to said frame, a rotatable drive sprocket carried by said frame for rotating at least one of said wheels in a direction to propel the device in a forward direction, and means interconnecting said lever and said sprocket for rotating said drive sprocket to propel the device in the forward direction;
said interconnecting means including an element movable through two positions relative to and in engagement with said sprocket, said element in said first position thereof relative to said sprocket engaging and driving said sprocket, said element in said second position thereof relative to said sprocket engaging said sprocket in non-driving relation thereto thereby disconnecting the drive connection between said lever and said sprocket and freeing said one wheel for rotation.

5,007,656

CROSS-COUNTRY SKI BINDING WITH AUTOMATIC CLOSURE

Eric Girault, Seynod, and Paul Arnulf, Alby sur Cheran, both of France, assignors to Salomon S.A., Annecy Cedex, France

Filed Aug. 2, 1989, Ser. No. 388,387
Claims priority, application France, Aug. 5, 1988, 88 10773
Int. Cl.[5] A63C *9/20*
U.S. Cl. 280—615 **47 Claims**



1. An automatic cross-country ski binding for a shoe or a boot having a traverse journal axle, said binding comprising a housing adapted to receive said journal axle, a latch being movable between a latching position and a position of insertion for latching said journal axle in said housing, wherein said latch is rotationally mounted about a rotational axis, and wherein said rotational axis of said latch is mounted for longitudinal displacement in the binding, said latch being elastically biased in longitudinal and rotational displacement by biasing means towards the latching position of said journal axle of the boot in said housing.

5,007,657

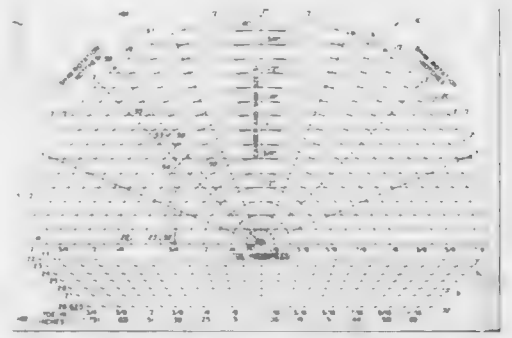
LATERALLY RELEASABLE BINDING UNIT

Martin Bogner, Ostfildern; Otto Harsányi, Leonberg, both of Fed. Rep. of Germany, and Henri Peyre, Saint Benin d'Azy, France, assignors to GEZE Sport International GmbH, Leonberg, Fed. Rep. of Germany

Filed Jul. 5, 1989, Ser. No. 375,7[illegible]
Claims priority, application Fed. Rep. of Germany, Jul. [illegible], 1988, 3825682
Int. Cl.[4] A63C *9/085*
U.S. Cl. 280—626 **9 Claims**

1. Laterally releasable ski safety binding unit for holding a front end of a ski boot on a ski, the binding unit comprising:

an upright carrier spigot fixed relative to the ski;
a release spring arranged substantially longitudinally on the ski and braced at one end on the carrier spigot, the other end exerting a release force having a substantial component in the longitudinal direction of the ski;
a sole clamp for holding the ski boot, the sole clamp having a receiving chamber remote from the ski boot for accommodating said release spring, and a limb configuration comprising one of (a) two side limbs and a hold down means comprising a clamp adjacent to said side limbs and (b) two side limbs and a hold down means, such that upon the release force exceeding a predetermined force exerted on the side limbs via the ski boot, said limbs swing outwardly sideways about a substantially upright pivot axis and thereby release the ski boot, the sole clamp being rotatably arranged on said carrier spigot mounted on the ski and vertically tiltably mounted about a transverse axis of the ski;
said release spring exerting a force having a downward component onto the hold down means to thereby press the hold down means with the force component against the top side of the sole of the ski boot;
a ball guide disposed within said carrier spigot and having a slide bore therein;
a draw rod passing through said slide bore;
a support disc secured to the rear of said draw rod against a substantially flat rear support surface of the carrier spigot, said support disc disposed between said draw rod and said carrier spigot and having a substantially flat counter surface in facing relationship with said rear support surface;
said draw rod extending into said receiving chamber and urged in the direction away from the ski boot by the front end of said release spring such that the support disc is pressed against said rear support surface;
the opposing, rear end of said release spring being braced against an abutment fixed relative to the sole clamp and having a substantially flat contact surface to thereby press said contact surface against a substantially flat front support surface of said carrier spigot;
the front and rear support surfaces of said carrier spigot and the counter and contact surfaces of the support disc and the abutment including cooperating tilted surface portions arranged to permit relative pivotal movements of said draw rod and thereby of said hold down means, about an axis transverse to the length of the ski such that within a predetermined vertical tilting region of the hold down means as a result of such pivotal movements, the hold down force is significantly reduced relative to the normal release hold down force.



5,007,658

SHIM AND COMPUTERIZED CHART FOR SIMULTANEOUSLY ADJUSTING CAMBER AND TOE-IN

James L. Blechschmidt, Tempe; Robert D. Johnson, and Robert F. Powell, both of Mesa, all of Ariz., assignors to Shimco, Inc., Mesa, Ariz.

Filed Mar. 16, 1990, Ser. No. 494,963
Int. Cl.[5] B62D *17/00*
U.S. Cl. 280—661 **3 Claims**

1. Orientation apparatus for
selecting from a plurality of different sized tapered shims at least one selected shim to be positioned in the wheel assembly of a vehicle to alter the alignment of the assembly by adjusting the camber and toe-in of the wheel assembly by selected amounts, and,
determining the orientation of the selected shim necessary to alter the alignment of said wheel assembly by the selected amounts of camber and toe-in,
the wheel assembly including
an axle member,
spindle means attached to the axle member for rotatably receiving and carrying a wheel, and
bolts for removably, fixedly securing the spindle means to the axle member, the bolts each having an imaginary longitudinal centerline,
each of the tapered shims having a taper different from the taper of the other of the tapered shims and including
(a) a first generally smooth contact surface lying in a first imaginary plane;
(b) a second generally smooth contact surface lying in a second imaginary plane, the second imaginary plane being at an acute angle with respect to the first plane, the first and second imaginary planes intersecting along a line and each being perpendicular to a third common imaginary plane;
(c) at least one arcuate opening formed through the tapered shim;
each of the shims being interposed between the spindle means and the axle member in any of at least three operative positions to adjust the alignment of the wheel,
(d) a first operative position which adjusts the camber of the wheel;
(e) a second operative position which adjusts the toe-in of the wheel; and,
(f) a third operative position which simultaneously adjusts both the toe-in and camber of the wheel:
the arcuate opening being shaped, contoured and dimensioned such that
(g) the bolts pass through the opening when the shim is interposed between the spindle means and the axle member and the bolts are utilized to fixedly secure the spindle means to the axle member;

(h) when the spindle means is, with the shim interposed therebetween, loosely secured to the axle member with the bolts, the shim can be rotated about an axis generally parallel to the longitudinal centerline of one of the bolts;
said orientation apparatus including
(a) chart means correlating camber and toe-in adjustment values with the orientation of each of the shims and including
(i) a first graduated axis indicating toe-in values,
(ii) a second graduated axis perpendicular to said first graduated axis and indicating camber values, each of said values on said first and second axis representing a size of shim and representing the maximum amount by which said represented size of shim can adjust the toe-in and camber of the wheel assembly, said toe-in and camber values increasing by selected increments as the distance along said axes from the intersection of the axes increases,
(iii) arcuate alignment lines interconnecting equivalent values on said first and second axes, each of said alignment lines indicating the amount by which the toe-in and camber of the wheel assembly is altered when a shim of the size represented by the equivalent values interconnected by the alignment line is interposed between the spindle and the axle of said wheel assembly in a selected position with respect to said bolts, said selected position being obtained by rotating the shim with respect to said bolts about said axis

generally parallel to the longitudinal centerline of one of said bolts,

(b) dial means including

(i) an outer peripheral edge,

(ii) a point of rotation on said dial means within said outer peripheral edge,

(iii) a first rule line passing through said point of rotation, and,

(iv) a second rule line passing through said point of rotation and perpendicular to said first rule line,

(c) mounting means for mounting said dial means on said chart means for

(i) movement in a first direction parallel to said first graduated axis,

(ii) movement in a second direction parallel to said second graduated axis, and,

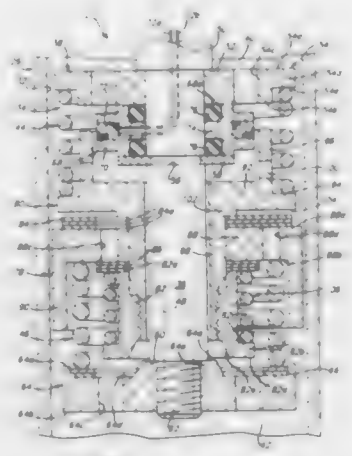
(iii) rotation about said point of rotation,

said orientation apparatus permitting a shim size to be selected by

determining the desired toe-in and camber change of the wheel assembly of a vehicle,

moving said point of rotation of said dial means along said second graduated axis to the value on said second graduated axis corresponding to said desired toe-in value,

moving said dial means to a first reference position by moving said point of rotation away from said second graduated axis and parallel to said first graduated axis a distance equal to the distance from said second graduated axis of the value on said first graduated axis corresponding to said desired camber change, and



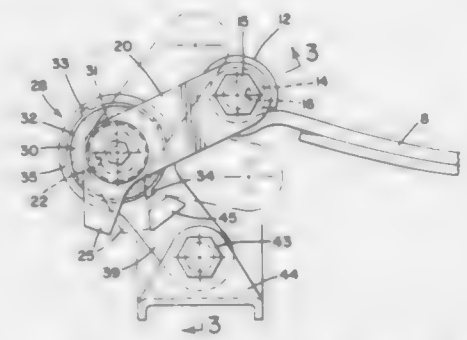
selecting the one of said arcuate alignment lines closest to said first reference position, said selected arcuate line interconnecting equivalent values on the first and second graduated axes representing the size of the shim selected.

5,007,659

INTERNAL DAMPING FORCE SENSOR

Yoram Guy, Ann Arbor, Mich., assignor to Monroe Auto Equipment Company, Monroe, Mich.

Filed Mar. 7, 1990, Ser. No. 489,920
Int. Cl.[5] B60G *11/26*
U.S. Cl. 280—707 33 Claims



1 A hydraulic damper for damping the relative movement between the sprung and unsprung masses of an automobile comprising a pressure cylinder to store damping fluid, an axially displaceable piston rod extending in a sealed manner into the cylinder, a damping piston reciprocably fitted to said piston rod and dividing the cylinder into a first and second chamber, a spoiler member connected to said piston for reciprocable movement relative to said piston rod, bias means for resisting axial movement of said piston relative to said rod, valve means associated with said piston for restrictively allowing damping fluid to flow between said chambers when said piston rod reciprocates within said cylinder, alternating voltage generator means external to said cylinder for energizing an electrical coil coaxial to the rod and generating a magnetic field about said spoiler, current sensing means remote to said piston for detecting movement of said spoiler relative to said magnetic field and operable to generate an electrical current signal in response to said movement, and electrically controllable flow means for regulating flow of damping fluid between said upper and lower chambers in response to said electrical control signal.

5,007,660

SUSPENSION SYSTEM

Roy L. Orndorff, Jr., Kent, and Mark J. Bono, Munroe Falls, both of Ohio, assignors to The B. F. Goodrich Company, Akron, Ohio

Continuation-in-part of Ser. No. 297,642, Jan. 17, 1989, abandoned. This application Aug. 17, 1989, Ser. No. 394,904
Int. Cl.[5] B60G *11/38*
U.S. Cl. 280—715 14 Claims

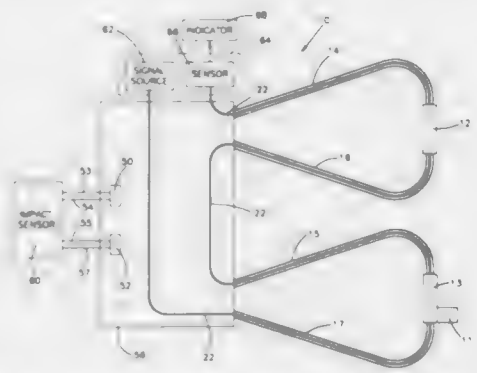
1. A motor vehicle suspension system having a frame, a wheel support member, a leaf spring secured to said wheel support member, first means pivotally connecting one end of said leaf spring to said frame, second means connecting the other end of said leaf spring to said frame, said second means comprising a torsion spring member, said torsion spring member having a central shaft, a lever member pivotally interconnecting said other end of said leaf spring to said central shaft, an annular elastomeric member having an inner bore with an inner annular surface, said annular elastomeric member having an outer annular surface, said inner annular surface secured to said shaft, an outer housing member secured to said outer annular surface of said elastomeric member, said outer housing member pivotally connected to said frame, and said outer housing member having a stop member, and said lever member having an abutment movable into engagement with said stop member upon rotation of said central shaft to thereby make said leaf spring as the sole suspension means.

5,007,661

SAFETY APPARATUS

Reiner Lenzen, Almont, Mich., assignor to TRW Vehicle Safety Systems Inc., Lyndhurst, Ohio

Filed May 16, 1989, Ser. No. 352,758
Int. Cl.[5] B60R *21/32*
U.S. Cl. 280—735 14 Claims



1 An apparatus comprising:

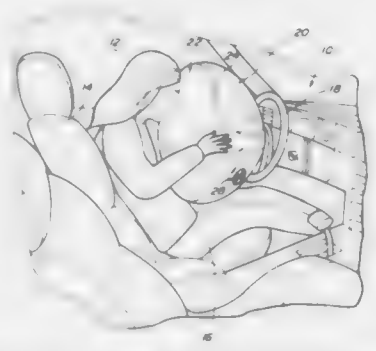
an actuatable safety device for protecting an occupant of a vehicle;

at least a pair of ignitable pyrotechnic transmission lines, one end of each pyrotechnic transmission line being connected to said safety device, ignition of either pyrotechnic transmission line effecting actuation of said safety device;

signal means for providing a signal;

conduit means coupled at one end to said signal means for receiving said signal from said signal means and extending through one pyrotechnic transmission line, through at least a portion of the actuatable safety device, and through the other pyrotechnic transmission line, said conduit means conducting said signal received from said signal means,

sensor means coupled to the other end of said conduit means for sensing receipt of said signal conducted through said conduit means; and



indicator means responsive to said sensor means for indicating a change in said signal conducted through said conduit means.

5,007,662

AIR BAG RELIEF VALVE

William M. Abramczyk, Rochester Hills; Edward I. Hull, West Bloomfield, and James R. Feustel, Ann Arbor, all of Mich., assignors to Ford Motor Company, Dearborn, Mich.

Filed Oct. 16, 1989, Ser. No. 421,882
Int. Cl.[5] B60R *21/28*
U.S. Cl. 280—739 10 Claims

1. An improved air bag for an automotive inflatable occupant restraint system of the type having a source of inflating gas connected to the air bag for pressurization thereof, the air bag comprising:

a flexible body portion having an internal chamber in fluid communication with the inflating gas source;

a discharge port formed through said body portion for directing said gas out of said chamber to the atmosphere; and

a valve comprising:

an annular base portion fixedly secured to said body portion;

a centrally located support portion positioned within said base portion;

a plurality of apertures formed through said support portion in circumferentially spaced relationship; and

a plurality of flap members hingedly connected to said support portion for movement between a position enclosing said discharge port and positions opening said discharge port in response to the pressurization of said chamber.

5,007,663

APPARATUS FOR PRODUCING ADDRESS LABELS

John Moran, P.O. Box 10458, Marina Del Rey, Calif. 90295

Filed Aug. 14, 1989, Ser. No. 393,968
Int. Cl.[5] B42D *15/00*
U.S. Cl. 283—81 3 Claims

1. A multiple ply label assembly suitable for producing a separate label in the course of printing a document sheet, said label assembly comprising

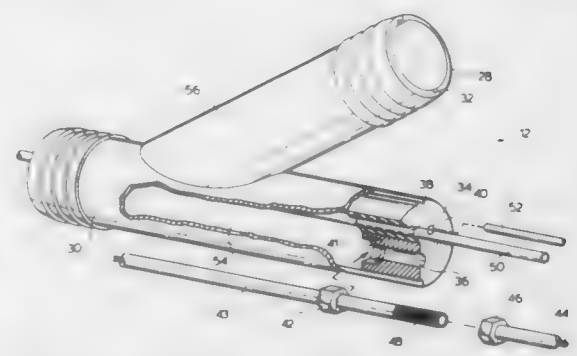
a label ply having upper and lower surfaces;

said base ply lower surface having low tack adhesive means applied thereto for removably bonding said base ply to the surface of the document sheet so that said base ply can be readily peeled from the sheet without damaging or leaving discernible residue on the sheet;

said base ply upper surface having a layer of release material applied thereto;

a label ply having upper nd lower surfaces;

said label ply lower surface having high tack adhesive means applied thereto suitable for nonremovably bonding said label ply to a surface of an end use sheet so that said label ply cannot readily be peeled from the end use sheet without damaging or leaving discernible residue on the sheet;



said label ply being superimposed on said base ply with said label ply adhesive means contacting said layer of release material to enable said label ply to be readily peeled from said base ply and be nonremovably bonded to the end use sheet surface.

5,007,664

JOINT IN FUME-EXTRACTING WELDING GUN

Robert N. Mann, Mississauga, Canada, assignor to Mig Vac Inc., Mississauga, Canada

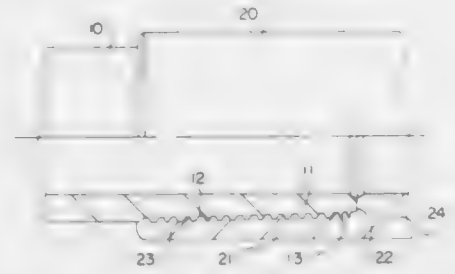
Filed Oct. 17, 1989, Ser. No. 422,760
Int. Cl.[5] F16L *35/00*
U.S. Cl. 285—330 3 Claims

1. A joint suitable for joining services to a welding gun, comprising:

two semi-circulary contoured pre-molded polymeric material elements each having curvilinear extremities of complimentary shape to the other to permit said elements to be snap-locked together along a longitudinal line of join of said elements one to another at said curvilinear extremities,

said joint having an elongate cylindrical first hollow body member and an elongate cylindrical second hollow body member extending at an angle to and merging with said first hollow body member so as to provide fluid-flow communication therebetween,

said first hollow body member being closed at one end by a cylindrical end closure integrally formed with one of said two pre-molded elements,



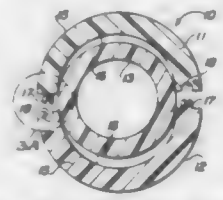
said end closure having a first bore therethrough with a keyed recess at an end thereof interior of said first hollow body member and further bores therethrough.

5,007,665

COUPLING FOR WELL CASINGS

Cipriano Bovisio, Via Borsa 12, 20100 Milano; Carlo Foglieni, Via San Bernardino, 95, 24100 Bergamo; Fulgenzio Fumagalli, Via Treviglio, 44, Fara D'Adda (Bergamo); Norberto Morlotti, Via Degli Albani, 17, 24100 Bergamo, and Mario Palladini, Via Trieste, 32, 24044 Dalmine (Bergamo), all of Italy

Filed Dec. 21, 1987, Ser. No. 136,599
Claims priority, application Italy, Dec. 23, 1986, 48786 A86
Int. Cl.[5] F16L *15/00*
U.S. Cl. 285—334 3 Claims



1 A casing joint comprising a pair of tubes and a hollow sleeve, each of said pair of tubes having at least one externally threaded end and said hollow sleeve having internally threaded opposite ends adapted to receive the externally threaded ends of the pair of tubes, wherein the internal threading on each of the opposite ends of the hollow sleeve terminates in an abutment extending radially inwardly and axially toward its respective end of the hollow sleeve to define a frustoconical surface, each externally threaded end of the pair of tubes having a complementarily shaped end surface for engagement with said abutment surfaces of the hollow sleeve, the external threading on the pair of tubes and the internal threading of the hollow sleeve being so dimensioned that, when the pair of tubes are received in the opposite ends of the hollow sleeve, the crest of the internal threading on the opposite ends of the hollow sleeve contacts the root of the external threading on the pair of tubes received in the hollow sleeve and the crest of the external threading of the tubes received in the sleeve is spaced from the root of the internal threading on the opposite ends of the hollow sleeve; and wherein forward faces of the internal threading on the opposite ends of the hollow sleeve are inclined outwardly toward their respective end of the hollow sleeve by an angle up to about 3 degrees with respect to a plane extending transversely through said hollow sleeve, forward faces of the external threading on the ends of the pair of tubes are inclined outwardly towards their respective end of the tube by an angle of up to about 3 degrees with respect to a plane extending transversely through the tube, back faces of the internal threading on the opposite ends of the hollow sleeve are inclined outwardly away from their respective end of the hollow sleeve by an angle from about 23 to about 28 degrees relative to a plane extending transversely through said hollow sleeve, and back faces of the external threading on the ends of the pair of tubes extends outwardly away from the corresponding ends of the tubes at an angle of about 23 to about 28 degrees with respect to a plane extending transversely through the said tubes.

5,007,666

TONGUE AND GROOVE SNAP-FIT PIPE COUPLING

Vincent Kyfes, Mesa, Ariz., assignor to C & L Development Inc. and Chill Tech, Inc., both of Mesa, Ariz., part interest to each

Filed Jan. 19, 1990, Ser. No. 467,190
Int. Cl.[5] F16L *47/06*
U.S. Cl. 285—373 3 Claims

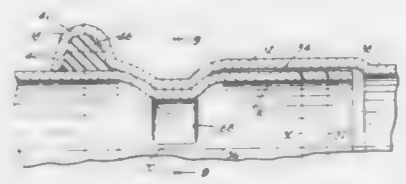
1. A longitudinally divided plastic pipe fitting for encompassing conduits comprising:

a pair of substantially similar interlocking plastics segments,

each of said segments comprising a generally arcuate shaped body having at least two longitudinal edges,

one of said edges comprising a tongue split longitudinally thereof in a direction substantially perpendicular to its length into two interconnected parts separated by a triangular slot, said slot being widest along the outside surface of said tongue, and further narrowing as it progresses to the interior of said tongue,

the other of said edges comprises a groove conforming to and receiving the tongue formed on the juxtapositioned edge of the other of said segments,



said tongue when forced into the opening in said groove in the other of said segments causing its two parts to engage each other along the length of its slot and when fully in the groove opening under memory of the plastic of said parts to form again said triangular slot causing the tongue to interlock with the periphery of said groove thereby interlocking the segments together.

Int. Cl.[5] F16L *13/14*
U.S. Cl. 285—[illegible]2.2 36 Claims

1. A crimped sleeve to the tube joint, including:

a tube of circular transverse cross-section;

a sleeve of circular transverse cross-section telescoped over said tube;

a seal ring containing flange at one end of said sleeve;

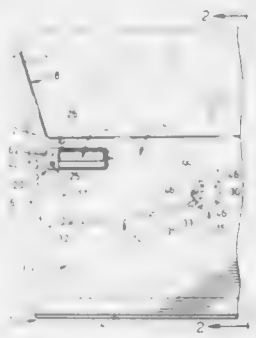
a seal ring contained within said seal ring containing flange;

said seal ring containing flange having been compressively reduced into engagement with the outer circumference of said tube, and said sleeve and said tube having been crimped at a location spaced from said one end to immobilize said sleeve against axial and circumferential movement relative to said tube, further including:

at least two crimps extending inwardly of the outer periphery of said respective sleeve and tube, and each extending arcuately of the circumference of said respective sleeve and tube on a constant radius of said respective sleeve and tube taken from the longitudinal axis of said sleeve and tube, said respective crimps being separated from each other circumferentially of said sleeve and tube by struts provided by axially extending portions of said sleeve and tube extending axially along the original radius of said respective sleeve and tube at the radially outermost porcave inwardly of the outer surface of said respective sleeve and tube;

said respective crimps each including radially outwardly divergent portions at the respective opposite ends of said circumferentially extending crimps;

said crimps, when viewed in transverse cross-section taken in a plane which includes the longitudinal axis of said respective sleeve and tube, extending symmetrically to opposite sides of a plane transverse to the longitudinal axis of said respective sleeve and tube, and each including radially inwardly convergent side faces providing transitions between the outer circumference of said respective sleeve and tube and a radially inner portion of said respective crimps;



said respective inwardly convergent side faces each extending on the surface of an imaginary cone having its perpendicular axis coincident with the longitudinal axis of said respective sleeve and tube.

INTEGRATED CONTROL DEVICE FOR A VEHICLE DOOR AND DOOR FITTED WITH THIS DEVICE

Nevio Di Giusto, Venaria, Italy, assignor to Fiat Auto S.p.A., Turin, Italy

Filed Jun. 1, 1990, Ser. No. 531,573
Int. Cl.[5] E05C *3/26*
U.S. Cl. 292—216 6 Claims

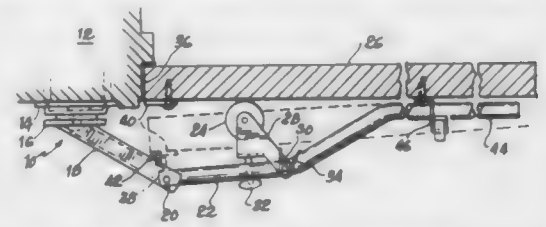
1. An integrated control device for a vehicle door, of the type comprising a lock equipped with an engaging fork, an outer handle and an inner handle that activate the lock, characterized in that said outer handle and said lock are held connected to each other by an L-shaped bracket, which supports said outer handle on a first wing and said lock on a second wing, projecting laterally from the first wing and supporting on its opposite side with respect to the first wing, said engaging fork; said inner handle being held fixed and idle by a second supporting bracket and being connected to said lock by a flexible cable whose ends are securely fixed to said supporting brackets, said brackets being equipped with means of fixing to said door.

5,007,669

LEVERAGED SECURITY DOOR LOCK

Kevin L. Pomerleau, 8621 Montezuma, #311, San Diego, Calif. 92115

Filed May 9, 1990, Ser. No. 520,744
Int. Cl.[5] E05C *17/12*
U.S. Cl. 292—262 10 Claims



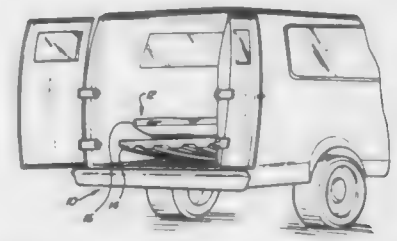
1. A leveraged security lock for a door system comprising a door frame having a door mounted in said frame and having a hinged edge and an opening edge, said lock having:

(a) a rigid leverage bar having a pivoted end and a distal end;

(b) a bar mount mounted to said frame and pivotally mounting said bar such that same may be alternatively swung clear of said door in an open mode, or across the opening of said door, to obstruct the opening of said door in a closed mode;

(c) latch means mounted to said door system to latch said bar in said closed mode to prevent the opening of said door; and,

(d) said bar having a rolling bearing between the pivoted end



and the distal end thereof for bearing against said door, such that the pressure applied to the distal end of said bar forcing same toward the closed mode yields the user a mechanical advantage.

5,007,670

REMOVABLE AND ADJUSTABLE FITTABLE VEHICLE BED LINER ASSEMBLY

Ronald D. Wise, 1305 Riverside Rd., Old Hickory, Tenn. 37138

Filed Oct. 31, 1989, Ser. No. 429,386
Int. Cl.[5] B62D *33/00*
U.S. Cl. 296—39.1 [illegible] Claims

1. A liner assembly for lining the bed portion of a pickup truck, a van and the like, said assembly comprising:

a liner having multiple layers;

one of said multiple layers is a base layer;

said base layer having a top side and a bottom side;

said base layer further having a width and a length;

another of said multiple layers is a resiliently yieldable layer fixed to said top side of said base layer;

said resiliently yieldable layer having a width and a length equivalent to that of said base layer;

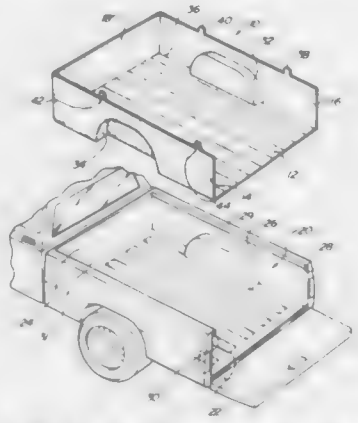
said resiliently yieldable layer further having a top side and a bottom side;

means for adjusting said length and said width of said base layer and said resiliently yieldable layer; and

a plurality of pairs of detachably interattachable portions, comprised of a hooked portion attached to said bottom side of said base layer and a looped portion attached to said bed portion.

5,007,671

UNDER THE RAIL LINER WITH TABS



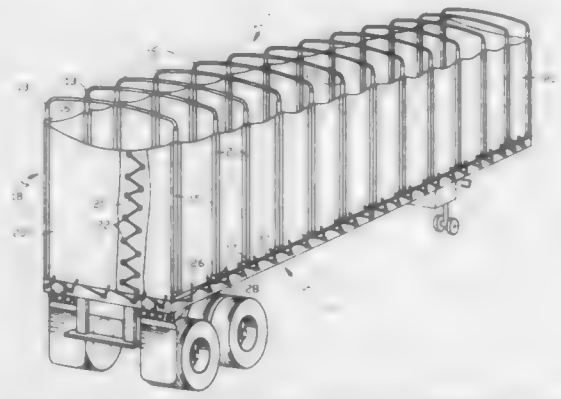
John C. Oprea, Caro, Mich., assignor to Durakon Industries, Inc., Lapeer, Mich.

Filed Dec. 22, 1989, Ser. No. 455,681
Int. Cl.[5] B60R *13/01*
U.S. Cl. 296—39.2 4 Claims

1. A protective liner for a truck bed, said bed having a floor, a front wall and two opposing side walls, each side wall having a lipped end portion, comprising:

a liner member adapted to be received into said truck bed,

said liner member having a bottom, a front wall and two opposing side walls, said opposing liner side walls respectively associated with said truck bed side walls, said liner side walls each having a first and second end, said first end of each liner side wall connected to said liner bottom and said second end of each liner side wall having a resilient portion, wherein the vertical height of said resilient portion and liner side wall is greater than the vertical height



of said truck bed side wall and wherein said resilient portion is deformed and retained in its deformed position within said lipped end of said truck bed side walls, said resilient portion of each said liner side wall urging its associated liner side wall against its respectively associated truck bed side wall and against said truck bed floor wherein said urging acts to retain said liner member within said truck bed.

5,007,672

COVER SYSTEM FOR FLAT BED VEHICLES

Ralph E. Koch, Poseyville, Ind., assignor to Ralph E. Koch Trucking, Inc., Poseyville, Ind.

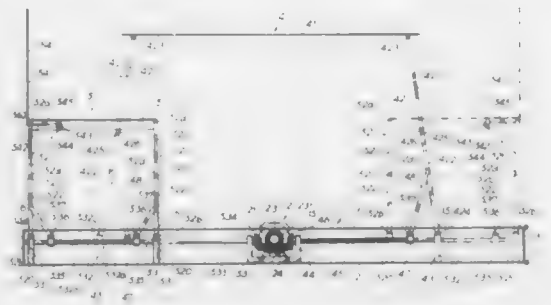
Filed Aug. 16, 1990, Ser. No. 568,413
Int. Cl.[5] B60P *7/04*
U.S. Cl. 296—100 **11 Claims**

1. A cover system for covering a load on a vehicle having a flat bed and a plurality of side post brackets, comprising:

a plurality of longitudinally arranged inverted U-shaped bows having a bow shaped section extending transversely across the flat bed and a pair of downwardly extending legs;

a plurality of side posts each having a lower end adapted to be received in one of the side post brackets and an upper end defining a socket adapted to receive therein one of said pair of downwardly extending legs of said U-shaped bows;

a top cover formed of a flexible, sheet-like tarpaulin material supported by said plurality of U-shaped bows and sized to extend over the top of a load carried on the flat bed of the vehicle; and



a side cover means including a plurality of side cover sections formed of a flexible, sheet-like tarpaulin material, said side cover sections formed separate from each other and from said top cover and each having a plurality of pockets sized to receive therein said side posts, each pocket having a portion thereof which is arranged to overlie said upper end of a corresponding one of said side posts and defining an opening through which is adapted to be received a corresponding one of said pair of downwardly extending legs of said U-shaped bows, said side cover sections extending from the top ends of said posts to the flat bed of the vehicle.

5,007,673

COLLAPSIBLE TABLE AND CHAIR SET

Yen-Feng Cheng, 5F, No. 64, Chien-Kang St., Shih-Lin District, Taipei City, Taiwan

Filed Aug. 13, 1990, Ser. No. 567,118
Int. Cl.[5] A47B *39/00*
U.S. Cl. 297—159 **6 Claims**

1. A collapsible table and chair set comprising:

a base platform;

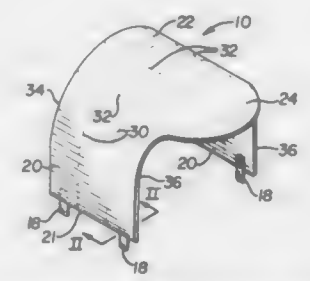
a driving means including a driving motor operatively rotatable forwardly or reversely, a main transmission shaft coupled to an inner shaft of the driving motor, a master bevel gear rotatably mounted in a central portion of said base platform driven by said main transmission shaft driven by said driving motor;

an erection and lay-down means including a reel operatively coupled to and driven by an outer shaft of said driving motor, a wire rope having an inner end portion wound on said reel and an outer end portion formed as a loop adapted to be hung on a hook fixed on a wall;

a table including a table plate and a plurality of linkages pivotally secured under the table plate and secured on said platform, a plurality of table worms radially rotatably mounted on said platform and operatively driven by said master bevel gear and said driving motor, and a plurality of table sleeves each having worm gear engageable with each said table worm and having a supporting link pivotally secured between said sleeve and said linkage for operatively raising said linkage for extending the table, or lowering said linkage for folding the table;

a plurality of chairs radially disposed around said table each said chair including a pair of seat bars pivotally connected with a plurality of linking legs pivotally secured to said platform, a two-way chair worm radially and rotatably mounted on the platform and operatively engageable with and driven by said master bevel gear and said driving motor, each said two-way worm having a rightwardly-threaded worm portion engageable with a chair sleeve secured with a transverse rod which is pivotably connected with two inner chair supporting links pivotally connected to a pair of inner linking legs formed on an inner portion of the chair, and a leftwardly-threaded worm portion engageable with another chair sleeve secured with another transverse rod which is pivotally connected with two outer chair supporting links pivotally connected to a pair of outer linking legs formed on an outer portion of the chair; and

a control means having a first selector switch for operatively extending or retracting a table and chair set, and a second selector switch for operatively erecting a folded table and chair set or laying down the table and chair set, whereby upon a forward rotation of said driving motor and said master bevel gear, said worms will be forwardly rotated to radially move said sleeves for raising said linkages and linking legs for upwardly extending the table and chairs;



and whereby upon a rotation of the reel, the wire rope can be receivably wound on the reel from a lower end portion of the wire rope to erect a folded table and chair set when an upper end portion of the wire rope is hanged on a wall and the table and chair set is folded.

5,007,674

INFANT SHADE APPARATUS

John Franc, 129 Schley Ave., Pittsburgh, County of Allegheny, Pa. 15205

Filed Jun. 15, 1987, Ser. No. 61,476
Int. Cl.[5] A47C *7/62*
U.S. Cl. 297—184 **12 Claims**

1. A sun shade for use in conjunction with an infant carrier such as a car seat to shield an infant from the elements comprising:

an expanse of resiliently flexible sheet-form foam rubber;

an envelope of sheet-form material substantially completely covering said expanse of foam rubber;

plural elongated attachment means extending along juxtaposed surface portions of said expanse of foam rubber and said envelope to secure said envelope and said foam rubber together at least at intervals along the extent of each said attachment means;

said elongated attachment means being cooperable with said expanse of foam rubber and said envelope to permit said shade to be formed as a self-supporting arched structure having a pair of spaced apart base portions and a continuously arched body extending over the space between said base portions; and

selectively releasable means affixed to said shade adjacent said base portions for co-action with such a carrier to retain said shade with respect to such a carrier as such a self-supporting arched structure.

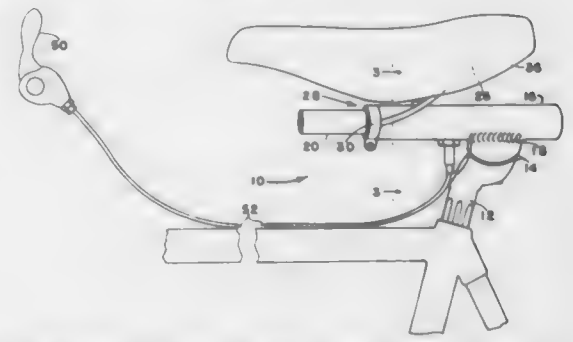
5,007,675

FORE-AND-AFT ADJUSTER FOR BICYCLE SEAT

Mario S. Musto, 60 Roan Pl., Woodside, and Scott W. Davis, 314 Palomar Dr., Redwood City, both of Calif. 94062

Continuation-in-part of Ser. No. 379,597, Jul. 14, 1989, abandoned. This application Apr. 10, 1990, Ser. No. 507,000
Int. Cl.[5] B62J *1/00*
U.S. Cl. 297—195 **22 Claims**

1. A bicycle seat adjuster for a bicycle which is arranged to move in a predetermined forward motion direction and which has a frame and an elongated seat post having upper end and lower ends, said lower end being attached to and supported by said frame, said seat adjuster comprising:



an outer tubular member having an extended length and a uniform bore along its length, said outer tubular member having a lower surface and an upper surface opposite to said lower surface,

mounting means for mounting said outer tubular member on said upper end of said seat post such that said uniform bore is aligned generally with said predetermined forward motion direction and said lower surfaces said upper end of said elongated seat post,

a slot of uniform width in said outer tubular member, said slot running longitudinally along said outer tubular member and parallel to said bore, said slot extending from said bore outwardly to the outside of said outer tubular member, said slot defining two facing and uniformly spaced slot walls, said slot being formed in said upper surface of said outer tubular member,

an inner member having an outer surface sized to fit slidingly within said bore, said inner member being positioned within said bore,

a slidable seat support member having two opposing faces spaced apart so as to fit slidingly within said two facing and uniformly spaced slot walls, said support member having lower and upper ends,

attachment means for attaching said lower end of said seat support member to said inner member so that said seat support member extends generally normal to said inner member and so that said inner member and said seat support member are united for common sliding motion within a given range of adjustment with respect to said outer member, said seat support member extending through said slot in said upper surface of said outer tubular member and protruding upwardly from said upper surface of said outer tubular member,

seat fastening means for fastening a bicycle seat to said upper end of said seat support member,

locking means for locking said inner member to said outer member in a plurality of positions within said given range of adjustment, and

urging means for continuously urging said seat support member in a given direction with respect to said outer tubular member, said given direction paralleling said predetermined forward motion direction,

whereby a seat attached to said seat support member can be slidingly adjusted fore and aft with respect to said frame of said bicycle, yet will be prevented from side movement in with a simple, reliable mechanism.

5,007,676

QUICK DETACHABLE VEHICLE SEAT COVER

Jack Lien, No. 30, Yen Chi Street, Kaohsiung, Taiwan

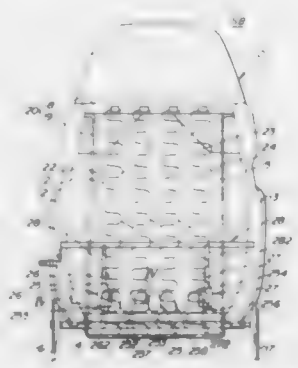
Filed Oct. 12, 1989, Ser. No. 420,404
Int. Cl.[5] A47K *27/00*
U.S. Cl. 297—218 **7 Claims**

1. A rapidly detachable vehicle seat cover including:

a cover cloth having a size corresponding to a vehicle seat and first fastening strips attached at its side edges;

a plurality of fastening elements detachably secured to said vehicle seat and connecting said cover thereto; said fasten-

ing elements each including a belt-like flexible rubber pad having several grooves for receiving respective clips, and second fastening strips covering said flexible rubber pad and tightly sealed thereto by a high frequency heat weld-



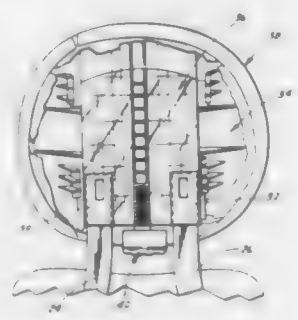
ing process; said clips respectively having a fixed half secured between said flexible rubber pad and said second fastening strip and a free half suspended from said flexible rubber pad.

5,007,677

VEHICULAR SEAT LUMBAR SUPPORT DEVICE

Makoto Ozawa, Odaware; Yasuo Hirama, Chigasaki, and Shyuzi Mizuno, Kanagawa, all of Japan, assignors to Ikeda Bussan Co., Ltd., Ayase and Nissan Shatai Company, Limited, Hiratsuka, both of, Japan

Filed Nov. 24, 1989, Ser. No. 441,043
Claims priority, application Japan, Nov. 29, 1988, 63-301294
Int. Cl.[5] A47C *3/00*
U.S. Cl. 297—284 8 Claims



1. A vehicular seat back lumbar support device comprising.
a seat back frame, said seat back frame including opposite side panels;
a plurality of vertical main springs, said plurality of vertical main springs being mounted on said seat back frame for resiliently supporting a seat back surface, said seat back frame constituting a structural base of a seat back;
a supporting member, said supporting member laterally extending between said opposite side panels of said seat back frame and being pivotally supported thereby;
a pair of arm members, said arm members being secured to said supporting member
a pair of support brackets, said support brackets being pivotally connected to said arm members through pivot portions;
a lateral spring, said lateral spring positioned at a portion of the seat back surface whereby a lumbar portion of a seat occupant is supported, said lateral spring being equipped with fixing portions which are fixed to said vertical main springs, said lateral spring having both resilient end portions bent rearward and said resilient end portions being supported by said support brackets; and
moving means, said moving means being arranged between said seat back frame and said supporting member for rotating said supporting member;
wherein, said moving means allows said pivot portion of said support bracket, by rotating said supporting member, to move from a normal position to a lumbar support position which is located forward of said normal position, so that said support brackets resiliently forwardly bias said lateral spring and said plurality of main vertical springs so as to provide a smoothly distributed degree of support across said lumbar portion of said seat occupant.

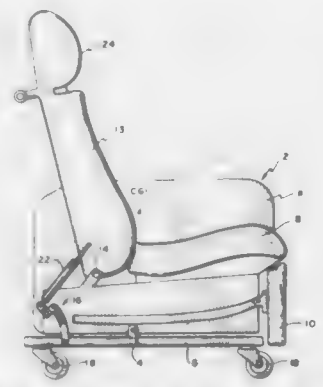
5,007,678

CHAIR BACK HEIGHT ADJUSTMENT MECHANISM

Larry DeKraker, Holland, Mich., assignor to Steelcase Inc., Grand Rapids, Mich.

Filed Oct. 11, 1989, Ser. No. 419,097
Int. Cl.[5] A47C *1/00*
U.S. Cl. 297—353 19 Claims

1. A chair back assembly, comprising:
an inner bracket having a socket adapted to receive a back support member, said inner bracket including a locking detent configured to engage the back support member and lock the inner bracket to said member;
an inner shell having a surface facing said bracket, said inner shell configured to define a chair back member;
slide means on said inner shell and said bracket for slideably mounting said inner shell for vertical adjustment relative to said bracket, said slide means including a slide and a cooperating guide, each on one of said inner shell and bracket;
adjustment means on said bracket and shell for releasably latching said shell to said bracket to permit thereby selective vertical positioning of said shell with respect to said bracket in a single handed fashion, and
an outer shell secured to said inner shell, said outer shell dimensional and configured to enclose said inner bracket.



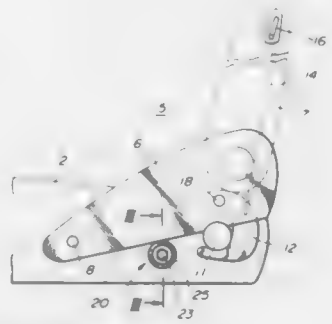
5,007,679

RECLINING CHAIR

Neil W. Mizelle, P.O. Box 5985, High Point, N.C. 27285

Filed Jun. 12, 1989, Ser. No. 364,377
Int. Cl.[5] A47C *1/02*
U.S. Cl. 297—374 13 Claims

1. A reclining chair, comprising,
a base member,
a chair assembly including a seat and a back, said back being tiltable relative to the seat from a generally upright sitting position to a generally horizontal reclining position,
a pivot means connecting the chair assembly to the base member for pivotal movement about a pivot axis that is fixed relative to the base member and the chair assembly,
said chair assembly being rearwardly tiltable on the pivot means for movement from a first position to a second position,
releasable locking means for holding the chair assembly at a fixed inclination angle relative to said base member,
said chair assembly, when the back is in said reclining position and the chair assembly is in its first position with an occupant seated thereon, having a center of gravity that is forward of the pivot axis so that the weight of the chair assembly moves it toward said first position; and,



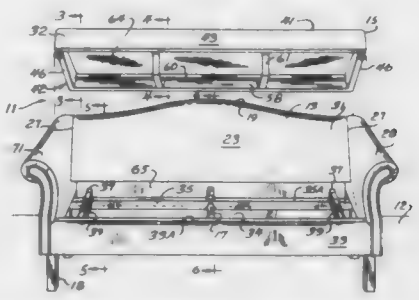
said center of gravity, when the back is in said reclining position and the chair assembly is in its second position, being behind the pivot axis so that the weight of the chair assembly moves it toward said second position, whereby the chair will be stable in both of said first and second positions.

5,007,680

VEHICULAR SEAT WITH SEATBACK INCLINING MECHANISM

Fumio Miyauchi, and Shyuzi Mizuno, both of Kanagawa, Japan, assignors to Ikeda Bussan Co., Ltd., Ayase, Japan

Filed Oct. 5, 1989, Ser. No. 417,491
Claims priority, application Japan, Oct. 28, 1988, 63-40572[U]
Int. Cl.[5] B60N *2/02*
U.S. Cl. 297—379 7 Claims



1. A vehicular seat comprising:
a seat cushion;
a seatback;
a base plate having one end pivotally connected to said seat cushion through a pivot pin;
a reclining device mounted on said base plate, said reclining device having a pivotal arm secured to said seatback;
a striker secured to said seat cushion;
a latch member pivotally connected to said base plate, said latch member being latchingly engageable with said striker;
cancelling means for cancelling the latching engagement between said latch member and said striker; and
a stopper structure secured to said seat cushion at a position between said striker and said pivot pin of said base plate, said stopper structure being positioned away from said striker by a given distance, said stopper structure having thereon an elastomeric member against which a lower edge portion of said base plate is pressed when said latch member is brought into a latching engagement with said striker.

FLUID-RESISTANT, UPHOLSTERED FURNITURE SEAT ADAPTED TO AID HOUSEKEEPING

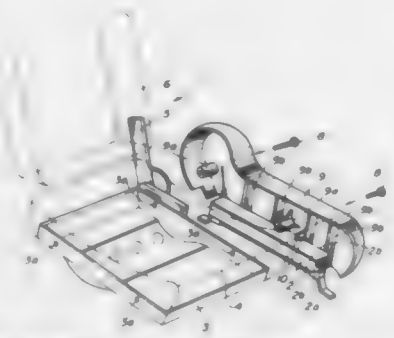
Louis M. Meier, Dubuque, Iowa, and Lloyd G. Berning, Hazel Green, Wis., assignors to Flexsteel Industries, Inc., Dubuque, Iowa

Filed Sep. 8, 1989, Ser. No. 404,870
Int. Cl.[5] A47C *7/00*
U.S. Cl. 297—440 14 Claims

1. A fluid resistant, upholstered furniture seat for use in health care and adapted for standing on a platform such as a floor, comprising:
a backrest portion defining an in-back side, an out-back side, a top edge and a bottom edge, said in-back side being substantially vertically oriented;
said backrest portion including a backrest frame member and a fluid-resistant upholstery cover covering said in-back-side;
a removable seat portion defining a substantially flat top surface and a bottom side;
said removable seat portion including a seat portion frame member associated with said bottom side, a monolithic fluid barrier upholstery cover covering said substantially flat top surface, a seat cushion disposed between said monolithic fluid barrier upholstery cover and said seat portion frame member;
a seat portion support frame member affixed to said backrest frame member for providing support for, without being coupled to, said removable seat portion so that said substantially flat top surface is substantially horizontally oriented and extends outwardly from said backrest member, adjacent said in-back side and said bottom edge;
structural means including bearing stop means disposed on either the lower portion of said seat portion frame member or on the upper portion of said seat portion support frame member for preventing forward or aft displacement of said seat portion frame member on said support frame while allowing said seat portion frame member to be lifted vertically in removing said seat portion frame member from said support frame member;
said removable seat portion covering said support frame and said opening formed in said support frame, with said substantially flat top surface of said removable seat portion inclining in decreasing elevation towards said backrest member when said removable seat portion is carried on said seat portion support frame; and
a plurality of feet adapted for supporting said back-rest member and said seat support frame above said platform.

5,007,682

VEHICULAR SEAT ASSEMBLY



Isao Kuwabara; Yoshio Watanabe; Susumu Yoshimura, and Hidekazu Maruyama, all of Kanagawa, Japan, assignors to Ikeda Bussan Co., Ltd., Ayase, Japan

Filed Apr. 7, 1989, Ser. No. 334,444

Claims priority, application Japan, Sep. 22, 1988, 63-124195[U]

Int. Cl.[5] B60N *1/00*

U.S. Cl. 297—452 **8 Claims**

1. A vehicular seat assembly comprising:

two seat sliders each including a lower rail secured to a vehicular floor and an upper rail slidably disposed on said lower rail;

a seat frame securely mounted on the upper rails of the seat sliders;

a seat cushion mounted on said seat frame;

a side decorative panel extending along one lateral side of said seat frame for concealing unsightly portions;

at least two studs integrally formed on said side decorative panel, said studs being secured to the lateral side of said seat frame; and

a projection integrally formed on said side decorative panel and having a free unattached end which is seated on the upper rail of one of said seat sliders.

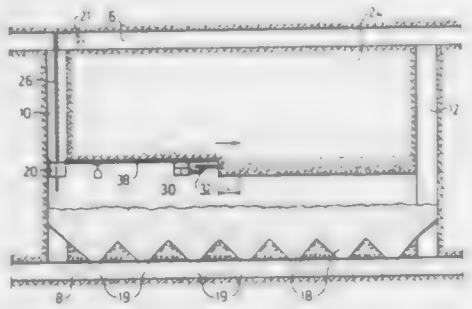
METHOD AND EQUIPMENT FOR NARROW ORE MINING

Roland Granskog, Skelleftea, Sweden, assignor to ALIMAK AB, Sweden



PCT No. PCT/SE88/00023, § 371 Date Aug. 14, 1989, § 102(e) Date Aug. 14, 1989, PCT Pub. No. WO88/06225, PCT Pub. Date Aug. 25, 1988

PCT Filed Jan. 22, 1988, Ser. No. 382,705

Claims priority, application Sweden, Feb. 19, 1987, 8700687

Int. Cl.[5] E21C *35/16, 41/00;* **B66B** *17/04*

U.S. Cl. 299—10 **14 Claims**

1. A method for mining a narrow ore body in a mine having a mining chamber comprising the steps of:

forming a raise which substantially follows the narrow ore body and is in communication with the chamber;

providing a lift cage movable along the raise, the cage including a guide and mining equipment movably attached to the guide from which mining operations within the chamber can be carried out;

suspending a plurality of guide rail sections from a roof of the chamber so that the guide of the cage can be aligned with the guide rail sections suspended from the chamber roof by appropriately positioning the cage in the raise to permit movement of the mining equipment from the guide to the guide rail sections; and

moving the mining equipment along the guide and the guide rail sections;

whereby ore can be mined with the working equipment as the equipment is moved along the chamber roof.

5,007,684

WATER SPRAY UNIT FOR MINING

George A. Parrott, Barnsley, England, assignor to Minnovation Limited, Barnsley, England

Filed Feb. 5, 1990, Ser. No. 475,335

Int. Cl.[5] E21C *35/22*

U.S. Cl. 299—81 **16 Claims**

1 A water spray unit adapted, in use, to be located in a receiving bore provided in a pick box, said water spray unit comprising an elongate nozzle portion and a fastener for said nozzle portion, and internal water-receiving chamber provided in said nozzle portion, a water inlet orifice in communication with said chamber and, at one end of said nozzle portion, a water discharge orifice in communication with said chamber, an external screw thread provided on said fastener and drive surfaces also provided on said fastener for screwing or unscrewing, with said one end of said nozzle portion being distal from said fastener and terminating in a nose having a frusto-conical sealing surface, adapted, in use, to be forced by said fastener, in tight, water-sealing engagement with a complementary frusto-conical seat of said receiving bore.

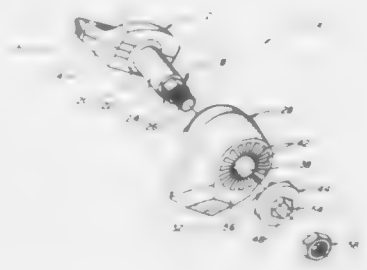
5,007,685

TRENCHING TOOL ASSEMBLY WITH DUAL INDEXING CAPABILITY

Wayne H. Beach, Roaring Spring, and Steven D. Shirk, Altoona, both of Pa., assignors to Kennametal Inc., Latrobe, Pa.

Filed Jan. 17, 1989, Ser. No. 297,909

Int. Cl.[5] E21C *35/18*



U.S. Cl. 299—91 **23 Claims**

1. A trenching tool assembly with an indexable cutter bit shank comprising:

a) a carrier block formed with a bore extending through the carrier block and an indexing surface having a plurality of serrations;

b) a cutter bit having a shank adapted to extend through the bore in the carrier block; and

c) at least one indexing means for orienting the shank of the cutter bit within the bore of the carrier block in a plurality of different radial settings, the indexing means including a plurality of serrations engageable with the serrations in the indexing surface of the carrier block at any one of different angular positions.

5,007,686

PROCESS FOR ROUNDING BRISTLE TIPS ON BRUSHES

Rolf M. Klein; Reinhart Poprawe, both of Aachen, and Gerd W. Herziger, Roetgen-Rott, all of Fed. Rep. of Germany, assignors to Blendax GmbH, Fed. Rep. of Germany

Filed Oct. 31, 1989, Ser. No. 429,740

Int. Cl.[5] A46D *1/04*

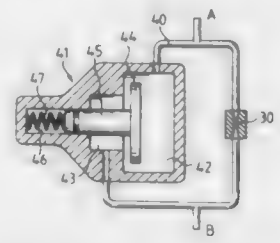
U.S. Cl. 300—21 **12 Claims**

1. A process for rounding off the tips of bristles used in brushes and made of thermoplastic material said process comprising subjecting said tips of said bristles to a pulsed laser beam operating in the kilowatt range and having a pulse duration in the microsecond range.

5,007,687

ANTI-SKID-CONTROLLED HYDRAULIC BRAKE SYSTEM

Dieter Kircher, Dortelweil, and Paul Schwarzer, Hofheim, both of Fed. Rep. of Germany, assignors to Alfred Teves GmbH, Frankfurt am Main, Fed. Rep. of Germany



Division of Ser. No. 287,307, Dec. 20, 1988, Pat. No. 4,919,495. This application Jan. 12, 1990, Ser. No. 464,097

Claims priority, application Fed. Rep. of Germany, Dec. 24, 1987, 3744070

Int. Cl.[5] B60T *11/10*

U.S. Cl. 303—113 **5 Claims**

1. An anti-skid controlled hydraulic brake system including a master cylinder, a pressure medium storage reservoir, at least one hydraulically controlled wheel brake connected to said master cylinder via a brake line and to said reservoir via a relief line, pressure modulation means in each of said brake and relief lines for modulating the pressure applied to said brake in response to pressure control signals, a pump having an intake connected to said reservoir and an outlet connected via pressure line means to said brake line at a first location, and throttling valve means for throttling flow between said pump and said master cylinder, a first check valve connected to said brake line in parallel with said throttling valve means accommodating flow from said master cylinder toward said wheel brake, and a second check valve connected to said brake line in parallel with said throttling valve means accommodating flow only from said wheel brake toward said master cylinder.

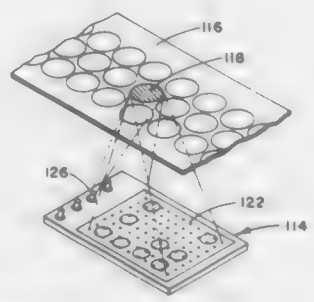
INFRA-RED TRANSMITTING OPTICAL COMPONENTS AND OPTICAL COATINGS THEREFOR

Christopher J. Kelly, Hyndland, Scotland, and Keith L. Lewis, Malvern, England, assignors to Barr & Stroud - U.K. Ministry of Defence, United Kingdom

Filed Aug. 30, 1989, Ser. No. 400,333
Claims priority, application United Kingdom, Sep. 8, 1988, 8821116
Int. Cl.[5] G02B *1/10, 5/26*
U.S. Cl. 350—1.6 13 Claims



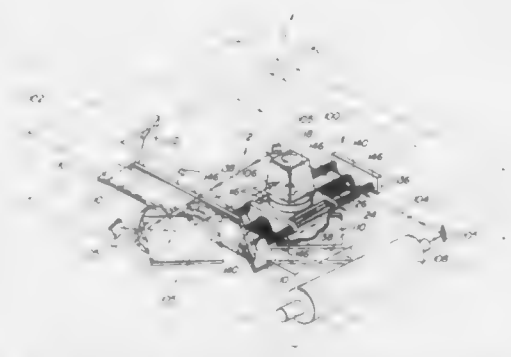
1. An infra-red transmitting optical component having an anti-reflecting coating thereon of boron phosphide, the coating having been deposited on the component by plasma-assisted chemical vapor deposition at a temperature of less than about 500° C. and having a disordered non-crystalline structure.

5,007,690

HOLOGRAPHIC DATA STORAGE AND RETRIEVAL SYSTEM

Mao-Jin Chern, Rancho Palos Verdes; Ronald T. Smith, Redondo Beach, both of Calif., and Brent C. Frogget, Los Alamos, N. Mex., assignors to Hughes Aircraft Company, Los Angeles, Calif.

Filed Mar. 21, 1989, Ser. No. 326,711
Int. Cl.[5] G02B *5/32;* G11B *7/00;* G11C *13/04*
U.S. Cl. 350—3.68 4 Claims



1. A holographic data storage and retrieval system comprising:
- a plurality of reflective diffusing holographic memory elements having holographically stored therein data to be read;
- a laser positioned to illuminate said reflective diffusing holographic memory elements;
- a detector array positioned to be illuminated by laser light reflected by said reflective diffusing holographic memory elements, said detector array having a plurality of detectors thereon so that at least one of said detectors is illuminated to correspond to data information stored in said memory elements, and said detector array is moveable with respect to said plurality of reflective holographic memory elements so that one of said memory elements can be positioned with respect to said array to be illuminated by said laser and reflect to said array;
- means for selecting which of said reflective holographic memory elements will reflect laser light to said detector array;
- a memory plate is fixed in position and said detector array is movable with respect to said memory plate so as to permit movement of said detector array to a selected position with respect to said memory plate to read the reflections from said laser off of said selected memory element; and
- an optical reflective holographic reader wherein said detector array and said laser are both mounted on said reader and said reader is movable with respect to said memory plate wherein said reader faces said memory plate and said reader is movable on rectangular axes with respect to said memory plate and said plurality of memory elements on said memory plate is arranged in a rectangular pattern.

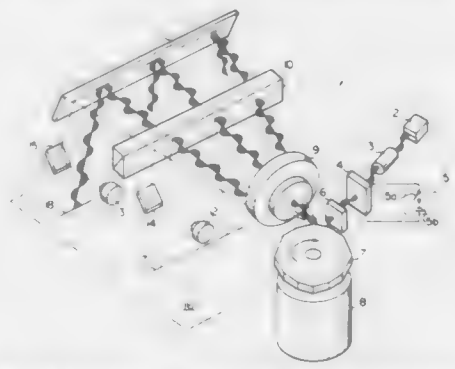
5,007,691

METHOD AND APPARATUS FOR BEAM SWEEPING IN A LASER SCANNER

Mohan L. Bobba, and Howard H. Nojiri, both of Eugene, Oreg., assignors to Spectra-Physics, Inc., San Jose, Calif.

Filed Aug. 28, 1989, Ser. No. 398,920
Int. Cl.[5] G02B *26/08*
U.S. Cl. 350—6.7 18 Claims

1. Beam sweeping apparatus for use in a laser scanner to receive a laser beam traveling along a path from a laser beam generating means and sweep the laser beam onto reflecting means which projects a scanning pattern beyond the laser scanner for each sweep of said laser beam, said beam sweeping apparatus comprising:
- mirror means for receiving and directing said laser beam onto said reflecting means;
- rotary drive means for supporting and rotating said mirror means to sweep said laser beam onto said reflecting means; and
- linear drive means for supporting and linearly moving said rotary drive means generally along the path of said laser beam to vary the point of focus of said laser beam along its projected direction beyond the laser scanner and thereby expand the effective depth of field of the laser scanner.



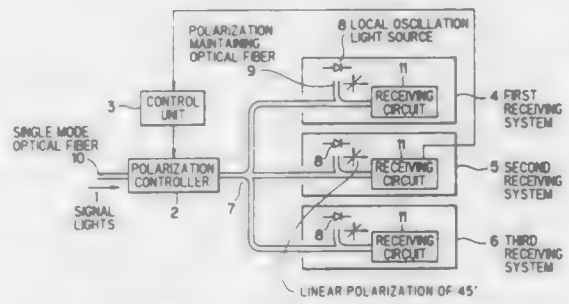
5,007,692

LASER BEAM SCANNING SYSTEM

Kazuo Matsuura, Osaka, Japan, assignor to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Filed Dec. 21, 1989, Ser. No. 455,598
Claims priority, application Japan, Dec. 29, 1988, 63-334762
Int. Cl.[5] G02B *26/08;* H01J *3/14*
U.S. Cl. 350—6.8 10 Claims

1. A laser beam scanning system comprising:
- laser beam generating means for generating a laser light beam which is linearly polarized;
- electro-optical means for selectively varying or not varying the polarized direction of the laser light beam generated from said laser beam generating means;
- a first beam receiving station;
- a second beam receiving station;
- scanning means for scanning the first and second beam receiving stations with the laser light beam after it has passed through said electro-optical means, and
- means for directing the laser light beam of which the polarized direction has been varied by said electro-optical means to said first beam receiving station and for directing the laser light beam of which the polarized direction has not been varied to said second beam receiving station.



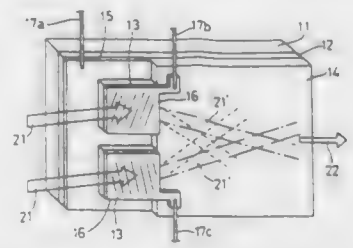
5,007,693

METHOD FOR CONTROLLING POLARIZATIONS OF SIGNAL LIGHTS IN AN OPTICAL FREQUENCY DIVISION MULTIPLEX COHERENT COMMUNICATION SYSTEM

Shuntaro Yamazaki; Takashi Ono, and Haruhito Shimizu, all of Tokyo, Japan, assignors to NEC Corporation, Tokyo, Japan

Filed Mar. 16, 1990, Ser. No. 494,381
Claims priority, application Japan, Mar. 16, 1989, 1-65716
Int. Cl.[5] H04B *10/00;* G02F *2/00*
U.S. Cl. 350—96.13 4 Claims

1. A method for controlling polarizations of signal lights in an optical frequency division multiplex coherent communication system, comprising steps of:
- propagating frequency division multiplex signal lights through an optical fiber;
- controlling polarizations of said frequency division multiplex signal lights collectively;
- controlling relative polarization states of local oscillation lights in receiving systems including optical heterodyne or homodyne receivers to coincide to each other; and
- receiving said frequency division multiplex signal lights having collectively controlled polarizations in accordance with said local oscillation lights separately by said receiving systems.



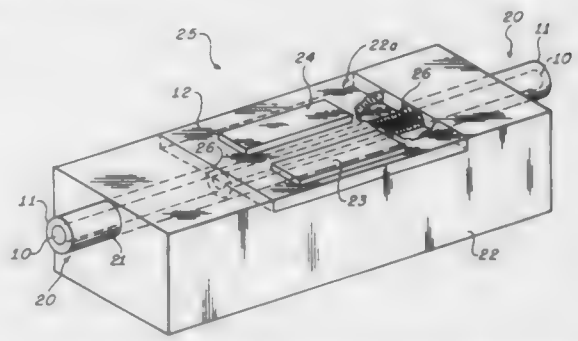
5,007,694

LIGHT WAVELENGTH CONVERTER

Osamu Yamamoto, and Toshihiko Yoshida, both of Nara, Japan, assignors to Sharp, Kabushiki Kaisha, Osaka, Japan

Filed Dec. 28, 1989, Ser. No. 457,320
Claims priority, application Japan, Dec. 29, 1988, 63-334135
Int. Cl.[5] G02B *6/10*
U.S. Cl. 350—96.14 7 Claims

1. A light wavelength converter comprising a substrate that is made of a non-linear optics material; an optical waveguide that is formed on the surface of said substrate; a light source that irradiates said optical waveguide with a pair of lights having a fundamental wavelength, said pair of lights being propagated within said optical waveguide and intersecting each other within said optical waveguide to thereby generate a second harmonic light; and a light deflection means that changes the intersection angle between the pair of lights based on an electric signal that is input into said light deflection means.



5,007,695

FIBER OPTIC PHASE MODULATOR USING ELECTRO-OPTIC MATERIAL IN EVANESCENT FIELD

Chin L. Chang, West Covina, Calif., assignor to Honeywell Inc., Minneapolis, Minn.

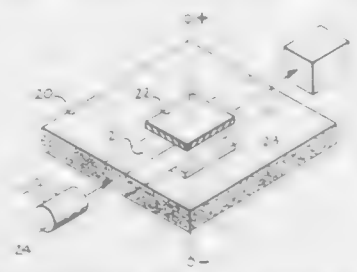
Filed Sep. 29, 1989, Ser. No. 415,014
Int. Cl.[5] G02B *6/00;* G02F *1/29*
U.S. Cl. 350—96.14 7 Claims

1. A phase modulator for use with an optical fiber having a fiber core and cladding, a light wave propagating in said fiber core having an evanescent field in said cladding, comprising
- electro-optical material disposed proximate said fiber core to access said evanescent field, said electro-optic material having a variable index of refraction, the propagation velocity of said light wave being determined by said index of refraction, and
- electrode means disposed proximate said electro-optic material to apply an electric field having an electric field distribution thereacross that is parallel to said electro-optic material, said electric field arranged to vary said index of refraction and said propagation velocity of said light wave in accordance with applied electric field, thereby modulating the phase of said light wave.

5,007,696

ELECTRO-OPTIC CHANNEL WAVEGUIDE

John I. Thackara, Sunnyvale; George F. Lipscomb, Palo Alto, both of Calif.; Hyun-Nam Yoon, New Providence, and Ronald N. De Martino, Wayne, both of N.J., assignors to Lockheed Missiles & Space Company, Inc., Sunnyvale, Calif.



Division of Ser. No. 225,450, Jul. 28, 1988. This application Jan. 8, 1990, Ser. No. 461,727
Int. Cl.[5] G02B *6/10*
U.S. Cl. 350—96.14 19 Claims

1. A polymer structure having an electro-optic channel

waveguide formed therein, said polymer structure consisting of a substantially non-linear optical polymer, said polymer structure comprising a waveguide portion and a cladding portion, said cladding portion abutting said waveguide portion so as to define a configuration for said channel waveguide, said waveguide portion and said cladding portion of said polymer structure being substantially identical to each other in chemical composition, said waveguide and cladding portions of said polymer structure being differentially poled with respect to each other, said channel waveguide being formed in said polymer structure by the process of:

(a) maintaining an electric field as a poling field in a portion of said polymer structure that is to become said waveguide portion, said poling field being patterned to define the configuration for said electro-optic channel waveguide;

(b) maintaining said polymer structure in a temperature range above glass-transition temperature for said polymer while said poling field is being maintained in said portion of said polymer structure that is to become said waveguide portion, said polymer structure being maintained above glass-transition temperature for a time sufficient to cause dipolar moieties of said polymer in said portion of

said polymer structure that is to become said waveguide portion to become sufficiently aligned by said poling field so as to produce a higher index of refraction in said portion that is to become said waveguide portion than in an adjacent portion of said polymer structure that is to become said cladding portion, said higher index of refraction being sufficient to support a guided mode of optical radiation of at least one polarization in said channel waveguide, and

(c) cooling said polymer structure below glass-transition temperature while said poling field continues to be maintained in said portion of said polymer structure that is to become said waveguide portion, said poling field being maintained in said portion that is to become said waveguide portion for a sufficient time as said polymer structure is being cooled below glass-transition temperature so that the aligned dipolar moieties of said polymer in said portion of said polymer structure that is to become said waveguide portion can achieve thermal relaxation only after a time that is long relative to a useful lifetime of said polymer structure in an application utilizing said waveguide portion of said polymer structure as said electro-optic channel waveguide.

5,007,697

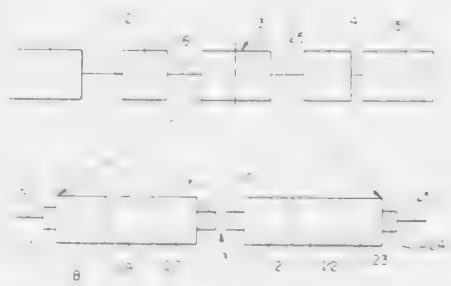
FIBRE OPTIC DATA COUPLER

Rajan Chadha, Glasgow, Scotland, assignor to The British Petroleum Company, plc, London, England

Filed Aug. 11, 1989, Ser. No. 392,755

Claims priority, application United Kingdom, Aug. 17, 1988, 8819574

Int. Cl.[5] G02B *6/26;* **G02F** *1/00*



U.S. Cl. 350—96.15 **10 Claims**

1. A fibre optic data coupler comprising:

(a) a fibre optic data link input module comprising an input connector for a fibre optic connected to a fibre optic receiver for providing a digital electrical output signal corresponding to the fibre optic signal,

(b) a coupler drive module for converting the digital electrical output signal to an analogue drive signal for input to an inductive coupler,

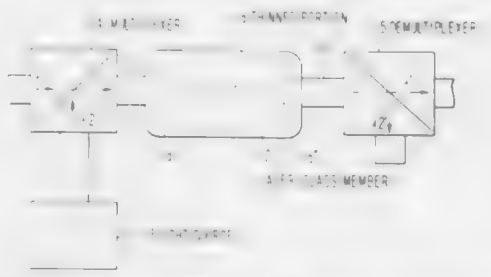
(c) an inductive coupler unit comprising an inlet element for receiving the analogue drive signal and an outlet element for transmitting an induced analogue drive signal, corresponding to the input signal,

(d) a coupler output module for converting the induced analogue drive signal to a digital electrical output signal for input to a fibre optic data link output module, and

(e) a fibre optic data link output module comprising a fibre optic transmitter module, for providing a fibre optic signal corresponding to the digital electrical input signal, connected to a connector for a fibre optic.

5,007,698

OPTICAL FIBER AMPLIFIER/MULTIPLEXER



Kazuya Sasaki, Mitaka; Sakae Yoshizawa, Tokyo; Shinya Inagaki, Tokyo, and Keiko Takeda, Yokohama, all of Japan, assignors to Fujitsu Limited, Kawasaki, Japan

Filed Aug. 15, 1990, Ser. No. 567,614

Claims priority, application Japan, Aug. 15, 1989, 1-209700

Int. Cl.[5] G02B *6/26;* **H01S** *3/30;* **H04J** *1/00*

U.S. Cl. 350—96.15 **24 Claims**

1. An optical waveguide amplifier for amplifying an optical signal propagating therein, comprising:

a laser glass member, doped with a rare earth element, and optical waveguide means, including:

input end means for receiving the optical signal from a light source, and

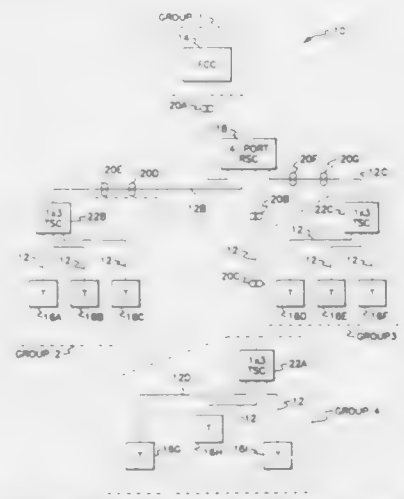
amplifying means, formed substantially thinner than the input end means, for contacting the laser glass member and for amplifying the optical signal.

5,007,699

FIBER OPTIC REFLECTIVE TREE ARCHITECTURE

James C. Stout, Phoenix, Ariz., assignor to Honeywell Inc., Minneapolis, Minn.

Filed Oct. 19, 1989, Ser. No. 423,901



Int. Cl.[5] G02B *6/28;* **G02F** *1/00*

U.S. Cl. 350—96.16 **3 Claims**

1. A fiber optic network contained within a structure, the structure being divided into a first plurality of compartments by a second plurality of bulkheads, said fiber optic network comprising:

(a) a reflective star coupler, being located in a predetermined compartment of said structure, and having m ports;

(b) a third plurality of terminals, each terminal being located in one of said compartments, each terminal capable of at least receiving optical signals containing information therein in accordance with a predefined protocol, the terminals being divided into a fourth plurality of terminal groups, each terminal group having a least one terminal, such that each terminal within the terminal group has at least one coupling through a common bulkhead to said reflective star coupler, the number of terminal groups being m corresponding to the number of ports of said reflective star coupler;

(c) m fiber optic cables, each fiber optic cable operatively connected to a port of the reflective star coupler and to a predetermined terminal group, such that each bulkhead has at most one coupling of the fiber optic cable through said bulkhead; and

(d) said each terminal terminal group having more than one terminal in the terminal group and contained in a single compartment, comprises:

(i) a 1 × n transmissive coupler, having an input port and n output ports; and

(ii) a plurality of terminals, each terminal operatively connected to the transmissive coupler, and wherein the input port is operatively connected to the reflective star coupler via one of said m fiber optic cables, where m is equal to the number of terminals in the terminal group.

5,007,700

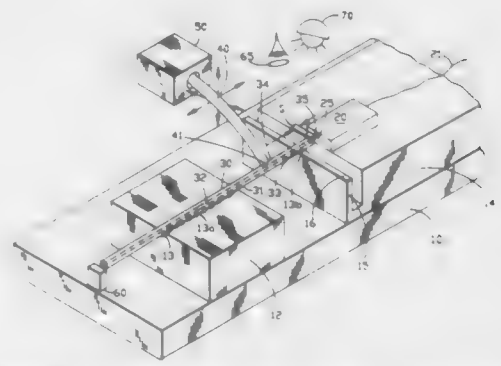
EDGE-EMITTING DIODE-TO-OPTICAL FIBER COUPLING TECHNIQUE

Donald J. Albares, San Diego, Calif., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Continuation-in-part of Ser. No. 318,989, Mar. 3, 1989, Pat. No. 4,930,854. This application Apr. 13, 1990, Ser. No. 509,107

Int. Cl.[5] G02B *6/42*

U.S. Cl. 350—96.17 **12 Claims**



1. A method of end-on optically coupling an optical fiber to the emitting aperture of an edge-emitting diode (EED) mounted on a base comprising:

mounting a semiconductor chip provided with a V-shaped groove on said base in a spaced-apart relationship with respect to said EED;

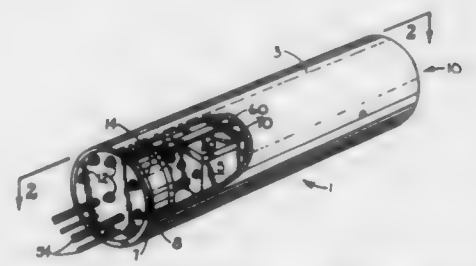
applying a UV curable optical cement in said V-shaped groove and on an exposed lateral surface of an overhanging portion of said optical fiber;

placing said optical fiber in said V-shaped groove to locate said overhanging portion including said lateral surface having the UV curable optical cement applied thereto on an end support rigidly affixed to said EED;

positioning said optical fiber to a position in which the end of said optical fiber has a position of desired optical alignment with said emitting aperture of said EED and a desired separation from said emitting aperture of said EED; and

radiating UV energy on said UV curable optical cement to cure it and to secure said optical fiber in said V-shaped groove and on said end support via said lateral surface on said overhanging portion o said optical fiber in said position of said desired optical alignment of said end of said optical fiber with said emitting aperture of said EED and said desired separation of said end of said optical fiber from said emitting aperture of said EED.

5,007,701



SPLICE CLOSURE APPARATUS

Gene Roberts, Clinton, Mo., assignor to Windsor Communications, Inc., Windsor, Mo.

Filed Jun. 29, 1989, Ser. No. 373,343

Int. Cl.[5] G02B *6/36;* **H02G** *15/08*

U.S. Cl. 350—96.20 **16 Claims**

1. In a splice closure having an internal compartment wherein a cable passes through a wall of the closure; the improvement comprising:

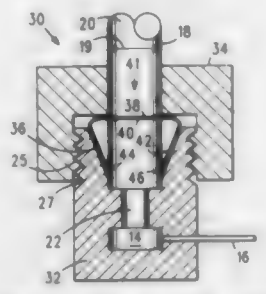
(a) compression anchoring means positioned in said compartment for securing said cable within said closure; and

(b) a hoop encircling said anchoring means to prevent radial expansion of said anchoring means, when compressed, beyond said hoop.

4. In a fiber optics closure adapted to receive a plurality of elongate fiber optic members wherein the elongate fiber optic members are passed through a compressible sealing barrier and joined in an internal compartment; the improvement comprising:

(a) said sealing barrier having an inner compressible portion and an outermost wall constructed of a non-conductive and non-corrosive material; said outermost wall adapted to cooperate with an inner wall and bolt means to compress said sealing barrier therebetween upon tightening of said bolt means when in an operational configuration; and

(b) said outermost wall including a plurality of back-to-back



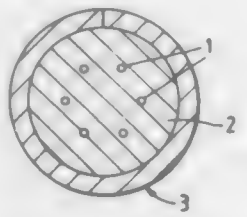
components with one of said components directly abutting said compressible portion; said components constructed of resilient material to prevent damage to said fiber optics from inadvertent overtightening of said bolt means.

5,007,702

FIBER OPTIC CABLE RETAINER

Eugene E. Segerson, 108 W. Erie, Tempe, Ariz. 85282

Filed Jan. 30, 1990, Ser. No. 472,523
Int. Cl.[5] G02B *6/26*
U.S. Cl. 350—96.20 15 Claims



1. A device facilitating unidirectional movement of a fiber optic cable during assembly, comprising, a body portion, a retainer of a springy material and a locking portion, wherein the body portion has an opening therein for admitting the fiber optic cable extending from an exterior of the body portion to an internal electro-optical component, wherein an outer part of the opening nearest the exterior is larger than an interior part of the opening, wherein the retainer resides in the outer part of the opening, wherein the retainer has an interior diameter at a first end oriented toward the interior part of the opening slightly smaller than the cable and an interior diameter at an opposite end larger than the cable so that when the cable is pushed through the retainer toward the interior the smaller end of the retainer expands slightly to allow passage of the cable and when an attempt is made to retract the cable the smaller end of the retainer bites into the cable, and wherein the locking portion is coupled to the body portion and presses against the retainer to adjust the cross-section of the interior end thereof.

OXIMETER

Ronald L. McCartney, Orange, Calif., assignor to Baxter International Inc., Deerfield, Ill.

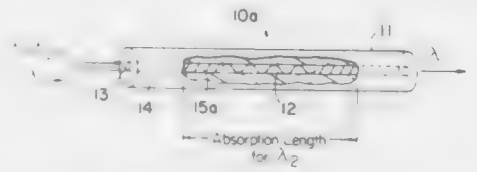
Continuation of Ser. No. 859,855, May 1, 1986, abandoned, which is a continuation of Ser. No. 546,500, Oct. 28, 1983, abandoned. This application Mar. 14, 1989, Ser. No. 323,054
The portion of the term of this patent subsequent to Dec. 8, 2004, has been disclaimed.
Int. Cl.[5] G02B *6/38*
U.S. Cl. 350—96.21 14 Claims

1. An apparatus comprising: at least one fiber optic light conductor; a connector body having a proximal end and an exterior face at said proximal end; means for mounting the fiber optic light conductor on the connector body with an end of the fiber optic light conductor being adjacent the face and capable of transmitting light to or from a location on said face;

a receptacle having a cavity for receiving the connector body, a floor, a face partly defining said cavity and means for transmitting light to or from a location on said face of said receptacle;

guide means at least partially on the receptacle comprising a cam surface on the face of the receptacle and a cam follower surface on the face of the connector body for guiding the connector body along a path in the cavity to move said faces toward each other to place said faces in confronting relationship and said locations substantially into engagement;

said path having a first section extending in a first direction into said cavity and a second section extending in a second direction along said cam surface on said receptacle, wherein said cam follower surface on said connector body cooperates with said cam surface on said receptacle to lift the proximal end of said connector body off the floor of said receptacle to place said locations substantially into engagement;



said connector body having a cam surface; and said receptacle having biasing means for cooperation with said cam surface on said connector body when the connector body is in the cavity of the receptacle and said locations are nearly in engagement for urging the connector body farther into the cavity along said path to move said faces toward each other and to place said locations on said faces in substantial engagement.

5,007,705

VARIABLE OPTICAL FIBER BRAGG FILTER ARRANGEMENT

William W. Morey, West Hartford; Fred J. Leonberger, Glastonbury; William H. Glenn, Vernon, and Gerald Meltz, Avon, all of Conn., assignors to United Technologies Corporation, Hartford, Conn.

Filed Dec. 26, 1989, Ser. No. 456,449
Int. Cl.[5] G02B *6/16*
U.S. Cl. 350—96.29 20 Claims

1. A variable light filtering arrangement comprising

at least one optical fiber section including a waveguiding core;

at least one permanent Bragg grating region in said optical fiber section, including a plurality of grating elements constituted by periodic refractive index variations of a predetermined initial periodicity and cumulatively redirecting, of the light launched into said core for guided propagation therein, that having an axial wavelength within a narrow band around a central wavelength that is determined by the periodicity and refractive index variations of said grating elements; and

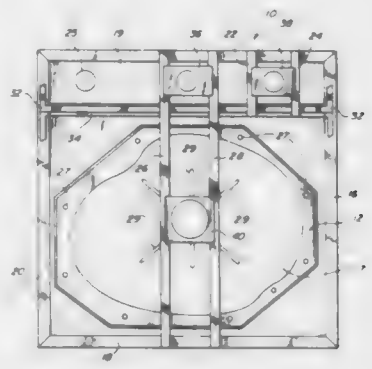
means for so applying at least to said grating region of said optical fiber section an external influence that is representative of a parameter other than structural strain as to modify at least one of the periodicity and refractive index variations of said grating region with an attendant change in said central wavelength within a predetermined wavelength range to an extent indicative of the magnitude of said parameter.

5,007,706

POLYMERIC OPTICAL FIBER

Theodore L. Parker, Lafayette, Calif., and Donald J. Perettie, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich.

PCT No. PCT/US87/00372, § 371 Date Oct. 8, 1987, § 102(e) Date Oct. 8, 1987, PCT Pub. No. WO87/05117, PCT Pub. Date Aug. 27, 1987
PCT Filed Feb. 19, 1987, Ser. No. 143,997
Int. Cl.[5] G02B *1/04*
U.S. Cl. 350—76.34 5 Claims



1. A polymeric optical fiber having a core and cladding structure characterized by (a) the core essentially comprising a copolymer of at least one monovinylidene aromatic monomer and alpha-methylstyrene prepared by anionically polymerizing the monovinylidene aromatic monomer and from 30 to 70 weight percent of alpha-methylstyrene based on the combined weight of monomer, at a temperature greater than 61° C. and less than the ceiling temperature of the monovinylidene aromatic monomer; and (b) the cladding essentially comprising a polymer having a refractive index of at least 3 percent less than the refractive index of the copolymer core and having sufficient adhesion to the copolymer core such that less than 15 percent attenuation of light transmission occurs upon bending of the polymeric optical fiber to a radius equal to thrice the radius of the polymeric optical fiber.

TECHNIQUE FOR PRODUCING ANTIREFLECTION GRATING SURFACES ON DIELECTRICS, SEMICONDUCTORS AND METALS

Thomas K. Gaylord; Elias N. Glytsis, both of Atlanta, Ga.; M. Gamal Moharam, Charlottesville, Va., and William E. Baird, Oxford, Ga., assignors to Georgia Tech Research Corporation, Atlanta, Ga.

Filed Jul. 26, 1988, Ser. No. 224,571
Int. Cl.[5] G02B *26/00*; G02F *1/00*
U.S. Cl. 350—162.2 28 Claims

9. A method of manufacturing an antireflection rectangular groove surface-relief grating comprising the steps of:

selecting a substrate material on which to form the surface-relief grating;

determining the polarization and range of wavelengths and angles of incidence of the electromagnetic waves incident on said substrate;

selecting a lossless medium in which said electromagnetic waves propagate;

determining the plurality of filling factors and corresponding groove depths for said rectangular-groove grating which will make said grating equivalent to a single homogeneous lossy layer;

selecting a filling factor and corresponding groove depth from said plurality of filling factors and corresponding groove depths; and

forming said rectangular groove diffraction grating characterized by said selected filling factor and corresponding groove depth on said substrate.

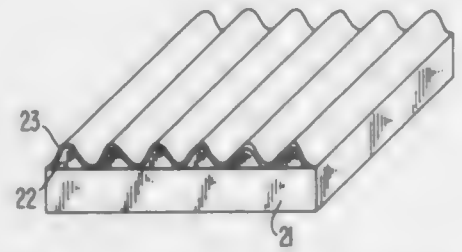
DIFFRACTION GRATING AND MANUFACTURING METHOD THEREOF



Masanori Iida, Nara; Kiyokazu Hagiwara, Hirakata; Hiroyuki Asakura, Osaka; Misoru Nishioka, Kobe, and Koichi Murase, Neyagawa, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Filed Dec. 17, 1988, Ser. No. 290,196

Claims priority, application Japan, Dec. 28, 1987, 62-331972; Dec. 28, 1987, 62-331978

Int. Cl.[5] G02B *5/18*

U.S. Cl. 350—162.22 **6 Claims**

1. A diffraction grating for diffracting light incident thereupon, comprising:

a substrate;

a photosensitive layer formed on said substrate and having formed on a surface thereof a pattern of cyclic grooves; and

a reflection film formed on said surface of said photosensitive layer,

wherein said grating has a groove profile $\eta(x)$ given by:

$$\eta(x)=h[\sin(Kx)+\gamma\sin(2Kx-90^\circ)],$$

where a direction perpendicular to the groove is indicated by x-axis, a groove pitch is indicated by d, $K=2\pi/d$, and parameters h and γ satisfy the following conditions:

$$0.26\leqq 2h/d\leqq 0.52$$

$$0.05\leqq\gamma\leqq 0.32,$$

wherein when the wavelength λ of the incident light is normalized with respect to the groove pitch d to a normalized wavelength λ/d, the normalized wavelength λ/d satisfies the following condition:

$$0.67\leqq\lambda/d\leqq 1.15,$$

and wherein said grating is used in a mount satisfying the following condition:

$$\Theta_L-5^\circ\leqq\Theta\leqq\Theta_L+5^\circ,$$

where Θ denotes the incident angle of the incident light and Θ_L denotes the first order Littrow angle.

COMPACT ARRANGEMENT FOR HEAD-UP DISPLAY COMPONENTS

Robert S. Wood, Hillsboro, and Mark A. Thomas, Lake Oswego, both of Oreg., assignors to Flight Dynamics, Inc., Portland, Oreg.

Filed Nov. 30, 1988, Ser. No. 278,198

Int. Cl.[5] G02B *5/32, 27/14;* **G03H** *1/30*

U.S. Cl. 350—174 **19 Claims**

1. An arrangement for head-up display system components within the cockpit of an aircraft, wherein the cockpit includes a canopy through which the pilot observes the outside real world scene, an over-nose vision surface beneath which the pilot cannot view the outside real world scene, and an imaginary ejection plane extending across the cockpit forward of the pilot, the arrangement comprising:

wavelength selective combiner means located forward of the pilot and mounted to extend across the pilot's line of sight when the pilot views the outside real world scene, for reflectively diffracting wavelengths of incident light lying within a preselected bandwidth and striking the combiner means within a preselected range of angles of incidence and for transmitting other wavelengths of incident light;

source means mounted within the cockpit beneath the over-nose vision surface forward of and spaced away from the ejection plane for projecting information-carrying source light of wavelengths lying within the preselected bandwidth;

upper mirror means of wavelength selective character mounted within the cockpit above the over-nose vision surface, forward of the combiner means, and across the pilot's line of sight through part of the combiner means for reflectively diffracting the source light emanating from the source means to strike the combiner means at a first angle of incidence to the combiner means, the first angle of incidence lying outside the preselected range of angles of incidence; and

collimator means mounted below the over-nose vision surface for collimating the source light reflectively diffracted by the upper mirror means and for directing the collimated source light to the combiner means at a second angle of incidence to the combiner means, the second angle of incidence lying within the preselected range of angles of incidence

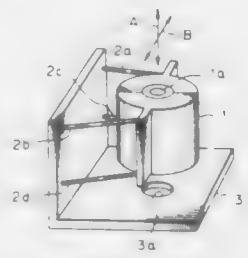
OPTICAL PICK-UP UNIT



Ikuya Kikuchi, and Ryo Sato, both of Tokorozawa, Japan, assignors to Pioneer Electronic Corporation, Tokyo, Japan

Filed Aug. 22, 1988, Ser. No. 234,547

Claims priority, application Japan, Jan. 21, 1988, 63-6061[U]

Int. Cl.[5] G02B *7/02*

U.S. Cl. 350—255 **2 Claims**

1. An optical pick-up unit mounted on a pick-up carriage of an optical disc player, said pick-up unit comprising:

a holder for holding an objective lens having an optical axis passing therethrough;

a base mount mounted on said pick-up carriage;

resilient support means for resiliently supporting said holder so that said holder can be translated in each of a focusing and a tracking direction relative to said base mount, said focusing direction being parallel to the optical axis of said lens and said tracking direction being transverse to said focusing direction; and

wherein said resilient support means comprises first and second pairs of resilient filamentary members interconnecting between said base mount and said holder, said filamentary members each being of equal length and attached to said holder at points equidistant from said optical axis of said lens, said points lying in a plane which passes through the optical axis of said lens, said first pair of filamentary members being disposed in a first plane perpendicular to the focusing direction, and said second pair of filamentary members being disposed in a second plane spaced from and parallel to said first plane and perpendicular to the focusing direction, the filamentary members within each of said first and second pairs being spaced apart from one another on said base mount and said holder, and wherein, a greater distance separates the filamentary members with respect to each of said first and second pairs on the base mount than on the holder.

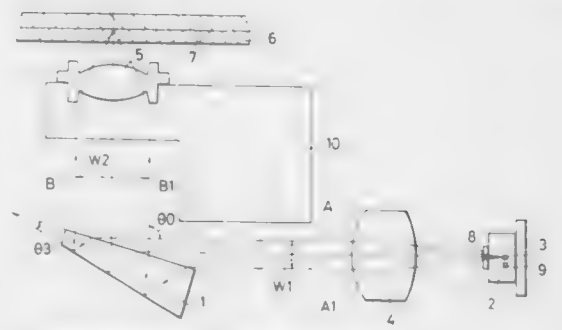
BEAM CONVERTING APPARATUS WITH A PARALLEL LIGHT BEAM INPUT AND OUTPUT FROM ONE PRISM PLANE



Koji Yoshifusa, and Taizo Yokota, both of Higashihiroshima, Japan, assignors to Sharp Kabushiki Kaisha, Osaka, Japan

Filed May 24, 1990, Ser. No. 527,779

Claims priority, application Japan, May 27, 1989, 1-133488

Int. Cl.[5] G02B *5/04, 13/10;* **G11B** *7/135*

U.S. Cl. 350—286 **4 Claims**

1. A beam converting apparatus comprising:

a semiconductor laser element,

means for converting the laser beam from the semiconductor laser element into a parallel beam, and

a prism possessing a first plane for receiving and transmitting the parallel beam and a second plane for fully reflecting so that the beam entering from the first plane may be emitted from the first plane, wherein the apex angle of the first plane and second plane is defined so that the sum of the incidence angle ($\theta 1$)to the normal of the first plane and the exit angle ($\theta 2$) to the normal of the first plane of the beam fully reflected from the second plane emitted from the first plane, ($\theta 1+\theta 2$), is about 90 degrees.

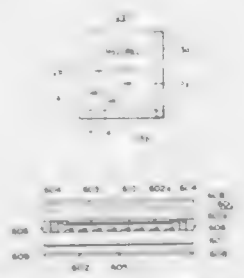
DISPLAY AND PICK-UP DEVICE FOR STEREOSCOPIC PICTURE DISPLAY

Antonius G. H. Verhulst, Eindhoven, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.

Filed Feb. 21, 1989, Ser. No. 313,666
Claims priority, application Netherlands, Mar. 10, 1988, 8800595
Int. Cl.[5] G02F 1/13; H04N 13/00
U.S. Cl. 350—334 15 Claims

1. A stereoscopic system, comprising:

imagining means for forming first and second optical images of a scene and for combining said images in superposed relation, said first image being characterized by a first optical polariation and said second image being characterized by a second optical polarization, different from said first optical polarization; and



first display means, in optical communication with said imaging means, for formig a first pattern of optical picture elements corresponding to said first image and a second pattern of optical picture elements corresponding to said second image, the optical picture elements of said first and second patterns being characterized by the same optical polarization.

5,007,716

LIQUID CRYSTAL DEVICE

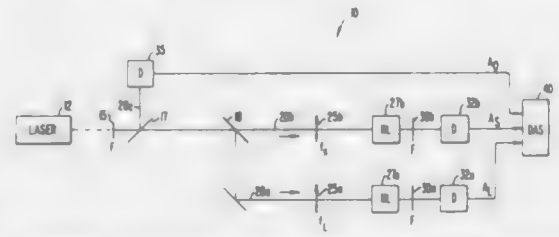
Yukio Hanyu, and Toshiharu Uchimi, both of Atsugi, Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Filed Jan. 11, 1989, Ser. No. 295,509
Claims priority, application Japan, Jan. 11, 1988, 63-004312
Int. Cl.[5] G02F 1/133
U.S. Cl. 350—336 14 Claims

1. A liquid crystal device, comprising:

(a) a first substrate having a plurality of first elongated electrodes formed thereon, each first elongated electrode defining two longitudinal edges and having a first linear projection associated therewith along one of said longitudinal edges, said first substrate being provided with a uniaxial orientation axis in the direction from said first linear projection toward the other of said two longitudinal edges of said first elongated electrode associated therewith,

(b) a second substrate having a plurality of second elongated electrodes disposed thereon opposite to and intersecting with said first elongated electrodes, said second substrate being provided with a uniaxial orientation axis in the same direction as the uniaxial orientation axis provided to said first substrate, and,



(c) a chiral smectic liquid crystal disposed between said first and second substrates in a thickness small enough to suppress the formation of a helical structure inherent to said chiral smectic liquid crystal in its bulk state, said chiral smectic liquid crystal having an inclination of forming or actually forming a pair of a hairpin defect and a lightning defect, said hairpin defect being formed after said lightning defect in the direction of the uniaxial orientation axes.

REAL TIME ANALYZER FOR PULSED LASER SYSTEMS

Antonello Cutolo, Via Albino 30, 80127 Napoli; Salvatore Solimeno, Mostra d'Oltremare, 80125 Napoli, both of Italy, and John M. J. Madey, 2120 Amherst St., Palo Alto, Calif. 94306

Filed May 11, 1988, Ser. No. 192,577
Int. Cl.[5] G02F 1/01; G01J 1/42, 1/40; H01J 40/14
U.S. Cl. 350—353 38 Claims

1. A method for measuring a beam parameter of a laser beam characterized by at least one laser pulse comprising the steps of:

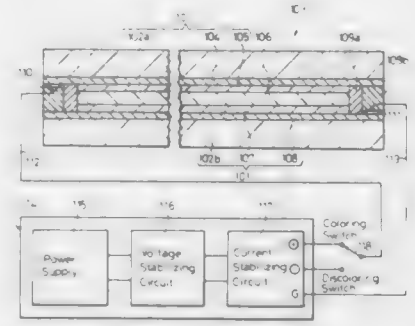
directing first, second, and third portions of the laser beam along separate first, second, and third beam paths;

focusing the first and second beam portions, each to a different degree;

passing the first and second beam portions through respective non-linear elements to generate radiation at a harmonic of the fundamental frequency in each of the first and second non-linear elements;

generating respective first and second signals representative of the energy of the harmonic radiation generated in the first and second non-linear elements;

generating a third signal representative of the total energy of the third beam portion; and



combining the first, second, and third signals to provide at least one value representative of a beam parameter.

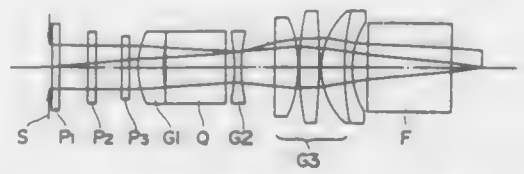
ELECTROCHROMIC ELEMENTS AND METHODS OF MANUFACTURING AND DRIVING THE SAME

Jun Minoura; Shigeyuki Takahahi; Hisaki Kato; Toshiyasu Ito; Takaaki Mori; Mamoru Kato; Junichi Shimada, all of Nishikasugai, and Katsuaki Okabayashi, Aichi, all of Japan, assignors to Kabushiki Kaisha Toyota Chuo Kenkyusho, Aichi and Toyoda Gosei Co., Ltd., Nishikasugai, Japan

Filed Apr. 1, 1988, Ser. No. 176,708
Claims priority, application Japan, Apr. 2, 1987, 62-82075; Apr. 28, 1987, 62-105419; Apr. 28, 1987, 62-105420; Aug. 13, 1987, 62-202246
Int. Cl.[5] G02F 1/01; G09G 3/34
U.S. Cl. 350—357 11 Claims

1. An electrochromic element comprising:

a pair of electrochromic bases, each comprising a substrate, an electrode layer disposed on said substrate, and a color-forming layer dispersed on said electrode layer, said electrochromic bases being superposed such that their respective color-forming layers face each other,



an ultraviolet-setting solid electrolyte disposed between said color-forming layers of said electrochromic bases, said solid electrolyte being a mixture including an ultraviolet-setting polymeric compound, an organic solvent and an ion conducting salt.

5,007,719

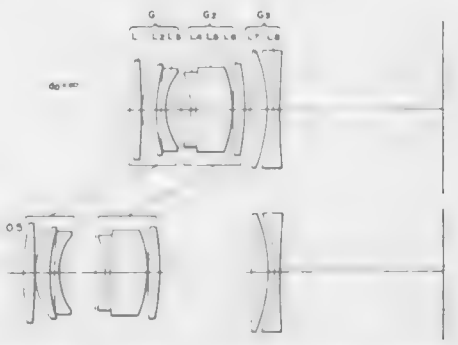
VARIFOCAL IMAGING OPTICAL SYSTEM HAVING MOIRE ELIMINATING FUNCTION

Akira Hasegawa, Tokyo, Japan, assignor to Olympus Optical Co., Ltd., Tokyo, Japan

Filed Apr. 30, 1990, Ser. No. 516,207
Claims priority, application Japan, Apr. 29, 1989, 1-109894
Int. Cl.[5] G02B 15/14
U.S. Cl. 350—425 21 Claims

1. An imaging optical system comprising an imaging lens system for forming an image of an object on a given image plane, the imaging lens system comprising a varifocal lens portion for allowing the imaging lens system as a whole to have different magnifications without changing the positional relationship between the object and the image plane, and a front lens portion arranged on the object side of the varifocal lens portion, the imaging lens system satisfying the following condition:

$$|\phi_{3T}| - |\phi_{3W}| \cong 0.8|(Z-1)SA31|$$



where Z is the ratio of the maximum value to the minimum value of the magnification of the imaging lens system; SA31 is the third-order coefficient of spherical aberration of the front lens portion; $|\phi_{3T}|$ is the sum of the third-order coefficients of spherical aberration of the respective lens surfaces of the imaging lens system in the state of the maximum magnification; and $|\phi_{3W}|$ is the sum of the third-order coefficients of spherical aberration of the respective lens surfaces of the imaging lens system in the state of the minimum magnification.

5,007,720

LENS SYSTEM ENABLING CLOSE DISTANCE PHOTOGRAPHING

Yoshinari Hamanishi, Wako, Japan, assignor to Nikon Corporation, Tokyo, Japan

Filed Apr. 23, 1990, Ser. No. 513,068
Claims priority, application Japan, Apr. 26, 1989, 1-106901
Int. Cl.[5] G02B 9/64, 15/22
U.S. Cl. 350—463 8 Claims

1. A lens system enabling close distance photography which comprises a 1st lens group having positive refractive power, a 2nd lens group having positive refractive power and a 3rd lens group having negative refractive power, arranged in this order from the object side, wherein the 3rd lens group comprises a positive lens and a negative lens fixed relative to the image plane and the 1st lens group and the 2nd lens group are so constructed that, in focussing from infinite distance to the closest distance, they move toward the object and away from the 3rd lens group while expanding the space between them, and wherein, when the synthetic focal distance of the entire optical system at infinite distance focussing is f, the focal distance of the 1st lens group is f_1, the focal distance of the 2nd lens group is f_2, the focal distance of the 3rd lens group is f_3, the synthetic focal distance of the 1st lens group and the 2nd lens group is f_{12} and the shape factor of the positive lens in the 3rd lens group is q, the following conditions are satisfied:

wherein the shape factor g is so defined that,

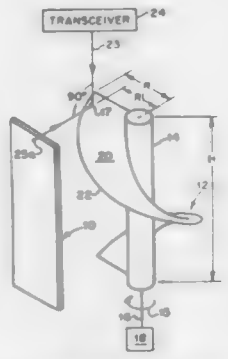
$$q = (rb + ra)/(rb - ra)$$

where ra stands for the radius of curvature of the object side surface of the lens and rb stands for the radius of curvature of the image side surface of the lens.

5,007,721

MECHANICALLY ROTATED DOPPLER FREQUENCY SHIFTER

John B. Morris, Billerica; Uve H. W. Lammers, Chelmsford, and Richard A. Marr, Billerica, all of Mass., assignors to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.



Filed May 25, 1990, Ser. No. 529,032
Int. Cl.[5] G02B 5/10, 7/18, 27/00; H01Q 15/16
U.S. Cl. 350—486 12 Claims

1. A Doppler frequency shifter for a transmitted high frequency narrow beam, the combination comprising:

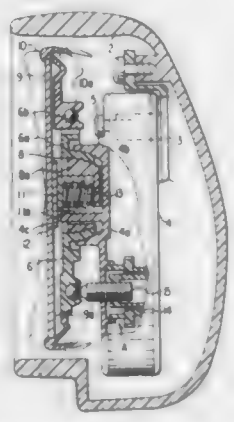
a transmitter for radiating said narrow beam, and a receiver for receiving Doppler shifted reflections of said beam;

a cylinder mounted for rotation on its axis, said axis being parallel to said beam;

a first reflector comprising a helix having a smooth reflecting surface for reflecting said beam, said helix being mounted on said cylinder and said transmitted beam impinging thereon at a radial distance Ri from said axis, the surface of said reflector being defined by an infinite number of lines drawn from every point on the outer edge of said helix to the cylinder, the extension of such lines being

perpendicular to and passing through the outer edge of said helix and the axis of said cylinder;

means for rotating said reflector on said axis, whereby said beam impinges on said surface along different heights of said helix and the length of travel of said. beam to said helix varies as said helix is rotated; and



a second reflector for intercepting reflected beam from said first reflector, and for reflecting said intercepted beam toward said receiver.

5,007,722

MIRROR APPARATUS WITH VIBRATOR FOR REMOVING WATER DROPS

Keiji Mori, Kariya, and Hidekazu Kogita, Toyota, both of Japan, assignors to Aiskin Seiki Kabushiki Kaisha, Kariya, Japan

Filed May 1, 1989, Ser. No. 345,302
Claims priority, application Japan, Apr. 30, 1988, 63-058903[U]
Int. Cl.[5] G02B *5/08*; B60R *1/06*
U.S. Cl. 350—382 5 Claims

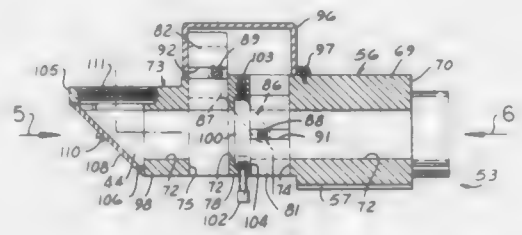
1. A mirror apparatus comprising:

a body;

a mirror member having at opposite sides thereof a reflecting surface and a backside and positioned within the body;

a vibrating member comprising means for generating vibrations and secured to the backside of the mirror member; and

a compressed spring comprising pressing means for continually pressing on the vibrating member in a direction towards the backside of the mirror member,



whereby vibrations from the vibrating members are effectively transmitted to the mirror member.

5,007,723

DOCUMENTATION ILLUMINATION MODULE FOR A MICROSCOPE SYSTEM

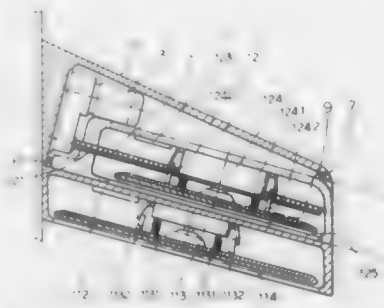
Larry K. Kleinberg, Toluca Lake, Calif., assignor to Storz Instrument Company, St. Louis, Mo.

Division of Ser. No. 50,948, May 15, 1987, Pat. No. 4,856,873.
This application Feb. 21, 1989, Ser. No. 312,904
Int. Cl.[5] G02B *21/06, 21/36*
U.S. Cl. 350—508 28 Claims

1. An illumination module for a microscope system providing illumination from a light source to a field of view and to documentation equipment such as a camera for recording an image from the field of view by operation of said module, said module comprising:

means for transmitting light from the light source to the field of view to produce a reflected image;

said means receiving the reflected image and transmitting the reflected image without a beam splitter to the documentation equipment; and



said means including prism means to transmit the light to the field of view and the reflected image to the documentation equipment.

5,007,724

AUXILIARY MIRROR ANGLE CHANGING DEVICE FOR A MAIN AND AUXILIARY REARVIEW MIRROR

Mei-Wen H. Hou, No. 200, Fu-Chiang Road, Sec. 2, Yung Kang Shiang, Tainan Hsien, Taiwan

Filed May 30, 1990, Ser. No. 530,322
Int. Cl.[5] G02B *7/18*
U.S. Cl. 350—604 1 Claim

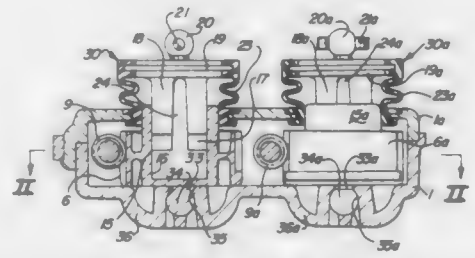
1. An auxiliary mirror angle changing device for a main and auxiliary rearview mirror comprising;

a main mirror frame;

an auxiliary mirror frame normally being moved in the interior of the main mirror frame and possible to be moved sidewise out of the main mirror frame by a motor connected with a reduction gear set to rotate a worm inserting and engaging in a threaded hole in the rear end wall of the auxiliary mirror frame, said motor being started by a switch and stopped by one of two micro switches fixed respectively at the front end and the rear end of the main mirror frame, said micro switch being actuated by touching of one of two touch blocks provided on and under the rear end wall of the auxiliary mirror frame, said auxiliary mirror frame possible to be inclined in its angle by a device comprising;

a digital motor mounted in said auxiliary mirror frame;

a control electric circuit having its output connected with the digital motor for rotating the digital motor clockwise or counterclockwise and connected with the micro switches which can start said control electric circuit when it is touched by one of the touch block; and



a base connected with the shaft of the digital motor enveloping said motor in its interior and being inclined backward or forward by clockwise or counterclockwise rotation of the digital motor to press a plurality of springs fixed on the back of the auxiliary mirror to incline said mirror to a certain angle wanted by pushing up or down a control switch.

5,007,725

MECHANISM WITH TORQUE-LIMITING DEVICE FOR CONTROLLING A REARVIEW MIRROR

Stéphane Manzoni, Saint-Claude, France, assignor to Societe Manzoni Bouchot, France

Continuation of Ser. No. 881,938, Jul. 3, 1986, abandoned, which is a continuation of Ser. No. 491,633, May 5, 1983, Pat. No. 4,598,605. This application Oct. 27, 1987, Ser. No. 115,655
Claims priority, application France, May 13, 1982, 82 08347
The portion of the term of this patent subsequent to Jul. 8, 2003, has been disclaimed.
Int. Cl.[5] B60R *1/02*
U.S. Cl. 350—633 5 Claims

1. A torque-limiting mechanism for operating a rearview mirror of a vehicle, said torque-limiting mechanism comprising:

a casing having a cavity therein;

a cover member mounted to said casing, said cover member having at least one opening therein;

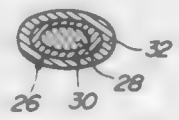
a support member attached to said mirror, said support member further being spaced a predetermined distance from said cover member of said casing;

rotation to translation means mounted in said cavity of said casing, said rotation to translation means comprising:

a pinion gear member located in said cavity, said pinion gear member having a bore with a threaded portion therein and a spherical member mounted thereto;

a selectively translatable control member having a central axis, said selectively translatable control member being translatable along said central axis and having an external threaded diameter portion mounted to said threaded portion of said bore of said pinion gear member said selectively translatable control member further having an end portion and an opposite end portion, said end portion being pivotally attached to said support member along said central axis to permit said mirror to pivot with respect to said selectively translatable control member about a pivot axis which extends perpendicularly through said central axis, the translation of said selectively translatable control member along said central axis causing a change in the operating position of said mirror about said pivot axis thereby pivoting said mirror with respect to said selectively translatable control member about said pivot axis, said selectively translatable control member being operatively connected to said pinion gear member, whereby rotation of said pinion gear member causes the translation of said selectively translatable control member along said central axis, the center of said spherical member of said pinion gear member lying along said central axis;

motor means mounted in said casing said motor means comprising screw means tangentially engaging said pinion gear member and adapted to impart rotational movement to said pinion gear member; and



a spherical bearing attached to said casing engaging said spherical member of said pinion gear member, whereby said pinion gear member is able to pivot within said spherical bearing as a result of non-axial loads which will be imparted to said selectively translatable control member when said selectively translatable control member is translated to cause a change in the operating position of said mirror.

COATED EYEGLASSES FRAME MEMBER

Akio Suzuki, Gunma; Hirofumi Kishita, Annaka; Shigehisa Sonegawa, Annaka; Masaaki Matumura, Annaka, and Takeshi Hoashimoto, Annaka, all of Japan, assignors to Shin-Etsu Chemical Co., Ltd., Tokyo, Japan

Filed Nov. 7, 1989, Ser. No. 432,491
Claims priority, application Japan, Nov. 8, 1988, 63-281671
Int. Cl.[5] G02C *5/02, 5/12, 5/14*
U.S. Cl. 351—41 6 Claims

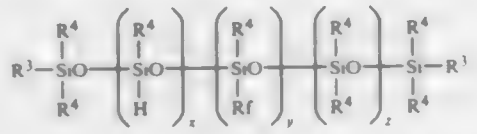
1. A frame member for eyeglasses having a surface coated with a cured fluorine-containing silicone, wherein the cured fluorine-containing silicone is a cured product of an addition reaction between an alkenyl group-containing organopolysiloxane and an organohydrogenpolysiloxane, wherein said alkenyl group-containing organopolysiloxane has the general formula (1):

wherein R^1 is an alkenyl group having 2 to 6 carbon atoms, R^2 is an alkyl group having 1 to 8 carbon atoms or a phenyl group, Rf is a fluorinated substituent selected from the group consisting of

$$F(CFCF_2O)_nCFCF_2OCH_2CH_2CH_2-,$$
$$\quad\;\; CF_3 \qquad CF_3$$

$$F(CFCF_2O)_nCFCH_2OCH_2CH_2CH_2-,$$
$$\quad\;\; CF_3 \qquad CF_3$$

$$C_mF_{2m+1}CH_2CH_2OCH_2CH_2CH_2-,$$



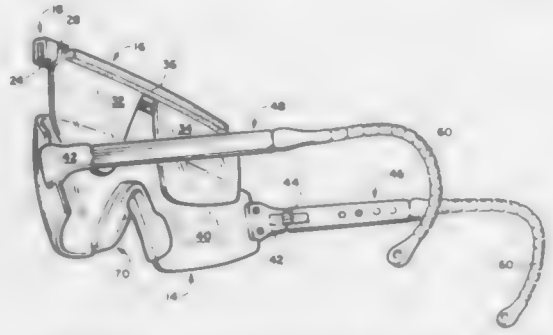
$$C_mF_{2m+1}CH_2OCH_2CH_2CH_2-,$$

$$C_mF_{2m+1}CH_2CH_2-, \text{ and } C_mF_{2m+1}CH_2CH_2CH_2-$$

wherein n is an integer of 1 to 5 and m is an integer of 3 to 10,

and letters a, x, y, and z are integers within the ranges: $1 \leqq a \leqq 3$, $0 \leqq x$, $1 \leqq y$, and $0 \leqq z$, and said organohydrogenpolysiloxane has the general formula (2):

(2)



wherein R^3 is selected from the group consisting of hydrogen, an alkyl group having 1 to 8 carbon atoms and a phenyl group, R^4 is an alkyl group having 1 to 8 carbon atoms or a phenyl group, Rf is a fluorinated substituent as defined above, and letters x, y, and z are integers within the ranges $0 \leqq x$, $1 \leqq y$, and $0 \leqq z$.

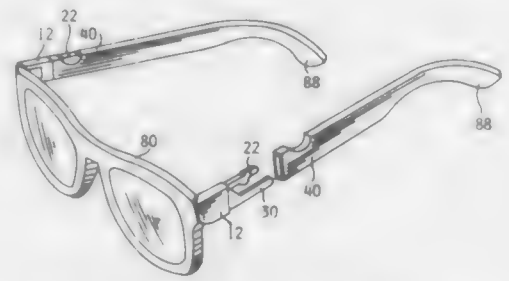
COMBINATION PRESCRIPTION LENS AND SUNGLASSES ASSEMBLY

Alan Kahaney, 2212 Place Monaco, Del Mar, Calif. 92014, and Robert Sved, 39557 Via Temprano, Murietta, Calif. 92362

Filed Feb. 26, 1990, Ser. No. 484,884
Int. Cl.[5] G02C *9/00*
U.S. Cl. 351—47 **5 Claims**



1. A combination prescription lens and sunglasses assembly comprising:
- a pair of sunglasses having a one-piece lens having a longitudinally extending top edge;
- a left eye prescription lens having a top edge, an inside edge, a front surface and a rear surface;
- a right eye prescription lens having a top edge, an inside edge, a front surface, and a rear surface;
- an elongated support member having a predetermined length, said support member having a top wall, a front wall, a rear wall and a bottom wall, said elongated support member having an arcuate longitudinal curvature when viewed in top plan view;
- means for fixedly securing the top edges of said respective left and right prescription lenses to the rear wall of said elongated support member to form a prescription lens assembly; and
- mounting means for detachably securing said elongated support bar on the top edge of the one piece lens of said pair of sunglasses so that said prescription lenses are positioned rearwardly of the one-piece lens of said sunglasses, said mounting means is a longitudinally extending groove in the bottom wall of said elongated support member.

5,007,728

DETACHABLE TWO-PIECE TEMPLE

Robert M. Magorien, 4324 Leatherwood Ct., Camarillo, Calif. 93010

Filed Dec. 26, 1989, Ser. No. 457,147
Int. Cl.[5] G02C *5/20*
U.S. Cl. 351—118 **1 Claim**

1. A detachable two-piece temple comprising:

A front piece having a front surface and a back surface, said front piece further comprising:
- (1) means to swivelly attach the front surface of said front piece to the back of an eyeglass frame.
- (2) a resilient locking rod that includes a lock notch and that integrally extends from the back surface of said front piece.
- (3) a guide rod spaced from said locking rod and that integrally extends from the back of said front piece.
- (4) a plurality of first snap lock fasteners located on the outer surface of said front piece.

B. a back piece having a front section and a back section
- (1) said front section having a forward facing cavity that further comprises:
  - (a) a locking rod cavity sized to accept and retain said resilient locking rod,
  - (b) a guide rod cavity sized to accept and retain said guide rod,
  - (c) a locking-rod release opening having a lock notch catch sized to catch and hold said lock notch when said locking rod is inserted into said locking rod cavity such that when so held, said front and back pieces are held together, where said locking-rod release opening also functions and is sized to allow said lock notch to be depressed and allow said back piece to be pulled away from said front piece.
- (2) said back section consisting of a temple ear-piece extension that fits over the ear of the eyeglass user,
- (3) a plurality of first snap lock fasteners located on the outer surface of said back piece, and

C. a combination top and side safety shield, with the top and side sections of said shield having an opening in alignment with said locking rod release opening, and with the side section of said shield having a corresponding plurality of second snap lock fasteners that when pressed into said first snap lock fasteners on said front and back pieces said combination top and side safety shield is corrected aligned and held in place, wherein said combination shield is made oversize to allow the specific eyeglass user to cut and shape said shield to conform to the contour of the individual's face.

WIDE ANGLE OPHTHALMIC LENS

Phillip J. Erickson; Janet L. Crossman, both of Bellevue; Gregory L. Heacock, Seattle, all of Wash., and Martin A. Mainster, Overland Park, Kans., assignors to Ocular Instruments, Inc., Bellevue, Wash.

Filed Oct. 27, 1989, Ser. No. 427,882
Int. Cl.[5] A61B *3/00;* **G02C** *7/04*
U.S. Cl. 351—219 **6 Claims**

1. An ophthalmic lens for observing the fundus including the peripheral retinal regions of the eye and for delivering laser energy thereto comprising:

a contact lens having a posterior surface and an anterior surface, said posterior surface having a radius of curvature (R_{2C}) compatible with the anterior surface of a cornea, the

anterior surface of the contact lens having a predetermined radius of curvature R_{1C},

an entry lens positioned anterior to the contact lens, the entry lens being aspheric, the surfaces of the entry lens being defined by the formula:

$$Z = \frac{CK^2}{1 + \sqrt{1 - C^2EK^2}},$$

wherein

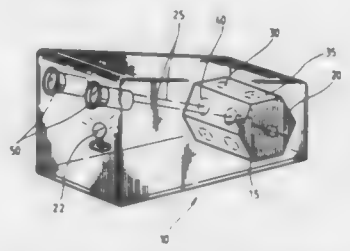
$C=(1/R)$,

$E=b+1$, and

$K^2=x^2+y^2$,

wherein for the anterior surface of the lens, R ranges from 14 mm to 50 mm and b ranges from -54 to -4, and wherein for the posterior surface of said lens, R ranges from 10 mm to 25 mm and b ranges from -0.6 to -2, said entry lens having a thickness ranging from 8.5 mm to 16.5 mm, and

a center lens positioned between the contact lens and the entry lens, the optical axes of the contact lens, the center lens, and the aspheric lens being substantially coincident, the center lens having a posterior surface having a radius of curvature R_{2CL}, the anterior surface of the entry lens having a radius of curvature R_{1CL}, the center lens element receiving light rays emerging from the eye and the contact lens and refracting the light rays toward the optical axis of the ophthalmic lens, the entry lens collecting the light rays emerging from the center lens and producing an aerial image anterior to and in close proximity to the entry lens, the contact lens and the center lens element being positioned relative to each other and to the entry lens and having their radii of curvature chosen such that light rays originating in the peripheral retinal region of the eye are positioned within the aerial image produced by the entry lens,



wherein the indices of refraction of said contact lens can range from 1.44 to 1.97, R_{1C} can range from 10.49 mm to 11.95 mm and the thickness of the contact lens (T_C) can range from 0.41 mm to 7.03 mm, and wherein the indices of refraction for the center lens can range from 1.60 to 1.97, R_{2CL} can range from 60.37 mm to 97.61 mm, R_{1CL} can range from 18.48 mm to 29.88 mm and the thickness of the center lens (T_{CL}) can range from 4.29 mm to 5.29 mm.

5,007,730

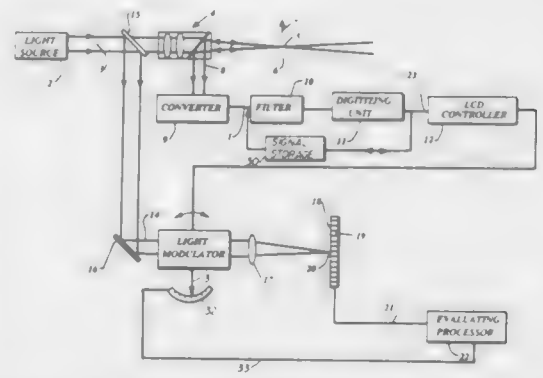
METHOD AND APPARATUS FOR MEASURING VISION BLOCKAGE RESULTING FROM GLARE

John A. McAllister, 7810 Overbrook, Houston, Tex. 77063, Tim C. Taylor, 4140 Southwest Freeway, No. 208, Houston, Tex. 77027

Continuation of Ser. No. 835,796, Mar. 3, 1986, abandoned. This application Jun. 16, 1988, Ser. No. 220,892
Int. Cl.[5] A61B *3/02, 3/10*
U.S. Cl. 351—243 **2 Claims**

1. Apparatus for measuring glare-induced vision blockage in a subject, said apparatus comprising:
- a hollow polygonal cylinder mounted for rotation about a longitudinal axis;
- each face of said cylinder comprising a plate;
- each said plate having a light-passing window formed therein;
- a viewer arranged to permit said subject to perceive at least one said plate;
- a light source interior to said cylinder;
- a pattern of alternating light and dark segments arranged about each said window;

said patterns being of varying actual sizes; and



an arm adapted to selectively rotate said cylinder.

5,007,731

DOPPLER FLUID FLOW VELOCITY MEASURING APPARATUS AND METHOD UTILIZING IMAGING OF SCATTERED LIGHT

Karl-Aloys Bütefisch, Bovenden, Fed. Rep. of Germany, assignor to Deutsche Forschungsanstalt fur Luft-und Ramfahrt, Bonn, Fed. Rep. of Germany

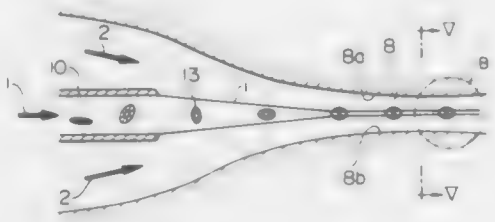
Filed May 3, 1989, Ser. No. 347,181
Claims priority, application Fed. Rep. of Germany, May 6, 1988, 3815474
Int. Cl.[4] G01P *3/36*
U.S. Cl. 356—28.5 **11 Claims**

11. A method of measuring fluid flow velocity in a wind tunnel or the like, with said method comprising the steps of:

illuminating the fluid with a coherent light beam to produce Doppler-shifter scattered light;

registering the Doppler-shifted scattered light and converting the registered light into electric signals;

displaying the electric signals as an image;



illuminating the displayed image with a coherent light beam to produce the Fourier transformation of the image;
focusing the Fourier transformation in a Fourier plane to generate a Fourier-transformed image; and
evaluating the Fourier transformed image to determine the fluid flow.

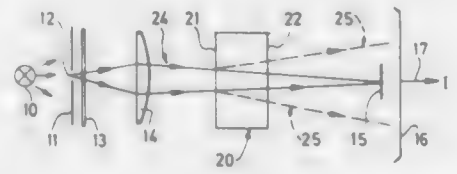
5,007,732

FLOW-CELL DEVICE

Hiroshi Ohki, Tsuchiura; Hideaki Kamohara, and Ryo Miyake, both of Ibaraki, all of Japan, assignors to Hitachi, Ltd., Japan

Filed Apr. 18, 1988, Ser. No. 182,430
Claims priority, application Japan, Apr. 20, 1987, 62-97130
Int. Cl.[5] G01N *21/00, 21/85*
U.S. Cl. 356—73 **9 Claims**

1. A sheath flow type flow-cell device for a flow-cytometer comprising:
a first inlet for sheath fluid,
a flow passage communicating with said first inlet and contracted toward downstream, said flow passage having a substantially rectangular cross section,
a straight capillary flow passage connected to said flow passage downstream thereof, said capillary flow passage having a substantially rectangular cross section,
a second inlet for sample fluid,
a nozzle communicating with said second inlet and opened within said flow passage in the same direction as the flow direction of said straight capillary flow passage,
a discharge port provided at a terminal end of said straight capillary flow passage, and
flow regulating means for regulating the flow of said sheath fluid in said straight capillary flow passage to be a laminar flow having a gradient of flow velocity, wherein said straight capillary flow passage has opposing first and second side walls connected by top and bottom walls and wherein said flow regulating means comprises said second said wall having a rougher surface than a surface of said first said wall.



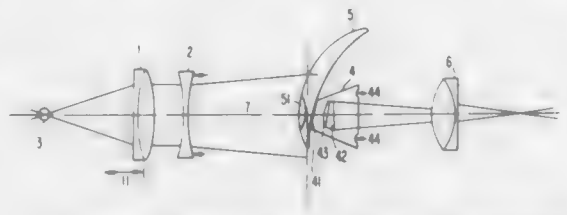
5,007,733

PROCESS AND DEVICE FOR DETERMINING THE CLOUD POINT OF A DIESEL OIL

Dominque Laurent; Gerard Fortunato, both of Lyons; Bernard Damin, Oullins, and Marcel Napoleon, St Verges Mepieu Montalieu Vercieu, all of France, assignors to Elf France, Paris, France

Filed Jun. 7, 1985, Ser. No. 742,580
Claims priority, application France, Jun. 12, 1984, 84 9127
Int. Cl.[5] G01N *33/28*
U.S. Cl. 356—70 **4 Claims**

1. A device for determining a cloud point comprising:
a directed light course having an optical axis;
a diaphragm having a central hole aligned on the optical axis of the light source;
lens means to focus a light beam emitted by the light source and delimited by the diaphragm onto a light-trapping means centered on the optical axis and having a predetermined cross-section sufficiently large to capture the entire focussed light beam;
a light filter interposed between the diaphragm and the lens means;
a test cell to receive diesel oil therein and wherein the test cell is defined by a chamber delimited by two opposite, parallel, planar, transparent walls disposed perpendicular to the optical axis of the light source;
each of said walls comprising a planar window element of transparent material, the cell being provided with an inlet conduit and an outlet conduit for the diesel oil,
photo-electric light-detecting means disposed downstream from the light-trapping means, with reference to the direction of propagation of the light beam, and having a light receiving zone of a size substantially larger than the cross section of the light trapping means, said photo-electric



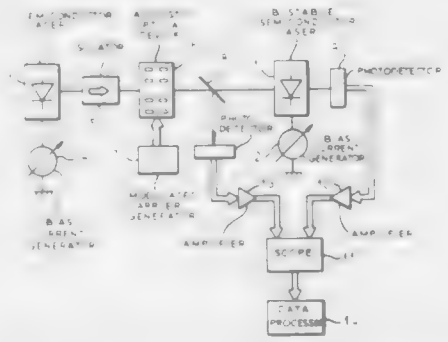
means being adapted to emit a signal when receiving scattered light which is not trapped by the light-trapping means; and
means for adjusting the temperature of the diesel oil in the cell comprised of thermo-electric sensors for measuring the temperature of the diesel oil and the temperature of the material delimiting the cell, and Peltier elements equipped with radiators adapted to receive a flow of heat-exchange fluid and
means of adjusting the temperature of the diesel oil in the cell, whereby the temperature of the diesel oil is adjusted at the instant when the photo-electric means receiving such scattered light represents the cloud point of the diesel oil in the cell.

5,007,734

APPARATUS FOR MEASURING THE REFRACTION CHARACTERISTICS OF OPHTHAMOLOGICAL LENSES

Karl-Heinz Wilms, Hans-Bierling-Str. 47, D-8089 Emmering, Fed. Rep. of Germany

PCT No. PCT/DE87/00385, § 371 Date Apr. 29, 1988, § 102(e) Date Apr. 29, 1988, PCT Pub. No. WO88/01735, PCT Pub. Date Mar. 10, 1988
PCT Filed Aug. 30, 1987, Ser. No. 192,517
Claims priority, application Fed. Rep. of Germany, Sep. 1, 1986, 3629676
Int. Cl.[5] G01M *11/02*
U.S. Cl. 356—124 **11 Claims**



1. An apparatus for measuring the refraction characteristics of ophthalmological lenses comprising a projection optic for projecting light of a light source via a field aperture and the ophthalmological lens arranged on a lens support means onto a light reception means, the refraction characteristics of the ophthalmological lens being determined from an image site in at least one direction, means for varying the vergency of the light beam on the object side of the ophthalmological lens between a position in which the refraction characteristics for the object distance are determined infinitely and at least one alterable position in which the refraction characteristics are determined for finite object distances, the lens support means being arranged stationary and enabling the ophthalmological lens to be definedly raised and positioned diagonally in the beam path, and compensation means for the diagonally arranged opthalmological lens for enabling adjustment to a specific dioptric measuring range being arranged for disposition in the beam path.

5,007,735

METHOD OF CHARACTERIZING BISTABLE SEMICONDUCTOR LASERS

Riccardo Calvani, Pino Torinese, and Renato Caponi, Turin, both of Italy, assignors to Cselt - Centro Studi e Laboratori Telecomunicazioni S.p.A., Turin, Italy

Filed Apr. 13, 1989, Ser. No. 337,383
Claims priority, application Italy, May 24, 1988, 67475 A/88
Int. Cl.[4] G01N *21/41;* **H01S** *3/30*
U.S. Cl. 356—128 **9 Claims**

1. A method of measuring characteristic parameters of a bistably operating semiconductor laser which comprises the steps of:
(a) biasing said bistably operating semiconductor laser with a current causing said bistably operating semiconductor laser to function as a laser amplifier;
(b) generating an optical pump signal by modulating a light beam emitted by a pumping semiconductor laser at a pumping wavelength exceeding an operating wavelength of said bistably operating semiconductor laser and energizing said bistably operating semiconductor laser with said pump signal to cause bistably operating semiconductor laser to operate in a bistable operating condition;
(c) measuring an output power (I2) of a light beam emitted by said bistably operating semiconductor laser and measuring an input power (I1) of pump signal energizing said bistably operating semiconductor laser;
(d) determining a hysteresis loop formed as a relationship of said output power (I2) to said input power (I1) having switching points (P1, P2) between two stable states of said bistably operating semiconductor laser;
(e) memorizing values of said input and output powers of each of said points; and
(f) computing from memorized values of said input and output powers of at least one of said points a value (n2) of a nonlinear coefficient of refractive index of material constituting said bistably operating semiconductor laser.

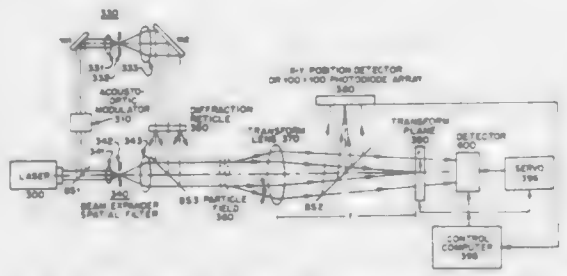
5,007,736

SYSTEM FOR TARGET DESIGNATION BY LASER

Jean-Pierre Daniel, and Jean-Pierre Fauchard, both of Paris, France, assignors to Thomson-CSF, Paris, France

Filed Feb. 14, 1979, Ser. No. 22,116
Claims priority, application France, Feb. 14, 1978, 78 04092
Int. Cl.[5] G01B *11/26;* **G01C** *1/00;* **F41G** *7/00;* **G01N** *1/20*
U.S. Cl. 356—152 **8 Claims**

1. An airborne target-designation system installed partly on an aircraft and partly on a pod carried by said aircraft, comprising:
target-predesignation means aboard the aircraft for generating a first set of off-aim signals representing angular deviations of a first line of sight from a first reference direction based upon the structure of the aircraft;
monitoring display means aboard the aircraft;
automatic acquisition equipment in the pod including a laser illuminator and a pick-up camera trained upon a common second line of sight, said camera feeding video signals to said display means for producing thereon an image of a target lying on said second line of sight, said equipment further including orientation means controlled by first servo circuitry and operatively linked with optical means in line with said camera and said illuminator for keeping said second line of sight trained upon the target in response to said first set of off-aim signals in a search mode and in response to said video signals in a tracking mode, said orientation means generating a second set of off-aim signals representing angular deviations of said second line of sight from a predetermined second reference direction based upon the structure of the pod;
selector means for establishing either one of said modes; and
alignment means for correlating said lines of sight with each other, said alignment means including pilot-operated means aboard the aircraft for generating corrective signals upon observation of an offset of the target image from a



reference point on said monitoring means, processing means switchable by said selector means to receive said first set of off-aim signals from said target-predesignation means and to translate same into error signals fed to said first servo circuitry in said search mode to slave said second line of sight to said first line of sight, said processing means being switchable by said selector means to receive said second set of off-aim signals from said orientation means and to translate same into instruction signals fed to second servo circuitry in said target-predesignation means in said tracking mode to slave said first line of sight to said second line of sight, and a connection extending from said pilot-operated means to said processing means for supplying said corrective signals thereto, said processing means vectorially combining the received set of off-aim signals with said corrective signals to produce said error signals in said search mode and said instruction signals in said tracking mode, said connection including a non-volatile memory for storing said corrective signals and switch means operable to disconnect said memory from said pilot-operated means upon mutual alignment of said lines of sight whereby the corrective signals thereafter supplied to said processing means have the value required to achieve said mutual alignment

5,007,737

PROGRAMMABLE DETECTOR CONFIGURATION FOR FRAUNHOFER DIFFRACTION PARTICLE SIZING INSTRUMENTS

Edwin D. Hirleman, Jr., Mesa, Ariz., assignor to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.

Filed Nov. 1, 1988, Ser. No. 266,952
Int. Cl.[5] G01N *15/02*
U.S. Cl. 356—336 8 Claims

1. A particle sizing system for determining particle size distributions in liquids and gases in a particle field using Fraunhofer diffraction patterns, said particle sizing system comprising:

a means for illuminating said particle field with a Fraunhofer diffraction pattern, said Fraunhofer diffraction pattern having a center axis;

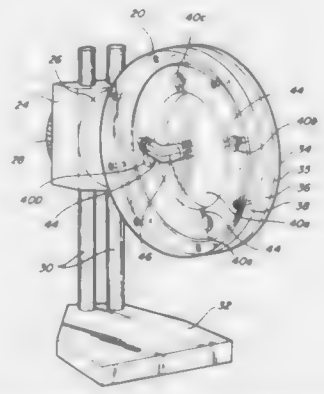
a transform lens which receives and focuses said Fraunhofer diffraction pattern from said particle field at its focal point to produce an output;

a transform plane which is fixed at the focal point of said transform lens, said transform plane comprising a spatial light modulator which physically separates different bands of light of said Fraunhofer diffraction pattern in order to produce an output by passing only light through concentric rings which are adjustable in radius and width about the diffraction pattern's center axis, said spatial light modulator thereby allowing adjustable detection of selective particle size distributions since light scattered by very large is concentrated about comparatively small angles from said center axis, while light scattered by comparatively small particles in the particle field goes into comparatively large angles about said center axis of said diffraction pattern from said transform lens;

a detector which receives and measures said Fraunhofer diffraction pattern from said transform plane at increments that are adjusted by said spatial light modulator to indicate thereby said particle size distribution by detecting magnitudes of discrete angular distributions of scattered light in said Fraunhofer diffraction pattern from said transform plane;

an on-line test means which tests said particle sizing system using a particle field sample with a known particle size distribution which is compared to detected particle size distributions measured by said detector, said particle field sample comprising a diffraction reticle which includes a transparent sheet with a particle array of circular apertures with said known particle size distribution;

a means for detecting the center axis of said Fraunhofer diffraction pattern from said transform plane, said detecting means outputting a detection signal; and



a means for controlling said spatial light modulator and said detector, said controlling means receiving said detection signal from said detecting means, and physically moving said detector so that it is aligned with the center axis of said Fraunhofer diffraction pattern from said transform lens, said controlling means also adjusting said spatial light modulator to pass only light through concentric rings which are incrementally adjusted in radius and width about said center axis of said Fraunhofer diffraction pattern, said controlling means also receiving and displaying measurements made by said detector to indicate thereby said particle size distribution in said particle field.

INTERFEROMETRIC TEST STANDARD

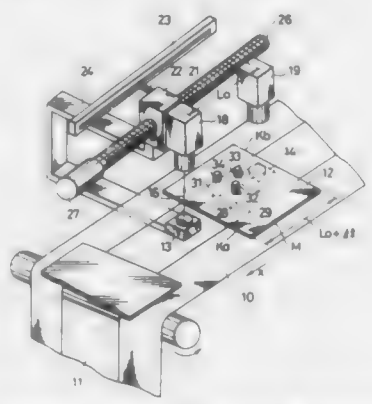
Ralph M. Grant, 4480 Sheldon Rd., Rochester, Mich. 48308-1006

Filed Mar. 14, 1990, Ser. No. 493,218
Int. Cl.[5] G01B *9/02*
U.S. Cl. 356—347 28 Claims

1. An interferometric test block, for calibrating interferometric analysis apparatus comprising:

a body of relatively rigid material having a first substantially planar face;

a sheet of relatively flexible material supported by said body and bonded to said face; and



means defining a cavity in said body, said cavity operable to weaken the support provided for the sheet by the body at that portion of said sheet overlying said cavity, so that when a predetermined deforming force is imposed on said test block, said overlying portion of sheet will deform, whereby interferometric measurements of said sheet before and after the imposition of said deforming force may be compared with a predetermined standard to calibrate said interferometric analysis apparatus.

LENGTH MEASURING APPARATUS

Masami Shimano, and Atuhiro Sano, both of Shizuoka, Japan, assignors to Fuji Photo Film Co., Ltd., Kanagawa, Japan

Filed Oct. 24, 1989, Ser. No. 432,918
Claims priority, application Japan, Oct. 24, 1988, 63-267675
Int. Cl.[5] G01B *11/04*
U.S. Cl. 356—383 6 Claims

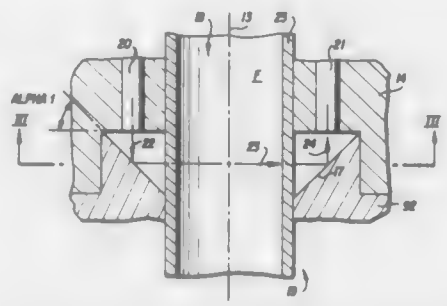
1. A measuring apparatus for measuring the actual length of a sheet moving at a constant speed in one direction, said apparatus comprising:

front edge detecting means for detecting the front edge of said sheet and for outputting a front edge signal;

rear edge detecting means disposed at a distance substantially equal to a desired sheet length from said front edge detecting means in said one direction for detecting the rear edge of said sheet and for outputting a rear edge signal;

inclination detecting means for detecting the angle of inclination of said sheet with respect to said one direction and for outputting an angle signal representative of said inclination angle;

said inclination detecting means comprising three sets of photosensors arranged at the apices of an isosceles triangle of which a perpendicular bisector of the base is parallel to said one direction and passes through the apex remote from the base; and



arithmetic means for determining an apparent length of said sheet in said one direction based on said front and rear edge signals output from said front edge and rear edge detecting means and for correcting said apparent length to said actual length based on said angle signal from said inclination detecting means.

5,007,740

OPTICAL PROBE FOR FLUID LIGHT TRANSMISSION PROPERTIES

Anthony C. Jeannotte, and Anthony C. Gilby, both of Foxboro, Mass., assignors to The Foxboro Company, Foxboro, Mass.

Filed Mar. 30, 1989, Ser. No. 330,533
Int. Cl.[5] G01N *21/00, 1/10*
U.S. Cl. 356—436 45 Claims

1. In an optical sensing system including a source of radiant energy and an optical detector, a probe for optical sampling comprising:

(a) a chamber having an optical entry and an optical exit and a fluid port,

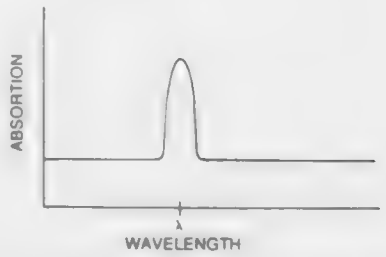
(b) means for directing radiant energy from said source into and through said chamber to an exit;

(c) means for collecting said radiant energy exiting from said chamber;

(d) first pathway means for conveying radiant energy to said means for directing radiant energy through said chamber; and

(e) second pathway means for conveying radiant energy away from said chamber exit to said detector,

(f) means for sealing said fluid port and providing thereby a stilling well;



wherein said means for directing radiant energy into and through said chamber to said exit and said means for collecting radiant energy comprise surface portions of an interior conical reflecting surface.

5,007,741

METHODS AND APPARATUS FOR DETECTING IMPURITIES IN SEMICONDUCTORS

Gary E. Carver, Flemington, N.J.; Gregory L. Koos, Yardley, and John D. Michalski, Furlong, both of Pa., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed Sep. 25, 1989, Ser. No. 412,043
Int. Cl.[5] G01N *21/55*
U.S. Cl. 356—448 8 Claims

1. A method for detecting and measuring a specific impurity which is not a conductivity-determining impurity in a crystalline semiconductor wafer comprising the steps of:

forming a light beam containing an optical frequency capable of being absorbed by the specific impurity.

polarizing the beam such that it contains light predominantly of a p-type polarization;

splitting the beam into first and second light components;

directing the first light component at a first semiconductor wafer containing an unknown density of the specific impurity;

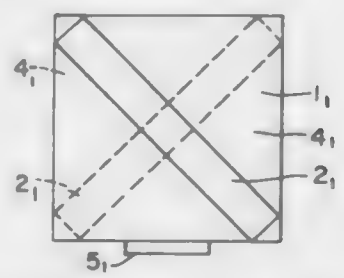
directing the second light component at a second semiconductor wafer containing a known density of the specific impurity;

the first and second light components being respectively directed at the first and second wafers at an angle of incidence substantially equal to the principal angle of incidence;

detecting p-type polarized light of the first light component reflected from the first water;

detecting p-type polarized light of the second light component reflected from the second wafer;

measuring the difference of intensity of the detected first and second p-type polarized light components;



and using the measured intensity difference to determine the density of the specific impurity contained in the first wafer.

5,007,742

TEMPERATURE-SENSING MEMBER

Masayoshi Usui, Numazu, and Hiroshi Kanesaka, Kawasaki, both of Japan, assignors to Usui Kokusai Sangyo Kaisha Limited, Japan

Filed Dec. 19, 1989, Ser. No. 452,820
Claims priority, application Japan, Dec. 27, 1988, 63-330620
Int. Cl.[5] G01K *5/62, 13/00*
U.S. Cl. 374—136 13 Claims

1. A temperature-sensing member for directly indicating magnitudes of temperature changes of a fluid, comprising:

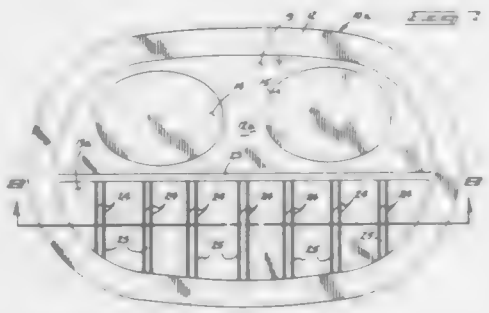
a columnar base having a longitudinal axis, opposed ends and an outer surface extending between the opposed ends, the outer surface defining at least first and second opposed surface areas extending longitudinally between the opposed ends, said base being formed from a first material having a coefficient of thermal expansion; and

at least one strip member of a second material having a coefficient of thermal expansion different from that of said base,

said strip member being secured directly on at least the first and second opposed surface areas of the outer surface of said base at acute angles with respect to the longitudinal axis of said base, portions of the strip member on the first surface area being angularly offset in a first direction relative to the longitudinal axis, and portions of the strip member on the second surface area being angularly offset in an opposed direction relative to the axis, such that the opposed ends of the base twist relative to one another in response to changes of temperature;

temperature indicating means mounted in proximity to one said end of the base for providing a direct indication of the magnitude of the temperature change.

5,007,743



FOOD METERING DISH

Leanne M. Brennan, R.D. #2, Box 475, Drums, Pa. 18222

Filed Nov. 20, 1989, Ser. No. 439,164

Int. Cl.[5] G01K *1/14*; **G01F** *15/00*

U.S. Cl. 374—141 **1 Claim**

1. A food metering dish including,

a floor and a continuous wall directed upwardly and in surrounding relationship to the floor to define a cavity within the dish, and

a first and second concave recess integrally formed within the floor, and

a first and second container selectively positionable within the first and second respective concave recess to maintain positioning of the first and second container relative to the floor, and

wherein the first and second container each includes measuring gradients formed to the container to enable an individual to ascertain individual portions within the container, and

wherein the first and second container each includes a respective first and second lid, the first and second containers defined by a respective first and second internal diameter, and the first and second lid each including an annular skirt defining an external diameter equal to the internal diameter of the first and second container, and

wherein indicia are imparted on the floor to provide caloric equivalence of preselected foods, and

wherein the continuous wall is hollow and defines a surrounding chamber therewithin in surrounding relationship relative to the floor, and

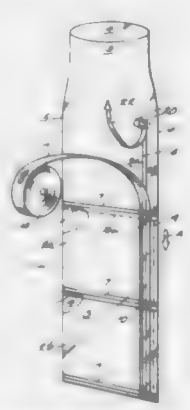
further including a thermometer integrally formed within the wall in contact with the chamber, and

wherein the chamber is completely filled with a mineral oil which may be heated to an elevated temperature to maintain a predetermined temperature gradient relative to foods contained within the cavity, and

wherein the dish is defined as an ellipse, and the floor is defined as an ellipse, and further including a major partition wall coextensive with and directed across the floor aligned with a major axis defined by the floor, and the first and second concave recess positioned aligned relative to one another on a first side of the major partition, and

wherein a second side of the major partition defines a further cavity between the second side of the major partition and an interior surface of the wall, and further including plural pairs of spaced ribs integrally formed to the floor between the second side of the partition and the interior surface of the wall, and further including partition walls defined by a width substantially equal to a predetermined width between the plural pairs of ribs for selective positioning of the partition walls between the ribs to control food portions contained between the partition walls, and the partition walls defined by a height equal to a predetermined height defined by the major partition wall.

5,007,744



STRIP OF INTERCONNECTED PRE-OPENED RECLOSABLE BAGS

Paul W. Scarberry, Menomonee Falls; Rodney L. Kazemba, Hartland, and Ralph A. Hestekin, West Bend, all of Wis., assignors to Sharp Packaging, Inc., Sussex, Wis.

Filed Dec. 21, 1989, Ser. No. 454,330

Int. Cl.[5] B65D *30/32, 33/16*

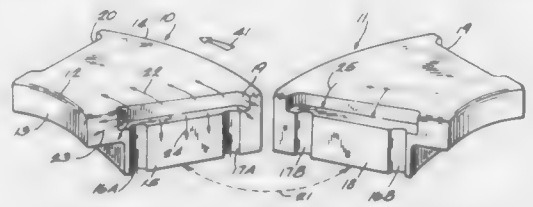
U.S. Cl. 383—37 **8 Claims**

1 In a strip having a plurality of flat pre-opened bags detachably connected together of the type including two layers of heat sealable flexible packaging material, a pair of spaced longitudinal closed edges and a plurality of spaced parallel transverse seals extending between the closed edges and joining the two layers together to define a plurality of bags therebetween, in which each bag in the strip includes (1) a first wall and a second wall consisting of sections of the two layers of the strip, (2) closed margins consisting of sections of the spaced longitudinal closed edges of the strip, (3) an open end along the first wall adjacent a transverse seal, (4) a first line of weakness along the second wall underlying the open end, and (5) a closed margin defined by a transverse seal, the improvement wherein:

each bag in the strip further includes an open zone in the first wall adjacent one closed margin of the bag, an adhesive tape closure adhered to an exterior surface of the first wall surrounding the open zone and adhered to an interior surface of the second wall within the open zone, and a second line of weakness defined in the first and second walls of the bag between the adhesive tape closure and said one closed margin of the bag,

whereby a filled bag of the strip is opened by removing sections of the first and second walls along the second line of weakness and peeling the walls apart along the adhesive tape closure within the open zone and reclosed by resealing the adhesive tape closure to the second wall within the open zone.

5,007,745



LOW FLOW TILTING PAD THRUST BEARING

James H. Ball, New Berlin, and Willis W. Gardner, Waukesha, both of Wis., assignors to Delaware Capital Formation, Inc., Wilmington, Del.

Filed Sep. 26, 1989, Ser. No. 412,503

Int. Cl.[5] F16C *17/04*

U.S. Cl. 384—307 **8 Claims**

1. A tilting pad thrust bearing for a shaft comprising:

retainer means including radially spaced apart generally circular inner and outer concentric wall members and a closure member spanning between the wall members to define an annular chamber, concentric to an axis,

a plurality of bearing pads constituting segments of a ring for being arranged circumferentially adjacent each other in said annular chamber about said axis, each pad having a thrust bearing surface for interfacing relatively rotationally with a planar collar on said shaft which collar is transverse to said axis, each pad having an inner end radially spaced from said axis and an outer end more radially remotely spaced from said axis, said pads having radially extending opposite edges that are leading and trailing in respect to the direction of relative rotation,

each pad having formed in its leading and trailing edges of said bearing surfaces, respectively, a groove which has opposite end walls and extends over less than the radial extent of the pad and which is open toward said bearing surface and open toward an edge of the pad so as to form in combination a radially extending pocket in conjunction with a corresponding groove in an adjacent pad,

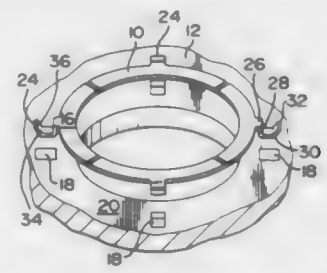
the leading and trailing edges of each pad containing at least one channel extending axially of the edge and terminating in said groove, the channel in the edge of one pad forming a duct in conjunction with a corresponding channel in an adjacent pad for conducting oil for cooling and lubricating said pads to said pocket, said edges of adjacent pads being spaced from each other by a small amount to create a small gap between them to allow for controlled leakage of oil conducted to the pockets, said pads being tiltable on an axis lying on a radial line to develop a lubricant wedge between said bearing surfaces and collar when there is relative rotation between said pads and collar.

5,007,746

THRUST BEARING WITH RESILIENT RETENTION TANG

Albert J. Matzelle, Howell, and William E. Scheerer, St. Johns, both of Mich., assignors to Federal-Mogul Corporation, Southfield, Mich.

Filed Dec. 26, 1989, Ser. No. 457,139



Int. Cl.[5] F16C *17/04, 33/10*

U.S. Cl. 384—420 **6 Claims**

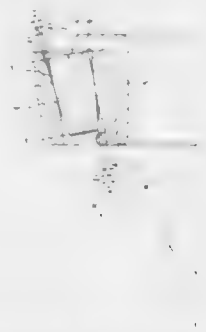
1. A thrust bearing adapted for positive spring-biased retention within a bearing housing, said bearing comprising;

a bearing body; and

resilient mounting means projecting from said bearing body, said mounting means comprising a pair of resilient spring projections diverging outwardly from a central portion, each one of said pair of spring projections having a free end portion cantilevered about said bearing body, said spring projections each comprising at least one chamfered camming surface for engaging said housing, for deflecting said spring projections, and for forming a spring-biased engagement between said spring projections and said housing.

5,007,747

RADIAL ROLLER BEARING



Masamichi Takeuchi, and Yasuo Asai, both of Osaka, Japan, assignors to Koyo Seiko Co., Ltd., Osaka, Japan

Filed May 22, 1990, Ser. No. 526,883

Claims priority, application Japan, May 22, 1989, 1-58921[U]

Int. Cl.[5] F16C *33/58*

U.S. Cl. 384—450 **5 Claims**

1. A radial roller bearing comprising:

a inner ring;

a outer ring; and

a plurality of rollers disposed between said rings and a retainer for said rollers;

at least one surface of raceway surfaces of said inner ring, a raceway surface of said outer ring and rolling contact surfaces of said rollers being crowned so that the amount of crowning is 0.0007 to 0.002;

one end surface of each roller being formed spherically convex;

at least one of elements of said inner ring and said outer ring being provided with a rib at its one end opposed to a convex end surface of each roller, said convex end surface of each roller being in contact with said rib, said contact surface of said rib being formed spherically concave in contact with said convex end surface of each roller.

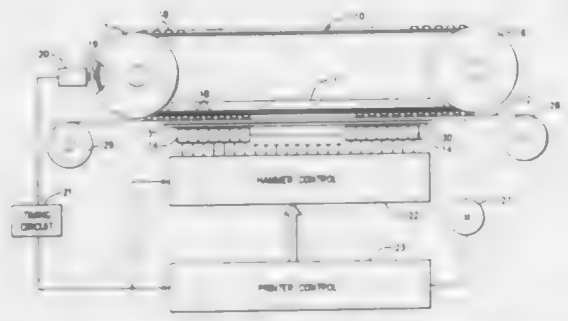
PRINTER FOR BAR CODE USING THIN AND THICK BAR CODE FONTS

Ho C. Lee; John R. O'Toole, both of Endicott; Alex T. Shalkey, and Jack L. Zable, both of Vestal, all of N.Y., assignors to International Business Machines Corp., Armonk, N.Y.

Filed May 16, 1989, Ser. No. 352,806

Int. Cl.[5] B41J *5/00*

U.S. Cl. 400—103 **11 Claims**



1. An impact printing device for printing bar code patterns on an information carrier, said patterns including a combination of parallel thin and wide bars separated by spaces wherein

said wide bars can have an imprint width which is a multiple of said thin bars, comprising

a movable type carrier,

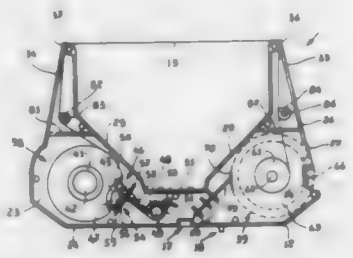
a plurality of bar code type elements on said type carrier,

said bar code type elements including first type elements having a pair of imprint forming parallel thin bars and second type elements having a single imprint forming thick bar, and

a plurality of print hammer means each defining a print position of a print line and each operable selectively to successively impact combinations of said first and second type elements at the same print position to form completed bar code imprints at said print position having a wide bar imprint with a width greater than said single thick bars of said second type elements.

5,007,749

CARTRIDGE INCLUDING TENSION MEANS FOR A TYPEWRITER CORRECTION RIBBON



Remo Falconieri, S. Giorgio, and Sergio Uggetti, Ivrea, both of Italy, assignors to Ing. C. Olivetti & C., S.p.A., Ivrea, Italy

Filed Apr. 25, 1989, Ser. No. 343,825

Claims priority, application Italy, May 9, 1988, 67425 A/88

Int. Cl.[5] B41J *35/28*

U.S. Cl. 400—208 18 Claims

1. A cartridge for a correction ribbon for typewriters, comprising a container accommodating a supply reel on which said correction ribbon is initially wound and a receiving reel on which said correction ribbon is rewound after having been used, said receiving reel co-operating with a feed mechanism of said typewriter to produce a unidirectional feed movement of said ribbon in each correction cycle and a tensioning device for said supply reel for tensioning said ribbon in opposition to said feed movement said feed mechanism, said tensioning device comprising a toothed ring having a series of peripheral teeth integral with said supply reel, and a spring element having a fixed part bearing against said container and a yielding part having an end engaged with said teeth of said toothed ring to urge said supply reel in a direction opposite to said feed movement of said correction ribbon for tensioning said ribbon, and in which said end of said spring element of being intermittently disengaged from said teeth during said feed movement of said ribbon and being held in engagement with one of said teeth for a given operating travel during which the end of said spring element applies said tensioning action to said supply reel

REPLACEABLE INKING CARTRIDGE WITH DEPLETION COUNTER

Donald E. Goubeaux, Miamisburg, Ohio, assignor to Monarch Marking Systems, Inc., Dayton, Ohio

Continuation of Ser. No. 916,988, Oct. 8, 1986, abandoned, which is a division of Ser. No. 356,077, Mar. 8, 1982, Pat. No. 4,636,097, which is a continuation of Ser. No. 152,058, May 20, 1980, abandoned. This application Oct. 19, 1987, Ser. No. 110,593

Int. Cl.[5] B41J *35/36*

U.S. Cl. 400—249 1 Claim

1 A replaceable inking cartridge, comprising: a housing including a cover, the housing defining interior space, the interior space including a stuffing chamber, an endless ink ribbon, a portion of the ink ribbon being confined in the stuffing chamber, another portion of the ink ribbon extending to a zone outside the interior space and adapted to cooperate with printing means, means mounted on the housing for feeding the ink ribbon, a counter disposed within the interior space but outside the stuffing chamber in a location inaccessible for resetting without opening the cover, and means for preventing further operation of the counter when the counter has reached a predetermined count.

5,007,751

PRINTER HAVING CARRIAGE ZEROING DEVICE

Kiyoshi Yamakawa, Gifu, Japan, assignor to Brother Kogyo Kabushiki Kaisha, Japan

Filed Oct. 13, 1988, Ser. No. 256,971

Claims priority, application Japan, Oct. 16, 1987, 62-262507

Int. Cl.[5] B41J *19/30*

U.S. Cl. 400—322 16 Claims

1. A printer comprising:

a carriage having a print head mounted thereon and movable along a line of printing;

a stepper motor for moving the carriage;

carriage-position detecting means for detecting arrival of the carriage at a detection point within a range of movement of the carriage;

a carriage stop disposed at one of opposite ends of said range of movement of the carriage, for determining said one end of said range of movement;

first setting means operable upon power application to the printer, for activating said stepper motor to move said carriage in a direction toward said carriage stop until the carriage arrives at said detection point, and further activating the carriage in said direction by a first predetermined number of steps from said detection point such that the stepper motor is activated without displacement thereof with the carriage held in abutting contact with said carriage stop for at least a last one of said first predetermined number of steps, whereby a zero point of the carriage is established for the first time after said power application;

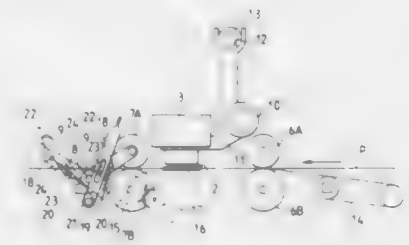
distance detecting means operable after said zero point of the carriage is established, for detecting a distance between said carriage stop and said detection point by activating said stepper motor to move said carriage in a direction opposite to said direction toward said carriage stop and counting a number of steps needed for moving said carriage from said carriage stop to said detection point;

said distance detecting means including a distance memory for storing data indicative of the counted number of steps representing said distance between said carriage stop and said detection point; and

second setting means operable when it is required to establish the zero point of the carriage for a second and subsequent times after said power application, for activating said stepper motor to move the carriage in said direction toward said carriage stop until the carriage arrives at said detection point, and further activating the carriage from said detection point in said direction toward said carriage stop by a sum of said counted number of steps stored in said distance memory and a second predetermined number of additional steps which number is smaller than said first predetermined number, so that the stepper motor is activated without displacement thereof with the carriage held in abutting contact with said carriage stop for at least a last one of the summed number of steps, whereby the zero point of the carriage is established.

5,007,752

PAPER FEED ROLLER ARRANGEMENT FOR PRINTER



Yoshiyuki Yasumi, and Hiroshi Sato, Iwate, both of Japan, assignors to Alps Electric Co., Ltd., Tokyo, Japan

Filed Aug. 1, 1989, Ser. No. 388,265

Claims priority, application Japan, Aug. 5, 1988, 63-103745[U]

Int. Cl.[5] B41J *13/03*

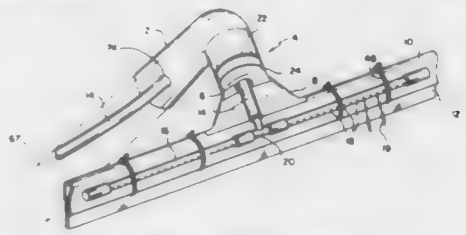
U.S. Cl. 400—636 5 Claims

1. A paper feed roller arrangement for a printer wherein a print head for printing with an ink ribbon of a ribbon cassette is disposed in an opposing relationship to a platen, said paper feed roller arrangement comprising:

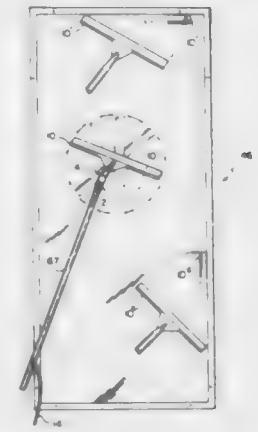
two pairs of paper feed rollers, one of said pairs being disposed adjacent to and on the upstream side of said print head and the other of said pairs of rollers being disposed adjacent to and on the downstream side of said print head when considered with respect to a paper feeding direction, one roller of said downstream pair of feed rollers located in a ribbon cassette installation path; and

means for moving said one roller of said downstream pair of feed rollers toward and away from said print head, wherein a range of motion of said one roller includes a portion outside said path of the ribbon cassette when the ribbon cassette is to be exchanged.

5,007,753



WINDOW CLEANING APPARATUS WITH ROTATABLE HEAD



Raymond B. England, Jr., P.O. Box 511, Albion, N.Y. 14411

Filed Dec. 30, 1988, Ser. No. 295,293

Int. Cl.[5] A47L *13/26, 13/30*

U.S. Cl. 401—139 4 Claims

1. Window cleaning apparatus for cleaning a window comprising:

a. a cleaning head;

b. a cleaning element which is attached to the cleaning head;

c. a rotatable sleeve coupling having a closed, flanged end and an open, tubular end, said coupling being comprised of

1. a smaller hollow cylinder having a side wall having an opening therethrough an open end and a closed flanged end formed by collapsing together a part of the cylinder side wall into a flattened surface, said smaller hollow cylinder containing an annular groove disposed on its outer surface in proximity to its open end,

2. a larger hollow cylinder having a side wall with an opening therethrough, two open ends and an annular rim with an opening therethrough, two open ends and an annular rim disposed on its inner surface in proximity to one of its open ends, said rim being rotatably mateable with the annular groove of the smaller cylinder;

the open end of the smaller hollow cylinder being telescopically fitted in to the open end of the larger hollow cylinder which is in proximity to the annular rim so that the annular rim on the inner surface of the large cylinder is rotatably mated with the annular groove on the outer surface of the smaller cylinder;

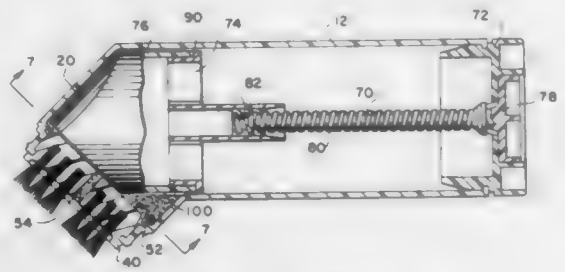
d. a fastening means which attaches the cleaning head to the closed, flanged end of the rotatable sleeve coupling;

e. a handle which is attached to the open, tubular end of the rotatable sleeve coupling the handle having a bend therein adjacent the rotatable sleeve coupling wherein when the handle is held to extend with a substantial vertical component the cleaning head rotates in a plane parallel to a

substantially vertically oriented window which is being cleaned;

f. a perforated, fluid distribution conduit attached to the outer surface of one of the side walls of the elongated channel forming the cleaning head for distribution fluid onto a window surface;

g. a fluid supply conduit for supplying fluid to the perforated fluid distribution conduit from a fluid source having one of its ends in communication with the perforated fluid distribution conduit and another of its ends in communication with the fluid source, said fluid supply conduit passing through the opening in the side wall of the smaller hollow cylinder and the surface of the rotatable sleeve coupling in a manner such that a part of said fluid supply conduit is positioned inside of the rotatable sleeve coupling; and



h. a rotatable union situated in the part of the fluid supply conduit positioned inside of the rotatable sleeve coupling, said rotatable union being comprised of two of the ends of the fluid supply conduit formed by severing the fluid supply conduit into two sections which are re-connected by a sleeve, each of said ends having an annular, beaded lip positioned thereon which permits their full rotation in relation to the sleeve and to each other.

5,007,754

SHOE POLISH APPLICATOR

Clarence D. Zierhut, Richardson, Tex., assignor to King Imports, Inc., San Antonio, Tex.

Filed Feb. 13, 1989, Ser. No. 309,376
Int. Cl.[5] A46B *11/02*
U.S. Cl. 401—174 1 Claim

1. A shoe polish applicator, comprising:

a hollow body having a plurality of internal walls defining a reservoir for shoe polish, said internal walls comprising a rearward internal side wall having elliptical cross-sections about a rearward axis and a forward internal side wall having circular cross-sections about a forward axis, said rearward and forward internal side walls being joined at a shoulder;

said rearward and forward axes intersecting at an obtuse included angle;

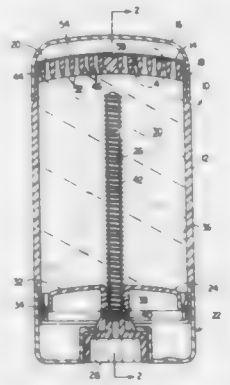
a planar forward internal end wall of said body joined to said forward internal side wall and being perpendicular to said forward axis;

extruder means for extruding said shoe polish from an opening in said forward internal end wall;

said extruder means including a plunger constrained for movement within said body and translation means for translating said plunger within said body;

said plunger including an external side wall elliptical about a plunger axis coaxial with said rearward axis of said body and spaced closely with said rearward internal side wall, a first external front wall partially cylindrical about said forward axis of said body and joined to said plunger side wall, and a second external front wall being planar and parallel to said forward end wall, said first and second external front walls being closely spaced to said forward internal side and end walls, respectively, when said plunger is translated to a forward-most position by way of said means for translation;

brushes extending from a surface about said opening in said forward internal end wall, said forward internal end wall being planar and having a circular perimeter, with said opening being centrally located in said forward internal end wall; and



a removable cap for covering said opening and brushes fixed to the hollow body, said cap including a stopper integral with the cap and extending from an internal surface thereof to seal the opening when the cap is fixed to the hollow body.

5,007,755

COSMETIC PRODUCT

Harold R. Thompson, Norwell, Mass., assignor to The Gillette Company, Boston, Mass.

Filed Oct. 5, 1989, Ser. No. 417,260
Int. Cl.[5] A45D *40/06, 40/08*
U.S. Cl. 401—175 21 Claims

1. A packaged cosmetic product comprising

container structure that includes annular chamber wall structure,

application surface structure at one end of said annular chamber wall structure, said application surface structure defining an application surface with an array of dispensing ports and having an array of elongated divider webs that define a corresponding array of directly connected distribution passages, said elongated divider webs having body portions, leading end surface portions of width less than said distribution passages to define flared entrance ports to said distribution passages, and relieved trailing end portions to define dispensing ports of cross-sectional areas greater than the minimum cross-sectional areas of the corresponding distribution passages at said application surface,

gel cosmetic material of less than 200,000 centipoises viscosity in said container structure, and

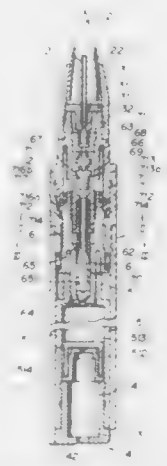
dispenser structure for urging said gel cosmetic material through said distribution passages and said corresponding directly connected dispensing ports to said application surface.

5,007,756

BALLPOINT PEN WITH CONDOM

Remo C. Wey, 31; Rue pres Guetins, CH-2520 La Neuveville, Switzerland

PCT No. PCT/CH88/00045, § 371 Date Oct. 5, 1988, § 102(e) Date Oct. 5, 1988, PCT Pub. No. WO88/06534, PCT Pub. Date Sep. 7, 1988
PCT Filed Feb. 25, 1988, Ser. No. 278,947
Claims priority, application Switzerland, Feb. 25, 1987, 007051/87
Int. Cl.[5] B43K *29/00*
U.S. Cl. 401—195 1 Claim



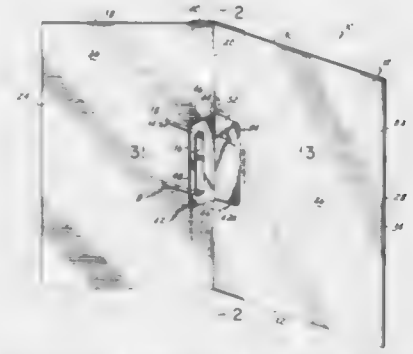
1. A ballpoint pen with a discreetly packed condom comprising a non-retractable writing head part connected to a cylindrical shell, the writing head part having a writing point connected to a filler containing writing fluid, wherein the cylindrical shell consists of individual cylindrical shells each being open at both ends, each of said cylindrical shells accommodating one condom, said cylindrical shells being threadably connectable with one another and threadably connectable with said writing head part, and the cylindrical shells having means for removing a condom.

5,007,757

LIQUID CONTAINER

Shigeo Iizuka, Funabashi, Japan, assignor to Yoshino Kogyosho Co., Ltd., Tokyo, Japan

Filed Aug. 30, 1989, Ser. No. 400,884
Claims priority, application Japan, Sep. 2, 1988, 63-115833[U]; Sep. 8, 1988, 63-118257[U]
Int. Cl.[5] A45D *34/04*
U.S. Cl. 401—278 9 Claims



1. A liquid container comprising.

5,007,758

FILE FOLDER

Murray B. Blumberg, Woodmead Springs, South Africa, assignor to Press Engineering Pty. Ltd., Johannesburg, South Africa

Filed Jan. 3, 1990, Ser. No. 460,506
Int. Cl.[5] B42F *13/00*
U.S. Cl. 402—75 12 Claims

1. In combination, a folder and a fastener for securing loose papers to the folder,

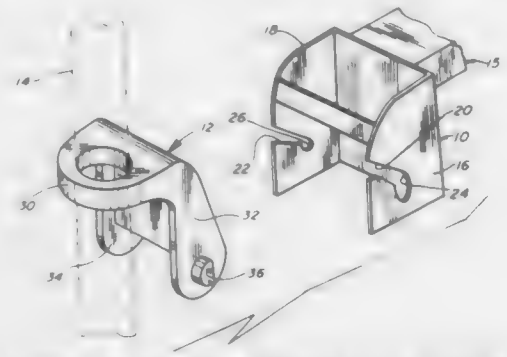
said folder having a first panel with first and second opposed faces and first and second opposed parallel side edges,

a cover strip,

said fastener comprising an elongate strip of sheet material, said fastener having a central body portion and a pair of opposed prongs extending from opposite ends of the central body portion,

said first panel having an internal flap formed from material of said first panel and being defined by a parting line that terminates at spaced first and second ends and a hinge line extending between said first and second ends, said flap being pivotal about said hinge line between a first position in which it is flush with said panel and a second position in which it projects upwardly from said first face of said panel thereby to define an opening in said panel,

said cover strip being secured to said panel on said second face of said panel, said cover strip being larger than said opening and overlying said opening, and



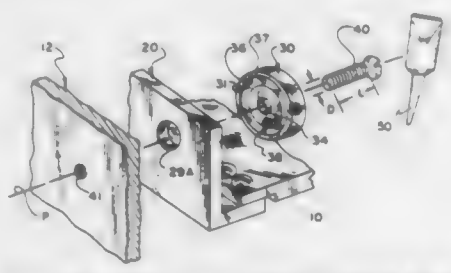
said folder further having securing means adapted to secure the flap to the cover strip with said body portion of said fastener sandwiched between said flap and said cover strip and with said prongs extending upwardly from said first face of said first panel.

5,007,759

ARRANGEMENT FOR ASSOCIATING AN ELECTRICAL DEVICE WITH A MOUNTING THEREFOR

Henry W. Scherer, Mt. Prospect, Ill., assignor to S&C Electric Company, Chicago, Ill.

Filed Nov. 7, 1988, Ser. No. 267,584
Int. Cl.[5] B25G *3/00*
U.S. Cl. 403—13 19 Claims



1. A system for preventing different types of electrical devices from being associated with inappropriate mountings, the electrical device including a fitting, the mounting including a support arrangement, the fitting and the support arrangement including cooperating support structure to support the electrical device with respect to the support arrangement, said cooperating support structure including predetermined different dimensions for each different type of electrical device and corresponding support arrangement such that each type of electrical device can be associated only with the corresponding support arrangement and preventing other combinations of support arrangements and electrical devices of different types from being associated, said cooperating structure comprising two spaced-apart protuberances on a first of said fitting or support arrangement and two spaced-apart receiving arrangements on the other of said fitting or support arrangement, said two protuberances each having a cross section of different predetermined dimension, said receiving arrangements each being dimensioned to interfit with and receive a respective one of said two protuberances, a first type of electrical device and corresponding first support structure and a second type of electrical device and corresponding second support structure including protuberances and receiving arrangements of the same predetermined dimensions but being reversed left to right from said first type to said second type.

5,007,760

DEVICE FOR ALIGNING AND MOUNTING A COPIER OR PRINTER SUBSYSTEM

Charles E. Mullen, Spencerport, and Arthur H. Crater, Warsaw, both of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

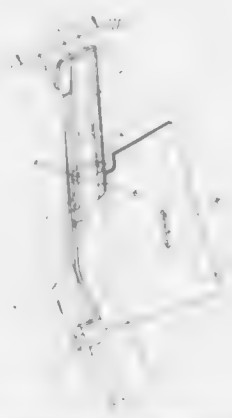
Continuation-in-part of Ser. No. 225,498, Jul. 28, 1988, abandoned. This application Jan. 12, 1990, Ser. No. 464,274
Int. Cl.[5] F16B *43/00*
U.S. Cl. 403—13 6 Claims

1. A device for aligning by precisely marking the trial and error achieved aligned position of, and then fastening in such position, a subsystem, of an electrostatographic copier or printer, including a mounting portion having a first alignment and screw mounting aperture therein substantially larger than a major diameter of a mounting screw being used for fastening such subsystem to a support frame, after such trial and error aligning thereof, such that the subsystem can thereafter be removed from the copier or printer, serviced, and then reinstalled in such precise aligned position therein without further need of such initial trial and error alignment thereof, the device comprising:

(a) a solid member having first and second ends, a front side, and a back side suitable for moving over, and placing tightly, against the mounting portion of such subsystem;

(b) a second screw mounting aperture formed in said first end from said front side clear through to said back side for aligning and mounting or fastening the subsystem therethrough, said second screw mounting aperture being substantially smaller than said first screw mounting aperture in said mounting portion for substantially narrowing and precisely marking an aligned position through said first and larger aperture, and said second screw mounting aperture being substantially the same size as the major diameter of the mounting screw being used for mounting such subsystem therethrough to the support frame;

(c) a recess formed at one of said ends in said back side for forming a cavity and holding adhesive against such mounting portion of the subsystem; and



(d) first and second adhesive introduction perforations at said second end formed from said front side clear through into said recess in said back side, for introducing an adhesive therethrough into the cavity formed by said recess against such mounting portion, thereby permanently bonding said aligning device against such mounting portion, and thereby permanently narrowing and marking such precise aligned position through said first and larger aperture such that the subsystem thereafter can be removed with the aligning device bonded thereto, serviced, and reinstalled in precise alignment without further need of such trial and error alignment thereof.

5,007,761

SEAL ARRANGEMENT FOR CONNECTING SEALS

Dietrich Wulff, Aidlingen; Hans-Ludwig Jäger, Böblingen, and Joachim Weisse, Herrenberg, all of Fed. Rep. of Germany, assignors to Daimler-Benz, Fed. Rep. of Germany

Filed Sep. 5, 1989, Ser. No. 402,536
Claims priority, application Fed. Rep. of Germany, Sep. 3, 1988, 3829968
Int. Cl.[5] B25G *3/00*; F10D *1/00*
U.S. Cl. 403—287 7 Claims

1. Sealing arrangement for connecting two seals with different seal profiles comprising:

a transition connection means, which is arranged between respective end regions of the two seals for connection to the two seals;

the transition connection means is fixedly connected to a first of the two seals and releasably connected to the second of the two seals;

said connection means having a sleeve-shaped seal receiving portion designed as a sealing surface and an accurately fitting lug;

said second of the two seals being releasably inserted into said receiving portion provided on the transition connection means; and

wherein the lug engages in an accurately fitting recess in the second of said two seals when the said second of the two seals is so inserted.

5,007,762

RELEASABLE LOCKING MECHANISM

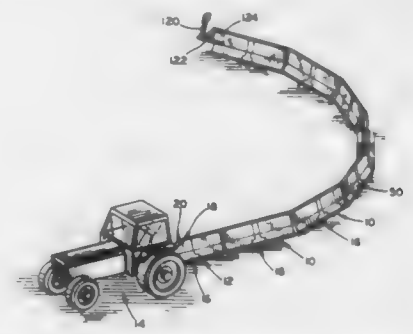
John A. Duran, Glendora, Calif., assignor to Avibank Mfg., Inc., Burbank, Calif.

Filed Jan. 9, 1990, Ser. No. 463,381
Int. Cl.[5] F16D *1/10*
U.S. Cl. 403—341 31 Claims

1. A locking mechanism comprising:

a first connecting member having a cavity with a bottom wall therein for receiving one end of a second connecting member therein;

a second connecting member having a terminal end receivable in said cavity and generally conforming to the configuration of said cavity, said terminal end having a bottom wall generally conforming to the bottom wall of said cavity so that said terminal end bottoms out in said cavity thereby preventing lateral movement of said first and second connecting members, said second connecting member having a locking sleeve with an inner wall axially slidable thereon normally held in a position away from said terminal end by means of a spring biased detent on said connecting member disposed in a groove on the inner wall of said sleeve, and first releasable locking sleeve means associated with said second connecting member and said locking sleeve for releasing said locking sleeve and allowing the same to be slid to a position overlying said terminal end thereby retaining said terminal end in said cavity when said terminal end is disposed in said cavity.



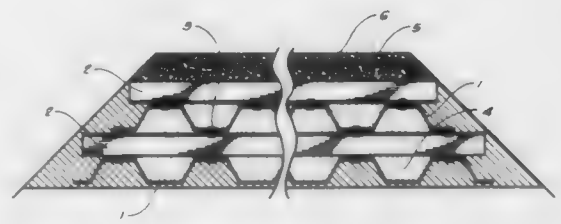
5,007,763

TRAFFIC BARRIERS WITH BUILT-IN CARRIERS

William B. Burgett, Rte. #3, Lost Run Rd., Fredericktown, Ohio 43019

Filed Feb. 1, 1990, Ser. No. 473,643
Int. Cl.[5] E01F *13/00*
U.S. Cl. 404—6 14 Claims

1. In combination, a plurality of rigid, non-articulated elongate traffic barrier sections, each of said traffic barrier sections having connecting means at ends thereof for pivotally connecting the barrier sections in end-to-end relationship, each of said traffic barrier sections having a traffic barrier carrier built in at a central portion of the section between the ends of the section to aid in raising the section for transportation from one location to another, each of said carriers comprising wheel means movably carried by the carrier, and moving means connected to said wheel means for moving said wheel means between an upper position in which said barrier section is supported on a surface and a lower position in which the section is raised above the surface.



5,007,764

INSULATED TRAFFICKED SURFACE

Eero Pontynen, Vesitorninkatu 9 A 9, 05820 Hyvinkaa 2, Finland

PCT No. PCT/FI89/00059, § 371 Date Jan. 24, 1990, § 102(e) Date Jan. 24, 1990, PCT Pub. No. WO89/09853, PCT Pub. Date Oct. 19, 1989
PCT Filed Mar. 30, 1989, Ser. No. 435,5[illegible]
Int. Cl.[5] E01C *3/06*
U.S. Cl. 404—70 8 Claims

1. An insulated trafficked surface comprising:

a first sheet of steel having corrugations;

a second sheet of steel having corrugations, said second sheet of steel being attached perpendicular to and overlying said first sheet, each of said first and second sheets having a plurality of cavities formed between corrugations;

a plurality of fastener rigidly affixing said first and second sheets together;

a heat insulating fill material filling said cavities of said first and second sheets;

a covering layer of aggregate material formed on a top surface of said first and second sheets; and

a surface layer of pavement formed over a top surface of said covering layer.

5,007,765

SEALING METHOD FOR JOINTS

John E. Dietlein, Bay City; Russel P. Kamis, Bay County, and Peggy L. Dixon, Midland, all of Mich., assignors to Dow Corning Corporation, Midland, Mich.

Filed Sep. 16, 1988, Ser. No. 245,[illegible]7
Int. Cl.[5] E01C *11/02*
U.S. Cl. 404—74 17 Claims

1. A method of sealing joints between surfaces, said method comprising the steps of

(A) cleaning the facing joint surfaces,

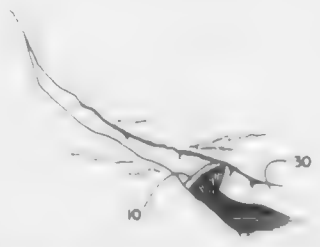
(B) installing a backer rod between the joint surfaces so that the space between the joint surfaces is filled by the backer rod and the upper surface of the backer rod is recessed

sufficiently from the panel surface to allow installation of a sealant, the backer rod being an essentially open cell foam rod having an impervious skin.

(C) applying a sealant in the space over the backer rod between the joint surfaces, and

(D) allowing the sealant to cure, to form a continuous seal between the joint surfaces.

5,007,766



SHAPED BARRIER FOR EROSION CONTROL AND SEDIMENT COLLECTION

W. Wayne Freed, Signal Mountain, and Robert M. Smith, Ooltewah, both of Tenn., assignors to Synthetic Industries, Inc., Chickamauga, Ga.

Continuation-in-part of Ser. No. 383,878, Jul. 21, 1989. This application Nov. 27, 1989, Ser. No. 441,513

Int. Cl.[5] **E02B** *3/04*

U.S. Cl. 405—24 **11 Claims**

1. An erosion control barrier for placement onto a normally dry watercourse subject to erosion from surface water runoff over the watercourse, comprising:

a structured array of fibers having a predetermined and uninterrupted orientation which spans across the entire width of the watercourse;

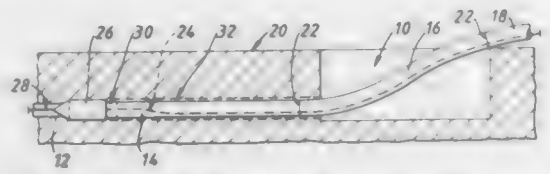
means fixing the fiber array in the predetermined orientation;

attachment means operatively associated with the array at the fixing means and extending therefrom, wherein the attachment means has a distal end with a point operative to penetrate the earth in the watercourse and thereby secure the structured array of fibers in fixed relation to the watercourse; and

the fibers having stiffness sufficient to remain substantially upright when the array is thus fixed in a dry watercourse and when surface water is flowing on the watercourse,

so that the structure of fibers reduces the energy of water flowing along the watercourse and thereby causes deposition of sediment carried through the array by the flowing water and also entraps entrained particles of sediment within the fibrous structure.

5,007,767



METHOD FOR JOINING POLYOLEFIN PIPES BY FUSION

Trevor G. Stafford, Tyne & Wear, England, assignor to British Gas Corporation, London, England

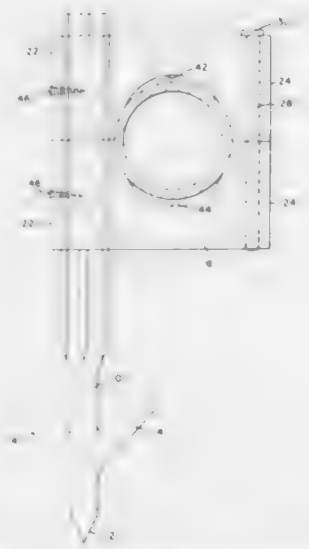
Continuation of Ser. No. 884,940, Jul. 14, 1986, abandoned. This application Sep. 19, 1988, Ser. No. 246,243

Int. Cl.[5] **B65H** *69/08*

U.S. Cl. 405—154 **11 Claims**

1. A method for fusion joining, end to end, lengths of pipe liner of the same diameter and wall thickness and made of polyolefin plastic material in which the wall thickness is in the range 2 to 4 millimeters and the ratio of the outside diameter of the pipe liner lengths to wall thickness is at least 40:1, comprising: closing respective aligned circular clamps around lengths of pipe liner adjacent the ends to be joined to reduce non-circularity of the ends, to hold the lengths, and to prevent deformation into oval shape of said ends of said pipe liner under their own weight; trimming the ends to leave trimmed ends more closely adjacent the respective clamps, the trimmed ends being substantially aligned and normal to the lengthwise direction of the lengths; reducing the distance between the clamps to force the trimmed ends against respective opposite faces of a heated body to form initial internal and external beads; reducing the pressure under which the ends engage the body faces, maintaining the ends in engagement with the body faces; separating the clamps to separate the ends from the body; retracting the body; and reducing the distance between the clamps to force the ends into engagement against each other to complete the internal and external beads and to form a strong, fluid-tight fusion joint between said lengths of pipe, the yield strength of said fusion joint being at least equal to the yield strength of the pipe liner wall over a major portion of the angular extent of the pipe liner wall, and being at least 75% of the yield strength of the pipe liner wall over a minor portion of the angular extent thereof, the total time during which the ends from the body and the period between separation of the ends from the body and their engagement against each other being short enough to ensure that the maximum distance which either bead extends away from the adjacent surface of the pipe liner wall is less than half the wall thickness.

5,007,768



ANCHORING STRUCTURE FOR UNDERGROUND PIPES

George W. Waller, Rte. 13, 190 Strickland Rd., Alpharetta, Ga. 30201

Filed Apr. 17, 1990, Ser. No. 510,181

Int. Cl.[5] **F16L** *3/00*

U.S. Cl. 405—154 **10 Claims**

1. A pipe anchor for securely anchoring in the ground different diameter pipes, said anchor comprising:

a. a stake body having a longitudinal axis and a non-circular cross section, the stake body including at least one laterally extending wing member to prevent stake movement after the stake body is driven into the ground;

b. first and second clamping members each independently slidably carried on the stake body at axially spaced positions therealong to define a pipe-receiving gap between the clamping members, each clamping member movable toward and away from the other and having a stake-body-receiving opening corresponding substantially in cross section and size with the cross section and size of the stake body to permit the clamping members to be independently positioned at a desired axial position along the stake body, each clamping member having in a laterally extending edge thereof, relative to the stake body axis, a recess including a plurality of substantially circular arcs to permit the clamping members to engagingly receive within the recesses pipes having different diameters; and

c. attachment means carried by each of the clamping members for securely attaching the clamping members in a desired axial position on the stake body.

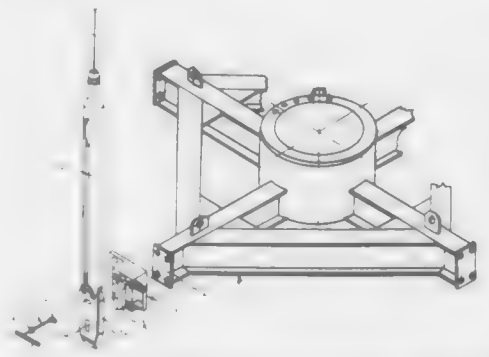
METHOD AND DEVICE FOR ATTACHING A REMOVABLE GUIDE POST



Bernard Legris, Stavanger; Magne Oppedal, Hommersak, both of Norway, and Eric Traonmilin, Billere, France, assignors to Elf Aquitaine Norge A/S, Stavanger, Norway

Continuation of Ser. No. 75,360, Jul. 20, 1987, abandoned. This application Jan. 4, 1989, Ser. No. 293,577

Claims priority, application Norway, Jul. 22, 1986, 86-2945

Int. Cl.[5] **E02B** *17/00;* **E21B** *43/10*

U.S. Cl. 405—195 **17 Claims**

1. A method for attaching a removable guide post to a guide base of an offshore hydrocarbon well installation on the floor of a body of water comprising, the steps of,

providing a protrusion extending laterally from a surface on the guide base,

providing a cavity on the guide post for receiving the protrusion of the guide base to connect the guide post to the guide base,

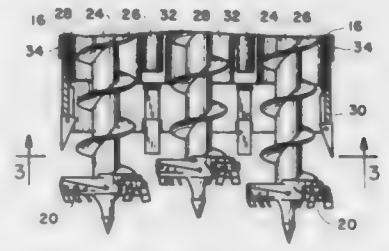
the cavity and protrusion having cooperating surfaces to cause the guide post to move laterally onto the protrusion in response to upward movement of the guidepost,

lowering the guide post with a guide line from a surface station to suspend the guide post in the vicinity of the guide base,

moving the guide post laterally to a position in which a lower surface of the projection is above an upwardly facing surface of the cavity, to generally align the protrusion on the guide base with the cavity of the guide post, and

exerting tension on the guide line to lift the guide post and move the cavity of the guide post into connecting engagement with the protrusion on the guide base.

5,007,770



METHOD AND APPARATUS FOR CONSTRUCTING A SUBSURFACE RETAINING WALL

Robert J. Simmons, 27308 Airvfen Ave., Hayward, Calif. 94542, and Key S. Kwak, 419 Beverly Pl., Castro Valley, Calif. 94546

Filed Dec. 4, 1989, Ser. No. 445,373

Int. Cl.[5] **E02D** *5/56*

U.S. Cl. 405—240 **8 Claims**

1. A method for constructing a subsurface retaining wall from existing grade elevations with a plurality of individual wall elements and without use of forms, shoring or underpinning, the method comprising the steps of:

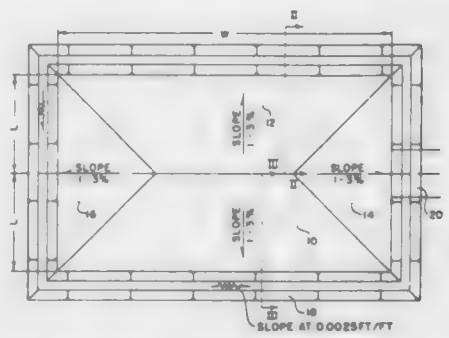
excavating a first rectilinear hole to a depth defining the desired vertical dimension of the wall to be constructed, the width of said rectilinear hole defining the desired thickness of said wall and the horizontal length of said hole defining the horizontal dimension of an individual wall element

filling said first hole with a suitable first retaining wall element

excavating a second rectilinear hole to a depth defining the desired vertical dimension of the wall to be constructed, said second hole having substantially the same width and length as said first hole, one edge of said second hole being in open communication with the adjacent edge of said first hole and said first retaining wall element, and

filling said second hole with a suitable second retaining wall element.

5,007,771



METHOD FOR TREATING CONTAMINATED SOIL BY BIOLOGICAL DEGRADATION ON A SLOPED SURFACE

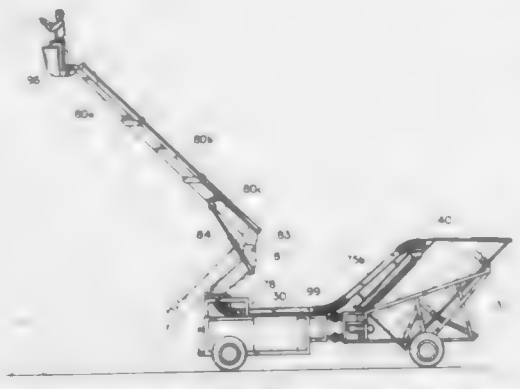
Jaw K. Fu, Pittsburgh; Arch J. Merritt, deceased, late of Pittsburgh by Helene Merritt, executrix , and John R. Smith, Pittsburgh, all of Pa., assignors to Keystone Environmental Resources, Inc., Monroeville, Pa.

Continuation of Ser. No. 150,536, Feb. 1, 1988, abandoned. This application Feb. 26, 1990, Ser. No. 485,228

Int. Cl.[5] **E02D** *3/00*

U.S. Cl. 405—258 **10 Claims**

1. A method for treating organically contaminated soil comprising the steps of arranging said contaminated soil in a treatment bed sloping from its interior toward one or more of its edges and having a collecting trench around said edges, applying nutrients to the soil to encourage growth therein of micro-



organisms capable of degrading the organic compound contaminants and applying water to said treatment bed on its surface and concurrently withdrawing water through said collecting trench; the shape of the treatment bed and the steepness of its slope being selected to minimize both vertically downward migration of water and water erosion of the shaped treatment bed.

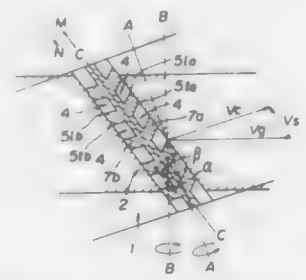
5,007,772

FRUIT HARVESTING MACHINE

Frank J. McKenna, 15914 Chadbourne, Shaker Heights, Ohio 44120; Richard K. Horst, 16201 Burton City Rd.; James F. Horst, 16155 Burton City Rd., both of Orrville, Ohio 44667, and Rodney L. Arney, 15995 Hackett Rd., Dalton, Ohio 44618

Continuation of Ser. No. 261,337, Oct. 24, 1988, abandoned.
This application Jul. 10, 1990, Ser. No. 550,811
Int. Cl.[5] B60P *1/60*
U.S. Cl. 406—39 **10 Claims**

1. In a machine for harvesting fruit from trees including a supporting vehicle, a hopper mounted on the vehicle, an extensible boom having a bottom arm rotatably mounted on the vehicle, a man-supporting bucket on the outer end of the boom, a conduit system extending through said boom and from said boom to the hopper, and means for maintaining sub-atmospheric pressure in said hopper to conduct fruit from the bucket through the conduit system into said hopper, the improvement comprising the boom having inner, middle and outer telescopically slidable boom sections enclosing inner, middle and outer telescopically slidable fruit conduit sections, the boom sections and conduit sections respectively increasing in size from outside to inside, the outer end of the outer conduit section being fixedly mounted to the outer end of the outer boom section, the inner end of the inner conduit section being fixedly mounted to the inner end of the inner boom section, the outer end of the inner conduit section being supported by slidable support means mounted on the inner end of the middle boom section and the outer end of the middle conduit section being slidably supported on the outer boom section by the outer end of the middle conduit being provided with outwardly extending plug means slidably received in longitudinal groove means on the outer boom section.



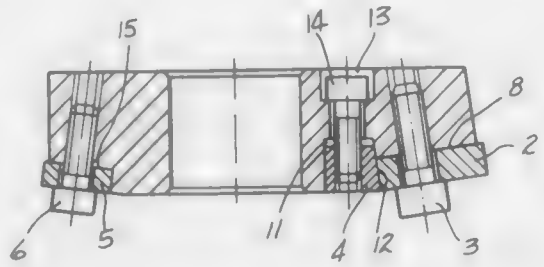
5,007,773

SHAVING CUTTER

Koichi Souketani; Yukio Ito, both of Toyama; Yoshio Sasaki, Toyota; Teiji Kurita, Toyota, and Jun Tamiya, Toyota, all of Japan, assignors to Nachi-Fujikoshi Corporation, Toyama, Japan

Filed Jun. 14, 1989, Ser. No. 366,178
Claims priority, application Japan, Jun. 17, 1988, 63-149539
Int. Cl.[5] B23F *21/00*
U.S. Cl. 407—27 **14 Claims**

1. In a helical toothed shaving cutter for shaving of gears which cutter is provided with a multiplicity of serrations extending on the cutter tooth flanks and including ribs made up by said serrations of said cutter, said ribs forming said cutter tooth flanks, the improvement wherein said ribs are arranged on each side of an axial centerline of each of the cutter teeth



and each of said ribs has a leading cutting edge having a positive rake angle and a trailing cutting edge having a negative rake angle as viewed in the direction of a lateral sliding of the teeth along the tooth trace of said cutter.

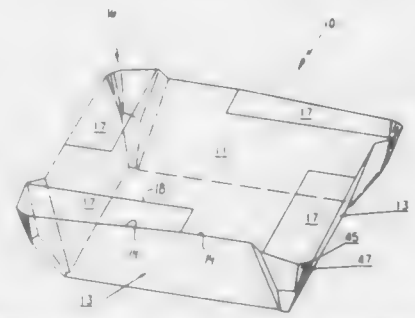
5,007,774

CUTTING OR DRAWING TOOL

Roland Kromer, Ettlingen, Fed. Rep. of Germany, assignor to Maag Gear-Wheel & Machine Company Limited, Zurich, Switzerland

Continuation of Ser. No. 261,688, Oct. 24, 1988, abandoned.
This application Sep. 12, 1990, Ser. No. 581,407
Claims priority, application Switzerland, Dec. 8, 1987, 04784/87
Int. Cl.[5] B23B *29/24, 27/00*
U.S. Cl. 407—94 **11 Claims**

1. A cutting apparatus for producing profiles on a workpiece comprising:
- a cutter plate holder having first, second and third bearing surfaces defining a channel;
- at least one cutter plate located within said channel and bearing on said first, second and third bearing surfaces;
- positioning means located within said cutter plate holder in abutting relationship with said at least one cutter plate for positioning the position of said at least one cutter plate within said channel against said second and third bearing surfaces; and
- clamping means for securely clamping said at least one cutter plate in said channel against said first bearing surface at said position.



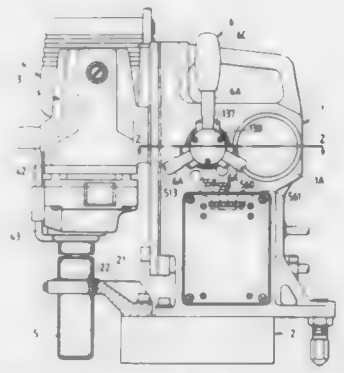
5,007,775

CUTTING INSERT FOR CHIP REMOVING MACHINING

Glenn G. E. Pantzar, Arsunda, Sweden, assignor to Sandvik AB, Sandviken, Sweden

Filed Aug. 29, 1989, Ser. No. 400,066
Claims priority, application Sweden, Sep. 6, 1988, 8803122
Int. Cl.[5] B23C *5/02*
U.S. Cl. 407—113 **20 Claims**

1. A cutting insert for chip cutting machining comprising a body of generally polygonal shape having a chip face, an opposite bottom face and at least one clearance face intersecting said chip face to define a cutting edge which extends to a corner of said body, a portion of said chip face extending along said cutting edge beveled in a direction linearly inclined toward and intersecting said cutting edge and simultaneously toward a midplane of said insert disposed intermediate said chip face and said bottom face such that a first angle of inclination disposed at a first location adjacent said corner and formed by the intersection of said beveled portion and said midplane is larger than a second angle of inclination formed by the intersection of said beveled portion and said midplane at a second location situated farther from said corner than said first location.

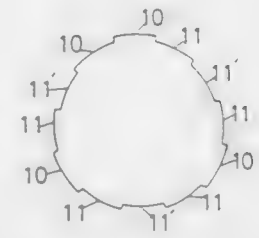


5,007,776

CONTROLLER FOR BORING APPARATUS

Michihiro Shoji, Tokyo, Japan, assignor to Nitto Kohki Co., Ltd, Japan

Filed Jun. 19, 1990, Ser. No. 540,197
Claims priority, application Japan, Jun. 23, 1989, 1-73942[U]; Jun. 23, 1989, 1-73943 [U]
Int. Cl.[5] B23B *45/14*
U.S. Cl. 408—6 **13 Claims**



1. A controller for a magnetic base drill unit comprising a frame having a magnetic base which magnetically adheres to a workpiece, an electric drill having a drill motor, and a feed motor fixed to the frame for causing the electric drill to advance upon and recede from the workpiece, the controller comprises:
- hole cutting termination detection means for detecting the termination of the hole cutting in the workpiece by the electric drill,
- feed motor reversing means responsive to the output of the hole cutting termination detection means for reversing the rotational direction of the feed motor, and for applying to the feed motor a voltage which is higher than the voltage applied to the feed motor during the advancing mode of the electric drill, and
- safety circuit means for detecting that a voltage higher than a predetermined voltage to be applied to the feed motor in the advancing mode of the electric drill is applied to the feed motor during the advancing mode, and for stopping the supply of power to the drill motor and the feed motor.

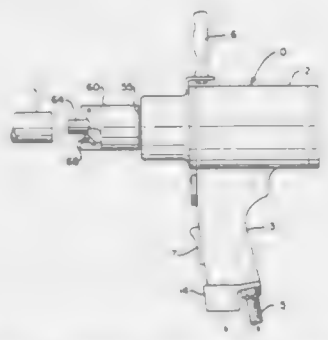
HOLE SAW

Noboru Itokazu, 5-33-808, Nankonaka 5-chome,, Suminoe-ku, Osaka-shi, Osaka 559, Japan

PCT No. PCT/JP87/00992, § 371 Date Aug. 18, 1988, § 102(e) Date Aug. 18, 1988, PCT Pub. No. WO88/04588, PCT Pub. Date Jun. 30, 1988
PCT Filed Dec. 18, 1987, Ser. No. 251,221
Claims priority, application Japan, Dec. 18, 1986, 61-195381[U]; Mar. 25, 1987, 62-44791[U]; Mar. 25, 1987, 62-44792[U]; May 8, 1987, 60-69089[U]; Dec. 23, 1987, 62-162800[U]
Int. Cl.[5] B23B *41/02*
U.S. Cl. 408—67 **23 Claims**

1. A hole saw comprising:
- a basal part having a coupling for joining to a rotary power source;
- a centering drill operatively mounted along a central axis of said basal part; and
- a tubular body having a first end joined to said basal portion and a second end provided with a cutting edge having cutting teeth, said cutting edge comprising a portion thereof having varying cross-sectional contour which locates said cutting teeth at different distances from said central axis, said cutting edge having a plurality of sections having cylindrical cross-sectional contours and a plurality of retreat sections, the retreat sections being provided between the cylindrical sections whereby a contour of said cutting edge alternates between a cylindrical section and a retreat section, the retreat sections having a cylindrical cross-sectional contour generally centered about the central axis, said cylindrical sections also being generally centered about the central axis but having a diameter therefrom which is greater than a diameter from the central axis to the retreat sections, the retreat and cylindrical sections each having a stepped portion therebetween, and each retreat section has a plurality of subsections positioned at varying distances from the central axis and interconnected by stepped portions.

5,007,778



PORTABLE POWER TOOL FOR MILLING TUBE ENDS

Tollief O. Hillestad, 108 9th Ave., W., Summerland Key, Fla. 33042, and Mark W. Hillestad, 220 Hatch Rd., Wadsworth, Ohio 44281

Continuation-in-part of Ser. No. 334,314, Apr. 6, 1989, Pat. No. 4,915,552, which is a continuation-in-part of Ser. No. 254,958, Nov. 7, 1988, Pat. No. 4,889,454. This application Feb. 21, 1990, Ser. No. 482,767
Int. Cl.[5] B23B *45/04*
U.S. Cl. 408—125 **56 Claims**

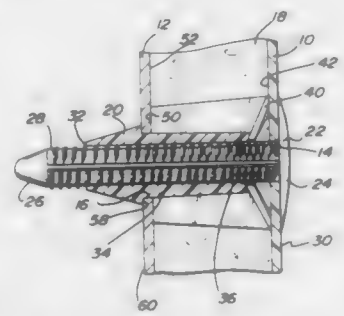
1. A portable, pneumatic-powered, rotary vane motor adapted to operate a rotary tool, the motor comprising:
- a pneumatic-powered, radial-vane rotary motor having a housing containing a cylindrical stator, said cylindrical stator having an inner surface defining a stator chamber, a circular rotor hub operatively supported by the housing and eccentrically set within the cylindrical stator, said motor housing being circular and the axis of the rotor hub being offset from the axis of said circular housing, said rotor hub containing a plurality of circumferentially

spaced, radially directed slots, each slot containing a radially directed vane adapted to extend radially outward to bear against the inner surface of the cylindrical stator during rotary movement of the rotor hub whereby said radially extended vanes define a plurality of expansible cavities within the stator chamber, a sealing point located between said rotor hub and said inner surface of said cylindrical stator whereby said vanes are maximally retracted at said sealing point;

a gas inlet port communicating with the interior of said stator chamber and located circumferentially adjacent to said sealing point between the rotor hub and the inner surface of the cylindrical stator, said gas inlet port adapted to admit gas under pressure to said expansible cavities within the stator chamber; and

a gas outlet port communicating with stator chamber and located at least 180 circumferential degrees from the gas inlet port, said gas outlet adapted to exhaust spent gas from said expansible cavities.

5,007,779



STANDOFF RETAINER

James L. Goran, Orchard Lake, Mich., assignor to Ford Motor Company, Dearborn, Mich.

Filed Oct. 10, 1989, Ser. No. 419,183

Int. Cl.[5] F16B *13/06*

U.S. Cl. 411—48 **19 Claims**

1. A standoff retainer for receiving a push-pin to secure a first panel to a second panel in spaced planar facing relationship with respect thereto, the panels each having an aperture formed therethrough, the standoff retainer comprising:

an elongated body positionable to extend between said panel apertures;

a through bore extending axially through said body between said panel apertures and adapted to receive said push-pin in axially locking relationship;

a mounting flange surrounding said through bore and abuttingly engagable with said first panel;

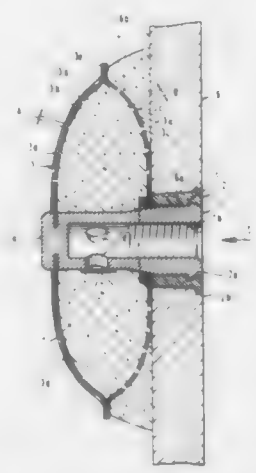
a plurality of circumferentially spaced standoff ribs extending perpendicularly from said mounting flange and having distal ends abuttingly engagable with said second panel;

snap-fit locking means integrally formed with said body for engaging said second panel aperture in the snap-fit axially fast relationship; and

means defining a funnel on the surface of said mounting flange facing said first panel, said funnel surrounding said through bore.

5,007,780

ATTACHMENT MEMBER ANCHORED BY HARDENABLE MASS TO PANEL-SHAPED STRUCTURAL COMPONENT



Armin Hoffmann, Landsberg/Lech; Wolfgang Ludwig, Landsberg, and Erich Leibhard, Munich, all of Fed. Rep. of Germany, assignors to Hilti Aktiengesellschaft, Fürstentum, Liechtenstein

Filed Apr. 12, 1990, Ser. No. 508,953

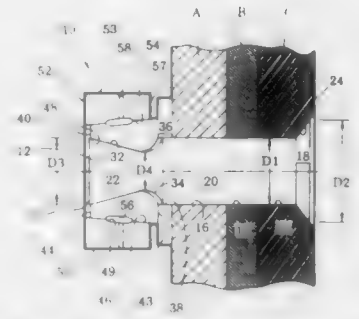
Claims priority, application Fed. Rep. of Germany, Apr. 17, 1989, 3912526

Int. Cl.[5] F16B *39/02*

U.S. Cl. 411—82 **12 Claims**

1. Attachment elements to be fixed to panel-shaped structural components by a hardenable material comprising an axially elongated dowel sleeve (1) having a first end (1*a*) leading in the direction in which said dowel sleeve is inserted through a borehole in the structural component and an oppositely directed second end, said dowel sleeve having a passageway extending from the second end toward the first end, said dowel sleeve having apertures extending therethrough from said passageway to exterior of said dowel sleeve, load attachment means within said passageway, an annular part encircling said dowel sleeve and having a first end and a second end with the first end located closer to the first end of said dowel sleeve than the second end of said annular part, said annular part arranged to fit closely in the borehole in the structural component through which said dowel sleeve is inserted and a bag-like member arranged to receive the hardenable material and fixed to said dowel sleeve adjacent the first end thereof and to said annular part adjacent the first end thereof, said bag-like member arranged to be inserted through the borehole in the structural component so that in the inserted condition said bag-like member is located on an inner side of the structural component opposite an outer side through which the dowel sleeve is first inserted, said bag-like member having a first side and an oppositely facing second side with said first side facing the inner side of the structural component after said dowel sleeve and annular part are inserted through the borehole in the structural component, said first side of said bag-like member being fixed to said annular part, wherein the improvement comprises that said apertures in said dowel sleeve open into said bag-like member, at least said first side of said bag-like member comprises openings therethrough for permitting excess hardenable material injected into said bag-like member through said dowel sleeve and apertures therein to pass outwardly from said bag-like member, said second side of said bag-like member is connected to said dowel sleeve, and said first and second sides being joined together radially outwardly from said annular part.

5,007,781



TAPERED SPLIT-BUSHING FASTENER

Jack E. Jensen, and Ebrahim Parekh, both of San Diego, Calif., assignors to General Dynamics Corporation, Convair Division, San Diego, Calif.

Filed Sep. 10, 1990, Ser. No. 580,016

Int. Cl.[5] F16B *21/00*

U.S. Cl. 411—337 **6 Claims**

1. A tapered split-bushing fastener comprising:

an elongated smooth pin having a predetermined length, said pin having a front end and a rear end;

in sequence from its front end to its rear end, said pin has a head portion, a shank portion and a rear portion;

said shank portion having an outer diameter D1, said head portion having a diameter D2 that is greater than D1;

said rear end portion having an outer diameter D3 that is no greater than D1 and it tapers axially forwardly from its rear end to a diameter D4 that is less than D1 by a predetermined amount;

a tubular split-bushing having a front end, a rear end, and inner annular surface and an outer annular surface, said bushing being split longitudinally into at least two pieces, said outer annular surface of said tubular split-bushing having a first circumferential annular groove therearound;

said tubular split-bushing being removably engagable around the tapered surface of the rear portion of said pin;

a tubular sleeve having a front end, a rear end and a lateral outer side wall;

said tubular sleeve having a bore hole that extends from its front end to its rear end, said bore hole having a second circumferential annular groove therearound and said bore hole matingly engages the outer annular surface of said split-bushing and said first and second circumferential annular grooves align to forming a closed chamber thereby; and

means for substantially filling said closed chamber with an adhesive for locking said tubular sleeve on said split-bushing so that neither of them can be removed from the rear end portion of said elongated pin.

5,007,782

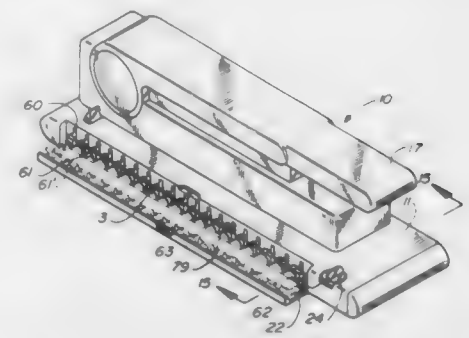
COMBINED PAPER PUNCH AND BINDING APPARATUS

Charles T. Groswith, III, Los Altos; Richard D. Phipps, Morgan Hill; Robert L. Lathrop, Jr.; John F. Stewart, both of San Jose, and Rick J. Kaufmann, Los Gatos, all of Calif., assignors to Taurus Tetraconcepts, Inc., Mountain View, Calif.

Filed Jul. 18, 1989, Ser. No. 381,612

Int. Cl.[5] B42B *9/00*

U.S. Cl. 412—40 **23 Claims**



1. A combined punching and binding apparatus comprising:

a base portion;

a first punch mechanism in said base portion and accessible to a first stack of paper sheets insertable along a first linear edge of said base portion for punching a first hole pattern in the first stack of paper sheets;

a second hole around mechanism in said base portion and accessible to a second stack of paper sheets insertable along a second linear edge of said base portion for punching a second hole pattern in the second stack of paper sheets;

a punch operational crank pivotally connected to said base portion;

means interconnecting said crank and each of said hole punch mechanisms for independently punching the first and second hole patterns in any stack of paper sheets inserted into said mechanisms at said first and second linear edges, respectively; and

binding means attached to said base portion for binding one of the first or second stacks of sheets.

5,007,783

POSITIONING APPARATUS FOR AN AUTOMATIC CARRIER SYSTEM

Sei Matsuo, Furukawa, Japan, assignor to Alps Electric Co., Ltd., Tokyo, Japan

Continuation-in-part of Ser. No. 325,581, Mar. 17, 1989, abandoned. This application Apr. 2, 1990, Ser. No. 503,181

Claims priority, application Japan, Jun. 2, 1988, 63-134373

Int. Cl.[5] B65G *21/20, 67/02*

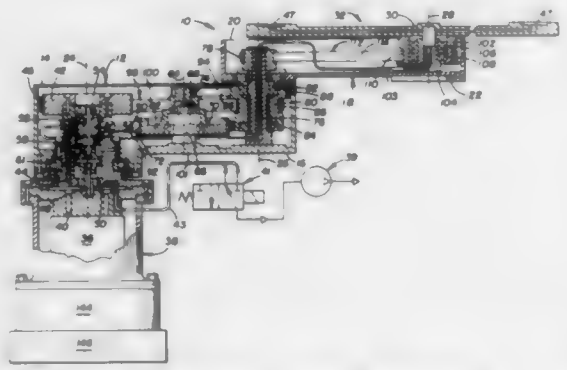
U.S. Cl. 414—222 **3 Claims**

1. An apparatus for positioning a workpiece relative to an automatic assembling machine comprising:

a carrier disposed adjacent said automatic assembling machine, said carrier supporting a pallet, fixed to said carrier, and a subpallet, slidably mounted on said pallet, said subpallet having means for holding said workpiece, said subpallet also having at least two positioning projections;

a robotic arm disposed on said automatic assembling machine having a positioning member capable of moving into and out of contact with said positioning projections, said positioning member made up of at least two positioning cylinders having tapered openings at one end thereon, said

tapered openings having a smallest diameter at the centers of said positioning cylinders;



wherein, when said carrier is placed such that said workpiece is positioned within a short distance of a desired position relative to said automatic assembling machine, said positioning member can be moved toward said carrier, and said positioning projections on said subpallet are engaged with said tapered openings of said positioning cylinders, said tapered openings causing said positioning projections to move toward the center of said tapered openings, thus causing said subpallet to slide on said pallet, thereby causing said workpiece to be disposed in said desired position relative to said automatic assembling machine.

5,007,784

DUAL END EFFECTOR ROBOTIC ARM

Genco Genov, Sunnyvale, and James Cameron, Mountain View, both of Calif., assignors to Genmark Automation, Sunnyvale, Calif.

Continuation-in-part of Ser. No. [redacted],754, Jan. 20, 1989. This application Sep. 20, 1989, Ser. No. 410,087
Int. Cl.[5] B25J 9/06
U.S. Cl. 414—225 11 Claims

4. A workpiece processing apparatus, comprising:

a workpiece holder adapted to hold a plurality of workpieces to be processed;

a work station adapted to hold and process successively held workpieces;

a workpiece receiver adapted to receive successively processed workpieces;

a robotic arm, comprising:

a plurality of sequentially pivotally attached links each having proximal and distal end portions, with the proximal end portion of each link except a proximalmost of said links being pivotally attached relative to the distal end portion of the preceding link;

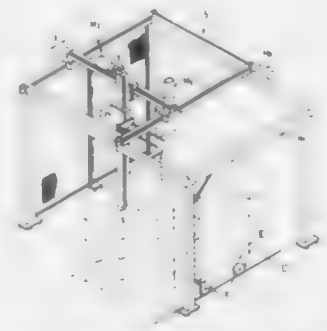
a relatively static structure to which the proximal end portion of the proximalmost of said links is pivotally mounted;

an end effector structure having a central portion and two substantially oppositely extending hands each capable of picking up a workpiece, said central portion being centrally pivotally mounted to the distal end portion of a distalmost of said links;

said links, end effector structure and static structure being of a construction sufficient to allow said robotic arm to reverse across the pivot axis of said proximal end portion of the proximalmost of said links;

radial drive means for driving said links in a manner such that the pivot axis of said central portion of said end effector structure moves only substantially linearly radially along a line passing through and perpendicular to said pivot axis of said proximal end portion of the proximalmost of said links and to the pivot axis of said central portion of said end effector structure and said end effector structure is maintained at a selected angle to said line; and

rotational drive means for rotating said relatively static structure and with it said links about the pivot axis of said proximal end portion of said proximalmost of said links;



said robotic arm being positioned and of a construction sufficient to remove successive workpieces from said holder using either of said hands, position said workpieces successively at said work station using either of said hands, remove said workpieces successively from said work station using either of said hands and position said workpieces successively in said receiver using either of said hands.

5,007,785

METHOD AND APPARATUS FOR UNLOADING STACKS OF TRAYS

Jelle van der Schoot, Aalten, Netherlands, assignor to Staalkat B. V., Aalten, Netherlands

Continuation-in-part of Ser. No. 270,590, Nov. 14, 1988, Pat. No. 4,917,559. This application Nov. 14, 1989, Ser. No. 435,968
The portion of the term of this patent subsequent to Apr. 17, 2007, has been disclaimed.
Int. Cl.[5] B65G 59/02, 67/24
U.S. Cl. 414—331 12 Claims

1. Apparatus for unloading stacks of trays from a movable storage container, comprising:

(1) a storage container having vertically-disposed supports and a plurality of horizontally-disposed sections connecting said supports and forming a plurality of horizontally-disposed shelves which are positioned at different vertical levels of said container for holding on each shelf at least three laterally adjacent stacks of trays, each shelf having a front side and a back side and a centrally located guide strip extending from near the back side to near the front side with the guide strip being substantially parallel to the other two sides of the shelf and having short guide ribs extending from the said other two sides at right angles thereto;

(2) unloading means for unloading a stack of trays from said container and having a configuration such that the unloading means is capable of being inserted under a lowermost tray of the middle stack of said trays of said three adjacent stacks of trays and supporting that middle stack of trays;

(3) unloading moving means for moving said unloading means; and

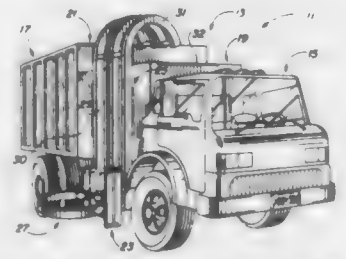
(4) control means for controlling the movement of the unloading means such that the unloading means is movable:

(a) vertically adjacent said container such as to place said unloading means at the top of a first shelf to be unloaded;

(b) horizontally forward such as to insert said unloading means under said lowermost tray of said middle stack of trays;

(c) vertically to slightly elevate the stack of trays from the shelf;

(d) laterally such as to loosen said middle stack of trays from said adjacent stacks so that the middle stack of trays is removable without interference from the other stacks of trays of the said three adjacent stacks of trays; and



(e) horizontally backwards such as to remove said middle stack of trays from said container.

5,007,786

REFUSE COLLECTION SYSTEM, REFUSE COLLECTION TRUCK AND LOADER ASSEMBLY THEREFOR

John W. Bingman, Mesa, Ariz., assignor to Sunbelt Automated Systems, Inc., Phoenix, Ariz.

Filed Dec. 8, 1988, Ser. No. 281,558
Int. Cl.[5] B65F 3/02
U.S. Cl. 414—409 13 Claims

13. An improved refuse collection system including a refuse truck having a truck cab for housing at least an operator, a truck frame, and a bed carried by said frame, said bed including an elongated bottom, a pair of longitudinal sides, a front end, and a rear tailgate defining a substantially hollow bed interior divided into an open top loading station and a refuse storage portion, said system including a refuse container-loading apparatus comprising:

rail means operatively fixedly mounted to at least one of said truck frame and one side of said bed adjacent said open top loading station at substantially one side of said truck, said rail means including means for forming a first set of wheel channels and a drive chain channel, said rail means including a relatively vertical lower end portion and a partially semicircular arcuately downwardly turned upper end portion extending over said one side of said bed and facing on said open top loading station;

carriage means including wheel means operatively disposed within said set of wheel channels for up and down movement therein and having a down home position and an up dump position;

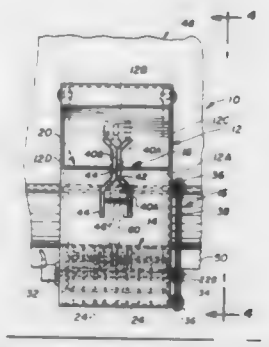
means operatively carried by said carriage means for retainably engaging and releasing a selected refuse container;

means operatively coupling said carriage means and said engaging and releasing means for extending said engaging and releasing means to a pick-up position a predetermined distance from said one side of said bed and spaced from said rail means for retainably engaging a refuse container to be emptied and releasing an emptied refuse container and retracting said engaging and releasing means to a home position adjacent said one side of said bed for enabling said carriage means to lift and lower same along said rail means for dumping purposes;

a single finite length of sprocket drive chain having first and second end portions which are unconnected from one another housed within said drive chain channel for up and down movement along said rail means;

means for operatively coupling and uncoupling said drive chain to said carriage means;

hydraulic motor means for driving said drive chain up and down said rail means; and



speed control responsive to the actual speed, acceleration and deceleration of said carriage means for automatically controllably adjusting the speed, acceleration and deceleration of said hydraulic motor means for minimizing the time required to lift a refuse can to be emptied, dump the contents thereof into said open top loading station and lower said emptied refuse container to said home position while simultaneously optimizing to dumping efficiency of system.

5,007,787

BAG CLAMPING DEVICE FOR WASTE MATERIAL DEBAGGING APPARATUS

Llewellyn R. Schnader, New Holland, Pa., assignor to Ford New Holland, Inc., New Holland, Pa.

Filed Dec. 26, 1989, Ser. No. 456,707
Int. Cl.[5] B65G 65/34
U.S. Cl. 414—412 6 Claims

1. A material debagging apparatus comprising:

a receptacle defining a chamber for holding bagged material;

means for rupturing a bag disposed in said chamber and at least partially filled with material, said rupturing means being carried on said receptacle;

drive means for operating said rupturing means to cause rupturing of the bag;

means mounted on said receptacle for releasably clamping the bag in order to releasably secure the bag to said receptacle; and

said clamping means including a pair of clamp members positioned side-by-side and normally disposed in a clamping condition for clamping and securing a top end portion of the bag, at least one of said clamp members being yieldably movable relative to said other clamp member to dispose said clamp members in a nonclamping condition for releasing the bag top end portion.

PITCH CHANGING DEVICE FOR CHANGING PITCHES OF PLATE-LIKE OBJECTS AND METHOD OF CHANGING PITCHES

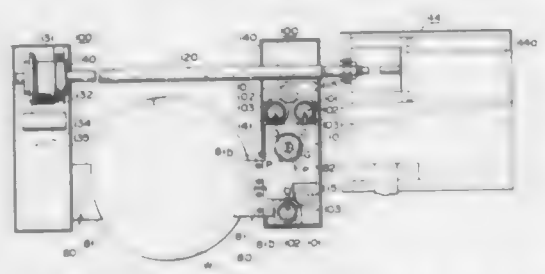
Takanobu Asano, Yokohama; Kenichi Yamaga, and Wataru Ohkase, both of Sagamihara, all of Japan, assignors to Tel Sagami Limited, Kanagawa, Japan

Filed Apr. 24, 1989, Ser. No. 342,345
Claims priority, application Japan, Apr. 25, 1988, 63-103403; May 17, 1988, 63-119580; Jul. 19, 1988, 63-179773
Int. Cl.[5] B65G 65/00
U.S. Cl. 414—417 6 Claims

1. A pitch changing device for changing pitches of semiconductor wafers arranged in parallel to each other, comprising:

means for unloading a plurality of wafers arranged in containing means at predetermined pitches while the pitches are kept unchanged; and

holding means for holding the unloaded wafers while the pitches are depth unchanged,



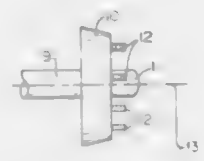
said holding means including,

a plurality of movable members for respectively holding the unloaded wafers,

elastic means, including a plurality of springs, for varying the pitches between the wafers which are held by the movable members, and

driving means, including a drive shaft surrounded by the

springs, flow allowing expansion/contraction of said springs, wherein pitches of the wafers are changed when



said springs are expanded/contracted by the driving means while the wafers are respectively held by the movable members.

VEHICLE WHEEL MOUNTING APPARATUS

Michael A. Painter, 15401 Stonewood Ter., Sherman Oaks, Calif. 91403

Filed Sep. 29, 1989, Ser. No. 414,[illegible]1
Int. Cl.[5] B60B *29/00*
U.S. Cl. 414—427 5 Claims

1. A vehicle wheel mounting apparatus for mounting a vehicle tire and wheel upon a vehicle axle comprising:

(a) a mounting base having a top and bottom surfaces;

(b) a plurality of wheel assemblies secured to the bottom surface of said mounting base;

(c) a positioning guide secured to the mounting base and extending upwardly from the top surface thereof;

(d) a wheel positioning member comprising an arcuate positioning frame having arcuate top and bottom surfaces and first and second longitudinal edge surfaces, the latter being in parallel spaced relation to each other;

(e) a plurality of equally spaced roller assemblies, each roller assembly including an axle and a cylindrical roller suitably journaled thereabout, each axle being secured between the first and second longitudinal edge surfaces, said roller assemblies being in parallel relation to each other, the cylindrical surface of each of said rollers uniformly extending above the arcuate top surface of said positioning frame, the cylindrical surfaces of said rollers being in contact with and adapted to uniformly support the vehicle tire whereby the tire may be rotated about its axis for alignment with the axle;

(f) guide means for guiding the vertical movement of said wheel positioning member along the positioning guide, said guide means coupled to the first longitudinal edge surface of said positioning frame; and

(g) hoisting means for lifting said wheel positioning member relative to the mounting base, said hoisting means being coupled intermediate the positioning frame and said mounting base.

SUSTAINED-RELEASE ORAL DRUG DOSAGE FORM

John W. Shell, Hillsborough, Calif., assignor to DepoMed Systems, Inc., Hillsborough, Calif.

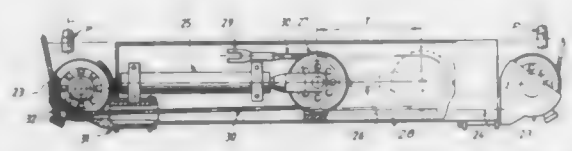
Filed Apr. 11, 1989, Ser. No. 336,440
Int. Cl.[5] A61K *9/48*
U.S. Cl. 424—451 9 Claims

1. A sustained-release oral drug dosage form for releasing a solution of drug into the stomach comprising:

a plurality of solid particles of a solid-state drug dispersed within a hydrophilic, water-swellable polymer that (i) swells via imbibition of gastric fluid to increase the particle size to a level that promotes retention in the stomach over said time period, (ii) permits dissolution of the dispersed drug by imbibed gastric fluid while the drug is within the particle and release of the resulting solution via a leaching action from the particles, thus assuring that drug only in solution reaches contact with the gastric mucosa, and (iii) maintains its physical integrity for at least a substantial portion of the time period during which the drug is released into he stomach and thereafter rapidly dissolves,

wherein said drug is selected from the group consisting of calcium carbonate, cimetidine, ranitidine, indomethacin, ibuprofen, naproxen, prednisone, prednisolone, dexamethasone, piroxicam, aspirin, nifedipine, and potassium chloride,

and wherein said polymer is selected from the group of polymers consisting of crosslinked gelatin, crosslinked albumin, crosslinked sodium alginate, crosslinked carboxymethylcellulose, crosslinked polyvinyl alcohol, and crosslinked chitin,



and wherein said dosage form is in the form of a tablet or capsule that maintains the particles in a packed mass prior to their ingestion and then rapidly disintegrates in gastric fluid to permit the particles to disperse in the stomach after their ingestion.

VEHICLE-MOUNTED LOAD HOISTING DEVICE

Hans Wiedeck, Mendener Strasse 82, D-4430 Mülheim, Fed. Rep. of Germany, and Michel Chiesura, Residence les Arcs Rue Moliere, F-42160 Andrezieux Boutheon, France

Filed Jul. 18, 1988, Ser. No. 220,672
Claims priority, application Fed. Rep. of Germany, Jul. 17, 1987, 3723604
Int. Cl.[5] B60P *1/16*
U.S. Cl. 414—500 17 Claims

1. In a vehicle-mounted load hoisting device for loading and unloading a load from a vehicle, including

a pivot frame having first and second ends; said pivot frame being mounted on the vehicle at said first end for pivotal motion about a first axis extending horizontally and transversely to a longitudinal direction of the vehicle;

a stop face provided on said pivot frame;

a cantilever arm having first and second ends; said cantilever arm being connected at the first end thereof to the second end of said pivot frame for pivotal motion relative to said pivot frame about a second axis extending spaced from and parallel to said first axis;

a power means supported on the vehicle and being articulated to said cantilever arm for pivoting said cantilever arm about said second axis into contact with said stop face;

the improvement comprising

(a) a pivot arm having first and second ends; said pivot arm being articulated at the first end thereof to the second end of said cantilever arm for pivotal motion relative to said cantilever arm about a third axis oriented parallel to said first and second axes and being spaced therefrom;

(b) a pulley mounted at the second end of said pivot arm;

(c) a winch;

(d) an elongated, flexible hoisting means wound on the winch and trained about said pulley and being adapted to extend from said pulley for attachment to the load;

(e) locking means for locking said cantilever arm and said pivot frame together to form a rigid unit pivotal about said first axis; in said rigid unit said cantilever arm being in contact with said stop face and extending as a longitudinally aligned continuation of said cantilever arm; and

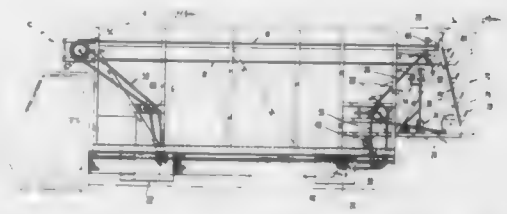
(f) a pair of catch hooks for standard pallets and standard containers; said catch hooks are pivotal out of the way.

5,007,793

BULK CONTAINERS AND APPARATUS FOR LOADING BULK CONTAINERS ONTO A TRUCK

John M. Irvin, 2905 Dolphin Dr., Miramar, Fla. 33025

Filed Aug. 21, 1989, Ser. No. 396,579
Int. Cl.[5] B60P *1/36, 1/44*
U.S. Cl. 414—502 23 Claims



1. A self-loading truck for loading containers having interfacing means, comprising:

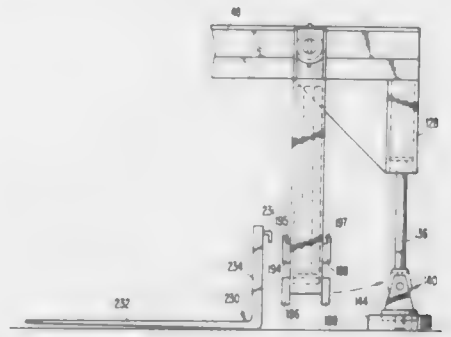
an elongate truck bed having a forward end and a rearward end;

lifting chain means mounted at the rearward end of said truck bed for releasably engaging said interfacing means and lifting and suspendedly supporting said containers to be loaded from a support surface onto said truck, said lifting chain means includes a pair of laterally spaced lift chain members, each member of said pair being disposed on an opposite side of said truck bed relative to the other member of said pair and each chain member forming a continuous loop;

horizontally disposed displacement chain means for suspendedly supporting above said truck bed containers lifted from said support surface by said lifting chain means;

said displacement chain means being mounted to said truck and extending substantially the entire longitudinal extent of said truck bed, said displacement chain means includes

a pair of laterally spaced, horizontally disposed chain members, each member of said pair of horizontal chain members being disposed on an opposite side of said truck bed relative to the other member of said pair of horizontal chain members and each horizontal chain member forming a continuous loop; and



said lifting chain means being closely spaced to a rearward end of said displacement chain means so that containers lifted by said lifting chain means are deposited by said lifting chain means onto said displacement chain means.

5,007,794

LOAD-CARRYING ATTACHMENT FOR MOTOR VEHICLES

José O. Lombard, Miami, Fla., assignor to Luis A. Figueroa, Coral Gables, Fla.

Division of Ser. No. 171,892, Mar. 22, 1988, Pat. No. 4,880,347.
This application Apr. 27, 1989, Ser. No. 343,684
Int. Cl.[5] B60P *1/46*
U.S. Cl. 414—542 20 Claims

1. A load-carrying attachment for a cargo carrying vehicle to unload cargo from or load cargo onto said vehicle when said attachment is attached to said vehicle, said attachment comprising:

a pair of spaced horizontal support beam assemblies having first and second ends, said beam assemblies being connected, said first ends of said support beam assemblies being attachable to said vehicle;

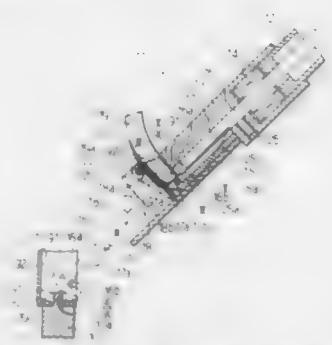
first and second leg members, said first leg member being attached to one of said support beam assemblies, said second leg member being attached to the other of said support beam assemblies;

an elongated mast having a longitudinal axis and being slidably attached to said beam assemblies such that said mast is movable along said beam assemblies, said mast being positioned between said beam assemblies, said mast also

being rotatably attached to said beam assemblies about a horizontal axis substantially perpendicular to said beam assemblies and substantially perpendicular to the longitudinal axis of said mast so as to be rotated between a use position and a non-use position;

a carriage slidably attached to said mast such that said carriage can slide parallel to the longitudinal axis of said mast; and

first means removably attachable to said carriage for engaging a load;



wherein said attachment is capable of unloading cargo from or loading cargo onto said vehicle when said horizontal support beam assemblies are attached to said vehicle.

5,007,795

SUPPLY HEAD OF NUT FEEDER

Masahiro Yoshimura, Nagoya, Japan, assignor to Yajima Kogyo, Inc., Nagoya, Japan

Filed Oct. 6, 1989, Ser. No. 418,311
Int. Cl.[5] B65L *1/00*
U.S. Cl. 414—737 2 Claims

1. A supply head of a nut feeder comprising:

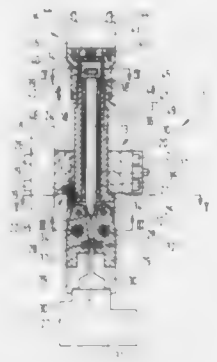
(a) a chute having a cylindrical body for transferring a T-shaped welding nut, said nut including a cylindrical tapped portion, and a flange portion formed in the tapped portion and having convexly curved arcuate end surfaces in a major axis direction and both end surfaces in a minor axis direction made planes in parallel to each other;

(b) a sleeve arranged at a front end of the supply head body for connecting said chute to the font end, a coil mounted to said sleeve and a bottom plate fixed to a lower side of the front end, said bottom plate having a pair of grooves;

(c) a nut holder fixed to said bottom plate between said grooves and having a semi-arc shaped receiving surface abutting on the outer circumferential surface of the lower side of the tapped portion of a nut transferred through said chute and holding the axial direction of the tapped portion of the nut in parallel to said sleeve;

(d) a rod arranged movable forward and backward in the sleeve axial direction within said sleeve and selectively magnetized by energization of said coil, a front end of said rod having a holding surface attracting an end surface of the tapped portion of a transferred nut when said coil is energized to magnetize said rod and said rod is moved forward to insert a projection in the tapped hole of the tapped portion of the nut at the center of the holding surface;

(e) a guide member fixed to the front end of said rod, said guide member having two side walls with each side wall movable in one of said bottom plate grooves and guiding an end surface in the minor axis direction of the flange portion of the transferred nut; and



(f) a shutter being opend or closed freely so as to lock the front side of the transferred nut at the front end of said sleeve.

HANDLING SYSTEM FOR WORKPIECES

Walter Sticht, Karl-Heinrich-Waggerl-Strasse 8, A-4800 Attnang-Puchheim, Austria

Continuation of Ser. No. 300,222, Jan. 23, 1989, abandoned, which is a continuation of Ser. No. 175,608, Mar. 28, 1988, abandoned, which is a continuation of Ser. No. 804,292, Dec. 3, 1985, abandoned. This application Feb. 27, 1990, Ser. No. 488,442
Claims priority, application Austria, Dec. 7, 1984, 3887/84
Int. Cl.[5] B25J *15/04*
U.S. Cl. 414—751 7 Claims

1. A system for handling a workpiece, comprising

(a) a carrier frame,

(b) a gripper device secured to the carrier frame, the gripper device comprising

(1) gripping means having gripping elements actuatable to

(2) a housing including a cylindrical housing member and a bearer head adjoining one end of the cylindrical housing member and carrying the gripping means,

(3) means for actuating the gripping means arranged in the housing, the actuating means comprising a guiding rod extending through the cylindrical housing member and cooperating with the gripping elements, the cylindrical housing member defining a longitudinal guide for the guiding rod, and

(4) a driving device coupled to the guiding rod at an end of the cylindrical housing member opposite the one end for moving the guiding rod along the longitudinal guide and thereby to actuate the gripping means,

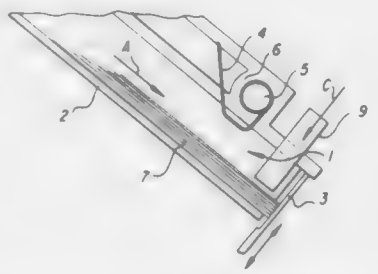
(c) bearing means for the cylindrical housing member, the bearing means comprising

(1) a clamping device holding the cylindrical housing member and securing the housing member with respect to the carrier frame, the clamping device comprising two cooperating clamping parts clamping the cylindrical housing member therebetwenn radially with respect to a longitudinal axis of the cylindrical housing member, the clamping parts and the bearer head having facing end faces extending in planes extending perpendicularly to the longitudinal axis of the cylindrical housing member, and

(2) the cylindrical housing member having a surface configuration designed to enable the housing member to fit the bearing means and to be held thereby,

(d) a first coupling device between the bearer head and the clamping device and cooperating therewith for holding the bearer head non-rotatably with respect to the bearing means, the first coupling device comprising

(1) aligned bores extending in the end faces of the bearer head and the clamping parts substantially parallel to the longitudinal axis and holding pins inserted into the aligned bores, and



(e) wherein the driving device is replaceably coupled to the guiding rod at the opposite cylindrical housing member end.

FLAPPING RESTRAINER DEVICE FOR ROTORCRAFT ROTOR BLADES, AND ROTOR HEAD COMPRISING SAID DEVICE

René L. Mouille, Aix-en Provence, and Robert J. Suzzi, Marseille, both of France, assignors to Societe Nationale Industrielle et Aerospatiale, Paris, France

Filed Sep. 22, 1989, Ser. No. 411,128
Claims priority, application France, Sep. 23, 1988, 88 12491
Int. Cl.[5] F01D *3/00*
U.S. Cl. 416—104 21 Claims

1. A flapping restrainer device for the blades of a rotorcraft main rotor, of the type including a hub mast assembly having a retaining means for the retention and articulation of the blades on the hub and at least one tubular part below the retaining means, comprising:

lower flapping restrainer means for restraining flapping of the blades, said lower flapping restraining means comprising at least one rigid component for support of the blades, said at least one rigid component being mounted to slide radially on a support fixed coaxially in the tubular part of the hub mast assembly;

each said blade having a lower supporting runner connected for movement with a root of the respective said blade so

as to limit the displacement of each respective said blade in a downward direction by engagement with said at least one rigid component; wherein said at least one rigid component is a plate having a plurality of branches;

resilient restoring means for resiliently biasing said plate toward a predetermined position;

wherein the number of said branches is equal the number of said blades, said plurality of branches being regularly distributed in a circumferential direction about said plate, each of said plurality of branches extending outwardly in a direction which is substantially radial in relation to said plate; each of said plurality of branches being engaged in respective openings disposed in said hub mast assembly, wherein each said lower supporting runner is disposed substantially entirely externally of said hub mast assembly, and wherein each said lower supporting runner is restrained against said external radial end of a corresponding one of said branches to limit downward flapping of each corresponding said blade.

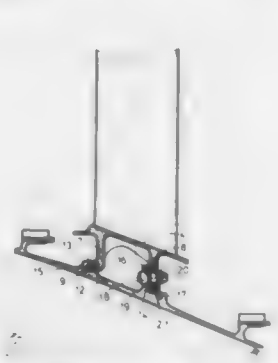
ROTOR BLADE FIXING FOR TURBOMACHINE ROTORS



Michel G. P. Hacault, Massy Villaine; Bertrand J. J. M. Heurtel, Vert Saint Denis, and Jacques R. Serre, Melun, all of France, assignors to Societe Nationale D'Etude Et De Construction De Moteurs D'Aviation "S.N.E.C.M.A.", Paris, France

Filed Oct. 4, 1989, Ser. No. 417,324

Claims priority, application France, Oct. 5, 1988, 88 13004

Int. Cl.[5] F01D *5/30*

U.S. Cl. 416—220.00 R **4 Claims**

1. A turbomachine rotor having:

a rotor drum, said drum being provided with

at least two radially outwardly directed flanges spaced axially apart from each other and defining an upstream drum flange and a downstream drum flange with respect to the direction of flow of gases through said turbomachine rotor,

a circular row of evenly spaced holes through said downstream drum flange, and

an annular groove adjacent the base of said downstream drum flange on the downstream side thereof;

a stage of rotor blades mounted circumferentially on said rotor drum, said stage including a plurality of blade platforms, each of said platforms carrying

at least two radially inwardly directed flanges spaced axially apart from each other and defining an upstream platform flange and a downstream platform flange cooperating respectively with said upstream and downstream flanges of said drum,

said downstream platform flange having at least one hole registering with at least one of said holes in said downstream drum flange;

a generally cylindrical pin projecting through each pair of registering holes of said downstream drum and platform flanges, each of said pins having

a substantially central radial collar interposed between said downstream drum flange and said downstream platform flange, and

an annular groove disposed downstream of said collar; and

a plurality of scalloped segments disposed in said annular groove of said drum,

each of said segments having its radially outer edge defining teeth separated by a plurality of cut-outs, each of said teeth being received in said annular groove of one of said pins to hold said pins and said rotor blades in position radially, axially and tangentially,

and each of said segments carrying a tongue at each end thereof, one of said tongues extending radially and the other of said tongues being bent at right angles to permit movement of said segment to engage said teeth in said grooves of said pins, said other tongue thereafter being radially straightened to lock said segments, said pins and said rotor blades in position.

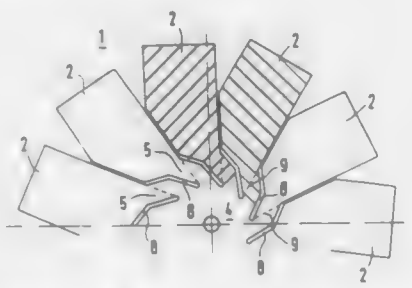
IMPELLER MADE FROM A SHEET-METAL DISK AND METHOD OF MANUFACTURING SAME



Reinhold Hopfensperger, Dietelskirchen, and Werner Eichhorn, Landshut, both of Fed. Rep. of Germany, assignors to Standard Elektrik Lorenz Aktiengesellschaft, Stuttgart, Fed. Rep. of Germany

Filed Aug. 9, 1988, Ser. No. 230,145

Claims priority, application Fed. Rep. of Germany, Aug. 10, 1987, 3726522

Int. Cl.[5] F01D *5/14*

U.S. Cl. 416—223 R **9 Claims**

1. An impeller made from a sheet-metal disk, comprising:

a plurality of radially outwardly extending blades having widths, said blades being formed by radial cuts in the sheet-metal disk,

a circular-saw-blade-shaped flat center piece having sawtooth-shaped projections, and

a plurality of blade roots bent out of the plane of said center piece and extending from said sawtooth-shaped projections, connecting said blades at approximately a right angle with the plane of said center piece, to said center piece, said blades having radially inward portions extending radially outward from said roots, said radially inward portions having opposite edges defined by the cuts, said radially inward portions of the respective blades having such dimensions that in a development of the impeller with said roots and said blades in the plane of said center piece, the edges of adjacent blades are substantially aligned with fold lines along which said roots are bent out of the plane of said center piece and said blades are separated by approximately S-shaped slots, each of said slots originating at one end thereof at a radially inward end of the fold line along which one of the roots is bent, said each of said slots terminating at a radially outward end thereof along an outward line which is located radially outside of and aligned with the fold line of another of the roots which is adjacent to one of the roots, the outward ends of said slots separating said edges of adjacent blades from each other by gaps which are narrower than the widths of the blades.

6. A method of manufacturing an impeller from sheet material, comprising the following steps:

providing a flat blank,

stamping the blank to form a center piece having sawtooth-shaped projections, blade roots adjacent the sawtooth-shaped projections, and successively adjacent blades extending radially outward from the blade roots, the blades having radially inward portions connected to the roots, the radially inward portions having opposite edges, said step of stamping includes the step of separating the blades with approximately S-shaped slots, each of the slots originating at one end thereof at a radially inward end of the straight line along which one of the blade is bent, each of the slots terminating at a radially outward end thereof along an outward line which is located radially outside of and aligned with the straight line of another of the blades which is adjacent to the one of the blades, the radially outward ends of said slots separating the opposite edges of a respective one of the blades from one of the edges of an adjacent blade by a respective gap which is narrower than widths of the blades, and

bending the blades out of the plane of the center piece by about 90 angular degrees on a straight line at the boundary between the sawtooth-shaped projections and the blade roots.

AIR OPERATED VACUUM PUMP

Anthony M. DiVito, Youngstown, and Lee H. Giesecke, Warren, both of Ohio, assignors to Global Pump, Inc., East Palestine, Ohio

Filed Sep. 28, 1989, Ser. No. 414,092

Int. Cl.[5] F04F *1/02*

U.S. Cl. 417—137 **15 Claims**

1. A method of pumping corrosive and erosive liquids, abrasive slurries and the like, the method comprising:

providing a fluid-tight pump body having respective inlet and outlet orifices communicating therewith in a lower portion of the pump body and one-way check valve means associated with each of said orifices;

providing nozzle means having an axial bore positioned in an upper portion of said pump body said nozzle means having an inlet end adapted to be placed in communication with a source of pressurized air and having an outlet end communicating with said pump body and in spaced relationship to a first end of an axially aligned exhaust passage;

providing pinch valve means having an elastomeric sleeve in said exhaust passage to permit air flow through said exhaust passage when in an open position and to shut off air flow therethrough when in a closed position; and

providing control means to selectively open and close said pinch valve means;

introducing a flow of pressurized air through said nozzle means and said exhaust passage to create a vacuum condition within said pump body when said pinch valve means is in an open position and to create a pressurized condition within said pump body when said pinch valve means is in a closed position;

regulating the flow of pressurized air to a first flow rate valve through the nozzle means when the vacuum condition exists within the pump body; and

regulating the flow of pressurized air to a second flow rate valve through the nozzle means when the pressurized condition exists within the pump body.

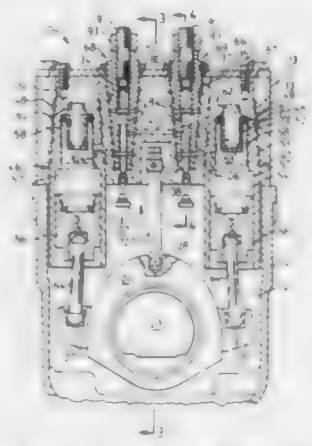
REVERSIBLE VARIABLE DISPLACEMENT HYDRAULIC DEVICE

James C. Goade, Joliet, Ill., and Claude H. Werner, Manhattan, Ill., assignors to Caterpillar Inc., Peoria, Ill.

Filed Jul. 2, 1990, Ser. No. 548,808

Int. Cl.[5] F04B *49/00, 1/30;* **F01B** *13/04*



U.S. Cl. 417—216 **38 Claims**

1. A reversible, variable displacement hydraulic device having a case and a drain cavity defined by the case, an angularly adjustable swash plate resiliently biased to a centered position and moveable in a clockwise direction from the centered position to control the displacement of the device in a first direction of operation and in a counterclockwise direction from the centered position to control the displacement of the device in a second direction of operation, first actuator means

for angularly moving the swash plate in the clockwise direction, and second actuator means for angularly moving the swash plate in the counterclockwise direction, comprising:

first and second servo valve means for controlling communication of hydraulic actuating fluid to the first and second actuator means respectively;

an elongate feedback plate pivotally connected to the case and having opposite end portions disposed in operational contact with the first and second servo valve means;

a "T" shaped follow-up lever pivotally connected to the case and having a pair of arms spaced from the end portions of the feedback plate;

a pair of springs disposed between the arms of the lever and the end portions of the feedback plate; and

means for connecting the lever to the swash plate so that the lever is pivoted in response to angular movement of the swash plate.

HERMETIC COMPRESSOR HAVING RESILIENT INTERNAL MOUNTING

Edwin L. Gannaway, Adrian, Mich., assignor to Tecumseh Products Company, Tecumseh, Mich.

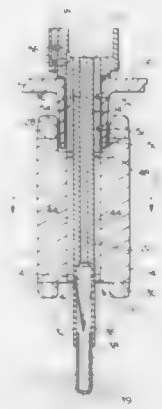
Filed Mar. 8, 1989, Ser. No. 320,554
Int. Cl.[5] F04B *39/00*
U.S. Cl. 417—363 20 Claims

1. In a vertically disposed compressor assembly comprising a compressor mechanism within a hermetically sealed housing having a sidewall, wherein said compressor mechanism includes a radially extending mounting flange having a top surface and a bottom surface, a mounting apparatus for resiliently mounting said compressor mechanism to said housing sidewall, comprising:

a plurality of circumferentially spaced mounting bores formed in said mounting flange, each said mounting bore extending vertically through said mounting flange between said top surface and said bottom surface thereof;

a plurality of anchoring members corresponding to said plurality of mounting bores, each said anchoring member being connected to said housing sidewall and extending substantially coaxially through a respective said mounting bore, thereby defining an annular space intermediate the anchoring member and the mounting bore;

a plurality of resilient members corresponding to said plurality of mounting bores, each said resilient member being disposed within a respective mounting bore in a manner to substantially occupy said annular space; and



a plurality of axial support means corresponding to said plurality of anchoring members, for axially supporting said compressor mechanism, each said axial support means being connected to a respective anchoring member and contacting said mounting flange bottom surface at a location thereon circumjacent a respective said mounting bore, whereby said compressor mechanism is axially supported and movement of said compressor mechanism in a lateral plane is resiliently restrained.

5,007,808

SLOTTED ROTOR LUBRICATION SYSTEM

Howard H. Fraser, Jr., Lafayette, and Mark P. Weldon, Liverpool, both of N.Y., assignors to Carrier Corporation, Syracuse, N.Y.

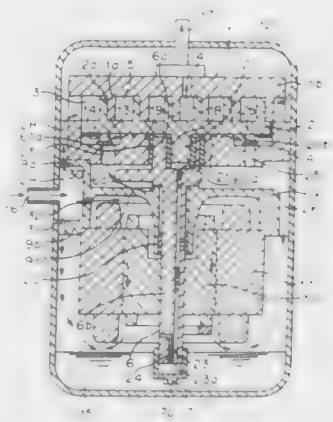
Filed Dec. 15, 1989, Ser. No. 451,152
Int. Cl.[5] F04B *39/02*
U.S. Cl. 417—368 5 Claims

1. A vertical rotor structure for a hermetic compressor, the rotor structure comprising:

a shaft having a central portion of a predetermined diameter and an upper portion of a greater diameter which fits into a bearing of the compressor, said shaft having an axial central bore, and means on a lower end of said shaft for carrying a liquid lubricant into the bore of said shaft;

a rotor disposed on the central portion of said shaft and formed of a stack of laminations, with an upper one of said laminations abutting a lower end of said upper portion of the shaft, said stack having a central bore to receive said shaft central portion and at least one slot therein continuous with said central bore and extending generally axially;

a lower distribution channel communicating radially from the central bore to a lower end of said at least one slot for permitting the lubricant to flow into said at least one slot where it is driven by rotational forces to an upper end of the at least one slot; and



at least one upper distribution channel in said shaft upper portion which communicates through a lower end of the upper portion directly with the upper end of said at least one slot and which conducts the lubricant from the upper end of said at least one slot to one or more bearing surfaces of said upper portion.

5,007,809

SCROLL COMPRESSOR WITH DIVIDING CHAMBER FOR SUCTION FLUID

Tadashi Kimura; Tetsuzo Matsugi, and Yasuyuki Suzuki, all of Wakayama, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Nov. 28, 1989, Ser. No. 442,152
Claims priority, application Japan, Dec. 7, 1988, 63-310327
Int. Cl.[5] F04B *39/06;* F04C *18/04;* H02K *9/12*
U.S. Cl. 417—371 10 Claims

1. A scroll compressor comprising:

a compression mechanism comprising a combination of a fixed scroll and an orbiting scroll;

a main shaft for driving the orbiting scroll;

an electric motor rotor and stator for driving the shaft;

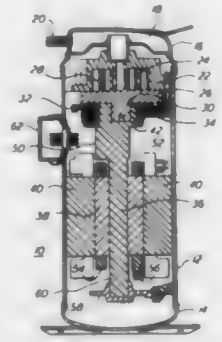
a first bearing frame for supporting the orbiting scroll in the axial direction via a bearing;

a second bearing frame for supporting the shaft in the radial direction via a bearing;

a hermetic shell including the compression mechanism in an upper portion, the rotor and stator in a lower portion, and a suction pipe for inspiring a working fluid; and

means forming a dividing chamber arranged in the shell so as to communicate with the suction pipe and having efflux holes for respectively directing the inspired working fluid into three separate paths, said paths comprising a first path directed to the compression mechanism in the upper portion, a second path directed to the stator and rotor in the lower portion, and a third path directed to an upper coil end of the stator placed in a position lateral to the chamber.

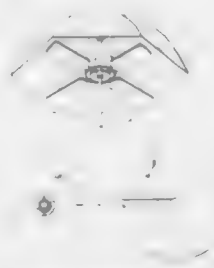
5,007,810



SCROLL COMPRESSOR WITH UNITARY CRANKSHAFT, UPPER BEARING AND COUNTERWEIGHT

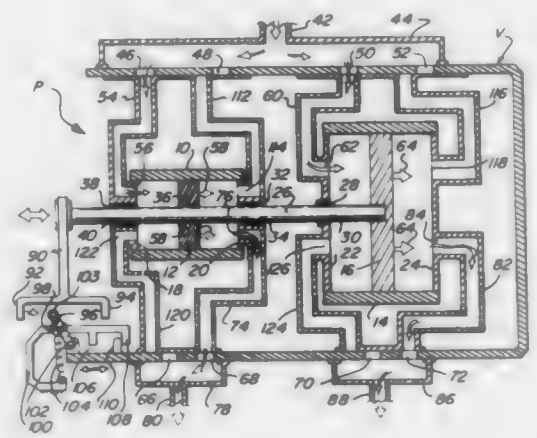
Howard H. Fraser, Jr., Lafayette, and Thomas R. Barito, East Syracuse, both of N.Y., assignors to Carrier Corporation, Syracuse, N.Y.

Filed Dec. 4, 1989, Ser. No. 445,552
Int. Cl.[5] F04B *35/04;* F04C *18/04, 29/00*
U.S. Cl. 417—410 5 Claims



1. A scroll compressor of the type including a shell which contains a fixed scroll and an orbiting scroll which is disposed off the axis of the fixed scroll for revolving about the axis of the fixed scroll, rotation-preventing means for holding the orbiting scroll against rotation but permitting it to revolve in an orbiting motion, an electric motor stator mounted within said shell and having a cylindrical passage therethrough of a predetermined radius, an electric motor rotor assembly rotatably journalled within the shell for driving said orbiting scroll in its

orbiting motion, the rotor assembly including an elongated crankshaft, a generally cylindrical rotor mounted on said crankshaft and fitting in said generally cylindrical passage of said stator, a crank situated at an upper end of said crankshaft and that is journalled in a journal housing member beneath said orbiting scroll, said crank including eccentric mounting means for driving said orbiting scroll and imparting said orbiting motion thereto, a counterweight on said crankshaft which balances the off-axis orbiting motion of said orbiting scroll, and



a lower bearing rotatably journalling a lower end of said crankshaft; wherein the improvement comprises said counterweight being integrally formed with said shaft, said counterweight being disposed within a radius no greater than said predetermined radium so as to be dimensioned to pass through said stator passage upon installation, and said conterweight being formed immediately adjacent the position of said crank below said journal housing, there being no structure other than the rotor assembly within said predetermined radius between said motor stator and said journal housing.

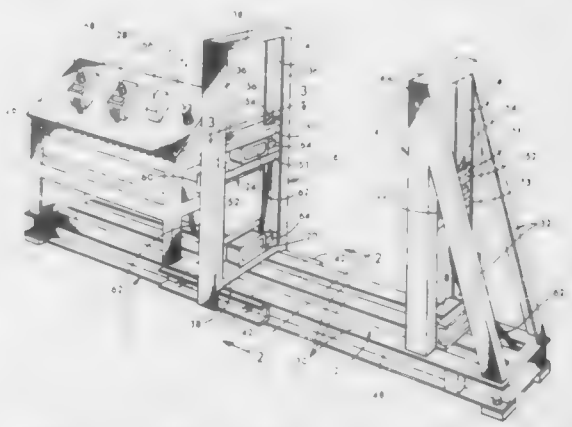
5,007,811
ELECTRIC FAN FOR PATIO UMBRELLA
Michael H. Hopkins, 315 W. 2nd St., Brenham, Tex. 77833
Filed Jul. 13, 1989, Ser. No. 379,085
Int. Cl.[5] A45B *23/00*
U.S. Cl. 135—16 **22 Claims**

1. An electric fan drive mountable on and about a unitary support shaft comprising:
a rotatable drive ring wherein said support shaft is positioned substantially perpendicular to and extending through said drive ring;
support means positioned on the outer surface of said unitary support shaft for rotatably supporting said drive ring;
an electric motor fixedly positioned adjacent said support shaft, said motor having at least one rotatable motor shaft extending from said motor; and
drive means coupling said motor shaft to said drive ring and adapted to transfer rotary motion from said motor shaft to said drive ring.

5,007,812
HYDRAULIC PUMP WITH PULSATING HIGH AND LOW PRESSURE OUTPUTS
Joseph R. Hartt, 6352 S. Poplar Ct., Englewood, Colo. 80122
Filed Sep. 5, 1989, Ser. No. 402,603
Int. Cl.[5] F04B *21/02*
U.S. Cl. 417—534 **17 Claims**

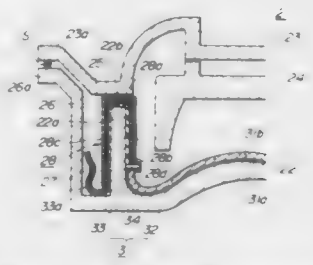
1. A method for providing a pulsating high pressure fluid output simultaneously with a pulsating low pressure output from a single high pressure, substantially non-compressible fluid input comprising the step of:
supplying a substantially non-compressible fluid from a single fluid supply inlet at a first pressure simultaneously to one side of a first cylinder of given diameter and one side of a second cylinder of given diameter to move a piston within each cylinder from one end thereof to the other; and
simultaneously discharging the same fluid from the first cylinder on the side of the piston opposite the one side at a high pressure and from the second cylinder on the side of the piston opposite the one side at a lower pressure

3. An hydraulic pump for providing a simultaneous pulsating high pressure and pulsating low pressure fluid output from a single, substantially non-compressible fluid input at a predetermined pressure, said pump comprising:
a first double acting piston and cylinder having first diameters, respectively, said first cylinder having a pair of first and second inlets on opposite sides of said first piston and a pair of first and second outlets on the opposite side of said first piston;
a second double action piston and cylinder having second diameters, respectively, said second cylinder having a pair of first and second inlets on opposite sides of said second piston and a pair of first and second outlets on opposite sides of said second piston;
a common piston rod interconnecting said pistons; and
means for alternately supplying a single, substantially non-compressible fluid to said first inlets of said first and second cylinders on said one side of each of said of said pistons, and then to said first inlets on said other side of each of said pistons to cause said first and second pistons to reciprocate within said first and second cylinders, respectively, so that said first piston discharges the same fluid through an outlet on the opposite side of said first piston from the inlet through which fluid enters to provide high pressure pulsating fluid output from said outlets of said first cylinder and said second piston discharges the same fluid through an outlet on the opposite side of said second piston from the inlet through which fluid enters to provide low pressure pulsating fluid output from said outlets of said second cylinder.



5,007,813
ROTARY ROLLING PISTON COMPRESSOR WITH FIXED VANE HAVING A RELIEVED INCLINE SECTION
Caio N. F. N. Da Costa, Joinville, Brazil, assignor to Empresa Brasileira de Compressores S/A - Embraco, Joinville, Brazil
Filed Jun. 12, 1989, Ser. No. 365,176
Claims priority, application Brazil, Jun. 15, 1988, 8802997
Int. Cl.[5] F04C *18/356, 29/02*
U.S. Cl. 418—63 **11 Claims**

1. A rotary rolling piston compressor comprising:
a shell,
a cylinder mounted within said shell,
a piston having an eccentric portion for rotation within said cylinder,
a shaft for rotating said piston,
a slot formed on an external part of said cylinder,
the shell containing lubricating oil which is also in the slot,
a vane whose lower end is within said slot, means for biasing the vane lower end to provide for reciprocating motion between the slot walls as the vane upper end rides against the rotating piston, the vane defining with the cylinder and piston on one side of the vane a suction chamber and on the other side a compression chamber,
the upper portion of the vane on the suction chamber side being planar in a plane parallel to the face of the compression chamber side of the vane, the lower portion of said vane on the suction chamber side having at least one relieved inclined section of not more than about 5° to the vertical axis of the vane which is within the walls of the slot to produce a hydrodynamic wedge with the lubricating oil between the inclined section and the side wall of the slot on the suction chamber side as the vane moves down toward the lower end of the slot.



5,007,814
DEVICE FOR SEPARATING AND CLOSING A SPLIT MOLD HAVING TWO HALVES
Raymond L. Saunders, 16895 Town Hall Rd., Walworth, Wis. 53184, and Joseph M. Forrestal, 1800 Patton Pl., Janesville, Wis. 53546
Filed Feb. 5, 1990, Ser. No. 475,035
Int. Cl.[5] B29C *45/64*
U.S. Cl. 425—3 **8 Claims**

1. A device for separating and closing in a horizontal press a split mold having two halves to permit access to said mold halves, the device comprising:
(a) a base which the split mold may be positioned and supported, wherein the base has at least one horizontal beam adapted to carry the weight of the split mold positioned thereon;
(b) a stationary platen that extends upwardly from and is rigidly connected to the base and has an electromagnet mounted thereon capable of exerting an attractive electromagnetic force upon a first of the two halves of the split mold when the mold is positioned upon the base and the first of the two mold halves is positioned adjacent the stationary platen;
(c) a movable platen that extends upwardly from the base and that opposed the stationary platen, the movable platen capable of travel toward and away from the stationary platen and the movable platen having an electromagnet mounted thereon capable of exerting an attractive electromagnetic force upon a second of the two halves of the split mold when the mold is positioned upon the base and the second of the two mold halves is positioned against the movable platen;
(d) a cross member rigidly affixed to the movable platen and extending in the direction of the base beam and slidably engaged with the base beam to retain the perpendicularity of the movable platen relative to the base; and
(e) means for moving the movable platen toward and away from the stationary platen, the movement of the movable

platen toward the stationary platen acting to close the clearances between the halves of the split mold and the platens and the movement of the movable platen away from the stationary platen separating the first of the two mold halves from the second of the mold halves by the attractive electromagnetic force of the electromagnet of the stationary platen holding the first mold half against the stationary platen and the attractive electromagnetic force of the electromagnet of the movable platen holding the second mold half against the movable platen.

5,007,815
MOLD ASSEMBLY FOR PRODUCING SKIN-COVERED FOAMED PLASTIC ARTICLE
Makoto Shoji, Kanagawa, Japan, assignor to Ikeda Bussan Co., Ltd., Ayase, Japan
Filed Oct. 25, 1989, Ser. No. 426,554
Claims priority, application Japan, Oct. 31, 1988, 63-142207[U]
Int. Cl.[5] B29C *39/10, 39/26*
U.S. Cl. 425—117 **7 Claims**

1. A mold assembly for producing a skin-covered foamed plastic article, comprising:
a lower mold having a cavity formed therein, said lower mold including a bottom wall, an outer wall which extends around a periphery of said bottom wall, and an inner wall which extends inside of a first portion of said outer wall with a given clearance defined therebetween, said inner wall having two opposed ends integrally connected to said outer wall, said inner wall being adapted to be covered with an outside part of an outer skin member when said outer skin member is properly positioned

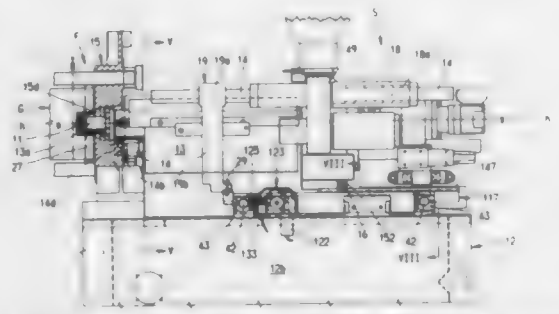
within said cavity, said cavity being defined by said bottom wall, a portion of said outer wall, and said inner wall;

a retaining member constructed of a resilient material, said retaining member defining a channel which is adapted to resiliently and detachably receive therein said inner wall with said outside part of said outer skin sandwiched therebetween, said retaining member including a top base wall, an inner wall extending downwardly from an inner edge of said top base wall, and an outer wall extending downwardly from an outer edge of said top base wall; and

an upper mold which is adapted to be placed on top of said lower mold to lose said cavity, said upper mold having a depressed portion which contacts said top base wall of said retaining member when said upper mold is properly positioned on said lower mold.

5,007,816

INJECTION MOLDING MACHINE HAVING A DISPLACEMENT CONTROL FOR AN INJECTING UNIT CARRIER



Karl Hehl, Arthur-Hehl-Str. 32, 7298 Loburg 1, Fed. Rep. of Germany

Filed Oct. 26, 1989, Ser. No. 431,174

Claims priority, application Fed. Rep. of Germany, Nov. 5, 1988, 3837640; Nov. 5, 1988, 3837641

Int. Cl.[5] B29C *45/76*

U.S. Cl. 425—135 **15 Claims**

1. In an injection molding machine for selective use with a first injection mold having a first stationary mold part formed with a central gate and with at least one second injection mold having a second stationary mold part formed with an off-center gate for forming a non-symmetrical sprue, which machine comprises

a machine pedestal defining a horizontal longitudinal direction and provided with horizontal tracks extending in a transverse direction at right angles to said longitudinal direction,

a clamping unit mounted on said pedestal and operable in said longitudinal direction and comprising a stationary mold support, which is adapted to carry said first stationary mold part with said central gate disposed at a first location and to carry said second stationary mold part with said off-center gate disposed at a second location, said stationary mold support being formed with an opening which extends in a plane in said transverse direction and registers in said longitudinal direction with said first and second locations,

an injecting unit defining an injection axis extending in said longitudinal direction,

a cast iron carrier, which carries said injecting unit and is coupled thereto for a movement in said transverse direction and is displaceable on said track means in said transverse direction together with said injecting unit between a first operating position, in which said injection axis is aligned in said longitudinal direction with said first location, and at least one second operating position, in which said injecting axis is aligned in said longitudinal direction with said second location,

a screw drive, which engages said machine pedestal, said screw drive being operatively connected to said carrier and operable to move said carrier and said injecting unit to each of said operating positions and to fix said carrier in each of said operating positions,

actuating means for reciprocating said injecting unit relative to said carrier in each of said operating positions in said longitudinal direction through said opening of said stationary mold support to and from injecting positions adjacent to said first and second locations,

the improvement residing in that

said carrier is formed with at least one retaining opening, said at least one retaining opening extending in said transverse direction and having an open outer end,

said screw drive being incorporated in a control device, said control device being operable under program control to control operation of said screw drive, said control device comprising a displacement measuring device for measuring displacement of said carrier along said tracks, and

said control device being detachably mounted in said at least one retaining opening and is held therein against a movement relative to said carrier in said longitudinal direction and said control device being movable out of said retaining opening through said open outer end thereof in said transverse direction.

PRESS WITH DIE CUSHION GAS MONITOR

Bernard J. Wallis, 2215 Dacosta, Dearborn, Mich. 48128

Filed Jan. 19, 1990, Ser. No. 467,189

Int. Cl.[5] B30B *15/14, 15/28*

U.S. Cl. 425—136 **11 Claims**

1. A pressure monitor for use in a press that includes a pair of die sections, a ram for propelling one of said die sections against the other for forming a workplace positioned therebetween, and a die cushion coupled to one of said die sections for cushioning force of engagement of said die sections, said die cushion including at least one gas cylinder coupled to said one section and a manifold for feeding gas under pressure to said cylinder, said pressure monitor comprising:

a pressure sensor coupled to said manifold for supplying an electrical pressure signal as a function of gas pressure in said manifold,

means for comparing said pressure signal to a predetermined threshold for supplying an alarm signal when gas pressure in said manifold is less than said threshold, and

means coupled to said ram and responsive to said alarm signal for disabling operation of said ram.

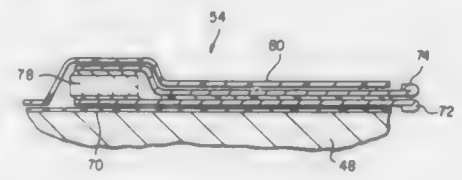
APPARATUS FOR THERMOPLASTICALLY SHAPING POLYMERIC RESINS



Martin B. Barancik, Evansville, Ind., and Erich O. Teutsch, Pittsfield, Mass., assignors to General Electric Company, Mt. Vernon, Ind.

Continuation-in-part of Ser. No. 28,647, Mar. 20, 1987, Pat. No. 4,897,028. This application Sep. 19, 1989, Ser. No. 409,356

The portion of the term of this patent subsequent to Jan. 30, 2007, has been disclaimed.

Int. Cl.[4] B29F *1/08*

U.S. Cl. 425—144 **6 Claims**

1 An apparatus for the production of a thermoplastically moldable polymeric resin article of a predetermined shape, by shaping the resin while in a thermoplastic state and which comprises; a mold having

(i) mold walls including an interior molding surface defining the predetermined shape; and

(ii) means associated with the mold walls for controlling the thermoplasticity of the resin being shaped;

the improvement, which comprises;

as the means for controlling the thermoplasticity of the resin being shaped, a thin-film resistance heater disposed on the molding surface.

DOUGH DISPENSER

Edward M. Anderson, 2620 E. Medicine Lake Dr., Plymouth, Minn. 55441

Filed Apr. 12, 1988, Ser. No. 180,390

Int. Cl.[4] A21C *3/04, 11/16*

U.S. Cl. 425—184 **19 Claims**

1. A dough dispenser, comprising

(a) a dough hopper;

(b) a removable cutter defining a dough outlet of said hopper;

(c) a reciprocable piston in and normally closing said outlet;

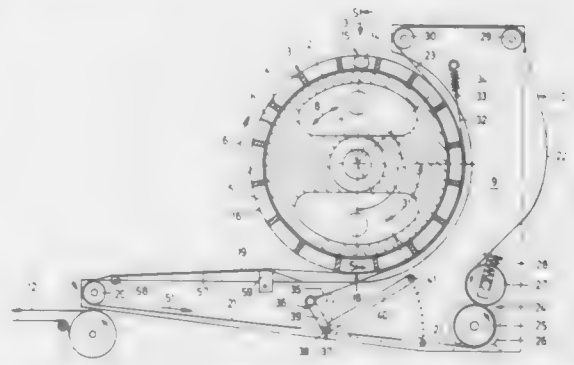
(d) piston drive means connected to said piston for moving the piston along its length within this said outlet; said drive means moving a stroke which is less than a height of said piston;

(e) a dough dispensing port in and through one radial side of the piston, said port being movable from a normal closed position within the outlet to an alternative dispensing position which is at least in part out of the outlet; and

(f) in which at least a portion of said piston is always within said outlet.

5,007,820

MACHINE FOR KNEADING DOUGH PORTIONS INTO A ROUND SHAPE



Wilhelm Schwab, Knittlingen, and Gerhard Müller, Asperg, both of Fed. Rep. of Germany, assignors to Werner & Pfleiderer, GmbH, Fed. Rep. of Germany

Filed Jun. 6, 1989, Ser. No. 362,070

Claims priority, application Fed. Rep. of Germany, Jun. 22, 1988, 3821045

Int. Cl.[5] B21C *3/00*

U.S. Cl. 425—333 **23 Claims**

1. A machine for kneading dough portions into a generally spherical shape, comprising:

a cylindrical kneading drum movable rotatably about the drum central axis and movable axially thereof, the drum having a rotatable, compartmented drum mounted concentrically thereof, the compartmented drum comprising kneading chambers extending radially of the drum and open radially outwardly and radially inwardly toward the kneading drum, the machine further comprising an endless kneading belt looped around the compartmented drum and having a portion in contact with the compartmented drum over a contact zone of less than 180° of peripheral arc of the compartmented drum peripheral surface, wherein the endless belt has a positive drive means which is independent of bearing forces between the belt and the compartmented drum surface, tension of the belt being such that bearing forces exerted by the kneading belt on the compartment drum is less than forces exerted on the belt by the dough portions being kneaded, and wherein the kneading belt is movable radially of the compartmented drum

INJECTION MOLDING MACHINE

Hitoshi Hara, Funabashi, and Katsutoshi Inoue, Chiba, both of Japan, assignors to Sumitomo Heavy Industries, Ltd., Tokyo, Japan

PCT No. PCT/JP88/00859, § 371 Date Apr. 19, 1989, § 102(e) Date Apr. 19, 1989, PCT Pub. No. WO89/01860, PCT Pub. Date Mar. 9, 1989
PCT Filed Aug. 29, 1988, Ser. No. 362,461
Claims priority, application Japan, Aug. 28, 1987, 62-212929
Int. Cl.[5] B29C *45/04*
U.S. Cl. 425—575 4 Claims

1. An injection molding machine comprising:

a plurality of stationary molds securely disposed in a row on a stationary platen and transversely arranged parallel to one another;

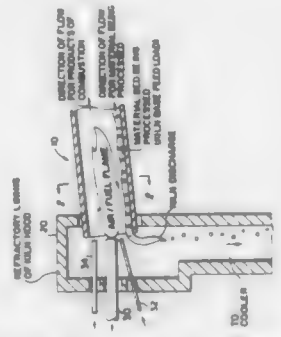
a moving mold which forms at least one mold cavity when coupled with each said stationary molds;

a mold holder formed with a passage within which the moving mold is disposed and is linearly slidable in a direction parallel to the row of stationary molds, said mold holder being mounted on a moving platen;

a plurality of injection units coupled, respectively, with said plurality of stationary molds;

transfer means for conveying the moving mold along said passage to positions, respectively, opposite each of said plurality of stationary molds; and

clamping means for moving said movable platen to apply pressure between said moving mold and a respective stationary mold;



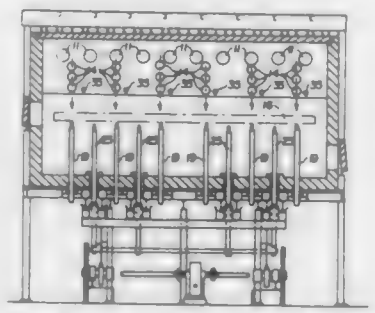
wherein said moving mold protrudes a short distance of not more than 0.05 mm toward said stationary mold from an end surface of said mold holder facing said stationary mold, said distance being selected such that slanting between said moving and stationary molds under pressure from within, due to off-center pressure of said clamping means, is minimized.

5,007,823

DUST RECYCLING TO ROTARY KILNS

Leo G. Mayotte, Whitehall, and Prince B. Eleazer, Allentown, both of Pa., assignors to Air Products and Chemicals, Inc., Allentown, Pa.

Filed Dec. 1, 1989, Ser. No. 444,493
Int. Cl.[5] F27B *15/00, 7/32*
U.S. Cl. 432—14 4 Claims



1. In a process for the operation of a rotary kiln for the thermal processing of a mineral feed by combustion of a fuel with air producing a flame in said kiln and in which a dust is generated from the mineral feed and is recovered from the combustion products exiting said kiln and recycled to said kiln, the improvement which comprises: enriching the air fed into said kiln to combust fuel introduced into said kiln with oxygen concurrently with the recycling of said dust, raising the amount of oxygen sufficiently to raise the concentration of oxygen to above 21% in said kiln and to thereby tend to shorten and intensify said flame and balancing the amount of dust being recycled to said kiln with consequent cooling of and lengthening of said flame against the amount of oxygen enrichment, thereby maintaining the temperature profile of said kiln at the same level as when the kiln was operated without oxygen enrichment and without dust recycling, and wherein the material being processed is a mineral selected from the group consisting of aluminas, clays, limes, cements and other oxides, and the amount of dust recycled comprises between 2% and 20% by weight of the feed material.

SKID MARK ERASURE SYSTEM

Clarence W. Sidwell, 320 Fort Duquesne Blvd., Pittsburgh, Pa. 15222-2363

Division of Ser. No. 369,345, Jun. 15, 1989, Pat. No. 4,936,771, which is a continuation-in-part of Ser. No. 89,406, Aug. 26, 1987, abandoned, which is a continuation-in-part of Ser. No. 886,117, Jul. 16, 1986, abandoned. This application May 11, 1990, Ser. No. 523,051
Int. Cl.[5] F27B *9/14*
U.S. Cl. 432—20 1 Claim

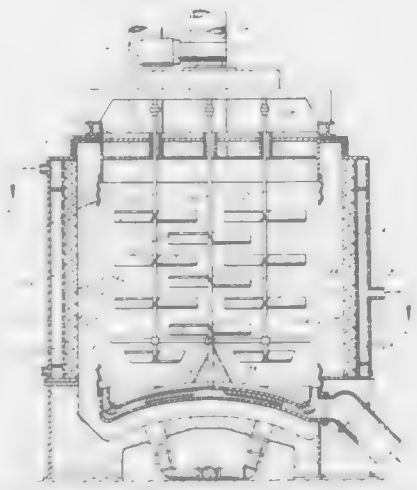
1. A method for removing skid marks from metal shapes transported through a reheat furnace, said furnace of the type having a plurality of parallel spaced-apart, water-cooled support rails longitudinally extending therein for supporting the metal shapes thereon as the metal shapes are moved through said furnace, the method comprising:

providing a plurality of high thrust burner means aligned in longitudinally extending, spaced-apart arrays positioned above each of the water-cooled support rails, wherein the high thrust burner means includes a plurality of spaced burner pairs, each of said burner pairs being aligned in a converging manner such that a flame developed by each overlap one another to produce a higher temperature zone in the overlap region;

sensing the presence of cold skid marks on the metal shapes and controlling said high thrust burner means for activating selected burners located above metal shapes having skid marks detected thereon and for deactivating other selected burners located above metal shapes having no skid mark detected thereon;

directing a high velocity flame front from each of said activated burners to impinge directly upon a surface of said metal shapes at a location above said water-cooled support rails;

heating the metal shapes in the location above said eater-cooled support rails and thereby removing a skid mark therefrom; and



including the step of directing high velocity flame fronts from burner means positioned below said metal shapes and aligned along said support rails.

HEAT RECLAMATION APPARATUS

Robert M. Williams, 16 La Hacienda, Ladue, Mo. 63124

Filed May 21, 1990, Ser. No. 525,650
Int. Cl.[5] F27D *1/08*
U.S. Cl. 432—99 4 Claims

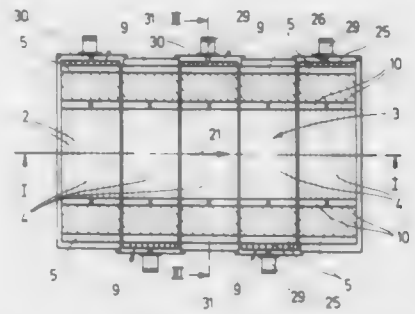
4 Apparatus for processing gypsum material in a heat conservation furnace comprising:

(a) a kettle for receiving gypsum material to be heat treated.

(b) a furnace surrounding said kettle and including an outer wall, an inner porous luminous fire wall spaced from said outer wall and having a flame illuminated heating space surrounding said kettle;

(c) means said furnace dividing said space between said outer wall and said porous luminous fire wall into separate portions;

(d) controllable means connected into said furnace outer wall for supplying fuel and air into each of said separate portions one at a time for combustion in said separate portions of said porous luminous fire wall to release products of combustion into said heating space, and said controllable means including means for evacuating products of combustion from said heating space through each of said separate portions of said porous luminous fire wall one at a time; and



(e) control means operably connected to said controllable mean for alternating the release of the products of combustion into said heating space and the evacuation of the products of combustion from said heating space in a sequence that maintains the temperature of the kettle higher than the temperature of the porous luminous fire wall, and alternates said separate portions of said porous luminous fire wall into a heat sink for returning the heat therein to support combustion.

ROLLER HEARTH FURNACE FOR THE HEAT TREATING OF METAL AND CERAMIC PARTS

Joachim Wünning, Berghalde 20, 7250 Leonberg 7, Fed. Rep. of Germany

Filed May 15, 1989, Ser. No. 351,794
Claims priority, application Fed. Rep. of Germany, May 14, 1988, 3816503; European Pat. Off., Apr. 4, 1989, 89105863.8
Int. Cl.[5] F27D *3/00*
U.S. Cl. 432—121 20 Claims

1 A roller hearth furnace for the heat treatment of parts passing therethrough, comprising:

a thermally insulated housing forming a heating space therein, and

a plurality of roller modules removably mounted in said housing for transporting parts longitudinally through said heating space, said roller modules being successively arranged along a direction of transport of the parts, each roller module including:

a pair of transversely spaced apart bearing beams removably supported in recesses formed in said housing, and

a plurality of rotatably driven rollers having their ends supported by said bearing beams, said rollers extending transversely of the direction of travel of the parts and being successively arranged along such direction of transport, said rollers being rotatable about stationary axes and being removable from said heating space along with said bearing beams in a direction transversely of said direction of transport.

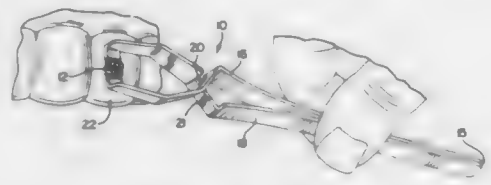
ORTHODONTIC TWEEZERS

Paul A. DiFranco, 511 W. Talcott, Parkridge, Ill. 60068



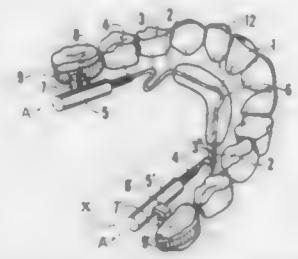
Filed Jul. 11, 1989, Ser. No. 378,005
Int. Cl.[5] A61C *3/00*
U.S. Cl. 433—4 3 Claims

1. In a tweezer comprising a pair of generally flat elongated members placed in an adjacent lengthwise relationship with one another, each member having a first end and a second end, the first ends of the members being fixably secured to one another, the first member and the second member crossing over one another between said first ends and said second ends, wherein the improvement comprises:

a first means for gripping integrally formed at the second end of the first member, the first means for gripping including a first vertical member having a first peripheral

edge extending generally in the direction of the longitudinal axis of the tweezer and a first horizontal member extending inwardly from the first vertical member at said first peripheral edge;

and a second means for gripping being integrally formed at the second end of the second member, the second means for gripping including a second vertical member having a second peripheral edge extending generally in the direc-



tion of the longitudinal axis of the tweezer and a second horizontal member extending inwardly from the second vertical member at said second peripheral edge thereof, towards the first horizontal member, whereby the first and second means for gripping cooperate to form a U-shaped gripping jaw adapted to grip an orthodontic brace behind the wings of the brace for placement of the brace on a tooth.

5,007,828

MOLAR CONTROLLING AND POSITIONING ORTHODONTIC APPLIANCE WITH SIMPLIFIED ORIENTATION, PRESSURE AND ADJUSTMENT MECHANISMS

Farel Rosenberg, Beverly Hills, Calif.

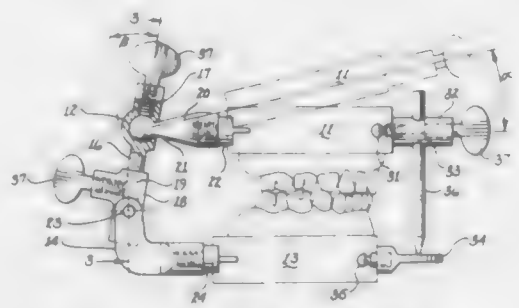
Filed Feb. 8, 1990, Ser. No. 476,734
Int. Cl.[5] A61C *3/00*
U.S. Cl. 433—18 **2 Claims**

1. A dental appliance for use as a molar movement inducer, inhibitor and controller comprised of:

a. A semi-rigid pad with a soft tissue contacting lower surface to be held in place against a tissue covered basal, bony area posterial to the front teeth.

b. A U-shaped wire embedded at its center n said semirigid pad and bent at each end into an S-shaped spring;

c. An externally threaded plunger rigidly attached at each end of said S-shaped spring;



d. A pair of hollow cylinders internally threaded and engaging said plungers, each cylinder provided with an insert to permit detachable joining to a receptacle attached to the lingual surface of said molar, whereby the hollow cylinders can be initially fully threaded onto said plungers, the pad placed against the applicable tissue covered basal bony area and each cylinder inserted into its corresponding receptacle, this attachment serving to produce a posterior force on each molar.

5,007,829

DENTAL ARTICULATOR APPARATUS

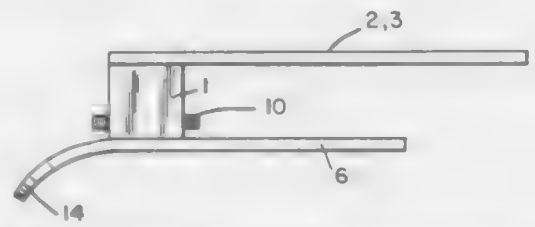
Frank C. Farrell, 18402 N. 70th Dr., Peoria, Ariz. 85345

Filed Aug. 22, 1988, Ser. No. 234,847
Int. Cl.[5] A61C *11/00*
U.S. Cl. 433—61 **10 Claims**

1 A dental articulator apparatus, comprising:

a ball joint having a ball member and a socket member, said ball member having an associated first joining means for removably coupling said ball member to a posterior aspect of a first teeth cast and said socket member further having a socket portion, a downwardly extending stem portion and first securing means for controlling movement of said ball member within said socket member;

second joining means for removably coupling to a posterior aspect of a second teeth cast said second joining means comprising a substantially L-shaped member having upstanding co-planar members defining a vertical slot therebetween, a pintle member disposed horizontally across said vertical slot and supported by said upstanding co-planar members and a substantially horizontal leg portion adapted to removably couple to the second teeth cast; and



a pivot member, pivotally coupled to said pintle member, having an internal bore adapted to reciprocally receive said downwardly extending stem portion of said socket member and second securing means for securing said downwardly extending stem portion.

5,007,830

DEVICE FOR DETERMINING THE OCCLUSAL PLANE

Eugene Joffe, 79-10 34th Ave., Jackson Hts., N.Y. 11372

Filed Jun. 6, 1989, Ser. No. 362,268
Int. Cl.[5] A61C *19/04*
U.S. Cl. 433—68 **7 Claims**

1 A device for determining an occlusal plane for teeth positioning in detal prostheses, comprising

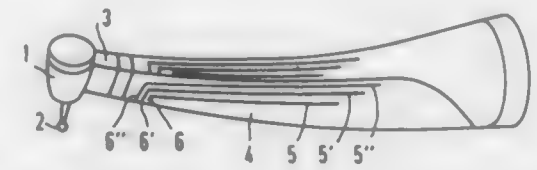
two first members pivotable about vertical axes in a first plane which can be aligned with an ear-nose plane of a patient;

a second member vertically adjustable relative to said first members and therefore said first plane so as to be brought in contact with plastic material on a base plate placed on an occlusal surface of remaining teeth or placed in correspondence with a lip line, said second member being movable parallel to said first members so that upon said contact said second member determines a position of a required occlusal surface;

means for moving said second member relative to said first members and including an adjusting element manually movable by a user;

a holding body, said first members being arranged pivotally relative to said holding body, said second member being arranged vertically displaceable relative to said holding body and having two pins;

two pivot pins each defining a respective one of said axes of pivoting of said first members,



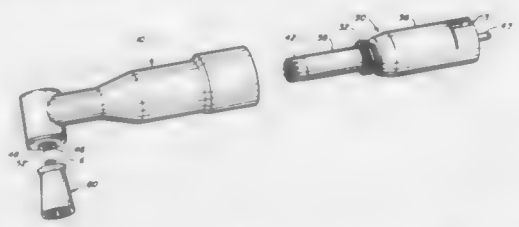
said holding body having two guiding openings in which said pins of said second member are vertically movably, said holding body further having two further guiding openings in which said pivot pins are turnably received, said first mentioned guiding openings being coaxial with said second mentioned guiding openings.

5,007,831

DENTAL HANDPIECE COMPRISING A GRIP PART

Thomas Bierbaum, Lorsch, and Johann Hain, Heppenheim-Kirschhausen, both of Fed. Rep. of Germany, assignors to Siemens Aktiengesellschaft, Berlin and Munich, Fed. Rep. of Germany

Filed May 3, 1989, Ser. No. 346,734
Claims priority, application Fed. Rep. of Germany, May 16, 1988, 3816612
Int. Cl.[5] A61C *3/00*
U.S. Cl. 433—114 **15 Claims**



1. In a dental handpiece having an elongated grip part provided with a surface that is a non-slip surface in comparison to the remaining surface of the handpiece, the improvements comprising the non-slip surface being formed by a plurality of thin lines having a roughened surface, said thin lines having first portions extending in a longitudinal direction of the handpiece, each of said lines having a second portion extending at an angle to the first portion to form a line pattern and said lines being arranged in at least two quadrants on the circumference of the grip part that lie diametrically opposite one another.

5,007,832

DISPOSABLE RIGHT ANGLE DENTAL HANDPIECE

Mosbe Meller, Lakewood, and Michael Feldman, Howell, both of N.J., assignors to MTI Precision Products, Inc., Lakewood, N.J.

Filed Mar. 30, 1990, Ser. No. 502,454
Int. Cl.[5] A61C *1/08*
U.S. Cl. 433—126 **28 Claims**

1. A disposable dental handpiece comprising:

an outer housing made of a disposable plastic material and having an elongated opening therein for receiving a drive shaft means;

a cavity in said outer housing for receiving a driven rotatable gear member;

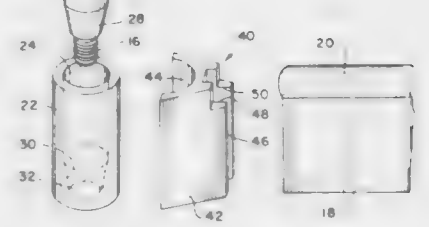
means for coupling a working member to said driven gear member for performing a working operation in an oral cavity of a patient;

a re-usable drive shaft means removably mounted in said elongated opening in said outer housing, said re-usable drive shaft means including:

a metallic drive shaft housing removably mounted in said outer housing;

a rotatable metal drive shaft mounted in said drive shaft housing and being rotatable relative to said drive shaft housing, said metal drive shaft having means at one end portion thereof which is driven by a dental drive means of a dental tool, so as to be rotatably driven within said outer housing; and

a driving gear at a distal end portion of said drive shaft, which distal end portion is opposite from said one end portion thereof, for engaging with said driven gear; and



means for removably coupling said re-usable drive shaft means to said outer housing for removably securing said re-usable driven shaft means in said elongated opening of said outer housing such that said driving gear is in engagement with said driven gear during use, and for permitting disengagement of said re-usable drive shaft means from said outer housing for disposal of said outer housing.

5,007,833

BUTTRESS CHANNEL

Norman K. Barbone, Mansfield, Ohio, assignor to Implant Plastics Corporation, Mansfield, Ohio

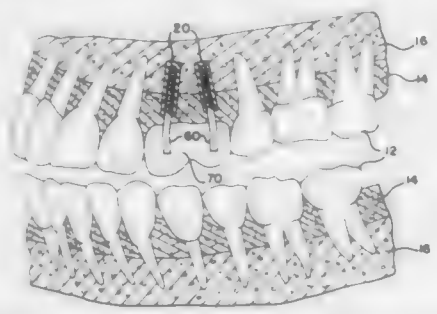
Filed Jul. 10, 1990, Ser. No. 550,661
Int. Cl.[5] A61C *13/12, 13/225, 8/00*
U.S. Cl. 433—172 **12 Claims**

1. A structural element for forming a transition joint between a support bar and an associated mounting sleeve in the fabrication of support structure for holding prosthetic teeth, said structural element comprising:

a solid elongated body molded of a resinous plastic material, an outwardly open recess extending longitudinally of the body along a first side thereof, said recess being sized and adapted throughout its length to closely engage an exterior of said mounting sleeve in a direction axially thereof, an outwardly open elongated groove having a width to resiliently engage the support bar, said groove extending longitudinally of the body along a second side opposite said first side, said second side being narrower than said first side and said body tapering in thickness from said first side to said second side.

5,007,834

MANUFACTURE AND INSTALLATION OF A DENTAL PROSTHESIS



Sergio Rubinstein, 1451 Brandywine La., Buffalo Grove, Ill. 60089, and Masayuki Hoshi, 9004 Kennedy Dr., Des Plaines, Ill. 60016

Filed Oct. 12, 1989, Ser. No. 420,274
Int. Cl.[5] A61C *8/00*
U.S. Cl. 433—173 **17 Claims**

1. A method of making an article used in the manufacture of

a dental prosthesis of the type utilizing an implant member, having a threaded bore, adapted to be placed beneath gum tissue and into underlying bone structure, comprising the following steps:

providing an analog of said implant member;

providing a temporary threaded shank, formed of meltable material;

screwing said shank into said analog; and

forming on an upper surface of said shank a temporary model of a post for said prosthesis, said model being formed of meltable material.

5,007,835

DENTAL IMPLANT

Maurice Valen, 198-45 Foothill Ave., Holliswood, N.Y. 11423

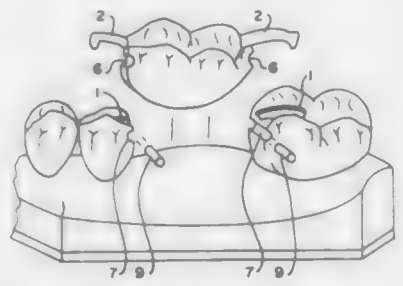
Filed Aug. 17, 1989, Ser. No. 394,906

Int. Cl.[5] A61C *8/00*

U.S. Cl. 433—174 **20 Claims**

1. A dental implant and tap combination for threaded insertion of said dental implant into a drilled and tapped bore hole having tapped wall threads created by a first tap for tapping into maxillary bone and a second tap for tapping into mandibular bone, said drilled and tapped bore hole providing a bore hole wall of undercut threads for the subsequent threading of said dental implant, said dental implant having a thread length of rounded threads, said rounded threads of said dental implant radially extending beyond an outer diameter of threads of said first or second tap causing compression against the wall of said undercut threads and said bore hole, whereby a controlled compressive force is provided by the threaded dental implant against said bore hole wall in said jaw bone for providing sufficient holding strength to withstand masticatory loads, but insufficient compression for causing necrosis.

5,007,836



GROOVE LOCK DENTAL BRIDGE ATTACHMENT AND METHOD

Donald W. Gayso, 1092 Perkins Ter., Memphis, Tenn. 38115

Filed May 26, 1988, Ser. No. 198,875

Int. Cl.[5] A61C *13/12*

U.S. Cl. 433—181 **14 Claims**

1. An artificial dental appliance for being positioned between adjacent first and second abutment teeth, each of said abutment teeth having an outer end and being modified to have a groove in said outer end thereof, said appliance comprising:

(a) bridge means for extending between said outer end of said first abutment tooth and said outer end of said second abutment tooth, said bridge means having a first side for being positioned adjacent said outer end of said first abutment tooth and having a second side for being positioned adjacent said outer end of said second abutment tooth, said first side of said bridge means having a groove therein, said second side of said bridge means having a groove therein; said groove in said outer end of said first abutment tooth and said groove in said first side of said bridge means being aligned with one another when said appliance is positioned between said abutment teeth; said groove in said outer end of said second abutment tooth and said groove in said second side of said bridge means being aligned with one another when said appliance is positioned between said abutment teeth;

(b) first securing means for securing said first side of said bridge means to said first abutment tooth, said first securing means including retaining means for being inserted into said groove in said outer end of said first abutment tooth and said groove in said first side of said bridge means; said retaining means of said first securing means including a retaining pin for being inserted into said groove in said outer end of said first abutment tooth and said groove in said first side of said bridge means; and

(c) second securing means for securing said second side of said bridge means to said second abutment tooth, said second securing means including retaining means for being inserted into said groove in said outer end of said second abutment tooth and said groove in said second side of said bridge means; said retaining means of said second securing means including a retaining pin for being inserted into said groove in said outer end of said second abutment tooth and said groove in said first side of said bridge means; each of said retaining pins including a handle portion for allowing easy removal thereof.

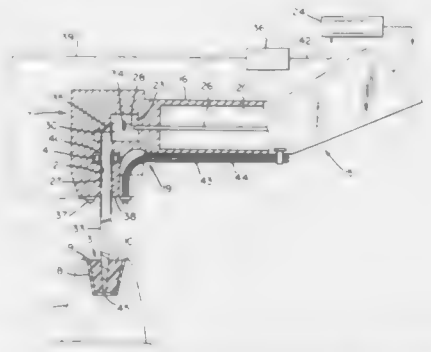
5,007,837

DIFFERENTIAL PHOTOPOLYMERIZATION PROCESS USED FOR FILLING A DENTAL CAVITY AND A TOOL INTENDED FOR ITS IMPLEMENTATION

Marc Werly, Paris, France, assignor to Ellena, Wissembourg, France

Filed Mar. 24, 1988, Ser. No. 172,562

Claims priority, application France, Mar. 26, 1987, 87 04230



Int. Cl.[5] A61C *5/04*

U.S. Cl. 433—226 **11 Claims**

1. A process of filling a cavity with photosensitive resin materials which are capable of being solidified by means of photopolymerization, comprising the steps of:

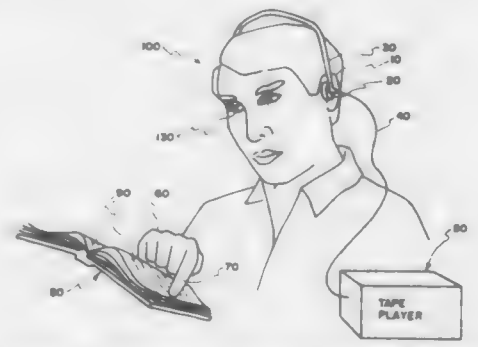
depositing a layer of a first resin material, which is photosensitive at a first predetermined level of luminous radiation, upon the walls of said cavity;

subsequently depositing a mass of a second resin material, which is photosensitive at a second predetermined level of luminous radiation which is different than said first predetermined level of luminous radiation, upon said layer of said first resin material;

subsequently exposing said first and second resin materials to said luminous radiation at said second predetermined level so as to harden only said second resin material by photopolymerization; and

subsequently exposing said first and second resin materials to said luminous radiation at said first predetermined level so as to harden said first resin material by photopolymerization.

5,007,838



TACTILE ENHANCEMENT METHOD FOR PROGRESSIVELY OPTIMIZED READING

Kirby Cochran, Provo, Utah, assignor to American Business Seminars, Inc., Provo, Utah

Filed Feb. 20, 1990, Ser. No. 482,388

Int. Cl.[5] G09B *17/00*

U.S. Cl. 434—178 **15 Claims**

2. A method which associatively stimulates a reader's senses comprising auditory, visual, and tactile to increase reading speed and comprehension, said method comprising the steps of:

causing the reader to ingest reading material as his finger travels across a page;

providing a reader-training prerecorded stereophonic audio recording which comprises two separate and independent channels of prerecorded signals, the prerecorded signals collectively comprising reading-rate-setting signals, subliminal affirmation signals, and aural interference reduction signals;

delivering the reading-rate-setting signals to only one ear and thence directly to one hemisphere of the brain of the reader to stimulate and focus rapid reader eye movement in conjunction with rapid tactile scanning of sequential lines of print on a page of written material at rates which suppress the tendency for subvocalization of individual words;

delivering the subliminal affirmation signals predominately related to the spoken word to one ear only and thence directly to one hemisphere of the brain;

delivering aural interference reduction signals to both ears and of the reader to reduce the detrimental effect of external noise.

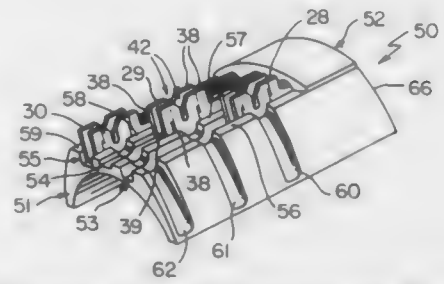
VACUUM CLEANER HOSE CONSTRUCTION, INSERT THEREFOR AND METHODS OF MAKING THE SAME

Homer N. Holden, Sylva, and Philip K. Loyer, Waynesville, both of N.C., assignors to Dayco Products, Inc., Dayton, Ohio



Division of Ser. No. 234,783, Aug. 22, 1988, Pat. No. 4,894,021.

This application Oct. 26, 1989, Ser. No. 427,269

The portion of the term of this patent subsequent to Jan. 16, 2007, has been disclaimed.

Int. Cl.[5] H01R *4/60*

U.S. Cl. 439—191 **11 Claims**

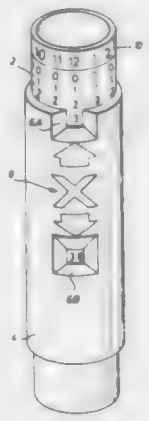
1. In a vacuum cleaner hose construction that comprises an elongated vacuum hose having an end and an electrical conductor extending helically therealong and being provided with an end portion at said end, an electrical terminal connector carried by said hose and being fixed to said end portion, and an insert for holding said connector and its interconnected end portion in a predetermined position, the improvement wherein said insert has opposed ends one of which has a substantially straight sot means therein and an angular groove means therein leading to said slot means and intersecting the same at an angle relative thereto, the other of said opposed ends of said insert having opening means therein, said connector having opposed ends respectively disposed in said slot means and said opening means to be held thereby, said end portion of said conductor being disposed in said angular groove means.

5,007,840

OPERATIONS PROCESSOR

Martin Gaskell, 21 Western Road, Tring, Herts., HP23 4BQ, United Kingdom

Filed Dec. 12, 1989, Ser. No. 449,554



Claims priority, application United Kingdom, Dec. 14, 1988, 8829200

Int. Cl.[5] G09B *19/02*

U.S. Cl. 434—206 **3 Claims**

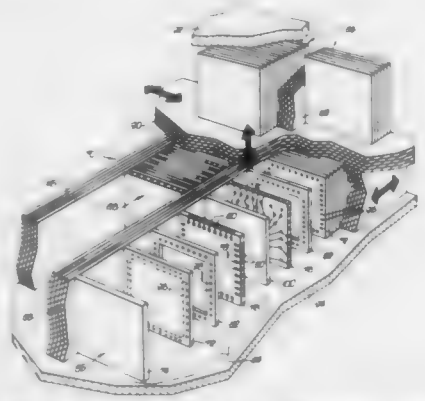
1. A multiplication operations processor comprising at least two concentric cylinders, the first of said cylinders having marked thereon a periodical array of numbers which comprises a first table having a first row of numbers representing a first operand and a column of numbers representing a second operand under each number of said first row and a second table displayed under said first table representing a solution to a multiplication of said first and second operands in which the first row of said first table comprises the numbers 1 to 12 consecutively and inclusively and each of the columns comprises numbers 0 to 12 consecutively, and said first of said cylinders retained within the second of said cylinders, and the

second of said cylinders having two or more indicating means, and the first of said indicating means exposing the second

operand and the second of said indicating means exposing the solution of said multiplication operation.

5,007,841

INTEGRATED-CIRCUIT CHIP INTERCONNECTION SYSTEM



Robert Smolley, Porteuguese Bend, Calif., assignor to TRW Inc., Redondo Beach, Calif.

Continuation-in-part of Ser. No. 499,137, May 31, 1983, abandoned, and a continuation-in-part of Ser. No. 499,136, May 31, 1983, Pat. No. 4,574,331, and a continuation-in-part of Ser. No. 737,631, May 24, 1985, Pat. No. 4,581,679. This application Mar. 3, 1986, Ser. No. 835,818

The portion of the term of this patent subsequent to Apr. 8, 2003, has been disclaimed.

Int. Cl.[5] **H05K** *1/14*

U.S. Cl. 439—66 **55 Claims**

1. An integrated-circuit (IC) chip packaging construction, comprising:

an integrated circuit chip having a plurality of contact areas;

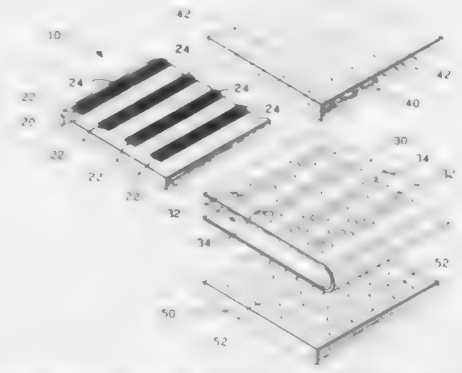
a rigid insulating board having a plurality of openings therethrough, with at least some of the openings at positions corresponding to the IC chip contact areas;

a circuit board having contact areas at positions corresponding to some of the openings in the insulating board;

a plurality of conductive connector elements disposed in selected ones of the openings in the insulating board, each of said connector elements including a wadded strand of conductive wire that is deformed when compressed and makes multiple electrical contacts with the IC chip and circuit board contact areas; and

means for compressing the IC chip toward the circuit board, thereby compressing the connector elements and making electrical contact between the IC chip contact areas and the circuit board contact areas.

5,007,842



FLEXIBLE AREA ARRAY CONNECTOR

Frederick R. Deak, Kernersville, and David B. Wrisley, Jr., Greensboro, both of N.C., assignors to AMP Incorporated, Harrisburg, Pa.

Filed Oct. 11, 1990, Ser. No. 596,163

Int. Cl.[5] **H01R** *9/09*

U.S. Cl. 439—66 **5 Claims**

1. A flexible area array connector for electrically connecting circuit pads on a pair of spaced substrates, said connector comprising:

a force application plate having a slot therethrough;

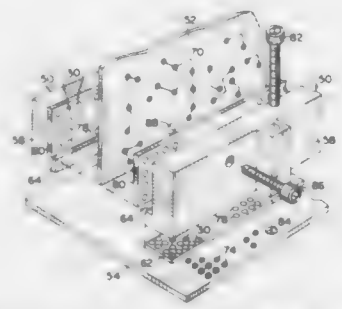
a spring member secured within said slot so as to extend beyond both surfaces of said plate;

a flexible interconnect member having conductive pads on a surface thereof;

said flexible member being folded around said force plate so that said conductive pads overlie said spring member on both surfaces of said plate; and

said flexible member and said force plate being disposed between substrates so that said conductive pads face circuit pads on the substrates.

5,007,843



HIGH-DENSITY CONTACT AREA ELECTRICAL CONNECTORS

Robert Smolley, Porteuguese Bend, Calif., assignor to TRW Inc., Redondo Beach, Calif.

Continuation-in-part of Ser. No. 835,818, Mar. 8, 1986, which is a continuation-in-part of Ser. No. 499,137, May 31, 1983, abandoned, and Ser. No. 499,136, May 31, 1983, Pat. No. 4,574,331, and Ser. No. 737,631, May 24, 1985, Pat. No. 4,581,679. This application Mar. 16, 1987, Ser. No. 26,327

Int. Cl.[5] **H01R** *9/09*

U.S. Cl. 439—66 **12 Claims**

1. An improved edge card connector for making electrical connections between an electronic component and a circuit board having edge contact areas, comprising:

an edge card connector housing having a plurality of contact areas to which leads from the electronic component are connected;

a first rigid insulating board disposed between the connector housing and the circuit board, the insulating board having a plurality of openings at positions corresponding to the connector housing contact areas and the circuit board contact areas;

a plurality of conductive connector elements disposed in selected ones of the openings in the insulating board; and

means for compressing the connector housing and the circuit board together, thereby compressing the connector elements and making electrical contact between the connector housing contract areas and the circuit board contact areas;

wherein the connector housing includes:

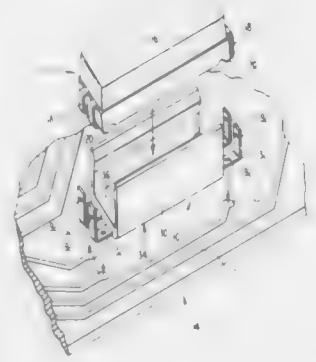
an edge card connector housing having a first plurality of contact areas for connecting leads in the connector housing to the circuit board contact areas and a second plurality of contact areas for connecting the leads in the connector housing to contact areas on the electronic component;

a second rigid insulating board disposed between the connector housing and the electronic component, the insulating board having openings at positions corresponding to the connector housing contact areas and the electronic component contact areas;

a plurality of conductive connector elements disposed in selected ones of the openings in the second insulating board; and

means for compressing the connector housing and the electronic component together, thereby compressing the connector elements and making electrical contact between the connector housing contract areas and the electronic component contact areas.

5,007,844



SURFACE MOUNT METHOD AND DEVICE

Scott C. Mason, Fort Collins, and Robert A. Slutz, Loveland, both of Colo., assignors to Hewlett-Packard Company, Palo Alto, Calif.

Filed Jan. 17, 1990, Ser. No. 466,169

Int. Cl.[5] **H01R** *9/09*

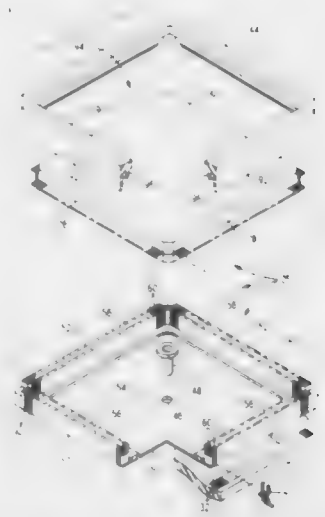
U.S. Cl. 439—68 **23 Claims**

1. A device for effecting electrical and mechanical connections between a surface mount electrical component and conductive pads on a printed circuit board, said device comprising:

socket means for receiving a surface mount electrical component, said component comprising a body member and a plurality of J-shaped leads; and

a plurality of contact elements mounted on said socket means, each of said contact elements having a first portion for soldering the contact element to a conductive pad on a printed circuit board and a second portion for soldering said contact element to a J-shaped lead of said electrical component, said first portion extending away from said socket means, and said second portion being at a distal end of the first portion to define an intermediate portion between the socket means and the second portion that overlays the conductive pad when said socket means is positioned on said printed circuit board, said intermediate portion providing an access space for soldering said contact element to said conductive pad and for visually inspecting a resulting solder joint.

5,007,845



LOW HEIGHT CHIP CARRIER SOCKET

Dimitry G. Grabbe, Middletown, Pa., assignor to AMP Incorporated, Harrisburg, Pa.

Filed Nov. 3, 1989, Ser. No. 431,519

Int. Cl.[5] **H01R** *9/09*

U.S. Cl. 439—73 **13 Claims**

1. A low height chip carrier socket for electrically connecting leads on the chip carrier to respective pads on a mounting surface, wherein the leads are spaced apart and projecting from a peripheral edge of the chip carrier, said socket comprising:

(a) a body having a chip carrier receiving cavity;

(b) a plurality of contacts in said body arranged for electrically connecting each of said leads to a respective one of said pads, each said contact including a contacting portion and an opposed backup portion;

(c) means for positioning and aligning each of said plurality of contacts with respective ones of said leads when said chip carrier is in said cavity so that each said lead is adjacent its respective contacting portion; and

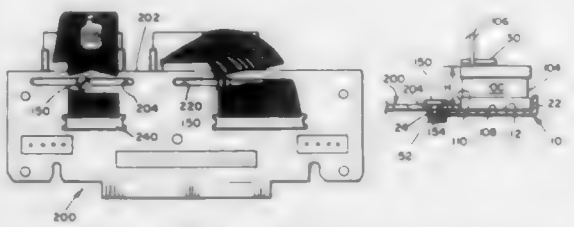
(d) locking means for wedging between each said lead and said backup portion so that each said lead is urged into pressing electrical contact with its respective contacting portion, said locking means including means for forming each said lead about the contacting portion of its respective contact.

5,007,846

SPECIALIZED FRAME FOR RETAINING AN EDGE CONNECTOR ON A PRINTED CIRCUIT BOARD

Gonen Ravid, 29034 Acanthus Ct., Agoura Hills, Calif. 91301

Filed Jun. 11, 1990, Ser. No. 536,963



Int. Cl.[5] **H01R** *23/70*

U.S. Cl. 439—79 **13 Claims**

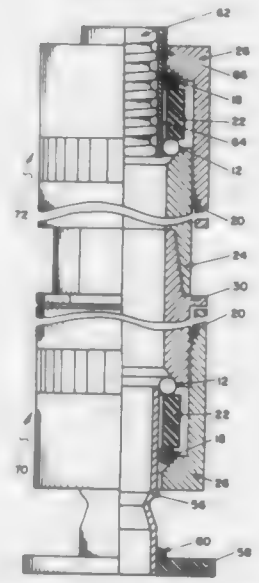
1. A frame for retaining and mounting on a printed circuit board an edge connector having a multiplicity of female connector members, the printed circuit board including at least one elongated slot running adjacent an edge of the printed circuit board, the frame comprising:

a. a bottom including a front edge, a rear edge, a first side edge and a second side edge;

b. a front lip affixed along said front edge of said bottom and extending generally perpendicular to the front edge;
c. a transverse opening extending through the bottom at a location adjacent said rear edge of said bottom;
d. a first side bracket having a sidewall affixed to said first side edge of said bottom and extending generally perpendicular to the side edge and a top lip affixed to the sidewall at a location remote from the bottom and extending generally perpendicular to the side wall and generally parallel to the bottom;
e. a second side bracket having a sidewall affixed to said second side edge of said bottom and extending generally perpendicular to the side edge and a top lip affixed to the sidewall at a location remote from the bottom and extending generally perpendicular to the side wall and generally parallel to the bottom; and

f. the top lips of each respective first and second side bracket extending toward each other and over the bottom;
g. attaching means for attaching the frame to the printed circuit board;
h. whereby said edge connector is retained within said frame such that the edge connector rests between the bottom and the top lip of the first and second side brackets, the front of the edge connector lies adjacent the front lip and the female connector members are unobstructed by the front lip, and the frame is attached to the printed circuit board by attaching means which extend through the slot in the printed circuit board and through the transverse opening in the frame with the frame affixed beneath the printed circuit board such that the edge of the printed circuit board adjacent the slot functions as a rear lip to retain the edge connector between the front lip of the frame and the printed circuit board.

5,007,847



UNIVERSAL GROUND ADAPTER ASSEMBLY

David S. Dixon, Old Lyme, and Nicholas Schade, Oakdale, both of Conn., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

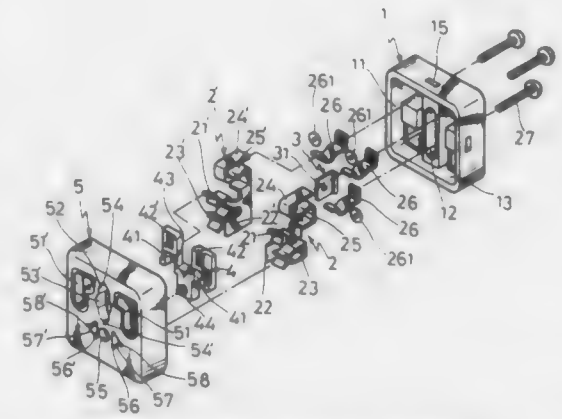
Filed Jun. 18, 1990, Ser. No. 539,954
Int. Cl.[5] H01R *4/66*
U.S. Cl. 439—100 **10 Claims**

1. A universal ground adapter assembly, electrically and mechanically connecting first and second members defining interior spaces of selected same and different particular outside dimensions selected over a range of comparatively greater and lesser outside dimensions, and shielding the interior spaces of the first and second members against electromagnetic interference, comprising:

first and second subassemblies each having opposing ends, one end of one of the first and second subassemblies having an electrically conductive connection annulus itself having ends, the connection annulus terminates on one of its ends in an outer threaded wall defining an electrically conductive male connector and terminates on the other of its ends in an outer threaded wall of a preselected outer dimension, one end of the other one of the first and second subassemblies having an electrically conductive connection annulus itself having ends, the connection annulus of the other one of the first and second subassemblies terminates on one of its ends in an inner threaded wall defining an electrically conductive female connector and terminates on the other of its ends in an outer threaded wall having a preselected outer dimension, said male and said female connectors each having a preselected predetermined dimension reciprocally selected to allow male/-female interconnection therebetween, each of the other ends of the first and second subassemblies having an electrically conductive member receiving annulus itself having ends, one end of each of the electrically conductive

member receiving annuli having an inner preselected dimension selected to closely fit around the particular outside dimension of a respective one of said first and second members and the other end of each of the electrically conductive member receiving annuli terminating in an inner threaded wall having a preselected inside dimension, the preselected inside dimensions of said threaded walls of said ends of said member receiving annuli and said preselected outside dimensions of said ends of said connection annuli being selected to allow their mutual threaded interconnection, the preselected outside dimensions of said ends of said connection annuli being selected in direct proportion to the particular outside dimensions of corresponding ones of said first and second members being connected within said range;

means cooperative with said connection and member receiving annuli of each of said first and second subassemblies for electrically contacting respective ones of said first and second members; and



means cooperative with said electrical contacting means and said connection and member receiving annuli of each of said first and second subassemblies for environmentally sealing said electrically contacting means.

MULTIPURPOSE SAFETY RECEPTACLE

Chiu-Shan Lee, No. 133-2, Lane 163, San Ho Rd., Section 4, San Chung City, Taipei Hsien, Taiwan

Filed Aug. 3, 1989, Ser. No. 388,876
Int. Cl.[5] H01R *13/652, 27/00*
U.S. Cl. 439—101 **9 Claims**

1. A multipurpose safety receptacle including:

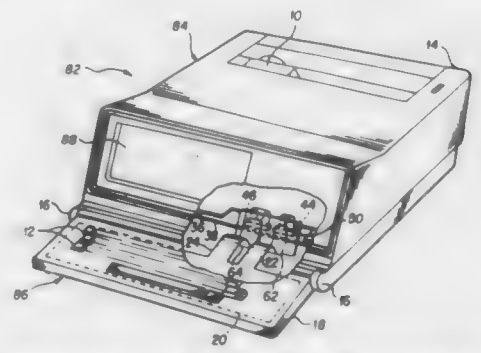
an upper cover comprising a pair of L-shaped pin holes bilaterally disposed at the top, an oval hole in the middle, a first round hole in the oval hole, two square holes set on the top and the lower end respectively of said oval hole, a second round hole set at a lower position below said oval hole, and a pair of openings each symmetrically set at a side of the second round hole, said pair of openings each being comprised of an elongated hole, a round hole and a square hole;

a division plate comprising bilaterally two opposite guide rails and two opposite slots, and a notch and a round hole in the middle;

a bottom block having two receiving troughs spaced apart laterally from each other and a ground connection trough disposed between said receiving troughs, and a plurality of retaining holes spaced around the periphery of said block;

two conductive frames being respectively set in said two receiving troughs of said bottom block, each comprising a spring leaf, a receiving plate, an U-shaped conducting plate, an U-shaped frame, said U-shaped frame comprising a corrugated track for setting therein of a control plate;

a ground connection frame having slightly inclined top end vertically bending downward to define a curved portion at both lateral sides for easy connection thereto of ground connection pins of different size;



characterized in that when a plug which has L-pins is connected thereto the L-pins are inserted to contact said guide rails of said division plate and further moved downward to contact said spring leaves of said conductive frames to let electric power be connected; when a plug which has flat plug pins is connected thereto the flat plug pins are inserted to set in between said receiving plates and said U-shaped conducting plates and to get connected with said receiving plates and said U-shaped conductive plates so as to let electric power be connected; when a plug which has two round plug pins or square plug pins is connected thereto the plug pins are inserted therein to set in said U-shaped conducting plates to let electric power be connected.

SIGNAL LINE CONNECTING STRUCTURE FOR A KEYBOARD OF ELECTRONIC APPARATUS

Akira Shinoda, Ohbu, Japan, assignor to Brother Kogyo Kabushiki Kaisha, Japan

Filed Jan. 29, 1990, Ser. No. 471,890
Claims priority, application Japan, Mar. 27, 1989, 1-34415[U]
Int. Cl.[5] H01R *35/00*
U.S. Cl. 439—165 **10 Claims**

1. A keyboard signal line connecting structure electrically connecting a keyboard to a host apparatus comprising:

a hinge member pivotally connecting the keyboard to a front face of the host apparatus so that the keyboard can assume a folding attitude uprightly facing the front face of the host apparatus and a virtually horizontal laid-down attitude whereby the keyboard is operable by an operator;

a key switch circuit board having a plurality of key switches arranged in a matrix in the keyboard;

a main controller board disposed inside the host apparatus, provided with electronic component parts for controlling the host apparatus; and

a flexible connecting printed circuit board which is one-piece with the key switch circuit board, said flexible connecting printed circuit board connecting a number of signal lines of the key switch circuit board to corresponding signal lines of the main controller board, extending from said key switch circuit board to the main controller board, and being provided with a bend section which increases its degree of bend when the keyboard assumes one of the folding attitude and the laid-down attitude, and decreases its degree of bend when said keyboard assumes the other attitude, said bend section being located inside a space within said host apparatus and wherein a portion of said keyboard extends inside of said space of said host apparatus, said portion including a slot wherein said flexible connecting printed circuit board passes from inside said keyboard through said slot and into said space.

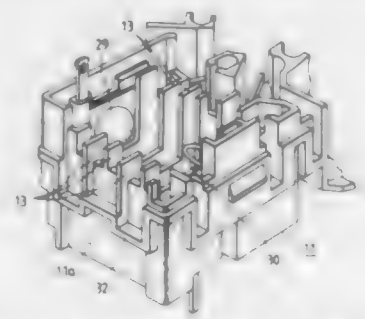
CATHODE RAY TUBE SOCKET HAVING AN IMPROVED HIGH VOLTAGE DISCHARGE HOUSING

Hirofumi Inaba, and Yasunori Nishikawa, both of Yao, Japan, assignors to Hosiden Electronics Co., Ltd., Osaka, Japan

Filed Sep. 14, 1989, Ser. No. 407,081
Claims priority, application Japan, Sep. 29, 1988, 63-128607; Sep. 29, 1988, 63-128608
Int. Cl.[5] H01R *13/53;* **H01J** *29/00*
U.S. Cl. 439—182 **5 Claims**



1. A cathode ray tube socket which is provided with a socket body having a plurality of contacts disposed in a circle and a high voltage discharge gap housing provided on one side of said socket body,

said high voltage discharge gap housing comprising a case formed as a unitary structure with said socket body and having an open end face, and a cover which overlies said opened face of said case;

said case having a plurality of plate-shaped first ribs formed on an inner wall surface of said case, said plurality of first

rib extending along said inner wall surface in a direction across a high voltage discharge in parallel and spaced-apart relation to one another; and

said cover having a plurality of plate-shaped second ribs formed on an inner wall surface of said cover to extend

therealong in a direction across the high voltage discharge, each of said second ribs being aligned with a corresponding one of said first ribs, end portions of each of said second ribs being located opposite to end portions of a corresponding one of said first ribs in a close but spaced-apart relation thereto

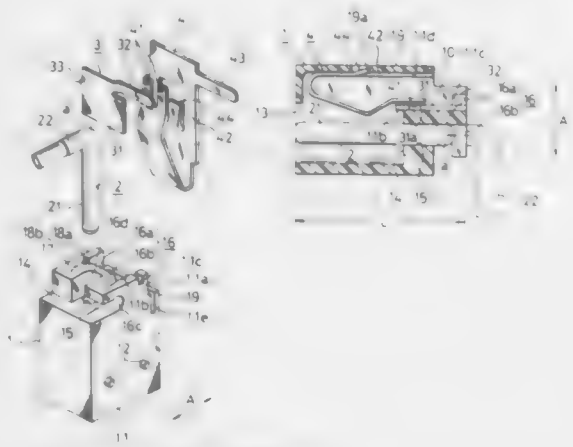
POWER SOCKET



Koji Matsumoto, Yao, Japan, assignor to Hosiden Corporation, Yao, Japan

Filed Oct. 4, 1990, Ser. No. 592,593

Claims priority, application Japan, Oct. 12, 1989, 1-119276[U]

Int. Cl.[5] H01R *29/00*

U.S. Cl. 439—188 **21 Claims**

1. A power socket comprising:

a housing;

an opening into and from which a plug is to be inserted and removed, said opening formed at the front end surface of said housing;

a rear wall having a pin insertion hole and formed at that position of the rear end surface of said housing which is opposite to said opening;

a pin having a plug connection portion and a terminal portion molded in an L-shape, said plug connection portion being inserted through said pin insertion hole into the hollow portion of said housing, said terminal portion extending along said rear wall and projecting toward a circuit board on which said power socket is to be mounted;

a stationary contact piece having (i) a plate portion having a stationary contact and (ii) a terminal which extends from said plate portion and which projects from said housing toward said circuit board, said stationary contact piece being disposed, with respect to said pin, in a direction along the surface of said circuit board;

a fixing portion formed at said stationary contact piece for securing said stationary contact piece to said housing;

a movable contact piece made of a metallic piece molded substantially in an U-shape, said movable contact piece being provided at one end thereof with movable contacts adapted to be separated from or come in contact with said stationary contact and at the other end thereof with a seat plate portion from which a terminal extends, said terminal projecting from said housing toward said circuit board, said movable contact piece being disposed, with respect to said pin, in said direction along the surface of said circuit board, said movable contact piece being adapted to be displaced by a plug inserted in or removed from said plug connection portion so that said movable contacts are separated from and come in contact with said stationary contact;

a fixing portion formed at said movable contact piece for securing said movable contact piece to said housing; and

an engagement fixing body engaged with the rear portion of said terminal portion of said pin for securing said terminal portion to said housing, said engagement fixing body being formed on said rear wall.

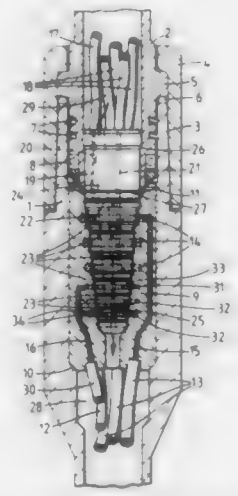
ELECTRICAL CABLE ASSEMBLY



Alan J. Dean, Aberdeenshire, and Hans P. Hopper, Abderdeen, both of Scotland, assignors to The British Petroleum Company p.l.c., London, England

Continuation of Ser. No. 173,226, Mar. 24, 1988, abandoned. This application Jan. 17, 1990, Ser. No. 469,751

Claims priority, application United Kingdom, Mar. 26, 1987, 07308

Int. Cl.[5] H01R *4/60*

U.S. Cl. 439—201 **9 Claims**

1. An electrical cable assembly formed of at least two lengths of joined pipe each length comprising:

(i) a length of hollow pipe having means at either end for joining lengths of the pipe,

(ii) at least one electrical cable within the pipe, and

(iii) a connector at each end of the cable adjacent to the ends of the pipe having at least one electrical contact so that on joining the lengths of the pipe the connectors are also automatically joined to form an electrical path through the joint,

(iv) the connector at one end of the pipe being a male connector and at the other end being a female connector,

(v) at least one electrical contact on each connector being a ring contact, and

(vi) each length of pipe having a passageway through its between the connectors, each connector having a passageway through it between the pipes, and each connection having access from the passageway to the area of the contacts, so that fluid fed to one end of the cable assembly can pass down a pipe, through the connector to the next pipe and so on and so that, at each connector, dielectric fluid can pass to the area of the contacts, whereby the contacts of each of the connectors can be flushed with fluid before use and, when in use, are immersed in dielectric fluid.

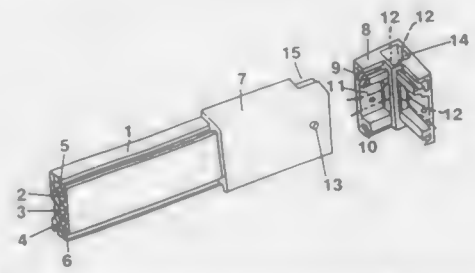
CASING SYSTEM FOR THE LAYING OF ELECTRICAL SUPPLY CONDUCTORS



Axel Olsen, Fjordskraenten 7, Graese Bakkeby, Frederikssund 3600, Denmark

Continuation-in-part of Ser. No. 254,798, Oct. 4, 1988, abandoned. This application Feb. 21, 1990, Ser. No. 483,983

Claims priority, application Denmark, Feb. 19, 1987, 847/87

Int. Cl.[5] H01R *4/64*

U.S. Cl. 439—211 **12 Claims**

1. A casing system for laying electric supply conductors and, if desired, signal conductors along the outer surface of walls of buildings, comprising

unitary elongated casing sections of insulating material and of a variety of fixed lengths, each such section having a front wall and a rear wall and at least two longitudinal cavities extending from end to end of the section in positions mutually displaced in a transverse direction parallel to said front wall,

an electric supply conductor being mounted in each of at least two such longitudinal cavities at a loose fit and being held therein against longitudinal displacement,

each casing section being constructed with a number of access modules distributed over the length of the section and each providing access for the touch and creep proof connection of outer conductors or installation components from the front side of the casing section to the supply conductors in the longitudinal cavities,

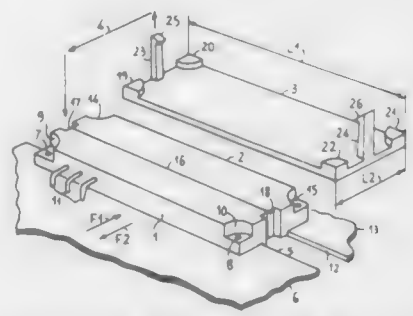
sliding cover sections profiled for positive sliding engagement with said casing sections and having a shape and a length such as to be capable of covering a gap of substantial length between two aligned casing sections,

corner sections having two legs disposed at an angle to each other, and end sections having one leg, each leg being shaped for positive sliding engagement with a sliding cover section in such a manner as to define a confined space between the sliding cover and the leg and to be capable of covering a gap of substantial length between the leg considered and the end of an aligned casing section,

said sliding cover sections being constructed for fixation relative to a wall of a building along which one or more casing sections are mounted.

5,007,854

LOCKING DEVICE FOR CONNECTORS OF PRINTED CIRCUIT BOARDS



Giampietro Crespiatico, Via Dell'Aprica 26, 20158 Milano, and Luciano Mondori, Via A. Righi 4, 20082 Binasco (MI), both of Italy

Filed May 8, 1990, Ser. No. 520,688

Claims priority, application Italy, Jun. 8, 1989, 20812 A/89

Int. Cl.[5] H01R *13/62*

U.S. Cl. 439—367 **1 Claim**

1. The combination comprising a pair of connectors for printed circuit boards and a related locking device, each of said connectors:

(A) being shaped as a rectangular parallelepiped having a length, a width and a height,

each of said connectors having:

(B) an insertion face disposed perpendicular to said width,

(C) a lower surface for fixing to a printed circuit board, said lower surface being disposed perpendicular to said height,

(D) an upper surface opposite said lower surface, and

(E) a pair of angular recesses located on said upper surface at the two corners of said parallelepiped opposite to said insertion face,

said pair of connectors being:

(F) coupled by mating of the respective insertion faces

said locking device comprising:

(G) a rectangular, elongated plate having:

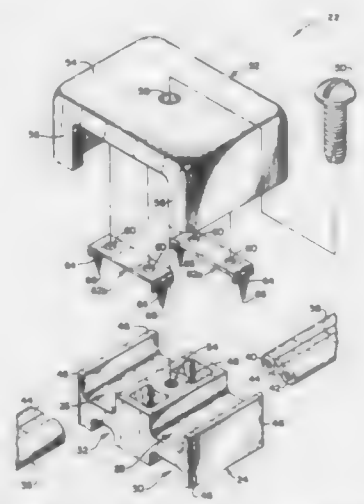
(1) a length equal to the length of said connectors,

(2) a width equal to the encumbrance of a coupled pair of said connectors in the direction of said connector width,

(3) upper and lower faces,

(4) a tenon at each of its corners protruding from said lower face, and

(5) two end arms situated intermediate the width of said plate and extending perpendicularly therefrom in the same direction as said tenons, each of said arms ending in a locking tooth, and



(H) said plate being overlapped to said coupled connectors with its lower face overlaying said upper surfaces of said connectors, said tenons being inserted in said connector recesses and said end arms locking, with their respective teeth, said plate to said coupled connectors, thereby preventing disconnection of said coupled connectors and removal of said plate from said coupled connectors.

CABLE CONNECTOR

Steven T. O'Brien, Champlin, and Jay J. Kakuk, Plymouth, both of Minn., assignors to The Toro Company, Minneapolis, Minn.

Filed Jun. 20, 1990, Ser. No. 542,491
Int. Cl.[5] H01R 4/24
U.S. Cl. 439—411 3 Claims

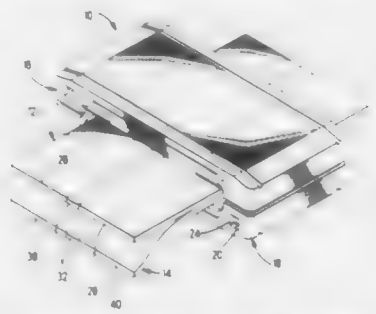
1. A low voltage cable connector for mechanically and electrically interconnecting a pair of low voltage electrical cables, said cables comprising electrically conductive material encased in electrically insulating material, said connector comprising:

(a) a pair of electrically conductive jumper elements, wherein each of said elements comprises a pair of spaced sharp protrusions wherein said sharp protrusions are electrically connected;

(b) a cap comprising electrically resistive material with means for engaging said electrically conductive jumper elements;

(c) a base comprising electrically resistive material with a plurality of channel-like cavities for accepting said electrical cables and wherein said base is sized so as to nest within said cap and wherein said cavities on said base are positioned so as to receive said protrusions such that said cables are penetrated by said protrusions when said base nests within said cap; and

(d) fastening means for retaining said cap to said base wherein said protrusions penetrate said insulating material and make electrical contact with said conductive material of said cables, wherein said base comprises a generally rectangular-like cross section and wherein said base comprises four said cavities,two of said cavities of equal width and depth for accepting cable of equal size, extending parallel to each other on one side of said base, and two of said cavities of unequal width and depth for accepting cable of unequal size extending off-parallel to each other along opposite side of said base; and wherein said base nests within said cap so that either set of said cavities will receive said protrusions of said elements engaged in said cap.



5,007,856

HOUSING FOR AN ELECTRICAL CONNECTION

Dean A. Puerner, Maricopa, Ariz., assignor to AMP Incorporated, Harrisburg, Pa.

Filed Dec. 21, 1989, Ser. No. 454,259
Int. Cl.[5] H01R 13/58
U.S. Cl. 439—452 6 Claims

1. A housing means for enclosing a termination site of flat electrical cable of substantial width and defining a substantially wide exit for the cable from the site, comprising first and second housing members securable together about the termination site, at least one of said housing members including a resilient cable-clamping means integral therewith, said cable-clamping means being opposed from a cable-engaging portion of the other said cover member for firmly clamping major side surfaces of at least a first said cable extending from said termination site and defining a cable exit, each said first cable-clamping means including a cable-engaging platform having a cable-remote base portion joined by deformable hinges to side portions of said cover member laterally to each side of said cable exit, said cable-remote base portion being deflectable normally outwardly against spring bias into a relief slot therebehind upon said cover members being urged together and clamping against said cable major surfaces, the deflection resulting from elastic deformation of said hinges, providing insulative structure generally closing off the aperture but adjustable to variations in cable thickness at said first cable exit of the interconnection and providing vibration resistance for at least a limited range of cable thicknesses at the cable exit.

ELECTRICAL RECEPTACLE WITH POWER INDICATOR LIGHT

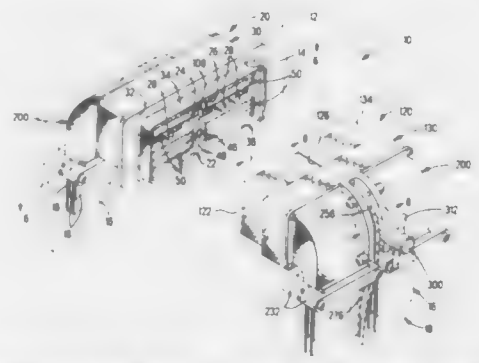
Duane E. Wright, R.R. 1 - Box 33A, Maddock, N. Dak. 58348

Filed Jul. 30, 1990, Ser. No. 559,653
Int. Cl.[5] H01R 3/00
U.S. Cl. 439—490 14 Claims

1. A unitary electrical receptacle configured for electrical connection with an electrical male plug having a pair of contact blades, the receptacle comprising:

a first pair of receptacle contacts configured for electrical connection with the pair of contact blades;

a second pair of receptacle contacts electrically insulated from the first pair of receptacle contacts and configured for making electrical connection with the first pair of receptacle contacts through the pair of contact blades when the pair of contact blades are electrically connected to the first pair of receptacle contacts; and



a lamp electrically connected in series between the second pair of receptacle contacts and adapted for interconnection to the first pair of receptacle contacts when the male plug is inserted into the receptacle.

5,007,858

ELECTRICAL CONNECTOR FOR FLAT POWER CABLE

John K. Daly, Scottsdale; Earl R. Kreinberg, Phoenix; Dean A. Puerner, Maricopa, and Marty E. Adcock, Scottsdale, all of Ariz., assignors to AMP Incorporated, Harrisburg, Pa.

Filed Apr. 20, 1990, Ser. No. 511,662
Int. Cl.[5] H01R 13/533, 9/07
U.S. Cl. 439—498 15 Claims

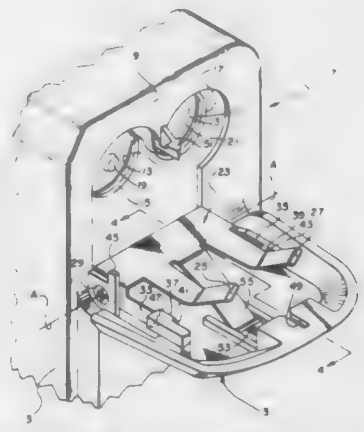
1. A connector for use with a plurality of flat cables each including at least one flat conductor of substantial width and incremental thickness, the connector being suitable for housing terminations to respective ones of the cable conductors for transmission of electrical power at substantial levels of current and voltage across a mating interface, the terminations extending laterally across the width of respective ones of the flat cables, comprising:

a shell member including at least one housing-receiving cavity extending from a rearward shell face to a front face through a transverse body section of substantial bulk material having good heat transfer properties, each said housing-receiving cavity being defined by wall sections of said shell member;

dielectric means including respective cavity means to house an end of each said flat cable to which is terminated a respective terminal means defining a termination, each said terminal means including contact sections extending forwardly into forward cavity means of said dielectric means for mating with a corresponding contact means of a mating electrical article, each said termination extending laterally across the width of the respective said flat cable and having major upper and lower surfaces, and each said dielectric means including an outwardly facing wall of limited thickness along one of said major upper and lower surfaces of each said termination therein; and

each said dielectric means containing said at least one termination being retained within said shell member and disposed within a respective said housing-receiving cavity such that at least one said cavity wall section coextends along and adjacent said wall of said dielectric means along said one of said major upper and lower surfaces of each said termination such that said wall section of said shell member is proximate said one of said major upper and lower surfaces of each said termination and defines a heat transfer system for dissipating heat from each said termination during in-service use.

5,007,859



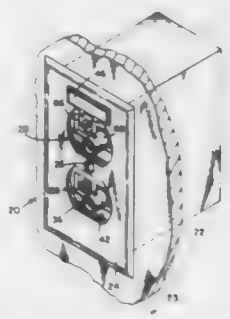
BATTERY-CONTAINING APPARATUS

Jude A. Sangregory, Spencerport, and Anthony DiRisio, Rochester, both of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

Filed Jan. 16, 1990, Ser. No. 465,670
Int. Cl.[5] H01R 3/00
U.S. Cl. 439—500 4 Claims

1. A battery-containing apparatus comprising a body portion defining a chamber having an opening for inserting at least one battery into said chamber, a door, mounting means supporting said door for pivotal movement relative to said chamber between a closed position covering said opening and an open position for uncovering the opening and for translational movement relative to the chamber in the closed position between a latched position for securing the door closed and an unlatched position for allowing the door to be opened, and a contact carrier including an electrically conductive contact for making electrical connection with a corresponding contact of the battery, characterized in that:

said mounting means includes cooperating means located on said body portion, said door, and said contact carrier for supporting the contact carrier for pivotal movement with



the door between the closed and open positions, to electrically connect said conductive contact of the contact carrier and the corresponding contact of the battery when the door is pivoted to its closed position and to disconnect the two contacts when the door is pivoted to its open position, and furthermore for supporting the door in its closed position for translational movement relative to the contact carrier between the latched and unlatched positions, to maintain the conductive contact of the contact carrier and the corresponding contact of the battery in fixed stationary relation when the door is translated in its closed position from its unlatched position to its latched position.

5,007,860

MODULAR HIGHER DENSITY COMMUNICATIONS COUPLING SYSTEM

Scott T. Robinson, Redmond; William K. Deaning, Everett; John M. Redfield, Brier, and John H. Garthwaite, Coupeville, all of Wash., assignors to Leviton Manufacturing Co., Inc., Little Neck, N.Y.

Filed Jan. 19, 1990, Ser. No. 463,328
Int. Cl.[5] H01R 13/60
U.S. Cl. 439—540 16 Claims

1. A telecommunications coupling device for mounting a pair of connectors through a single industry standard-sized hole, comprising:

a main body member;

a registration ridge extending forward from said main body member, at least a first portion of said ridge being adapted to extend into said hole to align said main body member with respect to said hole;

a pair of apertures through said main body member, and adjacent each other, said pair of apertures being generally surrounded by said registration ridge for alignment of both apertures with said hole;

a pair of retaining members extending rearwardly from said main body member, adjacent to said apertures, said retaining members being adapted to retain a pair of connector housings for supporting said respective connector in alignment with said respective apertures to permit coupling to a telecommunication apparatus; and

a pair of support members extending rearwardly from said main body member, adjacent to said apertures, said support members extending rearwardly beyond said retaining members, said support members having slots therein adapted to receive a termination plate and support said termination plate in a position above said retaining members and spanning said pair of apertures.

CRIMPLESS COAXIAL CABLE CONNECTOR WITH PULL BACK CABLE ENGAGEMENT

Albert Stirling, Gormley, Canada, assignor to Stirling Connectors Inc., Markham, Canada

Filed Jun. 1, 1990, Ser. No. 532,292

Int. Cl.[5] H01R *13/00*

U.S. Cl. 439—578 **12 Claims**

1. A connector for use with a coaxial cable of the type having a core with a central wire conductor and a foil conductor and having a deformable outer insulating jacket, said connector also being for use with a threaded coupling unit, said connector comprising:

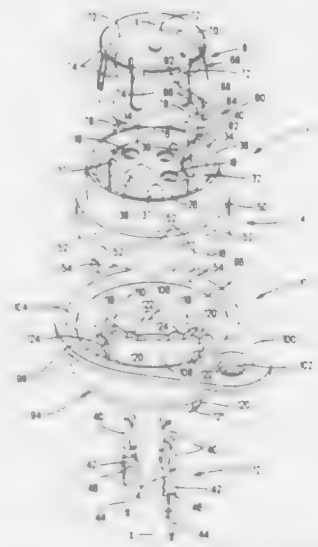
a generally cylindrical body open at both ends, having a threaded portion at one end engageable with said coupling unit, and at the other end being adapted to receive said cable;

a rigid bushing with a bore of a diameter to closely receive said cable, mounted within said body proximal to said other end thereof;

an annular mandrel with a bore of a diameter to closely receive said core of said cable, slidably housed within said body proximal to said one end thereof, said mandrel having a sleeve adapted to engage the cable beneath said jacket, contacting said foil, to thereby stretch and increase the outer diameter of the jacket to a diameter greater than the internal diameter of the bushing, the sleeve being engageable with the cable by pushing the mandrel and the cable together,

said mandrel being movable longitudinally within said body from a first position in which the sleeve is not surrounded by the bushing whereby the sleeve may be engaged to the cable, to a second position via an intermediate position in both of which positions the sleeve is at least partially within the bushing whereby the jacket frictionally engages the bushing to retain the cable in the connector the mandrel being displaced to the intermediate position by pulling the cable away from the connector after engagement of the cable with the mandrel, and the mandrel being displaced to the second position by screwing the connector onto the coupling unit.

5,007,862



SHIELDED CONNECTOR HAVING A MULTIPLY ORIENTABLE HOUSING

George R. Defibaugh, Mechanicsburg; Earl C. Myers, Jr., Harrisburg, and Steven G. Smith, Linglestown, all of Pa., assignors to AMP Incorporated, Harrisburg, Pa.

Filed Jun. 15, 1990, Ser. No. 540,678

Int. Cl.[5] H01R *13/648*

U.S. Cl. 439—607 **17 Claims**

1. A circular cross section electrical connector for mounting in a position on a circuit board, the connector comprising,

a dielectric housing having a mating first end face and a second end face opposite thereto, a plurality of electrical terminal receiving cavities each opening into both of said faces and at least one housing orienting lug projecting from said second end face proximate to the radially outer periphery thereof;

an electrical terminal retained in each cavity and having a contact tail projecting from said second end face substantially normally thereof for insertion into a hole in the circuit board and a mating portion extending in the opposite direction to said tail; and

an outer metal shield having a peripheral wall defining a seat for receiving said housing with said second face thereof leading, a rudimentary wall projecting radially inwardly from the peripheral wall and defining a central hole for the passage of said contact tails therethrough, a plurality of openings being distributed in spaced relationship circumferentially of said rudimentary wall, in each of which openings said at least one orienting lug is selective engagable in order- to select the angular orientation of said dielectric housing with respect to said outer metal shield

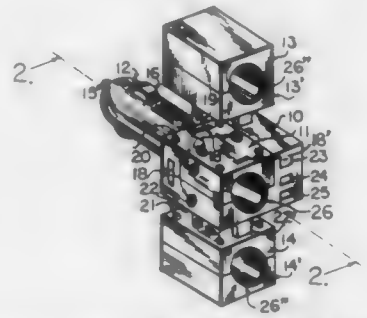
MODULE-TYPE MULTI-FUNCTION ELECTRICAL POWER ADAPTER FOR AUTOMOBILES AND THE LIKE

Jialuo Xuan, 914 Sherman Ave., #2F, Evanston, Ill. 60202

Filed Sep. 17, 1990, Ser. No. 583,689

Int. Cl.[5] H01R *25/00*

U.S. Cl. 439—639 **3 Claims**



1. A module-type multi-function electrical power adapter, for use with electrical cigarette lighter socket in automobiles and boats, which comprises:

a master module and additional modules, each provides a socket for accommodating one accessory, said master module having cylindrical extender insertable into the cigarette lighter socket and constructed to receive the two-prong power connection; said additional modules able to be attached to the said master module; each additional module also be able to receive another module; and

housing means defining a plastic bottom half portion and a plastic top half portion, both having stepped edges for rigid combination by screws, forming a narrow round slot to hold a cylindrical wall element or socket for both said master module and said additional modules;

insulator means having ring shape to mount on a small end of said wall element to insulate a negative lead from a positive central lead in either said master module or said additional modules;

insulator means having cylindrical shape to insulate the central positive contact from outside negative contact in the said cylindrical extender of the said master module; having an enlarged outside end to hold a negative contact, having a cylindrical inner space to hold said positive contact, spring, electrical fuse, and spacing block;

positioning hole means on sides of the said master module, having rectangular shape to receive positioning pins with correct sizes from said additional module;

positioning pin means on the said additional module being able to match the said positioning holes on the said master module;

receiving ring means on sides of said master module, having side portions being punched inwardly to keep tight tough with inserting power connecting legs from said additional module, having one end to be riveted onto the said master module;

power connecting leg means on said additional module having cylindrical shape and shorter than said positioning pins to ensure correct power connection, having one end to be riveted onto the said additional module;

power lead means having ring-shaped ends to be inserted into a slot on said wall element or put under said power connecting legs or said receiving rings for easy assembly without welding;

inner structure means of the said master module having space for a printed-circuit board mounted by a central screw.

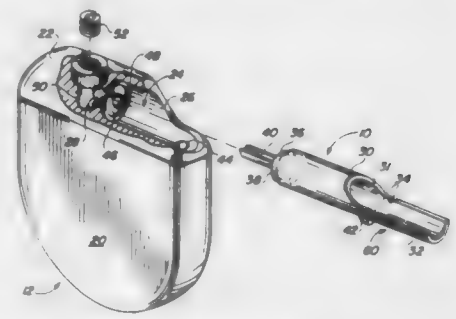
DEVICE FOR ADAPTING A PACEMAKER LEAD TO A PACEMAKER

William H. Stutz, Jr., Burbank, Calif., assignor to Siemens-Pacesetter, Inc., Sylmar, Calif.

Filed Nov. 27, 1989, Ser. No. 441,844

Int. Cl.[5] H01R *25/00*



U.S. Cl. 439—651 **28 Claims**

1. An adapter for use in a coping a generally cylindrical terminal electrode assembly to a device having a jack for receiving the assembly, the terminal electrode assembly being undersized relative to the dimensions of the jack, the adapter comprising:

a thin-walled tubular portion defining a hollow bore terminating in an end wall at a distal end thereof and an entry opening at a proximal end thereof, the outer diameter of the tubular portion being selected to match the inner diameter of the jack, the diameter of the tubular portion being selected to match the outer diameter of the terminal electrode assembly;

means for releasably latching the adapter within the jack of the device;

means for releasing the latching means and withdrawing the adapter from the jack, wherein the releasing and withdrawing means is detachable from the adapter; and

wherein the releasing and withdrawing means further comprises:

a tab extending from one side of the tubular portion outwardly past the entry opening; and

means defining a pair of notches located to establish a separation point to facilitate breaking off the tab from the tubular portion.

U.S. Cl. 439—839 **5 Claims**

1. A stamped and formed electrical terminal comprising a receptacle portion, a wire connecting portion and a backing spring portion, the receptacle portion comprising a channel shaped body having a base and a pair of side walls upstanding from opposite edges of the base, a pair of cantilever contact springs projecting in juxtaposed relationship, each from a respective side all at one end of the body, each contact spring having a bowed contact surface proximate to its free end, said contact surfaces being bowed towards each other to receive a male contact element between them the wire connecting portion extending from the other end of the body, the backing spring portion comprising a backing spring support secured to the body and from which project a pair of cantilever backing springs resiliently restraining movement of the contact springs away from each other, each backing spring having a free end portion projecting substantially normally thereof and having a

free end engaging the respective contact spring at a position opposite to its contact surface; characterized in that the backing spring support is also channel shaped and receives the body of the receptacle portion, said support having a base superposed with the base of the body and side walls each of which is substantially parallel to a side wall of the body, a pair of flanges projecting from the free longitudinal edge of each side wall of the backing spring support and being spaced from each other longitudinally of said free longitudinal edge and engaging a free edge of a respective side wall of the body from which free edge upstands a lug between said flanges,

a cantilever locking tongue projecting from the base of said body at said one end thereof, obliquely away therefrom and between the side walls of said body and having a free end at the other end of the body, proximate to, but lying above, the free longitudinal edge of said side walls of the body.

5,007,866

TRIMMING/TILTING SYSTEM FOR MARINE PROPULSION UNIT

Ryozo Okita, Hamamatsu, Japan, assignor to Sanshin Industries Co., Ltd., Hamamatsu, Japan

Filed Oct. 4, 1989, Ser. No. 416,865
Claims priority, application Japan, Oct. 4, 1988, 63-250306
Int. Cl.[5] B63H *21/26*
U.S. Cl. 440—61 **9 Claims**

1. A hydraulic tilt and trim system for an outboard drive unit mounted on the transom of a marine vessel for tilting movement of the drive unit and movement between a plurality of trim positions, comprising first and second fluid motors each adapted to effect tilting and trimming movement and each connected to said drive unit and said transom, said fluid motors having cylinder housings and moveable members defining first and second fluid chambers in each fluid motor, a pump for delivering hydraulic fluid to said fluid motors, and a selector valve for effecting quick tilting-up movement of the drive unit by permitting hydraulic fluid to flow to only one of said fluid motors and for effecting slow trimming movement of the drive unit between a plurality of trim positions by permitting hydraulic fluid to flow simultaneously to both of said fluid motors.

5,007,867

WEED RING FOR TROLLING MOTOR

Michael P. Kelley, Broken Arrow, Okla., assignor to Zebco Corporation, Tulsa, Okla.

Filed May 16, 1989, Ser. No. 352,570
Int. Cl.[5] B63H *5/16*
U.S. Cl. 440—71 **12 Claims**

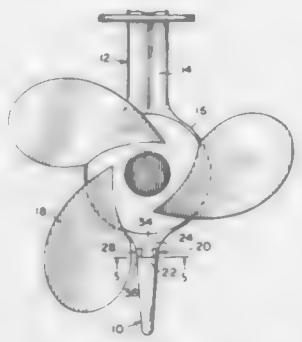
12. An improved trolling motor of the type having a propeller, a housing with axially spaced leading and trailing ends, a shaft carrying the propeller and journalled for rotation in the housing, and means for rotatably driving the shaft and propeller, the improvement comprising:

said housing trailing end having an outer, radially outwardly facing surface and an annular radially inwardly facing surface;

said propeller having a hub with an annular radially outwardly facing outer surface to which a plurality of blades are attached; and

cooperating means on the housing, shaft and propeller for mounting the propeller with respect to the housing so that the radially inwardly facing housing surface is radially outside of, in axially overlapping relationship with, and in close proximity to, the outwardly facing propeller surface,

wherein the cooperating means includes a strip attached to the housing outer surface defining said radially inwardly facing housing surface,



wherein at least portions of the outer surfaces of the housing trailing end and propeller housing are spaced from each other in an axial direction to define a radially opening space and the strip overlaps the radially opening space so that the radially opening space is completely blocked in a radial direction by said strip over substantially the entire circumferential extend of the radially opening space.

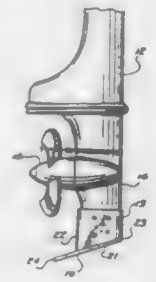
5,007,868

REPLACEABLE SKEG FOR A MARINE PROPULSION DEVICE

Trenton Fry, Northland Lodge, Orr, Minn. 55771

Filed Jan. 22, 1990, Ser. No. 468,254
Int. Cl.[5] B63H *5/16*
U.S. Cl. 440—071 **2 Claims**

1. A replaceable skeg for a marine propulsion device of the type having a drive shaft housing, a gear case housing fixed, to the bottom end of the drive shaft housing and rotatably mounted propelling element on the rear end of the gear case housing, said skeg comprising a means for removably connecting the top of said skeg to the lower portion of the gear case housing so that when said skeg is hit by an underwater obstruction, said skeg will fracture at said removable connecting means and break away, leaving the lower portion of the gear case housing intact and undamaged in which another said skeg can be installed thereto,



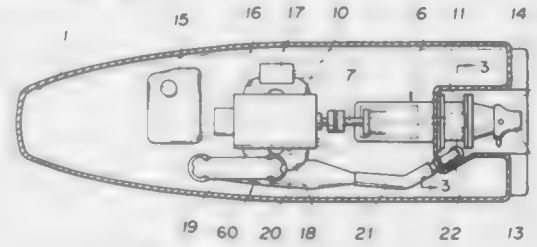
wherein said removable connecting means includes a dovetail tongue and groove joint between the top of said skeg and the lower portion of the gear case housing, and wherein said dovetail tongue and groove joint is tapered, being wider at the leading edge and narrower at the trailing edge of the top of said skeg and the lower portion of the gear case housing to ensure a tight fit for said skeg.

5,007,869

PROP-SAVER (PROPELLER GUARD DEVICE)

Allen W. Zoellner, P.O. Box 283, Topock, Ariz. 86436

Continuation-in-part of Ser. No. 492,960, Mar. 13, 1990, abandoned. This application Jul. 19, 1990, Ser. No. 555,373
Int. Cl.[5] B63H *5/16*
U.S. Cl. 440—71 **3 Claims**



1. A propeller guard for mounting on the lowermost portion of a skeg of a marine drive having propeller blades, said guard comprising an oval shaped sleeve with a vertical longitudinal axis, a top and a bottom, said top being open as to allow the sleeve to be slipped over said skeg, said guard further comprising a generally flat fin attached to and closing said bottom of said sleeve, with said fin having an angle of pitch of 3 to 5 degrees to said vertical longitudinal axis of said sleeve and extending downward and rearwardly, said fin having a trailing edge at least as wide as the circumference of the rotational path of said propeller blades and said guard further comprising means for readily attaching and detaching said sleeve to said skeg.

5,007,870

JET PROPULSION CRAFT PROVIDED WITH EXHAUST NOISE ELIMINATING APPARATUS

Susumu Okubo, and Yutaka Sasaki, both of Hamamatsu, Japan, assignors to Suzuki Jidosha Kogyo Kabushiki Kaisha, Kamimura, Japan

Filed Jun. 21, 1989, Ser. No. 369,174
Claims priority, application Japan, Jul. 6, 1988, 63-166933
Int. Cl.[5] B63H *21/32*
U.S. Cl. 440—89 **15 Claims**

1. A jet propulsion craft for propulsion upon a water surface, comprising:

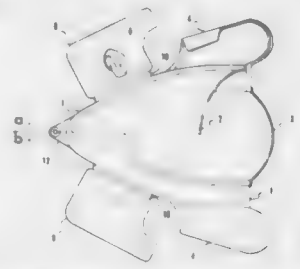
a hull structure generally comprising a bottom plate and an upper plate;

an engine mounted upon said bottom plate at substantially a middle portion of said hull structure as considered in the longitudinal direction thereof, said engine being provided with an exhaust port;

an exhaust system extending rearwardly from said engine and provided with an inlet end and an outlet end, said inlet end being operatively connected to said engine exhaust port;

a jet pump mounted upon said bottom plate at a rear portion of said hull structure and driven by said engine, said jet pump being adapted to ingest water and to exhaust said ingested water outwardly as a water jet from a jet nozzle for propelling said jet propulsion craft with respect to said water surface;

an exhaust gas noise eliminating means operatively connected to said outlet end of said exhaust system and mounted upon a rear portion of said hull within the vicinity of said jet nozzle for eliminating said exhaust gas noise; and



an exhaust gas discharging port operatively connected to said exhaust gas noise eliminating means for discharging said exhaust gas at reduced noise levels.

5,007,871

DIVE-PLANE

William R. Dyer, 4517 126th St. SE., Everett, Wash. 98208

Filed Jul. 31, 1989, Ser. No. 387,588
Int. Cl.[5] A63C *15/00*
U.S. Cl. 441—65 **7 Claims**

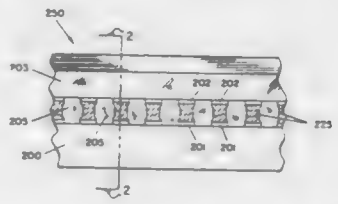
1. An aquatic dive plane device for under water search and exploration, comprising:

(a) a body of buoyant plastic material to float said dive plane device, said body being shaped such that it has a generally pointed, closed front end and rearwardly extending, spaced apart side portions having both inside and outside edges, said side portions being of predetermined length and defining an open operator area therebetween and rearwardly of said front end,

(b) arm support means attached to each of said side portions on the outside edge thereof,

(c) a wing member made of buoyant plastic material affixed to the outer edge of each side portion forwardly of said arm support means, said wing members having top and bottom surfaces and being affixed along said outer edge by hinge means for limited up and down movement,

(d) handle means detachable secured to the top surface of each of said wing members to be grasped by the operator for control of said wing members and said dive plane device and



(e) Upper an lower semi-parabolic transparent fairing means removably attached to said body.

5,007,872

SCREENED INTERCONNECT SYSTEM

Sang T. Tang, Pomona, Calif., assignor to Babcock Display Products, Inc., Anaheim, Calif.

Filed Jun. 12, 1989, Ser. No. 364,629
Int. Cl.[5] H01J *9/00*
U.S. Cl. 445—25 **15 Claims**

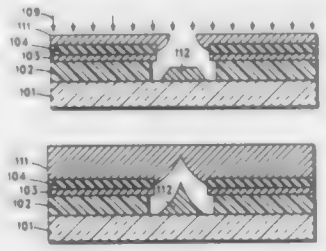
1. An interconnect system for electrically interconnecting electrical conductors on parallel plates comprising,

first and second planar plates of substantially electrically non-conducting material,

a plurality of closely spaced conductor paths on a surface of each of said first and second planar plates,

said conductor paths are on the order of 0.5 mm wide with spacing on the order of 0.5 mm therebetween,

said first and second planar plates arranged in parallel, spaced apart relation with the plurality of conductor paths on said first planar plate in alignment with the plurality of conductor paths on said second planar plate, and



independent and unsupported interconnections formed of a conductive material having substantially the same thermal coefficiently of thermal expansion as said first and second planar plates and joined to the aligned conductor paths on said first and second planar plates in order to electrically interconnect said aligned conductor paths.

5,007,873

NON-PLANAR FIELD EMISSION DEVICE HAVING AN EMITTER FORMED WITH A SUBSTANTIALLY NORMAL VAPOR DEPOSITION PROCESS

Herbert Goronkin, Scottsdale, Ariz., and Robert C. Kane, Woodstock, Ill., assignors to Motorola, Inc., Schaumburg, Ill.

Filed Feb. 9, 1990, Ser. No. 477,694
Int. Cl.[5] H01J *9/02*
U.S. Cl. 445—49 **20 Claims**

1. A method of forming a substantially non-planar cold-cathode field emission device, comprising the steps of:

(a) providing a body having a cavity formed therein;

(b) forming an emitter within the cavity through use only of a substantially, but not absolutely, normal encapsulated by build up of material deposited onto the body at the edge of the cavity through said substantially normal vapor deposition process.

5,007,874

METHOD OF MAKING A CATHODE FROM TUNGSTEN AND IRIDIUM POWDERS USING A REACTION PRODUCT FROM REACTING A GROUP III A METAL WITH BARIUM PEROXIDE AS AN IMPREGNANT

Louis E. Branovich, Howell; Donald W. Eckart, Wall; Bernard Smith, Ocean, and Gerard Freeman, Freehold, all of N.J., assignors to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed Oct. 15, 1990, Ser. No. 597,637
Int. Cl.[5] H01J *9/04*
U.S. Cl. 445—50 **9 Claims**

1. Method of making a cathode for operation in microwave devices from tungsten and iridium powders using a reaction product formed from reacting a Group III A metal powder with barium peroxide powder in the mole ratio of 2 to 3 as an impregnant, said method including the steps of

(A) mixing the tungsten and iridium powders,

(B) adding about 2 percent by weight of an activator to the mixture,

(C) ball milling the mixture for about 8 hours,

(D) pressing the ball milled mixture into a billet at about 48,000 psi in a die,

(E) sintering the billet at about 1800° C. for about thirty minutes in dry hydrogen of less than −100 dewpoint,

(F) backfilling the billet with copper in dry hydrogen at about 1500° C.,

(G) machining the billet to the desired geometry,

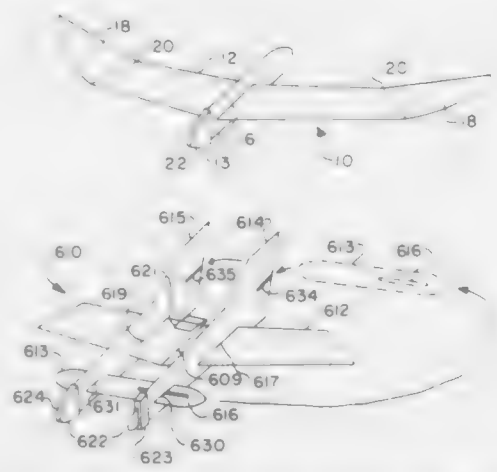
(H) removing the copper by etching in nitric acid,

(I) thoroughly rinsing in deionized water, methanol and then drying,

(J) firing the billet in dry hydrogen at about 140° C for about 15 minutes,

(K) impregnating the billet with reaction product formed from reacting a Group III A metal powder with barium peroxide powder in the mole ratio of 2 to 3 by firing the billet in a dry hydrogen furnace at a temperature at which the impregnant melts for about two minutes,

(L) removing the billet from the furnace after the furnace is cooled, and



(M) removing any loose pieces of impregnant from the billet

5,007,875

MULTIPLE CONFIGURATION MODEL AIRCRAFT

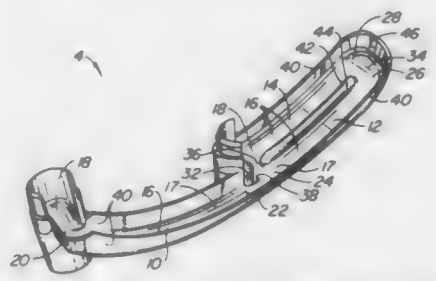
Madhava Dasa, P.O. Box 461, Kula, Hi. 96790-0461

Filed Oct. 2, 1987, Ser. No. 103,954
Int. Cl.[5] A63H *27/18*
U.S. Cl. 446—66 **4 Claims**

1. A model aircraft kit including constituent parts which are adapted to be assembled together in connected relation in differing model aircraft configurations providing correspondingly different model aircraft appearances and aerodynamic characteristics, comprising:

a wing panel having a longitudinal center line and and left and right wing portions symmetrical about the centerline,

a first planar member of elongate configuration having a slot therein extending in the direction of elongation, said wing panel being insertable into said slot of said first planar member in the first configuration of the model aircraft, and



at least one second planar member having an elongate body portion, a first end portion at one end of said body portion and a second, enlarged end portion at the opposite end of said body portion, said second planar member also having a first slot in said body portion thereof extending in the direction of elongation and of such length in said body portion thereof extending in the direction of elongation and of such length as to receive said wing panel, and a third slot in said second end portion, said wing panel being insertable into said second slot in the second and third configurations of the model aircraft and said first planar member being insertable into said first slot in the second configuration thereof and into said third slot in the third configuration thereof.

5,007,876

BANKED HAIRPIN MARBLE RACE TOY

Daniel B. Klitsner, San Francisco, Calif., assignor to Discovery Toys, Inc., Martinez, Calif.

Filed Jul. 1, 1988, Ser. No. 214,243
Int. Cl.[5] A63H *29/08*; A63F *9/14*
U.S. Cl. 446—168 **20 Claims**

1. A marble race toy for use with a marble race game of the type in which a marble moves along a tortuous path comprising:

a marble track having an entrance and an exit;

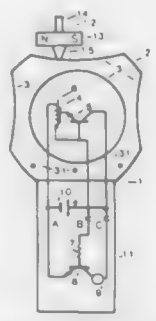
the track including a first portion, having first and second ends, sloping downwardly from the entrance, a second portion, having third and fourth ends, sloping upwardly from the second end, a third portion, having fifth and sixth ends, sloping downwardly from the fourth end, and a U-shaped track portion, coupling the fourth and fifth ends, which generally reverses the direction of the marble;

the first end being adjacent the entrance;

the sixth end being adjacent the exit;

the first and second portions forming a smoothly curving track portion together defining a vertically oriented flat plane;

the second and third portions being juxtaposed, generally parallel to one another, and having a common wall therebetween dividing the second and third portions;



the first, second, third, fourth, fifth and sixth ends being at first through sixth elevations, the first elevation being above the fourth and fifth elevations which are above the second, third and sixth elevations.

5,007,877

NOVELTY MAGNETIC TOP

Thomas A. Watson, 2358 Workman St., Montreal, Quebec, Canada H3J 1L6

Filed Jan. 16, 1990, Ser. No. 468,131
Int. Cl.[5] A63H *1/02*
U.S. Cl. 446—242 **9 Claims**

1. A novelty magnetic toy having a stator coil and an electric circuit, a magnetic top, supporting means for the top in close proximity to and externally of the coil for supporting the top for rotation relative to and external of the coil, a source of electric potential in the electric circuit and means in the electric circuit operable by the coil current induced by rotation of the magnetic top for momentarily connecting the source of electric potential across the coil to momentarily impose a magnetic field on the magnetic top to accelerate rotation thereof, the supporting means mounted externally on a head which contains the coil, a shank connected to the head, wherein the shank is arranged to form a handle.

5,007,878

PROCESS FOR CALIBRATION OF STANDARDIZATION OF NATURAL INTESTINES

Peter A. Klöpping, An der Alster 3, D-2000 Hamburg 1, Fed. Rep. of Germany

Filed Dec. 4, 1989, Ser. No. 444,874
Claims priority, application Fed. Rep. of Germany, Dec. 12, 1988, 3841808
Int. Cl.[5] A22C *11/00*
U.S. Cl. 452—198 **5 Claims**

1. A process for the calibration or standardization of natural intestines for use as skins for foods and the like, comprising:

placing the natural intestines around a carrier having a desired caliber; and

subjecting the natural intestines to a microwave field.

5,007,879

DOG CHEW PROCESSING METHOD

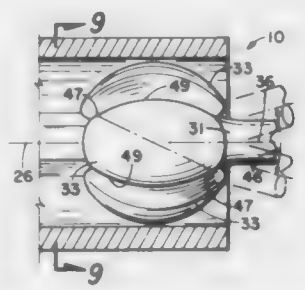
Richard L. Lawson, 3272 N. Greenwood, Sanger, Calif. 93657

Continuation of Ser. No. 443,457, Nov. 29, 1989, Pat. No. 4,985,964. This application Oct. 12, 1990, Ser. No. 596,276
Int. Cl.[5] A22C *17/00*
U.S. Cl. 452—198 **9 Claims**

1. A method for processing a hoof for use as a pet chew, the hoof having a bottom and an upper edge, comprising the following steps:

cleaning the hoof;

removing a portion of the bottom of the hoof, the portion having a thickness; and



limiting the thickness of said portion so as not to create a hole in the bottom of the hoof.

5,007,880

BEVEL SPLINED ARTICULATED JOINT

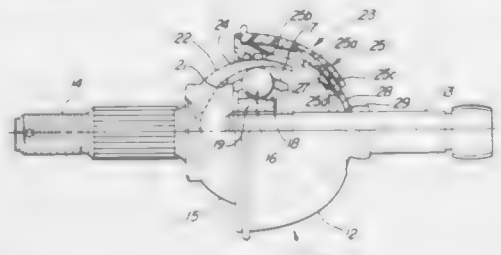
Stanley L. Walker, Rte. 4, Box 13, Eureka Springs, Ark. 72632

Filed May 9, 1990, Ser. No. 521,231
Int. Cl.[5] F16D *3/18*
U.S. Cl. 464—159 **8 Claims**

1. A joint articulable to a maximum predetermined angle ϕ comprising:

a cylindrical socket having a major inner diameter complimentary to a predetermined diameter 'd' and a preselected number 'n', at least three, longitudinal internal splines

integrally and uniformly extending inwardly from said major diameter and centered on planes cyclically angularly disposed through a longitudinal axis of said socket;



a ball having a preselected number 'n', at least three, of external splines integrally outwardly extending from said ball, said splines being centered on planes cyclically angularly disposed through a longitudinal axis of said ball and having an exterior surface defined by rotation of a circular arc about said ball axis, said arc having a radius 'r_{spline}' $= d(1 - \text{Tan } \phi/2)$ and said arc point of origin being spaced from said axis by a distance 'x_{spline}' $= d(0.50 - \text{Tan } \phi/2)$, said external splines having exterior edges, said exterior edges of adjacent external splines being spaced at a constant distance and said external splines being meshably insertable between said internal splines when said ball and socket longitudinal axes are aligned.

5,007,881

MULTI-COMPONENT, MULTI-SEGMENT, NON-FLEXIBLE BOOT FOR MECHANICAL JOINT

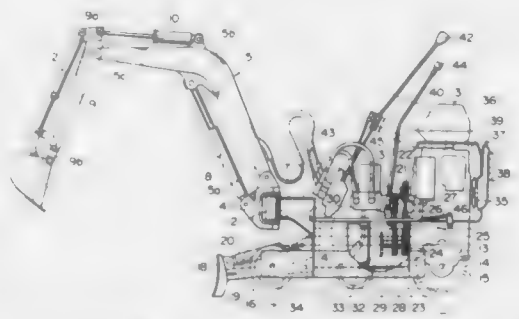
Daniel W. Hazebrook, Detroit, Mich., assignor to GKN Automotive, Inc., Auburn Hills, Mich.

Filed Feb. 24, 1986, Ser. No. 832,865
Int. Cl.[5] F16D *3/84*
U.S. Cl. 464—171 **4 Claims**

1. A boot for sealing a power transmitting mechanical joint, said joint comprising an input shaft, an output shaft, an outer race connected to one of said input shaft and said output shaft, and means to transmit power from the other of said input shaft and output shaft to said outer race, said outer race having a spherical outer surface, said input shaft and said output shaft being subject to articulation relative to one another during the operation of said mechanical joint, said boot comprising:

a first boot segment formed by at least two separate concentrically mounted components, at least one of said at least two concentrically mounted components being an inner component, at least one other of said at least two concentrically mounted components being an outer component, said outer component being formed from a first semi-rigid material, said inner component being formed from a second semi-rigid material, said first semi-rigid material having a hardness greater than said second semi-rigid material, said inner component being mounted to said spherical outer surface of said outer race, said inner component further surrounding and sealing engaging a portion of said spherical outer surface of said outer race, said outer component having a first portion mounted contiguous said inner component and a second portion spaced a predetermined distance from said inner component to define a spherical groove therebetween, said spherical groove facing one of said input shaft and said output shaft, said first portion being capable of articulating with respect to said outer race without the loss of the sealing relationship therewith; and

a second boot segment formed from a semi-rigid material, said second boot segment having one end portion extended into said spherical groove defined by said inner and outer component of said first boot segment, said second boot segment further having an opposite end portion sealingly engaging the other of said input shaft and said output shaft, said one end portion further being sealing and slidingly received in said spherical groove of said first boot segment and being sealingly articulatable with respect to said first boot segment, said second boot segment together with said first boot segment, sealing the power transmitting mechanical joint between said outer race and the other of said input shaft and said output shaft to retain lubricant within said joint and to prevent dirt and other contaminants from entering said joint;



said spherical groove in said first boot segment having a predetermined length so that the articulation of said second boot segment with respect to said first boot segment causes said one end portion of said second boot segment to bottom in said spherical groove in said first boot segment, said boot being capable of further articulation by the articulation of said first boot segment with respect to said outer race of said power transmitting mechanical joint after said one end portion of said second boot segment bottoms in said spherical groove in said first boot segment.

5,007,882

BELT TRANSMISSION FOR VERY SMALL SIZE SHOVEL CAR

Takeshi Mizumoto, and Yoshiaki Murakami, both of Ehime, Japan, assignors to Kabushiki Kaisha Kobe Seiko Sho, Kobe, Japan

Filed Jul. 23, 1990, Ser. No. 555,650
Claims priority, application Japan, Aug. 7, 1989, 1-204167
Int. Cl.[5] F16H *7/00, 7/08*
U.S. Cl. 474—84 **2 Claims**

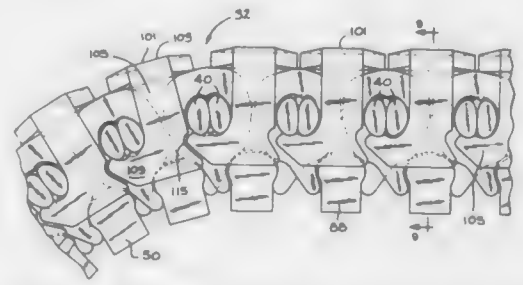
1. A belt transmission for a very small size shovel car which includes an engine, a transmission case connected to said engine by way of said belt transmission for driving said shovel car to run, and a hydraulic pump for operating a working boom, comprising a first pulley mounted on an output shaft of said engine, a second pulley mounted on an input shaft of said transmission case, a first belt extending between and around said first and second pulleys, a belt tension clutch movable to and from an operative position in which it engages with said first belt to cause said first belt to transmit power from said first pulley to said second pulley, a third pulley also mounted on said input shaft of said transmission case, a fourth pulley mounted on an input shaft of said hydraulic pump, and a second belt extending between and around said third and fourth pulleys.

5,007,883

CHAIN-BELT

Edward H. Cole, Jr., Ithaca, and John D. Bilynsky, Auburn, both of N.Y., assignors to Borg-Warner Automotive, Inc., Sterling Heights, Mich.

Filed Mar. 20, 1990, Ser. No. 496,833
Int. Cl.[5] F16G *5/16*
U.S. Cl. 474—242 **13 Claims**



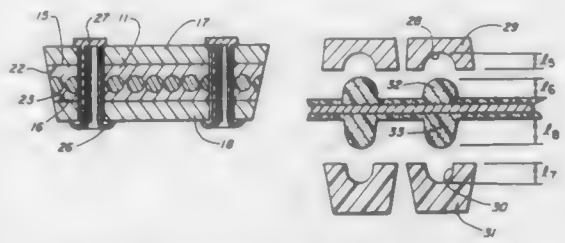
1. A power transmission (**10**) chain-belt (**32**) especially adaptable for connecting the pulleys (**12, 14**) of a pulley transmission (**10**) comprising:

a plurality of interleaved sets (**34**) of links (**36**), each set (**34**) having a plurality of transversely arranged links (**36**);

pivot means (**40**) joining said adjacent sets (**34**) of links (**36**) to form an endless loop;

at least one toe (**42A, 42B**) extending from each link (**36**) in at least some sets (**34**) of links (**36**), at least said toes (**42A, 42B**) on adjacent links (**36**) being in opposed relationship and said toes (**42A, 42B**) defining a passageway (**80**);

a plurality of load blocks (**50**) connected to said links (**36**), said load blocks (**50**) being positioned in said passageway (**80**) defined by said toes (**42A, 42B**), each load block (**50**) having edge surfaces (**88**) for contacting said pulleys (**12, 14**) of said transmission (**10**), and



a retainer bracket (**101**) positioned on each sets (**34**) of links (**36**), said retainer bracket (**101**) having a first section (**103**) that extends across the side of said links (**36**) that is in spaced apart, opposed relationship to said passageway (**80**) and a second section (**105**) that extends along the sides of said links (**36**), said retainer bracket (**101**) being held in place on said links (**36**) by said pivot means (**40**), said retainer bracket (**10**) contacting said ends of said load block (**50**) to restrain said load block (**50**) from movement transverse to the direction of travel of said chain-belt (**32**).

5,007,884

BELT FOR HIGH LOAD TRANSMISSION

Takashi Masuda; Kengiro Hashimoto, both of Kobe; Shinichi Takagi, Nishinomiya, and Masayuki Tanaka, Kobe, all of Japan, assignors to Mitsuboshi Belting Ltd., Japan

Division of Ser. No. 235,162, Aug. 23, 1988. This application Jan. 9, 1990, Ser. No. 462,611
Claims priority, application Japan, Sep. 1, 1987, 62-133862
Int. Cl.[5] F16G *5/16, 1/22*
U.S. Cl. 474—242 **15 Claims**

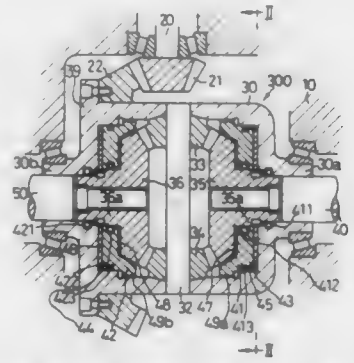
1. In a power transmission belt for transmitting high loads, said belt including:

an elastomeric neutral belt defining an outer flat surface and an inner flat surface, said belt including longitudinally spaced outer and inner aligned projections having heights;

a tensile cord extending longitudinally in said neutral belt;

a plurality of pairs of aligned longitudinally, equally spaced first and second blocks adjacent said outer and inner surfaces respectively of said neutral belt, at least one of said blocks being provided with a recess for receiving one of said projections having a depth different than the height of said projection and surfaces for contacting a neutral belt flat surface, said blocks having an outer portion comprising thermoset synthetic resin material having friction-reducing fibers distributed therein; and

means for securing said blocks to said neutral belt, said securing means extending through said neutral belt and the aligned blocks to said outer and inner surfaces, said securing means comprising means for causing said surfaces of said one block to be compressed against a neutral belt flat surface,



whereby said belt flat surface and said surfaces of one said block are in clamped, high friction engagement.

5,007,885

DRIVING TORQUE TRANSMITTING DEVICE

Masaji Yamamoto; Shigeo Tanooka, both of Okazaki, and Toshifumi Sakai, Aichi, all of Japan, assignors to Toyoda Koki Kabushiki Kaisha, Kariya, Japan

Continuation of Ser. No. 227,806, Aug. 3, 1988, abandoned. This application Dec. 19, 1989, Ser. No. 453,190
Claims priority, application Japan, Aug. 3, 1987, 62-193908; Aug. 19, 1987, 62-205550
The portion of the term of this patent subsequent to Mar. 6, 2007, has been disclaimed.
Int. Cl.[5] F16H *1/44*
U.S. Cl. 475—231 **5 Claims**

1. A driving torque transmitting device for transmitting driving torque from a driving torque supply to two output shafts connected to wheels, comprising:

an input shaft rotatably supported on a housing to be rotated by said driving torque supply and provided with an input gear at its one end;

a cylindrical case body supported within said housing so as to be rotatable about a rotational axis perpendicular to the rotational axis of said input shaft and provided on its outer periphery with a ring gear meshing said input gear each other so as to be rotated;

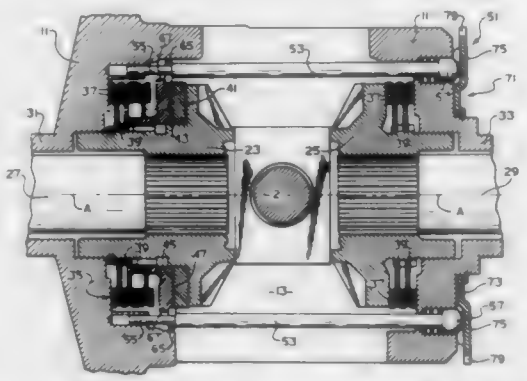
two output shafts arranged to be rotatable about an axis coinciding with said rotational axis of said cylindrical case body, each end of said two output shafts penetrating end walls of said case body;

two first engaging members each provided on an outer surface of said ends of said output shafts so as to be rotatable with and axially slidable relative to said output shafts;

two second engaging members provided within said case body in contact with each of said first engaging members;

two piston members each provided on an outer surface of said ends of said output shafts in contact with respective first engaging members so as to form two closed actuating chambers charged with viscous fluid together with two radially extending walls formed integrally with said case body; said piston members being rotatable with and axially slidable relative to said case body; and

two blade members each being rotatable bodily with each of said output shafts and disposed within each of said closed actuating chambers in relative slidable contact relation



with said piston members, each of said blade members having an axial width which is narrower in an axial direction than said closed actuating chambers so that upon rotation of each of said blade members respectively with said closed actuating chambers, a high pressure is generated due to said viscous fluid being compulsorily moved between two respective surfaces defining respectively said closed actuating chambers, so as to axially respectively move said piston members respectively toward said first engaging members and so as to tightly respectively engage the same with said second engaging members for torque transmission between respective output shafts and said case body, wherein each of said blade members includes at least two radially extending blade portions which are formed to provide a circumferential space section between every two blade portions of said at least two radially extending blade portions so as that a large volume of said viscous fluid is filled within said circumferential space sections.

5,007,886

LIMITED SLIP DIFFERENTIAL

Ralph E. Helmquist, Battle Creek, and David A. Janson, Plymouth, both of Mich., assignors to Eaton Corporation, Cleveland, Ohio

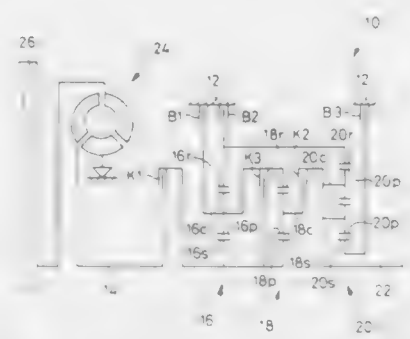
Filed Dec. 26, 1989, Ser. No. 457,072
Int. Cl.[5] F16H *1/44*
U.S. Cl. 475—231 16 Claims

1. A differential gear mechanism of the type including a gear case defining an axis of rotation and a gear chamber; differential gear means disposed in said gear chamber including at least one input gear and first and second output gears; means for limiting differentiating action of said differential gear means in response to an input signal, said limiting means including clutch means operable between an engaged condition, effective to retard relative rotation between said gear case and said output gears, and a disengaged condition; said limiting means further including cam means operatively associated with said clutch means, and including first and second cam members, said second cam member being axially movable relative to said first cam member in response to relative rotation therebetween away from a neutral position, to effect said engaged condition of said clutch means; and an elongated actuation member being mounted for movement relative to said gear case and operable to be in engagement with said second cam member; characterized by:

(a) said elongated actuation member being supported by said gear case at two axially spaced-apart locations disposed on axially opposite sides of said input gear, and including a terminal portion extending through said gear case to the exterior thereof;

(b) said elongated actuation member being axially movable relative to said gear case, and including means biasing said actuation member toward a normally disengaged condition in which said first and second cam members remain in said neutral position;

(c) said actuation means further including means operable in response to said input signal to engage said actuation member and cause axial movement thereof, in opposition to the force of said biasing means; and



(d) said elongated actuation member being operably engaged with said second cam member, such that axial movement of said actuation member results in axial movement of said second cam member, relative to said first cam member, away from said neutral position.

PLANETARY GEAR TRANSMISSION FOR MOTOR VEHICLE

Toshiyuki Asada, Susono, Japan, assignor to Toyota Jidosha Kabushiki Kaisha, Toyota, Japan

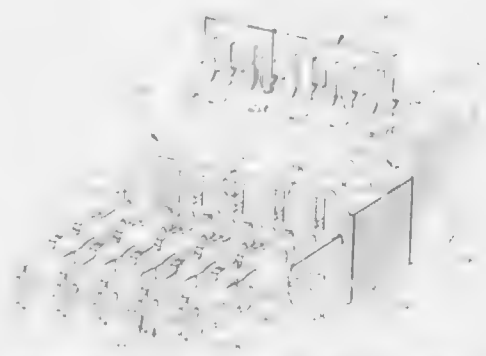
Filed Nov. 17, 1989, Ser. No. 437,838
Claims priority, application Japan, Nov. 21, 1988, 63-294158
Int. Cl.[5] F16H *57/10*
U.S. Cl. 45—[illegible] 24 Claims

1. A planetary gear transmission for a motor vehicle, including an input member, an output member, a first single-pinion type planetary gear unit having a first sun gear, a first planetary gear meshing with the first sun gear, a first ring gear meshing with the first planetary gear and a first carrier rotatably supporting the first planetary gear, a second single-pinion type planetary gear unit having a second sun gear, a second planetary gear meshing with the second sun gear, a second ring gear meshing with the second planetary gear and a second carrier rotatably supporting the second planetary gear, and a third double-pinion type planetary gear unit having a third sun gear, at least one pair of third planetary gears which mesh with each other and one of which meshes with the third sun gear, a third ring gear meshing with the other of said at least one pair of third planetary gears, and a third carrier rotatably supporting said at least one pair of third planetary gears, said first, second and third planetary gear units being disposed coaxially with each other in the order of description, for transmitting power from said input member to said output member, at a selected one of different speed reduction ratios, wherein the improvement comprises:

said first and second sun gears being associated with each other by one of fixing means for fixing said first and second sun gears to each other, and a coupling device by which said first and second sun gears are connectable to each other;

said first carrier and said second ring gear being associated with each other by one of fixing means for fixing said first carrier and said second ring gear, and a coupling device by which said first carrier and said second ring gear are connectable to each other,

said first and third ring gears being associated with each other by one of fixing means for fixing said first and third ring gears to each other, and a coupling device by which said first and third ring gears are connectable to each other; and



said second and third carriers being associated with each other by one of fixing means for fixing said second and third carriers to each other, and a coupling device by which said second and third carriers are connectable to each other.

5,007,888

ELECTRICAL INTERCONNECTION ASSEMBLY

Alain Goutiere, Cergy Saint Christophe, France, assignor to AMP Incorporated, Harrisburg, Pa.

Filed Mar. 13, 1990, Ser. No. 493,027
Claims priority, application France, Mar. 13, 1989, 89 03251
Int. Cl.[5] H01R *29/00*
U.S. Cl. 439—189 2 Claims

1. An electrical interconnection assembly comprising a housing having an array of electrical contact members therein, said contacts arranged for exposure to opposed openings in said housing, whereby electrical connection may be made therewith, where said contacts are elongated members having male tabs at each end thereof and disposed in parallel relationship within said housing, and including means for electrically engaging certain adjacent elongated contact members, characterized in that said means comprise a plurality of laterally disposed planar members accessible to said array of contact members through a lateral slot in a wall of said housing, and that each said planar member includes a slot for slidably receiving one elongated member, and means adapted to engage a wall of said housing to secure said elongated contact members from premature withdrawal from said housing.

5,007,889

APPARATUS FOR FEEDING CONTAINER BLANKS TO CONTAINER BOTTOM FORMING MANDREL

Shigeru Wakabayashi; Masao Shimokawa, and Masaki Takahashi, all of Tokushima, Japan, assignors to Shikoku Kakoki Co., Ltd., Tokushima, Japan

Filed Dec. 27, 1989, Ser. No. 457,651
Claims priority, application Japan, Dec. 28, 1988, 63-170924[U]
Int. Cl.[5] B31B *5/06, 3/78*
U.S. Cl. 493—316 6 Claims

1. An apparatus for feeding blanks to a forming mandrel, each of the blanks having first to fourth four side wall panels divided by scores and joined to one another endlessly, the blank being folded to a flat form along the score between the first side wall panel and the second side wall panel and along the score between the third side wall panel and the fourth side wall panel so as to be unfoldable into a tube of rectangular to square cross section, the apparatus being adapted to unfold each blank to the tubular form and feed the tubular blank to the forming mandrel at rest at a feed station, the apparatus comprising:

a magazine having a delivery opening at one end thereof for accommodating a multiplicity of vertical flat blanks as arranged side by side from said one end toward the other end of the magazine, with the second and third side wall panels directed toward the delivery opening and with the second side wall panel positioned under the third side wall panel, the delivery opening being positioned at one side of an extension of the axis of the mandrel obliquely thereabove,

transport means for delivering the blanks from the delivery opening one by one and transporting each blank to a position on the extension of axis of the mandrel, the transport means having transport arms and a suction member for holding the second side wall panel of the blank thereto by suction, the suction member being attached to the forward ends of transport arms, the transport arms being fixed at their base ends to a first rotatable shaft from moving said arms disposed below the magazine and extending in parallel to the extension of axis of the mandrel,

means for unfolding the blank from the flat form to the tubular form by forming a fold in the opposed flat portions of the blank while the blank is being transported by the transport means, the unfolding means having an unfolding arm, the unfolding arm being fixed at its base portion to a second rotatable shaft for moving said arm extending in parallel to the first rotatable shaft, the second rotatable shaft being disposed on opposite side to the first rotatable shaft with respect to the path of movement of the second side wall panel of the blank held to the suction member so as to render the forward end of the unfolding arm movable into and out of the path of movement,

a holder for holding the tubular blank on the extension of axis of the mandrel in alignment therewith movably along the extension, and

a transfer assembly for transferring the blank from the holder to the mandrel.

5,007,890

WEB PLOW FOLDING

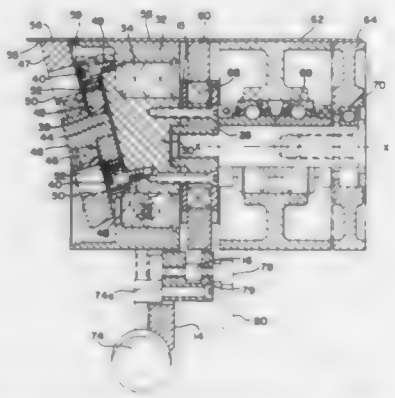
Ronald W. Alverth, Warrenville; Thomas H. Schumacher, Downers Grove, and Thaddeus M. Przybylowski, Worth, all of Ill., assignors to WPC Machinery Corporation, Downers Grove, Ill.

Continuation of Ser. No. 224,115, Jul. 25, 1988, abandoned. This application Dec. 6, 1989, Ser. No. 446,977
Int. Cl.[5] B65H *45/16*
U.S. Cl. 493—434 16 Claims

1. Apparatus for folding an elongated flexible web material having a path of travel there-through generally in the lengthwise direction of the apparatus, the web having a width that includes a main unfolded portion and a folded side portion after having passed through the apparatus, said apparatus comprising:

a frame,

entrance and exit rollers supported from said frame transversely of said path,



a plow folder assembly supported on the frame intermediate of said entrance and exit rollers and cooperative therewith to effect longitudinal folding of one side portion of said web material as it is moved along said lengthwise path from said entrance to said exit rollers, said plow folder assembly being in contact with the web material at an elevation that is generally different from the elevation of

said entrance and exit rollers, said plow folder assembly comprising:

a support means for attaching said plow folder assembly to said frame;

a generally hollow cylindrical roller means having an axis of rotation and being supported for rotation by said support means, said cylindrical roller means extending transversely relative to the lengthwise direction of the apparatus, the roller means presenting an arcuate portion of its periphery which provides a support surface for the main unfolded portion of the web material, said roller means having a predetermined diameter and having a hollow recess for receiving a portion of a rotatable plow folder member;

a plow folder means being attached to said support means adjacent said cylindrical roller means, said plow folder means having a frusto-conical peripheral outer portion rotatable about an axis of rotation and said outer portion having an outer diameter smaller than the inside diameter

of said recess of said cylindrical roller means so that said plow folder means at least partially fits within said recess of said cylindrical roller means, said frusto-conical peripheral outer portion being adapted to contact the web material along an arcuate angle and provide a relatively sharp edge for initiating the formation of a fold in the web material, said plow folder means being oriented relative to said cylindrical roller means such that the portion of said frusto-conical peripheral outer surface along said arcuate angle which is adapted to contact the web material is generally coextensive with the outer surface of said arcuate portion of the periphery of said cylindrical roller means so as to present a substantially uninterrupted support for the web material;

means for adjusting the angular orientation of said plow folder means generally around the axis of rotation of said cylindrical roller means to thereby adjust the angular orientation of said arcuate angle of said plow folder means and of said cylindrical roller means which contacts the web material.

5,007,891

DEVICE FOR PRODUCING AN ADDITIONAL FOLD IN FOLDING DEVICES OF ROTARY PRINTING PRESSES

Eduard von Hein, Bern, Switzerland, assignor to Maschinenfabrik Wifag, Bern, Switzerland

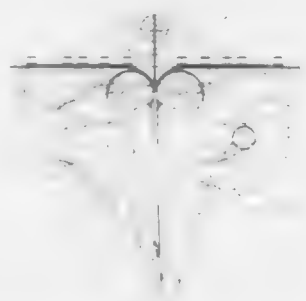
Filed Oct. 25, 1989, Ser. No. 427,463

Claims priority, application Fed. Rep. of Germany, Oct. 28, 1988, 3836342

Int. Cl.[5] **B65H** *45/16*

U.S. Cl. 493—444 **7 Claims**

1. A print copy folding device arrangement, comprising:



folding blade means;

first folding roller;

a second folding roller, said second folding roller rotating in a direction opposite to the direction of rotation of said first folding roller, said first folding roller and said second folding roller each having a central rotational axis and being driven in cadence with print copies, said first folding roller including a peripheral surface divided into three peripheral area segments sequentially arranged around the circumference of said first folding roller, including

a first peripheral area having a surface extending about a first circumferential portion of said first roller,

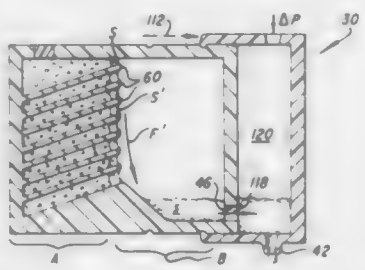
a second peripheral area including a recessed peripheral surface, said recessed peripheral surface being disposed

radially inwardly with respect to said surface of said first peripheral area and having residual peripheral surfaces disposed at each side of said recessed peripheral surface, said residual peripheral surface forming a continuation of said surface of said first peripheral area,

a third peripheral area extending about a third circumferential portion of said first roller, said third peripheral area having a recessed surface; and,

conveyor belt means engaging each of said rollers for removing the folded print copies from the folding zone.

5,007,892



PHASE SEPARATION CONTAINER WITH FIXED MEANS PREVENTING REMIXING

Richard L. Columbus, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.J.

Filed Mar. 20, 1989, Ser. No. 325,725

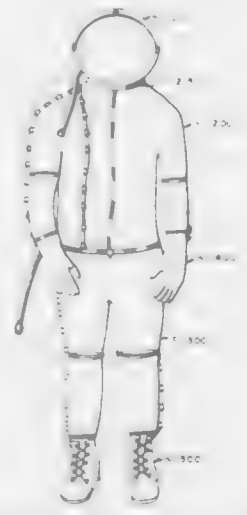
Int. Cl.[5] **B04B** *11/04*

U.S. Cl. 494—17 **9 Claims**

1. In a centrifuge container for separating two phases of different specific gravities in a liquid by centrifuging the heavier phase away from the lighter phase, said container including a compartment for said liquid defined by opposing walls, and means in said compartment for maintaining said phases in separate regions of the compartment after centrifugation,

the improvement wherein said means comprise fixed maintaining means that will accommodate expected variations in phase volumes, including porous mechanical means for resisting flow of the heavier phase out of its compartment portion in the presence of shear forces occurring when the lighter phase is drawn off, said mechanical means being disposed in said compartment region to be occupied by said heavier phase.

5,007,893



COMBINATION ANTI-G AND PRESSURE SUIT

Roderick J. Row, P.O. Box 923, Destin, Fla. 32541

Filed Mar. 16, 1988, Ser. No. 169,049

Int. Cl.[5] **A62B** *17/00*

U.S. Cl. 600—20 **7 Claims**

1. An anti-G suit adapted to simulate liquid immersion from the neck to the feet of a wearer thereof and capable of providing for both negative and positive protection during vertical accelerations, which comprises:

an inner, air-impervious, elastic suit adapted to fit from the neck to the feet over the body of the wearer;

an outer, air-impervious flexible, non-distensible suit adapted to fit from the neck to the feet over the body of the wearer, said outer suit being joined to said inner suit such that said inner and outer suits define a plurality of air-impervious separate toroidal segments which are adapted to encircle the wearer's body from the neck to the feet, said toroidal segments being stacked one upon another in the vertical direction when said suit is worn in the wearer's normal standing position;

helmet means adapted to be affixed to the neck region of said suit;

collar sealing means for preventing any air from leaking between said helmet means and the space between said helmet means and the body of the wearer in use;

means for introducing respiratory air into said helmet means at a controlled substantially constant pressure regardless of any gross accelerations to which the wearer is subjected;

means for exhausting exhaled air from said helmet means;

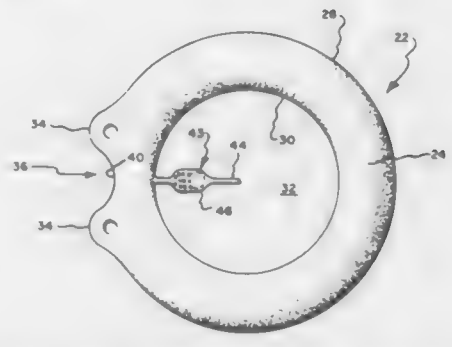
means for introducing and removing a pressurized gas into each of said toroidal segments, the pressure of the gas being transmitted during use to the body of the wearer through said inner suit; and

means cooperative with said means for introducing and removing a pressurized gas into said toroidal segments for continuously adjusting the gas pressure in each respective segment during use in accordance with the following equation:

$$P_s = P_r + (Sg \times V \times G)$$

where P_s is the gas pressure in each respective segment, P_r is the pressure of the respiratory air in said helmet, Sg is the gravity gradient of the body fluid of the wearer in use, V is the vertical center height of each respective segment relative to an arbitrary mid-chest location (V_o) at which thoracic external displacement due to respiration will encounter an average external pressure equal to internal respiration pressure, and G is the acceleration of gravity, to match the internal body fluid pressures of the wearer encircled thereby in use resulting from vertical accelerations, thereby providing both positive and negative G protection.

5,007,894



FEMALE INCONTINENCE DEVICE

Goran Enhorning, 21 Oakland Pl., Buffalo, N.Y. 14222

Filed Feb. 10, 1989, Ser. No. 309,383

Int. Cl.[5] **A61F** *2/00*

U.S. Cl. 600—29 **7 Claims**

1. A female incontinence device capable of being removably inserted into the vagina for supporting the tissue of the vaginal wall to each side of the urethra, comprising:

an annular inflatable body section for insertion into the vagina, the body section having an exterior surface capable of contacting the walls of the vagina when inflated so that relative movement of said body section with respect to the vagina is restricted,

said body section including two projections, there being a U-shaped surface between the projections, the projections supporting the superior vaginal tissue on each side of the urethra in such a manner that the tissue therebetween is stretched and can offer counter pressure when intra-abdominal pressure is suddenly raised as occurs during coughing, sneezing, laughing and physical exercise such that the intra-abdominal pressure is transmitted to the upper urethra so that the greatest difference between intra-urethral and simultaneous bladder pressure remains positive regardless of the changes in the intra-abdominal pressure so continence is preserved; and

means for inflating and deflating the body section so that proper support of the superior wall of the vagina is accomplished.

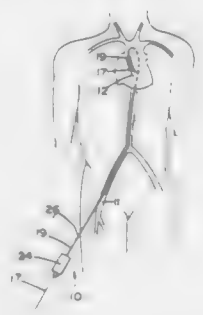
ROTARY-CATHETER FOR ATHERECTOMY



Samuel Shiber, Woburn, Mass., assignor to Surgical Systems & Instruments, Inc., Mundelein, Ill.

Continuation-in-part of Ser. No. 286,509, Dec. 19, 1988, Pat. No. 4,894,051, which is a continuation-in-part of Ser. No. 243,900, Sep. 13, 1988, Pat. No. 4,886,490, which is a continuation-in-part of Ser. No. 78,042, Jul. 27, 1987, Pat. No. 4,819,634, Ser. No. 205,479, Jun. 13, 1988, Pat. No. 4,883,458, and Ser. No. 225,880, Jul. 29, 1988, Pat. No. 4,842,579, said Ser. No. 78,042, is a continuation-in-part of Ser. No. 18,083, Feb. 24, 1987, said Ser. No. 205,479, is a continuation-in-part of Ser. No. 18,083, , said Ser. No. 225,880, is a continuation-in-part of Ser. No. 18,083, , which is a continuation-in-part of Ser. No. 874,546, Jun. 16, 1986, Pat. No. 4,732,154, which is a continuation-in-part of Ser. No. 609,846, May 14, 1984, abandoned. This application Mar. 16, 1989, Ser. No. 324,616

The portion of the term of this patent subsequent to Mar. 22, 2005, has been disclaimed.

Int. Cl.[5] A61B *17/32*

U.S. Cl. 604—22 22 Claims

1. An atherectomy system insertable into a human blood vessel for coring and removing an obstruction therein, comprising in combination:

a flexible guide-wire insertable into said blood vessel,

a flexible rotary-catheter defining continuous passage and being rotatably disposed and slidable over said flexible guide-wire, said flexible rotary-catheter having a proximal and distal ends,

a rotary coring means for cutting and ingesting obstruction material, located at said distal end,

a coupling means for rotating said flexible rotary-catheter around said flexible guide-wire, located at said proximal end,

means for diametricaly stabilizing and means for transmitting torque being incorporated in said flexible rotary-catheter.

DRUG DELIVERY CATHETER

Irvin M. Kalb, 327 Alta Ave., Santa Monica, Calif. 90402, and Michael J. Ram, 1 Horseshoe Rd., Bell Canyon, Calif. 91307

Filed May 30, 1989, Ser. No. 358,083

Int. Cl.[5] A61M *25/00*

U.S. Cl. 604—43 4 Claims

1. A system for the controlled, continuous delivery over an extended period of time of a drug containing fluid to the prostate comprising a catheter including an elongated tubular member having an external distal end and a proximal end for placement into the urinary bladder through the male urethra, expandable means adjacent the proximal end to retain the catheter in sealing abutment against the neck of the bladder, an expandable porous membrane bag integral with and spaced from the outer surface of said tubular member, distal to the expandable means for retention of the catheter, a drug lumen within said tubular wall connecting the space between the outer surface of said tubular member and the membrane bag with a valve mounted on the distal end of the lumen for the introduction of the drug to the prostate, said membrane positioned so that upon placement of the catheter the membrane bag is adjacent the prostate ducts, the catheter having a lumen within the wall of said tubular member connecting the expandable retention means with a valve on the distal end of said tubular member the elongated tubular member also having a drainage lumen therein extending from the proximal end only partially along the length of the elongated member, the expansion lumen and the drug lumen for a portion of their length being enclosed within tubular members having semicircular crosssections and opposing flat surfaces.

5,007,898

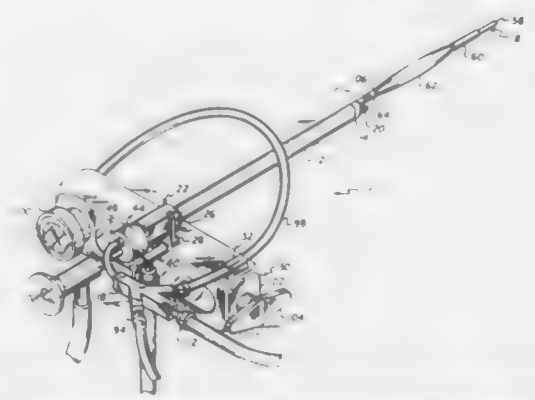
BALLOON DILATATION CATHETER

Robert F. Rosenbluth, Laguna Niguel; Jay A. Lenker, Laguna Beach, and George R. Greene, Costa Mesa, all of Calif., assignors to Advanced Surgical Intervention, Inc., San Clemente, Calif.

Filed Jun. 2, 1988, Ser. No. 201,686

Int. Cl.[5] A61M *29/02*

U.S. Cl. 604—54 16 Claims



1. An intraurethral dilatation apparatus for relieving the symptoms of obstructive prostatism, said device comprising:

an axially elongate introduction sheath, adapted for insertion into the urethra to receive and guide both a catheter shaft and a cystoscopic lens therethrough, so as to minimize trauma to the urethral lining during the insertion of said catheter and said lens;

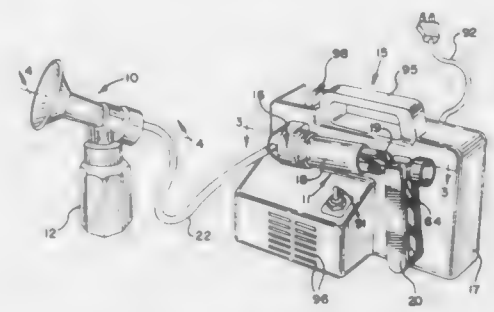
a tubular, axially elongate, catheter shaft for insertion through said sheath, having a distal end to facilitate manipulation of said device within the urethra;

an expansible locating balloon, disposed near the distal tip of said catheter shaft and bonded thereto; and

a dilatation balloon, on said catheter shaft situated proximally of said expansible locating balloon, said dilatation ballon outwardly radially expandable to a preselected configuration in response to inflation thereof, wherein said dilatation balloon exhibits proximal and distal shoulders, and

wherein a portion of said locating balloon overlaps at least a portion of said distal shoulder of said dilatation balloon.

5,007,899



DRIVE UNIT ADAPTED FOR USE WITH MANUAL PISTON PUMP

Karl O. A. H. Larsson, Schweiz, Switzerland, assignor to ISG-/AG, Zug, Switzerland

Filed Feb. 29, 1988, Ser. No. 162,056

Int. Cl.[5] A61M *1/06*

U.S. Cl. 604—74 13 Claims

1. An improved breast pump assembly including a hand-held manually operable breast pump having a hand-drivable piston pump with a piston rod specifically adapted to be grasped to drive a piston received for reciprocating movement within a chamber of a piston cylinder to generate, in use, a periodic suction within a breast-hood emplaced on a breast to effect the expression of mother's milk, wherein the improvement comprises:

a motor drive unit having means for releasably receiving and holding the hand-drivable piston pump, said drive unit further having means for driving the piston rod for reciprocating movement of the piston in the piston chamber.

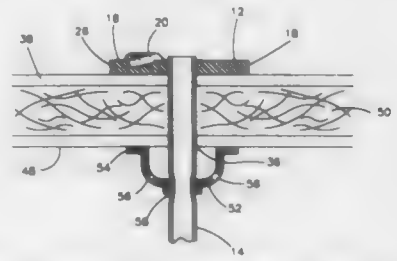
5,007,900

PERCUTANEOUS ENDOSCOPIC GASTROSTOMY DEVICE

George J. Picha, Independence, and Dean J. Secrest, Euclid, both of Ohio, assignors to Applied Medical Technology, Inc., Independence, Ohio

Filed Oct. 31, 1989, Ser. No. 429,769

Int. Cl.[5] A61M *5/32*



U.S. Cl. 604—106 25 Claims

1. A catheter insertable into a passage through a wall using a rod having a tip, said catheter comprising:

a resilient tube having a distal end, a central axis and a proximal end;

a pair of resilient diametrically opposed, oppositely extending wings connected about the distal end; and

a pocket in at least one of said wings, said pocket being spaced radially outward from the central axis of said tube

and being adapted to receive the tip of the rod, whereby the pair of wings may be urged to a position collateral with the tube by inserting the tip in the pocket and orienting the rod collateral with the tube.

5,007,901

INTRAVENOUS CATHETER INSERTION DEVICE

Jack W. Shields, 1950 Las Tunas Rd., Santa Barbara, Calif. 93103

Continuation of Ser. No. 440,859, Nov. 24, 1989, abandoned. This application Sep. 12, 1990, Ser. No. 582,128

Int. Cl.[5] A61M *5/50*

U.S. Cl. 604—110 4 Claims

1. An integral intravenous catheter placement assembly for introducing a catheter into the vein of a patient comprising, in combination, an intravenous catheter and an intravenous catheter insertion assembly,. said intravenous catheter having a distal end adapted for insertion within a vein of a patient, said catheter further having a proximal end having a luer-lock hub attached thereto, said luer-lock hub providing means for the secure attachment of said intravenous catheter to said intravenous catheter insertion assembly, said intravenous catheter insertion assembly further comprising a needle trap with a luer-lock fitting on its distal end to releasably engage said proximal hub on said intravenous catheter, a hollow introducer needle having a proximal end and a sharp distal end, said introducer needle being disposed within the lumen of said intravenous catheter, and a needle guide breakably attached to the proximal end of said hollow introducer needle.

5,007,902

CATHETER SET FOR PLEXUS ANESTHESIA

Hans-Hinrich Witt, Koerle, Fed. Rep. of Germany, assignor to B. Braun Melsungen AG, Melsungen, Fed. Rep. of Germany

Filed Feb. 22, 1989, Ser. No. 313,706

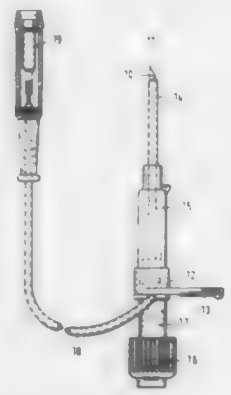
Claims priority, application Fed. Rep. of Germany, Mar. 9, 1988, 8803153[U]

Int. Cl.[5] A61M *5/162*

U.S. Cl. 604—117 5 Claims

1. A catheter set for plexus anesthesia, comprising:

a puncture cannula,



a capillary releasably fastened to the puncture cannula,

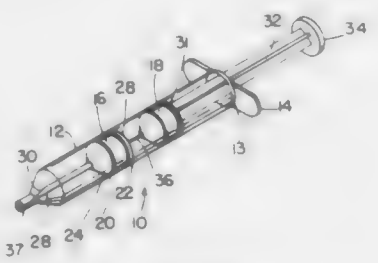
a catheter adapted for insertion through the capillary, the catheter having a front end and a rear end, the front end of the catheter being open,

an electrically conductive guide wire adapted for insertion into the catheter, the guide wire having a front end and a rear end,

means for indicating the relative position of the guide wire and the catheter, and

an electric contact provided at the rear end of the guide

wire, the electric contact being adapted for electrical connection to a neurostimulator,



wherein the position of the catheter in the fascia can be determined by neurostimulation through the guide wire.

5,007,903

SYRINGE ADAPTED TO PREVENT NEEDLE STICKS

Terence R. Illiard, Seattle, Wash., assignor to Real World Design & Development Company, Seattle, Wash.

Filed Nov. 22, 1988, Ser. No. 274,817
Int. Cl.[5] A61M *5/32*
U.S. Cl. 604—195 14 Claims

1. An improved syringe, comprising:

a syringe barrel;

a first, forward piston member and a second rear piston member, said first and second piston members being positioned in succession within the syringe barrel and adapted for fluid-tight movement therein;

a hollow needle extending from the front end of the first piston member and in fluid communications with the space between the first and second piston members, wherein said needle extends outwardly from the front end of the barrel when the first piston member is in its forwardmost position within the barrel;

a plunger attached to the second piston member, the plunger extending from the rear end of the barrel;

a connecting member, independent of the needle and the barrel, extending between the first and second piston members and connected thereto, wherein said connecting member is positioned within the barrel and is collapsible such that when the first and second piston members are in a first relationship relative to each other, forward movement of the second piston member results in forward movement of the first piston member and such that when the first and second piston members are in a second relationship relative to each other, rearward movement of the second piston member results in rearward movement of said first piston member and such that the second piston member can move a selected distance toward and away from the first piston member within the barrel without moving the first piston member when the first and second piston members are not in said first or second relationship

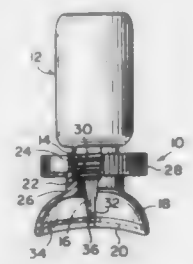
PLUNGER FOR POWER INJECTOR ANGIOGRAPHIC SYRINGE, AND SYRINGE COMPRISING SAME

Larry L. Deasmore, Raleigh, N.C., and Thomas A. Lindner, Brookfield, Wis., assignors to Coeur Laboratories, Inc., Raleigh, N.C.

Filed Jan. 19, 1989, Ser. No. 299,974
Int. Cl.[5] A61M *5/20*
U.S. Cl. 604—228 12 Claims



1. A plunger for a power-driven angiographic syringe, said plunger comprising a body of generally convergent distal profile having a proximal face with ram-engageable coupling structure thereon, said coupling structure comprising a wall extending rearwardly from said proximal face of the plunger body and partially circumferentially thereon, said wall terminating at a proximal extremity, with a radially inwardly extending flange joined at an outer peripheral portion thereof to a proximal extremity of the wall, the radially inwardly extending flange and the wall forming with the proximal face of the plunger body a cavity transversely open to insertion thereinto of a ram head of a driving mechanism for said power-driven angiographic syringe, said coupling structure being transversely engageable by, and transversely disengageable from, said ram head of said driving mechanism for said power-driven angiographic syringe, but once transversely engaged by said ram head, being non-disengageable by rotation of said ram head relative to said plunger, in the absence of any transverse translation of the driving mechanism and plunger relative to one another.

5,007,905

EYE DROP APPLICATOR

George C. Bauer, P.O. Box 825, Meredith, N.H. 03253

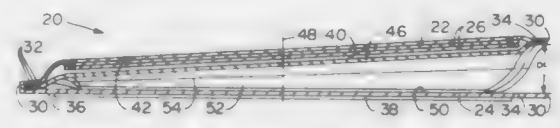
Filed Feb. 20, 1990, Ser. No. 481,634
Int. Cl.[5] A61M *35/00*
U.S. Cl. 604—295 1 Claim

1. An improved eye drop applicator for an eye dropper vial of the type having an externally threaded neck and a nozzle, said improved eye drop applicator comprising:

(a) a cup having a lip portion adapted to fit around an eyeball of a user of said improved eye drop applicator so as to keep the eye lid open;

(b) a sleeve having an internally threaded passageway extending from the apex of said cup, in which said internally threaded passageway is removably connected to the externally threaded neck of the eye dropper vial, so that the user can squeeze the eye dropper vial to direct an eye drop from the nozzle of the eye dropper vial onto the center of the eyeball, said internally threaded passageway of said sleeve having an annular shoulder therein to prevent the tip of the nozzle of the eye dropper vial from penetrating too far into said cup thereby maintaining the nozzle in a desired spaced relationship to the eyeball of the user of said improved eye drop applicator;

(c) an enlarged collar concentrically affixed onto said sleeve to help aid the user of said improved eye drop applicator to removably connect said internally threaded passageway of said sleeve to the externally threaded neck of the eye dropper vial; and



(d) a protective shield having a central aperture and is affixed within said cup with said central aperture directly under the tip of the nozzle of the eye dropper vial, whereby said protective shield will help prevent the eyeball of the user of said improved eye drop applicator from making contact with the tip of the nozzle of the eye dropper vial.

DECOUPLED SANITARY NAPKIN

Thomas W. Osborn, III, Cincinnati, and Deborah C. Schmitz, West Chester, both of Ohio, assignors to The Procter & Gamble Company, Cincinnati, Ohio

Filed Oct. 27, 1989, Ser. No. 429,252
Int. Cl.[5] A61F *13/15, 13/20*
U.S. Cl. 604—385.1 9 Claims

1. A sanitary napkin having two spaced apart transverse edges, said sanitary napkin comprising:

a liquid pervious topsheet;

a liquid resistant backsheet joined to said topsheet along one said transverse edge and unattached to said topsheet along the other said transverse edge, whereby said backsheet may be separated from said topsheet at said unattached transverse edge;

an absorbent core associated with said topsheet and intermediate said topsheet and said backsheet; and

a means for controlling the separation of said topsheet from said backsheet.

5,007,907

RESECTOSCOPE APPARATUS

Shinichi Nishigaki, Tokyo, and Shiro Bito, Hachioji, both of Japan, assignors to Olympus Optical Co., Ltd., Tokyo, Japan

Filed Oct. 7, 1988, Ser. No. 254,741
Claims priority, application Japan, Oct. 7, 1987, 62-254069
Int. Cl.[5] A61B *17/36*
U.S. Cl. 606—46 8 Claims

1. A resectoscope apparatus comprising:

an elongate hollow sheath to be inserted into a body cavity;

an electrode inserted through said sheath to make such treatments as of resecting and coagulating tissues within the body cavity by using a high frequency current;

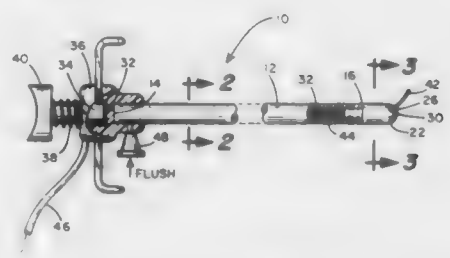
an operating part which can operate said electrode from outside the body;

a cord for feeding a high frequency current to said electrode from a high frequency current source;

an optical sighting tube inserted through said sheath and having an optical system which can observe the body cavity interior; and

a connecting means mechanically removably connecting said electrode shaft part at the rear end to said slider,

wherein said electrode is made integral at least on the rear



end side with said cord, wherein said electrode on the rear end side and said cord are made integral as electrically connected as insulated from outside, wherein said electrode has a shaft part connected at the rear end to said operating part and inserted in said sheath and a tip electrode part provided at the tip of said shaft part and projected and retracted from said sheath tip by the operation of said operating part, wherein said operating part has a connecting part removably connectable to said sheath at the rear end and a slider connected with said electrode shaft part at the rear end and slidable in the axial direction.

5,007,908

ELECTROSURGICAL INSTRUMENT HAVING NEEDLE CUTTING ELECTRODE AND SPOT-COAG ELECTRODE

Mark A. Rydell, Golden Valley, Minn., assignor to Everest Medical Corporation, Brooklyn Center, Minn.

Filed Sep. 29, 1989, Ser. No. 414,448
Int. Cl.[5] A61B *17/39*
U.S. Cl. 606—47 8 Claims

1. An electrosurgical instrument comprising:

(a) an elongated tubular member having a proximal end, a distal end and plural lumens extending between said proximal and distal ends;

(b) a bullet-shaped ceramic tip member affixed to said distal end of said tubular member, said tip member having a longitudinal bore formed therein, said bore exiting through an opening in the exterior of said tip member at a location displaced laterally from the longitudinal axis of said tubular member;

(c) a first conductor disposed in one of said lumens;

(d) means connected to said proximal end of said tubular member and joined to said first conductor for selectively displacing said first conductor whereby the distal end of said first conductor may be made to pass through said longitudinal bore and said opening;

(e) a conductive surface adhered to said exterior of said ceramic tip member and surrounding but spaced from said opening; and

(f) a second conductor passing through another of said plural lumens and electrically joined to said conductive surface.

5,007,909

APPARATUS FOR INTERNALLY FIXING THE SPINE

Chaim Rogozinski, 4453 Forest Dr. South, Jacksonville, Fla.

Filed Nov. 5, 1986, Ser. No. 928,647
Int. Cl.[5] A61F *5/00*
U.S. Cl. 606—61 **5 Claims**

1. A method for correcting deformaties or instabilities of the spine by posterior surgical procedures, which method comprises:

surgically exposing the spine posteriorly;

affixing clamps onto the laminae of vertebrae;

beginning at either end of the line of affixed clamps attaching rod attachment means to each of said clamps; and

beginning at either end of said line of affixed clamps inserting a rod into said rod attachment means;

compression or distraction being applied to the spine between a first clamp and a second clamp in the line of clamped vertebrae by fixedly securing said rod to said first clamp and compressing or distracting said second clamp with respect to said first clamp and fixedly securing said rod to said second clamp, proceeding from the secured second clamp to the next clamp in the line of clamped vertebrae and compressing or distracting the next clamp with respect to said second clamp and fixedly securing said rod to said next clamp until all clamps are secured to said rod.

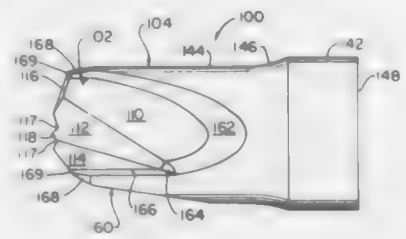
DEVICE FOR COMPRESSION SCREWING

Emmanuel Anapliotis, Kiebitzweg 5, D-1000 Berlin 33; Gernot Regener, Bockafeldstrrasse 1e, D-1000 Berlin 20; Uwe Ahrens, Nürnberger Strasse 46, D-1000 Berlin 30, and Hermann Jehle, Kreiskrankenhaus Alte Waibstädter Str. 2, D-6920 Sinsheim, all of Fed. Rep. of Germany

Filed Dec. 22, 1989, Ser. No. 453,289
Claims priority, application Fed. Rep. of Germany, Jan. 4, 1989, 8900121[U]
Int. Cl.[5] A61F *5/04*
U.S. Cl. 606—65 **6 Claims**

1. Device for compression screwing fractures of the femural neck, consisting of a plate of a sleeve, the sleeve being hollow and cylindrical in shape, the plate of the sleeve being attached by screws to the femur shaft and of a bone screw being located within the sleeve which is provided with a female thread on its head side into which a compression screw having a respective male thread fits, whereby said compression screw is supported by means of the (bottom edge of its head (or) by a respective, especially conical contact surface) for the limitation of its movement against a fixing ring being located within said sleeve in such a way that it can be displaced, sliding with its surface along the inner surface of said sleeve and having a conical surface in an axial direction that is adapted to the bottom edge of the head of said compression screw and the cone angle of which is sized in such a way that the adhesive friction between the outer surface of the fixing ring and the inner surface of said



sleeve is greater than the compressional force acting in the longitudinal direction of said compression screw.

5,007,911

DRILL HEAD ASSEMBLY FOR CRANIAL PERFORATORS

John W. Baker, 4 Wachusett Dr., Acton, Mass. 01720

Continuation of Ser. No. 108,421, Oct. 14, 1987, abandoned.
This application Oct. 18, 1989, Ser. No. 423,660
Int. Cl.[5] A61B *17/16*
U.S. Cl. 606—80 **24 Claims**

1. A perforator comprising:

(1) a drill head assembly comprising (a) an inner drill having a plurality of inner cutting flutes, each terminating in a front cutting edge, and (b) an outer drill comprising a plurality of outer cutting flutes, each terminating in a front cutting edge, said drill head assembly being constructed so that the leading portions of said front cutting edges of said outer cutting flutes are contiguous with the peripheral portions of said front cutting edges of said inner cutting flutes so long as said drill assembly is enabled and said inner drill encounters a resistive surface; and

(2) drive means for enabling said drill head assembly when said inner drill is encountering a resistive surface, and disabling said drill head assembly when said inner drill is no longer encountering said resistive surface while said outer drill is still encountering said resistive surface.

5,007,912

ARRANGEMENT FOR FIXING A KNEE-JOINT IN DEFINED POSITIONS AND FOR POSITIONAL CONTROL OF INSTRUMENTS FOR REPLACING THE KNEE-JOINT WITH A PROSTHESIS

Björn Albrektsson, Värslevägen 39, Askim, Sweden S-436 43 , and Stig Wennberg, Villa Holma Pl 6266, Angered, Sweden S-424 57

Filed May 30, 1990, Ser. No. 530,611
Int. Cl.[5] A61F *5/04, 5/37;* **A61G** *13/00*
U.S. Cl. 606—87 **9 Claims**

1. Arrangement for fixing a knee-joint in defined positions and for positional control of instruments for replacing the knee-joint of a patient with a prosthesis, which arrangement is

designed to be connected to an operating table (1) intended to support the patient, characterized in that the arrangement comprises, on the one hand, a stand (3) which can be connected to the operating table (1), an alignment instrument (2) which is supported by the stand and is used for aligning both femur and the tibia relative to a reference axis, and, on the other hand, a positional control unit (47) which can be connected to the stand in defined positions and is used for positional control of at least one instrument (48) relative to the knee-joint, which alignment instrument comprises a fixture (4),

supported by the stand, for the trunk of the patient, which trunk fixture is adjustable and can be locked in selected positions by displacement transverse to the said reference axis, and a limb fixture, supported by the stand, for fixing the knee-joint (20, 22) and ankle-joint (23) of the patient, in that the said limb fixture (11) for fixing the knee-joint and ankle-joint consists of a fixation frame which is pivotably mounted on the stand by means of a pivot hinge (13) and which, by means of its pivotability, can be set in different angular positions relative to the operating table.

5,007,913

APPARATUS AND METHOD FOR IMPLANTATION OF INTRAOCULAR LENSES

David H. Dulebohn, Tonka Bay, and Winston R. Lindberg, Plymouth, both of Minn., assignors to Alcon Surgical, Inc., Fort Worth, Tex.

Filed Sep. 19, 1989, Ser. No. 409,329
Int. Cl.[4] A61F *9/00*
U.S. Cl. 606—107 **36 Claims**

1. An apparatus for insertion of an intraocular lens into a patient's eye comprising:

manipulating tool means for holding and transporting the lens through an incision into the eye and releasing the lens in the eye;

a sling means having an elastromeric resilient surface and connection means for attachment to the manipulating tool means and being resilient to extend to substantially encapsulate the lens when folded upon itself;

the surface of the sling means being adapted to receive and substantially encapsulate a lens folded upon itself; and

the manipulating tool means being adjustable between a first position where the connection means allows manipulation of the sling means to encapsulate and hold the lens within the sling means, and a second position where the connection means allows manipulation of the sling means to resiliently open to receive the lens before insertion into the eye, and to release the lens from its folded state once in the eye

CATHETER-INSERTION DEVICE

Paul E. Schweigerling, 130 Rolling Green La., Elma, N.Y. 14059

Division of Ser. No. 208,670, Jun. 20, 1988, Pat. No. 4,889,118.
This application Nov. 15, 1989, Ser. No. 473,716
Int. Cl.[4] A61M *25/01*
U.S. Cl. 606—108 **8 Claims**

1 A device for inserting a catheter into a body vessel of a patient wherein said catheter is of the type having a catheter hub and an elongated tube attached thereto and is mounted on a cannula of the type having a cannula hub with an elongated needle having a pointed tip which extends into and beyond said tube of said catheter comprising first engagement means for engaging and holding said cannula hub, second engagement means for engaging said catheter hub, first finger-receiving means, first connecting means connecting said first finger-receiving means to said first engagement means, second finger-receiving means, second connecting means connecting said second finger-receiving means to said second engagement means, means mounting said first and second connecting means for movement relative to each other, said first and second engagement means initially occupying a position wherein said cannula and catheter may be cooperatively mounted on said device with said pointed tip extending beyond said tube to permit said pointed tip of said cannula and said tube to be initially inserted into said body vessel, and said first and second finger-receiving means being movable relative to each other while said first engagement means continues to hold said cannula to cause said first engagement means to withdraw said cannula from said catheter after said tube has been inserted into said body vessel and while said second engagement means remains in engagement with said catheter to cause it to remain in position in said body vessel.

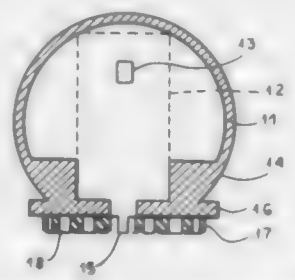
5,007,915

DEPILATORY DEVICE

Avraham Nussbaum, Moshav Mazor, Israel, assignor to Crestmoore Ltd., Hong Kong

Continuation of Ser. No. 258,584, Oct. 17, 1988, Pat. No. 4,923,463. This application Nov. 28, 1989, Ser. No. 442,778
Claims priority, application Israel, Feb. 28, 1988, 85568
The portion of the term of this patent subsequent to May 8, 2007, has been disclaimed.
Int. Cl.[5] A61B *17/00*
U.S. Cl. 606—133 **6 Claims**

1. A depilatory apparatus comprising:



a manually grippable and portable housing including an exterior plate adapted to be moved in juxtaposed relationship to an area of a user's skin from which hair sprouts;

the housing provided with an electric motor and switching means operatively associated therewith for optionally engaging it with and disengaging it from a source of energy;

a plurality of pins arranged to project outwardly from the housing through the plate for engagement with and sub-

stantially normal to said skin with the pins connected operatively to the motor for rotation;

an endless belt engaged to run continuously about at least two of the pins, whereby when the pins contact the hair, strands of the hair are caught between at least one of the

last-mentioned pins and the belt for clamping the strands therebetween to depilate the strands of hair along said skin;

the motor having a shaft to which the pins are coupled, the number of pins being from 2 to 30 inclusive, the belt being made of an elastomeric material.

5,007,916

METHOD AND MATERIAL FOR PREVENTION OF SURGICAL ADHESIONS

Cary B. Linsky, East Brunswick, and Timothy J. Cunningham, Flemington, both of N.J., assignors to Johnson & Johnson Medical, Inc., Arlington, Tex.

Division of Ser. No. 768,280, Aug. 22, 1985. This application Nov. 16, 1989, Ser. No. 437,234

Int. Cl.[5] A61B *17/08*

U.S. Cl. 606—151 **14 Claims**

1. A PostoPerative adhesion barrier comPrising a conformable fabric constructed of a bioresorbable material, said fabric being characterized by having a density of 8.0 to 15 mg/cm2 and a Porosity of 12 to 20 Percent oPen area

SINGLE BLADE CUTTER FOR ARTHROSCOPIC SURGERY

James A. Evans, Galesburg, Mich., assignor to Stryker Corporation, Kalamazoo, Mich.

Filed Mar. 8, 1990, Ser. No. 490,913

Int. Cl.[5] A61B *17/00*

U.S. Cl. 606—170 **8 Claims**

1. A surgical instrument for cutting tissue comprising:

a cylindrical tube having an open distal end and a side window formed in its distal end through which tissue may enter said tube for cutting;

a tissue cutter head rotatable within said tube relative to said open end and said window, said cutter head including:

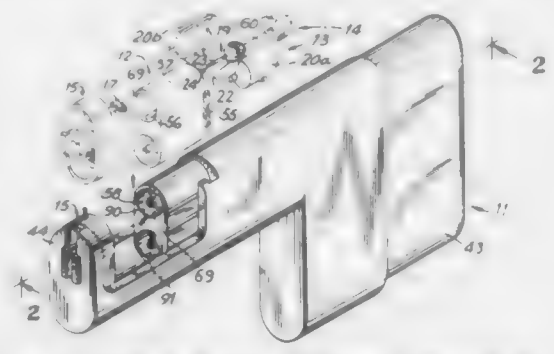
(i) a cylindrical base portion having a radial surface closely conforming to the inside surface of said tube;

(ii) a sole blade located along one circumferential side of and extending distally from said base portion and bearing a first and a second cutting edge, said first cutting edge disposed on said blade for traveling in a cylindrical locus closely adjacent to the inside surface of said tube relative to said window for passing across one edge of said window during at least a portion of the rotation of said cutter head for cutting tissue protruding laterally through said window, and said second cutting edge for cutting tissue protruding axially through said distal end, said first and second cutting edges meeting in a sole point, said sole point being the most distal point of said cutter head, and

(iii) a sole debris channel formed by a cavity in said cutter head and passing through said base portion for receiving tissue severed by said first and second cutting edges

---

5,007,918



EAR PIERCING CARTRIDGE ASSEMBLY

Samuel J. Mann, Englewood, N.J., assignor to Inverness Corporation, Fair Lawn, N.J.

Filed Jan. 24, 1990, Ser. No. 469,626

Int. Cl.[5] A44C *7/00*; **A61B** *17/34*

U.S. Cl. 606—188 **11 Claims**

1. An ear piercing assembly comprising in combination:

a piercing earring including an ornamental head and a piercing pin projecting from the head;

a cartridge adapted to receive the piercing earring and substantially envelope the piercing earring, the cartridge including an elongated opening partially supporting the piercing pin, and a further opening proximate the ornamental head of the earring, said further opening being in axial alignment with the elongated opening, the elongated opening having a smaller lateral dimension than the further opening;

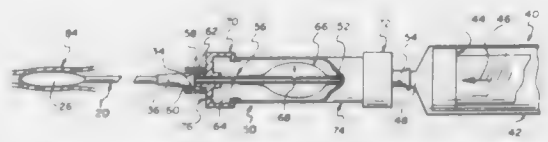
a shield means positioned within said cartridge between the ornamental head of the piercing earring and the further opening so that the pressure across the ornamental head from a push rod which enters the further opening is distributed by said shield means; and

a housing means for receiving the cartridge and for positioning the cartridge openings in alignment with a push rod to prevent displacement of the cartridge when a push rod is displaced through the earring cartridge.

5,007,919

METHOD AND APPARATUS FOR PATIENT PROTECTION AGAINST VESSEL RUPTURE FROM BALLOON-TIPPED CATHETERS

Fidel H. Silva, 967 E. Center Fork Cir., Sandy, Utah 84094, and Dwayne R. Westenskow, 3439 Winesap, Salt Lake City, Utah 84121



Filed Oct. 11, 1989, Ser. No. 419,828

Int. Cl.[5] A61M *29/02*

U.S. Cl. 606—194 **15 Claims**

3. A safety inflation apparatus for use with a catheter including a catheter balloon disposed thereon, said catheter balloon having both a first predetermined inflation threshold pressure and a normal inflated diameter in a substantially externally unconstrained state, said apparatus being adapted to prevent damage to a body cavity of lesser internal diameter than said normal inflated diameter of said balloon when inflation of said catheter balloon within the external constraint of said body cavity is attempted, and said apparatus comprising:

relief conduit means having fluid inlet means adapted to receive fluid and fluid outlet means adapted to dispense said fluid through said catheter to said catheter balloon within said body cavity,

a fluid relief aperture in said conduit means between said fluid inlet means and said fluid outlet means communicating the interior of said relief conduit means with the exterior thereof; and

safety reservoir means preloaded in tension against expansion, in communication with said relief conduit means through said relief aperture, and expandable at a second threshold pressure between that of said catheter balloon in its said substantially unconstrained state and that at which damage to said body cavity would normally result.

5,007,920

TENDON SECTIONING SUPPORT CLAMP

Randall J. Torre, 842 S. Clover, San Jose, Calif. 9512[illegible]

Filed Mar. 24, 1989, Ser. No. 328,492

Int. Cl.[4] A61B *17/28*

U.S. Cl. 606—207 **7 Claims**

1. Apparatus for supporting in place a tendon or other smooth muscle during surgical procedures comprising:

first and second elongated members;

pivot means medially interconnecting said first and second elongated members;

an elongated lateral block fixedly attached to a distal end of said first elongated member, said elongated lateral block extending transversely therefrom;

an elongated support block fixedly attached to a distal end of said second elongated member, said elongated support block extending transversely therefrom being adjacent thereto and generally longitudinally parallel with said elongated lateral block, said elongated support block having an open channel formed in an upper surface thereof, said channel extending longitudinally substantially the length of said elongated support block, said channel being generally transverse to said first and second elongated members; and

ratchet means disposed between said first and second elongated members coupling said elongated members together, said lateral block and said support block disposed in spaced apart relationship within said ratchet means are disengaged, said lateral block and said support block disposed adjacent to and in contact with the other along longitudinal facing edges thereof and urged toward each other when said ratchet means is engaged.

COMPOSITES OF UNSINTERED CALCIUM PHOSPHATES AND SYNTHETIC BIODEGRADABLE POLYMERS USEFUL AS HARD TISSUE PROSTHETICS
Linneaus C. Dorman, Midland, Mich., and Paul A. Meyers, Dublin, Calif., assignors to The Dow Chemical Company, Midland, Mich.
Continuation of Ser. No. 357,515, May 26, 1989, abandoned, which is a division of Ser. No. 56,496, Jun. 1, 1987, Pat. No. 4,842,604, which is a continuation of Ser. No. 914,419, Oct. 2, 1986, Pat. No. 4,698,375, which is a division of Ser. No. 702,998, Feb. 19, 1985, Pat. No. 4,636,526. This application Aug. 6, 1990, Ser. No. 563,881
Int. Cl.[5] A61F *2/28*
U.S. Cl. 623—16 **9 Claims**

1. A process for the prosthetic supplementation or replacement of hard tissue which comprises coating a conventional prosthetic device with a composite material containing from about 25 to about 75 percent by weight of an unsintered calcium phosphate biomaterial and about 75 to about 25 percent by weight of synthetic biodegradable polymer.

5,007,931
POROUS COATED PROSTHESIS
Todd S. Smith, Warsaw, Ind., assignor to Boehringer Mannheim Corporation, Indianapolis, Ind.
Filed May 4, 1990, Ser. No. 518,943
Int. Cl.[5] A61F *2/32, 2/28*
U.S. Cl. 623—23 **7 Claims**

1. A femoral component for a hip prosthesis comprising:
a head member for rotatable engagement with an acetabular component;
an elongated stem member having a longitudinal axis and an external surface and intended for cementless fixation in the intramedullary canal of a femur; and
a neck member integrally joining said head member and said stem member;
said stem member extending between a proximal portion adjacent said neck member and a distal portion distal from said neck member, and including an intermediate portion between and integral with said proximal portion and said distal portion, said intermediate portion having a plurality

of longitudinally extending channels, each of said channels defined by a bottom surface and opposed sidewalls connecting said bottom surface to said external surface; and

a porous medium for encouraging bone ingrowth fixation bonded to said bottom surface of each of said channels while remaining free of said sidewalls, said porous medium presenting an outer surface generally defined by a first surface lying

in a plane generally parallel to a plane of said external surface and second and third surfaces lying generally, respectively, in angularly spaced radial planes containing said longitudinal axis.

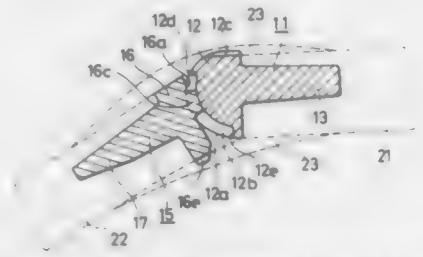
ARTIFICIAL BONE JOINT



Katsutoshi Bekki; Kazuo Kondo; Yoshimasa Shibata, and Shigeo Niwa, all of Aichi, Japan, assignors to NGK Spark Plug Co., Ltd., Aichi, Japan

Continuation of Ser. No. 865,825, May 22, 1986, abandoned, which is a continuation-in-part of Ser. No. 817,116, Jan. 8, 1986, abandoned. This application Feb. 27, 1989, Ser. No. 316,526

Claims priority, application Japan, Jan. 8, 1985, 60-738[U]; Jan. 8, 1985, 60-739[U]; Jan. 8, 1985, 60-776[U]

Int. Cl.[5] A61F *2/30, 2/42*

U.S. Cl. 623—18 **23 Claims**

1 An artificial bone joint for joining first and second bones comprising:

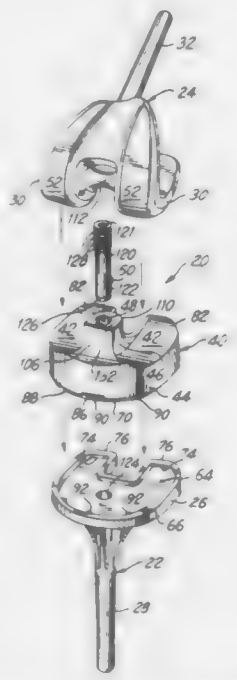
a first member including a first elongated anchor portion having a proximal end, a distal end, and a first central longitudinal axis extending from said proximal end to said distal end in a first direction, and including a first sliding portion having a convex curved surface;

a second member including a second elongated anchor portion having a proximal end, a distal end, and a second central longitudinal axis extending from said proximal end to said distal end in a second direction, and including a second sliding portion having a concave curved surface for pivotally engaging said convex surface;

said first anchor portion including a plurality of axially spaced first recesses forming at least one pair of first anchor bosses symmetrically opposed to each other about said first central longitudinal axis having perimetrical surfaces defining a maximum cross-sectional area of the first anchor portion and each of said first recesses having a proximal end wall defined by a radially extending surface transverse to the longitudinal axis and a bottom surface inclined from a proximal to distal direction at a first angle of less than 90° with the proximal end wall to form a catching structure for said first member; and

said second anchor portion including a plurality of axially spaced second recesses forming at least one pair of second anchor bosses symmetrically opposed to each other about said second central axis having perimetrical surfaces defining a maximum cross-sectional area of the second anchor portion and each of said second recesses having a proximal end wall defined by a radially extending surface transverse to the longitudinal axis and a bottom surface inclined from a proximal to distal direction at a first angle of less than 90° with the proximal end wall to form a catching structure for said second member.

5,007,933



MODULAR KNEE PROSTHESIS SYSTEM

Christopher G. Sidebotham, Middletown, N.Y.; Donald E. McNulty, Warsaw, Ind., and Alan M. Lombardo, Elmwood Park, N.J., assignors to Osteonics Corp., Allendale, N.J.

Filed Jan. 31, 1989, Ser. No. 304,754

Int. Cl.[4] A61F *2/38, 2/30*

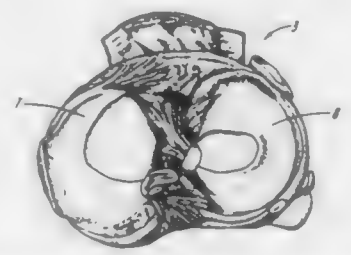
U.S. Cl. 623—20 **22 Claims**

1. In a knee prosthesis system for a prosthetic knee, the knee prosthesis system including a tibial component having a tray element, a femoral component having laterally spaced apart condylar elements, and a selectable bearing member to be carried by the tray element of the tibial component for supporting the condylar elements of the femoral component of operation of the knee prosthesis, including flexion of the prosthetic knee, the bearing member being constructed of a bearing material and having an integral eminence of bearing material projecting superiorly longitudinally upwardly from an inferior end adjacent the tibial component toward a superior end adjacent the tibial component for reception between the condylar elements of the femoral component to provide controlled restraint against excessive relative movement between the femoral component and the tibial component, control of the anterior-posterior portions of the relative movement being provided by a cam surface on the eminence and a follower on the femoral component for following the cam surface, the improvement comprising:

a stabilizing post including a stabilizing portion for projecting superiorly from the tibial component toward the femoral component; and

a recess in the eminence, the recess including a recess portion so complementary to the stabilizing portion of the stabilizing post such that when the bearing member is seated on the tray element of the tibial component, the stabilizing portion of the stabilizing post comprises means on the stabilizing post located within the recess portion of the recess in such complementary relationship with the recess portion as to be engaged positively with the material of the eminence along the recess portion so as to reinforce and stabilize the material of the eminence against forces exerted upon the eminence during operation of the knee prosthesis.

5,007,934



PROSTHETIC MENISCUS

Kevin R. Stone, San Francisco, Calif., assignor to ReGen Corporation, San Francisco, Calif.

Continuation-in-part of Ser. No. 75,352, Jul. 20, 1987, Pat. No. 4,880,429. This application Mar. 2, 1989, Ser. No. 317,951

Int. Cl.[4] A61F *2/38*

U.S. Cl. 623—20 **34 Claims**

1. A prosthetic meniscus comprising a dry porous matrix of biocompatible bioresorbable fibers,

said fibers selected from the group consisting of natural polymers, and analogs and mixtures thereof,

said matrix being adapted to have an vivo an outer surface contour substantially the same as that of a natural meniscus,

said matrix having pore size in the approximate range of greater than 50 microns to less than about 500 microns,

whereby said matrix establishes an at least partially bioresorbable scaffold adapted for ingrowth of meniscal fibrochondrocytes, and wherein said scaffold and said ingrown meniscal fibrochondrocytes support natural meniscal load forces.

5,007,935

JOINT MEMBER FOR A HIP PROSTHESIS

Andre Vincent, La Hulpe, and Evrard Munting, Brussels, both of Belgium, assignors to S. A. Manufacture Belge De Gembloux, Gembloux, Belgium

Continuation of Ser. No. 929,192, Sep. 10, 1986, abandoned. This application May 12, 1989, Ser. No. 352,643

Int. Cl.[5] A61F *2/32*

U.S. Cl. 623—22 **21 Claims**

1. A stemless femoral prosthesis comprising:

a block shaped supporting member configured to be positioned on a V-shape resected surface in the medial surface at the proximal end of the femur;

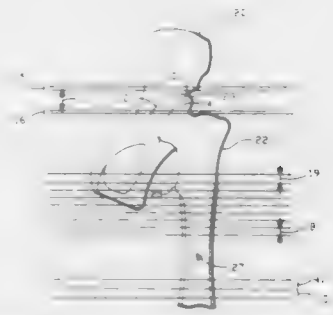
a joint head connected to the supporting member;

an anti-rotation means extending outwardly from the supporting member;

a retaining means to be positioned on the lateral surface of the femur and operatively coupled to the anti-rotation means to exert a tensile force on the supporting member thereby urging the supporting member against the resected surfaces; and

said supporting member including supporting surfaces designed to cooperate with the V-shaped resected surface of the bone, one of the supporting surfaces positioned generally parallel to the femur axis and another of said supporting surfaces positioned essentially perpendicular thereto.

5,007,936



SURGICAL METHOD FOR HIP JOINT REPLACEMENT

Steven T. Woolson, Los Altos, Calif., assignor to Cemax, Inc., Fremont, Calif.

Filed Feb. 18, 1988, Ser. No. 157,259

Int. Cl.[4] A61F *2/36, 2/34, 2/32*

U.S. Cl. 623—23 **6 Claims**

1. A method of implanting a hip prosthesis in a patient having at least a portion of an acetabulum and a femur, the prosthesis including an acetabular component for attachment to a femoral component to provide predetermined anteversion and abduction angles, said method comprising the steps of:

A. selecting the size of said femoral and acetabular components;

B. defining a reference plane relative to said acetabulum by identifying the location of fixation points about the acetabulum according to at least one of CT scan data, PET data and NMR data, a first one of said fixation points being located at the superior rim of said acetabulum, a second of said fixation points being located on the inner wall of said acetabulum at a fixed distance distal to said first fixation point wherein said second fixation point is located at the posterior rim of said acetabulum, and a third one of said fixation points being located on the rim of said acetabulum at a fixed distance distal to said first fixation point thereby to define said reference plane for establishing an orientation for implanting said acetabular component;

C. positioning about the acetabulum a reference guide having predetermined anteversion and abduction angles relative to said reference plane;

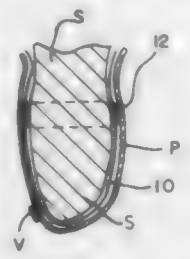
D. reaming subchondral bone using an appropriate reaming device of said acetabulum relative to said guide thereby to form a properly oriented socket for placement of the acetabular component;

E. positioning a drill guide at first, second and third fixation points which are triangularly related to one another to establish said reference plane for said acetabular component;

F. drilling a hole through the central wall of the acetabulum at an angle relative to said reference plane;

G. placing a visual reference marker in said drilled hole;

H. visually aligning said reaming device with said reference guide during said reaming step thereby to obtain accurately the proper orientation of said acetabular component after implant thereof; and



I. fixing said acetabular component in said reamed socket of said acetabulum thereby to establish the predetermined anteversion and abduction angles when functioning with said femoral component.

5,007,937

STRUCTURE FOR ENHANCED RETENTION OF ARTIFICIAL LIMBS AND METHOD OF FABRICATION

Sidney Fishman, New York, and William Lembeck, Forest Hills, both of N.Y., assignors to New York University Medical Center, New York, N.Y.

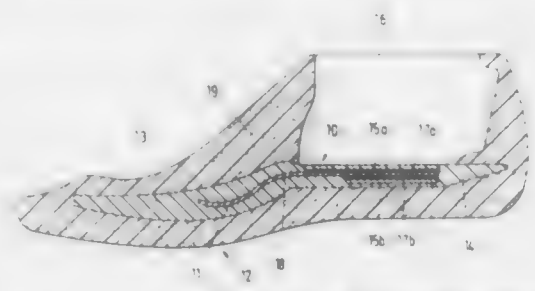
Filed Mar. 31, 1988, Ser. No. 175,828
Int. Cl.[5] A61F 2/80
U.S. Cl. 623—34 7 Claims

1. A prosthetic sock for use in a stumpreceiving socket of a patient's artificial limb, said sock comprising

an air permeable stump cladding interposed between the stump and the socket and having means at its distal end for limiting the degree to which the cladding may be drawn onto the patient's stump, said cladding having an open proximal end dimensioned to fit over the patient's stump; and

an air impermeable, elastic, annular sealing band having an axial extent which is substantially less than that of said stump cladding said band being impregnated into and through said stump cladding so as to extend thereabout at an axial position calculated to achieve a sealing effect between the socket and the stump, at least, in a closed area at the bottom of the stump when it is inserted into said socket, the artificial limb being retained on the patient's stump substantially entirely by means of differential air pressure between the closed area and the exterior of the socket.

5,007,938



ARTIFICIAL FOOT FOR A LEG PROSTHESIS

Gregor M. Prahl, Rullstorf, Fed. Rep. of Germany, assignor to IPOS GmbH & Co. KG, Fed. Rep. of Germany

Filed Aug. 15, 1989, Ser. No. 394,093
Claims priority, application Fed. Rep. of Germany, Jul. 8, 1989, 8908356[U]
Int. Cl.[5] A61F 2/66
U.S. Cl. 623—55 19 Claims

1. Artificial foot for a leg prosthesis, comprising a foamed plastic molded foot part and a plate-shaped reinforcing member embedded within its plantar area

said reinforcing member including at least two superimposed upper and lower leaf springs and a spacer in the form of an elastic sliding insert of polyethylene possessing a high degree of slidability between said leaf springs, an offset portion within the area of the ball of the foot and extending in the manner of a ball of the foot for supporting a foot rolling function, elastically yielding springing means having a forefoot core and a function core disposed within a calcaneal area and forming a tongue, the function core and the reinforcing member being rigidly interconnected.

characterized in that, a carbon fiber-reinforced synthetic resin leaf spring is disposed between said upper and lower leaf springs, and said synthetic resin leaf spring is configured in conformity with the rolling profile of the foot and extends as far as into the area of the offset portion.

5,007,939

ARTICLE MADE OF LACTIC ACID POLYMER CAPABLE OF BEING EMPLOYED PARTICULARLY AS A BIODEGRADABLE PROSTHESIS AND PROCESS FOR ITS MANUFACTURE

Luc Delcommune, Monfalcone, Italy, and Philippe Ghyselinck, Braine-L'Alleud, Belgium, assignors to Solvay & Cie (Societe Anonyme), Brussels, Belgium

Filed Nov. 7, 1988, Ser. No. 269,879
Claims priority, application France, Nov. 19, 1987, 87 16147
Int. Cl.[5] A61F 2/02, 2/28; A61B 17/56
U.S. Cl. 623—66 9 Claims

1. A biodegradable prosthesis comprising a molecularly oriented lactic acid polymer exhibiting at 23° C. a tensile rigidity modulus higher than 5000 MPa and a tensile resilience higher than 500 kJ/m^2.

5,007,940

INJECTABLE POLYMERIC BODIES

Eric P. Berg, Plymouth, Minn., assignor to American Medical Systems, Inc., Minnetonka, Minn.

Filed Jun. 9, 1989, Ser. No. 364,722
Int. Cl.[5] A61F 2/02, 2/12; A61M 5/00
U.S. Cl. 623—66 7 Claims

1. An injectable composition consisting of plurality of discrete physiologically-compatible, non-biodegradable, polymeric bodies, said bodies having (i) an average outside diameter of from about 0.005 to 0.20 inch, (ii) reversible deformability of about 20 to 75% of their unstressed outside diameter, and (iii) a lubricious surface.

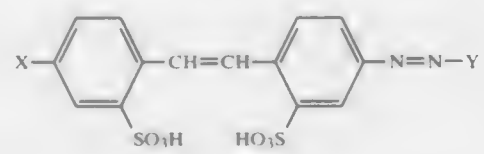
5,007,941

PROCESS FOR DYEING LEATHER: AQUEOUS BATH CONTAINING MIXTURE OF CARBON BLACK AND ACID DYE, DIRECT DYE OR METAL COMPLEX DYE

Bruno Martinelli, Allschwil; Markus Ghezzi, Oberschwiller, both of Switzerland, and Günter Streicher, Weil am Rhein, Fed. Rep. of Germany, assignors to Ciba-Geigy Corporation, Ardsley, N.Y.

Filed Dec. 21, 1989, Ser. No. 454,499
Claims priority, application Switzerland, Jan. 2, 1989, 2/89
Int. Cl.[5] D06P 1/30
U.S. Cl. 8—436 16 Claims

1. A process for dyeing leather, which comprises treating leather by the exhaust process with an aqueous liquor which contains a formulation consisting essentially of a black anionic dye selected from the group consisting of acid dyes, direct dyes and metal complex dyes and a carbon black pigment; the weight ratio of anionic dye to black pigment being from 95:5 to 50:50.



5,007,942

LIGHT-POLARIZING FILMS OR SHEETS CONTAINING STILBENE DYESTUFFS

Uwe Claussen, Leverkusen, and Friedrich W. Kröck, Odenthal, both of Fed. Rep. of Germany, assignors to Bayer Aktiengesellschaft, Leverkusen, Fed. Rep. of Germany

Filed Dec. 14, 1989, Ser. No. 450,757
Claims priority, application Fed. Rep. of Germany, Dec. 23, 1988, 3843417; Jul. 1, 1989, 3921669
Int. Cl.[5] D06P 5/00; F21V 9/14; C09K 19/00
U.S. Cl. 8—506 6 Claims

1. Light-polarizing films or sheets containing dyestuffs which, in the form of the free acid, conform to the formula

in which

X signifies —CN, —CF_3, halogen, R^1CONH—, —COOH, —$CONH_2$, —$CONHR^1$, —$CONR^1R^2$, —$COOR^1$, —OH, —OR^1, —O—CO—R^1, —N—N—Y^1, or a substituted or unsubstituted heterocyclic radical,

R^1, R^2 signify alkyl, cycloalkyl, aryl or aralkyl, which may be interrupted by O and/or S, and

Y, Y^1 signify a substituted or unsubstituted aryl or heterocyclic radical.

5,007,943

SOL-GEL PROCESS ALUMINA ABRASIVE GRAIN BLENDS IN COATED ABRASIVE MATERIAL

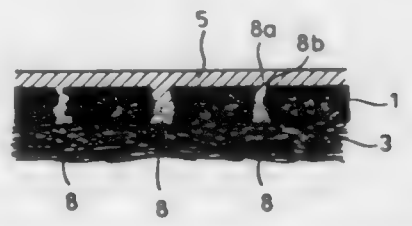
Robert G. Kelly, Latham; Bernard T. Loughlin, Averill Park, and William F. McCutcheon, Rexford, all of N.Y., assignors to Norton Company, Worcester, Mass.

Filed Nov. 3, 1989, Ser. No. 431,400
Int. Cl.[5] B24B 1/00
U.S. Cl. 51—295 12 Claims

1. Coated abrasive material having a backing member and a layer of coated abrasive adhered thereto comprising:

(a) at least one layer of a maker coat;

(b) at least one layer of abrasive grains adhered to said backing member by said maker coat; and



(c) a size coat on top of said at least one layer of abrasive grains said at least one layer of abrasive grains comprising a blend of sol gel process alumina abrasive grains in the proportion of from at least about 15% to about 75% by volume, and abrasive grains of alumina-zirconia abrasive grains in the amount of from about no more than 85% to about 25% by volume.

5,007,944

PROCESS FOR INCREASING THE SELECTIVITY OF ASYMMETRIC MEMBRANES

Ingo Pinnau, Hamburg, and Jan Wind, Borsbüttel, both of Fed. Rep. of Germany, assignors to GKSS Forschungszentrum Geesthacht GmbH, Geesthacht, Fed. Rep. of Germany

Filed May 11, 1987, Ser. No. 48,636
Claims priority, application Fed. Rep. of Germany, May 9, 1986, 3615649
Int. Cl.[5] B01D 53/22, 71/64
U.S. Cl. 55—16 12 Claims

1. A method for producing integral, asymmetric membranes for separating gases in mixture, comprising:

mixing together a polyether imide membrane forming polymer which forms membranes that are permeable to at least one gas in a mixture of gases, a volatile solvent for said polymer having a lower boiling point than any other component in the mixture, and an organic liquid swelling agent in which said polymer is not soluble and which does not react with either said polymer or said solvent, to form a pourable liquid mixture;

spreading said liquid mixture to form a thin film;

exposing said thin film to air or an inert gas to form a surface skin by evaporation;

contacting said thin film with a precipitation agent to form an integral, asymmetric polyether imide membrane;

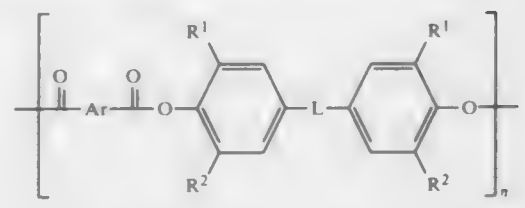
treating said membrane with an organic fluid which is a solvent for polyether imide, or a swelling agent in which said membrane is not soluble, and a selective polymer dissolved in said organic fluid selected from the group consisting of polyether imide and polyvinyl fluoride, and

removing said organic fluid.

4. A method of separating gases in mixture, comprising:

contacting a mixture of gases to be separated with an integral asymmetric membrane produced by the process of claim 1, and

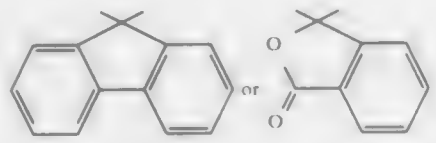
separating at least one gas from said gases in mixture by permeation through said membrane.



5,007,945

MEMBRANES FORMED FROM AROMATIC POLYARYLATES

Chao-Fong Tien, Macungie, and Andrew D. Surnamer, Allentown, both of Pa., assignors to Air Products and Chemicals, Inc., Allentown, Pa.



Filed Apr. 12, 1990, Ser. No. 508,763
Int. Cl.[5] B01D 53/22, 71/24
U.S. Cl. 55—16 12 Claims

1. A semi-permeable membrane formed from a polyarylate containing polymerizable units of the formula:

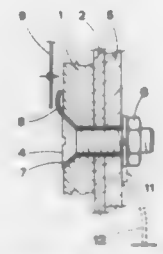
Wherein Ar is a C_1–C_{20} divalent hydrocarbon radical; R^1 and

R^2 are independently halo substituents; n is an integer greater than 50; and L is a multicyclo bridging group or

10. A process for separating a component of a gas mixture containing at least one other component, said process comprising: bringing said gas mixture into contact with the membrane of claim 1 which is selectively permeable toward one component of said gas mixture, whereby said component selectively permeates through said membrane from a feed side having both a higher partial pressure of said component and a higher total pressure to a permeate side having and a lower partial pressure of said component and a lower total pressure.

5,007,946

GRATING AND DUST-FILTER UNIT FOR CLOSING THE VENTILATING HOLE OF ELECTRONIC EQUIPMENT, WITH PROTECTIVE DEVICE AGAINST ELECTROMAGNETIC AND ELECTROSTATIC INTERFERENCE



Ezio Babini, Bologna, Italy, assignor to Fittings for Industry S.R.L., Bologna Via Di Corticella, Italy

Filed May 7, 1990, Ser. No. 519,898

Claims priority, application Italy, May 12, 1989, 4808/89[U]

Int. Cl.[5] B01D *46/10*

U.S. Cl. 55—501 **3 Claims**

1. A grating and dust-filter unit for closing a ventilating hole of electronic equipment, with protective device against electromagnetic and electrostatic interference, said unit comprising:

a grating fastened to the housing of an electronic computer, through locking means;

a metal net placed above said locking means and kept in place by a cover suited to remain snap-locked to said grating;

a small bushing, for each locking means, with said locking means passing through and being electrically connected with said bushing;

said small bushing being provided with an extension turned towards the centre of said grating, so to remain below a corresponding portion of said net as well as to be electrically connected with said net, so that said net results to be electrically connected with said housing, with possibility for said net to be detached from said housing and connected with said housing respectively by being removed therefrom and being placed thereon.

METHOD FOR THE MANUFACTURE CAMERA MIRROR-DRUM

Kazuei Kenmoti, Hirakata, and Masamitu Miyazaki, Kadoma, both of Japan, assignors to Matsushita Electric Industrial Co. Ltd., Osaka, Japan

Filed Apr. 7, 1989, Ser. No. 334,837

Claims priority, application Japan, Apr. 8, 1988, 63-87471

Int. Cl.[5] C03C *25/02*

U.S. Cl. 65—3.43 **5 Claims**

1. A method for the manufacture of camera mirror-drums comprising the steps of fusing glass in a vessel, drawing the fused glass from small holes in the bottom of said vessel to form glass fibers, forming indentations at regular intervals in said glass fibers while said fibers are still in a softened state, hardening said glass fibers, chopping said glass fibers at said indentations so that the chopped fibers are of uniform length, blending the chopped glass fibers of uniform lengths into a resin at certain proportions, and injection molding the mixture to produce a camera mirror-drum.

5,007,948

ESSENTIALLY COLORLESS SILVER-CONTAINING GLASSES THROUGH ION EXCHANGE

Roger J. Araujo, Big Flats, N.Y., assignor to Corning Incorporated, Corning, N.Y.

Filed Mar. 19, 1990, Ser. No. 495,081

Int. Cl.[5] C03C *21/00*

U.S. Cl. 65—30.13 **8 Claims**

1. An essentially colorless, alkali metal oxide-Al_2O_3 and/or B_2O_3-SiO_2 glass, wherein at least a portion thereof contains silver ions produced through an ion exchange reaction wherein Ag^+ ions from an external source are exchanged with alkali metal ions in the glass, said glass having a base composition in which the alkali metal oxide and the Al_2O_3 and/or B_2O_3 are present in such concentrations that the glass possesses at atomic structure in which the fraction of non-bridging oxygen atoms is less than 0.03, and wherein up to a total of 7.5 cation percent Al_2O_3 and/or B_2O_3 can be replaced with at least one metal oxide selected from the group consisting of BeO, CaO, Ga_2O_3, La_2O_3, MgO, Nb_2O_5, Ta_2O_5, Yb_2O_3, ZnO, and ZrO_2, while maintaining the fraction of non-bridging oxygen atoms at less than 0.03.

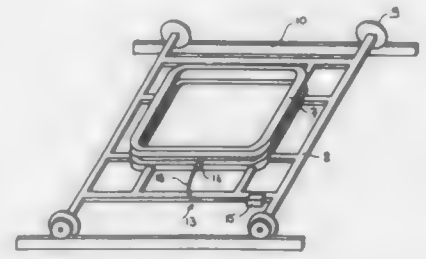
5,007,949

SUPPORT FRAME FOR A GLASS SHEET

Denis Mathivat, and Jean-Marc Petitcollin, both of Thourotte, France, assignors to Saint-Gobain Vitrage International, Courbevoie, France

Filed Dec. 20, 1989, Ser. No. 453,938

Claims priority, application France, Dec. 21, 1988, 88 16892



Int. Cl.[5] C03B *23/03*

U.S. Cl. 65—160 **8 Claims**

1. Support frame for a glass sheet that is heated to a temperature beyond its deformation temperature, comprising:

a moving trolley, said support frame being mounted on said moving trolley and having a shape adapted to the contour of the glass sheet, said moving trolley being movable into and out of a shaping station and to a position below an upper mold located within said shaping station, said shaping station comprising means for raising said heated glass sheet against said upper mold, wherein said moving trolley and said support frame are positioned below said upper mold when said heated glass sheet is raised against said upper mold;

a contactless detection device operatively connected to said support frame for selectively detecting the presence of

said glass sheet within an area defined by a region adjacent to said upper mold and a region adjacent to said support frame including said support frame after said glass sheet has been released from said upper mold and generating a signal indicative thereof; and

means for converting said signal received from said detection device into electrical pulses for controlling the movement of said support frame into and out of said shaping station in response to said detected signal.

1. A 5-(N-3,4,5,6-tetrahydrophthalimido)benzoic acid thiol ester of formula I

(I)

wherein

n is 0, 1 or 2,

R_1 is C_1-C_3alkyl,

R_2 is hydrogen or halogen,

R_3 is halogen,

A is a C_1-C_4alkylene bridge, which is unsubstituted or mono- or polysubstituted by C_1-C_4alkoxy, C_1-C_4alkylthio or cyano,

Q is hydroxyl, halogen, cyano, thiocyanato, C_2-C_6alkenyl, C_2-C_6haloalkenyl, C_2-C_6cyanoalkenyl, C_2-C_{14}alkynyl, or a radical $-C(R_4)=CH-COOR_5$, $-CH(N(R_4)_2)COOR_4$, $-NR_6R_7$, $-COR_8$, $-CON(R_6)SO_2CH_3$, $-N(R_4)CH_2CN$, diallylaminocarbonyl, $-Si(R_{11})_3$, $-COOCH_2Si(CH_3)_2C_1$-C_6alkyl, $-COON=C(R_9)_2$, $-PO(OR_{12})-(O)_mR_{12}$, $-CON(R_4)SO_2C_1$-C_6alkyl, $-CON(R_4)SO_2C_1$-C_4haloalkyl, C_1-C_6alkylcarbonyl, a benzoyl or benzylcarbonyl radical whose phenyl ring is unsubstituted, mono- or polysubstituted by halogen, C_1-C_4alkyl, C_1-C_4haloalkyl, C_1-C_4alkoxy, C_1-C_4haloalkoxy, cyano or nitro, $-COOCH(CH_3)CH_2SR_4$, $-CON(R_4)CH_2C(OC_1$-C_6alkyl$)_2$, $-COO(CH_2)_{n+1}OC_3$-C_7alkenyl, $-COOC_1$-C_4cyanoalkyl, $-COO-C_1$-C_4alkylene-$N(R_4)_2$ or C_1-C_8alkanoyloxy,

A is a C_1-C_4alkylene bridge, which is mono- or polysubstituted by C_1-C_4alkoxy, C_1-C_4alkylthio or cyano, Q also is $COOR_{13}$,

R_4 is hydrogen, C_1-C_6alkyl or C_2-C_6alkoxyalkyl,

R_5 is C_1-C_6alkyl or C_1-C_6hydroxyalkyl,

R_6 and R_7 are independently of each other hydrogen, C_1-C_6alkyl, C_2-C_6alkoxyalkyl, C_3-C_6alkenyl, C_3-C_6alkenyl, C_3-C_6alkynyl or C_3-C_6cycloalkyl, 2-furanylmethyl, 2-tetrahydrofuranylmethyl, 2-(5-methyl)-tetrahydrofuranylmethyl or 2-thienylmethyl,

R_8 is a pyrrolidino, piperidino, morpholino, thiomorpholino, 4-methylpiperazino, pyrazolidino, imidazolidino or 1,2,4-triazol radical, which radical is unsubstituted or mono- or disubstituted by C_1-C_4alkyl,

R_9 is C_1-C_6alkyl or two adjacent R_9 can form a C_2-C_6alkylene bridge,

R_{11} is C_1-C_6alkyl or C_1-C_6alkoxy,

R_{12} is hydrogen, C_1-C_6alkyl, C_2-C_6alkenyl, C_3-C_6alkynyl C_3-C_7cycloalkyl, and

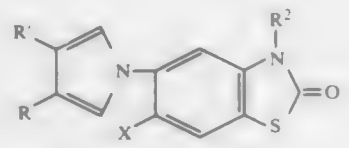
m is zero or 1.

26. A method of defoliating or desiccating crops of cotton and potatoes in order to facilitate the harvesting thereof, which method comprises treating the crop, shortly before harvesting, with an effective amount of a compound of formula I according to claim 1, or of a composition containing such a compound as the active ingredient.

5,007,952

HERBICIDAL NOVEL BENZOTHIAZOLONYL PYRROLES

Toyohiko Kume; Toshio Goto; Atsumi Kamochi; Akihiko Yanagi; Hiroshi Miyauchi, and Tadao Asami, all of Tokyo, Japan, assignors to Nihon Tokushu Noyaku Seizo K. K., Tokyo, Japan



Filed Nov. 9, 1989, Ser. No. 435,223

Claims priority, application Japan, Nov. 17, 1988, 63-288796

Int. Cl.[5] A01N *43/76, 43/78, 43/86*

U.S. Cl. 71—73 **8 Claims**

1. A pyrrole of the formula

(I)

wherein

R^1 represents C_{1-4} alkyl, or one R^1 together with the other R^1 forms tetramethylene or butenylene,

X represents hydrogen or halogen,

R^2 represents hydrogen, C_{1-5} alkyl, halogeno-C_{1-5} alkyl, cyclopropylmethyl, C_{3-4} alkenyl, halogeno-C_{3-4} alkenyl, C_{3-4} alkynyl, C_{1-3} alkoxy-C_{1-2} alkyl, C_{1-3} alkylthio-C_{1-2} alkyl, C_{1-3} alkylsulfinyl-C_{1-2} alkyl, C_{1-3} alkylsulfonyl-C_{1-2} alkyl, phenylthio-C_{1-2} alkyl optionally substituted by halogen; phenylsulfinyl-C_{1-2} alkyl, phenylsulfonyl-C_{1-2} alkyl, cyano-C_{1-2} alkyl, carbamoylmethyl, thiocarbamoylmethyl, tri-C_{1-3} alkylsilylmethyl, phenyl-C_{1-2} alkyl optionally substituted by halogen, methyl or methoxy; or R^2 represents

wherein

m represents 2 or 3,

R^3 represents hydrogen or C_{1-4} alkyl,

R^4 represents C_{1-4} alkyl, or phenyl optionally substituted by halogen or C_{1-4} alkyl,

R^5 represents hydrogen, C_{1-4} alkyl, C_{3-4} alkenyl, C_{3-4} alkynyl, benzyl, C_{1-4}-alkyl-carbonyl, or C_{1-4} alkanesulfonyl,

R^6 and R^7 each represent C_{1-4} alkyl or C_{1-4} alkylcarbonyl,

R^8 represents C_{1-5} alkyl,

R^9 represents C_{1-5} alkyl or C_{1-4} alkyl-carbonyl or R^8 and R^9 together with the nitrogen atom to which they are bonded form a pyrrolidine, piperidine, N-methylpiperazine, piperazine or morpholine radical,

R^{10} represents C_{1-6} alkoxy, C_{3-7} cycloalkoxy, C_{2-3} haloalkoxy, C_{1-5} alkylamino, C_{2-8} dialkylamino, or N-C_{1-4} alkyl-N-phenylamino wherein the phenyl of the N-phenyl may be substituted by halogen and/or methyl or R^{10} represents N,N-C_{4-6} polymethyleneamino or tri-C_{1-3} alkylsilylmethoxy, and

R^{11} represents a triazole, thiazole, isoxazole, oxadiazole, thiadiazole, pyridine or pyrazine radical optionally substituted by C_{1-4} alkyl or C_{1-4} alkoxy.

7. A method of combatting unwanted vegetation which comprises applying thereto or to a locus from which it is desired to exclude such vegetation a herbicidally effective amount of a compound according to claim 1.

5,007,953

SEED TREATMENT COMPOSITIONS

Charles C. Chollet, Caldwell, Id., assignor to Snake River Chemicals, Inc., Caldwell, Id.

Continuation-in-part of Ser. No. 859,240, May 7, 1986, abandoned, which is a continuation of Ser. No. 696,443, Jan. 30, 1985, abandoned. This application Dec. 22, 1988, Ser. No. 290,236

Int. Cl.[5] A01N *31/04, 43/78, 47/14*

U.S. Cl. 71—77 **36 Claims**

1. A seed treatment dust, comprising:

(a) an effective amount of a fungicide;

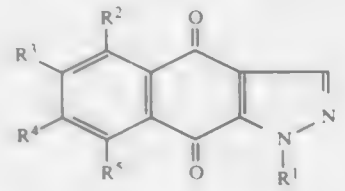
(b) a diluent material; and

(c) comminuted Alder bark.

5,007,954

CONTROLLING UNDESIRABLE PLANT GROWTH USING NAPHTHINDAZOLE-4,9-QUINONES

Klaus Ditrich, Bad Durkheim; Gerhard Hamprecht, Weinheim; Bruno Wuerzer, Otterstadt; Norbert Meyer, Ladenburg; Karl-Otto Westphalen, Speyer, and Hartmut Laatsch, Goettingen, all of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany



Filed Sep. 14, 1989, Ser. No. 407,318

Claims priority, application Fed. Rep. of Germany, Sep. 15, 1988, 3831332

Int. Cl.[5] A01N *43/56, 43/90*

U.S. Cl. 71—90 **6 Claims**

1. A process for combating the growth of unwanted plants comprising: applying a herbicidally effective amount of a naphthindazole-4,9-quinone of the formula

where:

R^1 is hydrogen, C_1-C_{10}-alkyl, C_2-C_{10}-alkenyl, C_2-C_{10}-alkynyl, C_1-C_{10}-haloalkyl, C_1-C_{10}-hydroxyalkyl, C_2-C_{14}-alkoxyalkyl, C_2-C_{14}-alkylthioalkyl, C_3-C_7-cycloalkyl, C_1-C_4-alkylcabonyloxy-C_1-C_4-alkyl, C_1-C_4-alkylaminocarbonyloxy-C_1-C_4-alkyl, phenylaminocarbonyloxy-C_1-C_4-alkyl which is unsubstituted or substituted in the phenyl moiety by halogen, C_1-C_4-alkyl or C_1-C_4-alkoxy, phenylsulfonyloxy-C_1-C_4-alkyl which is unsubstituted or substituted in the phenyl moiety by halogen, C_1-C_4-alkyl or C_1-C_4-alkoxy, C_1-C_4-alkoxycarbonyl-C_1-C-alkyl, hydroxycarbonyl-C_1-C_4-alkyl, aminocarbonyl-C_1-C_4-alkyl, C_1-C_4-alkylaminocarbonyl-C_1-C_4-alkyl, di-(C_1-C_4-alkyl)-aminocarbonyl-C_1-C_4-alkyl, halo-C_3-C_4-alkynyl, unsubstituted or halogen- or C_1-C_4-alkyl-substituted heteroaryl radical with one or two nitrogen atoms, phenyl which is unsubstituted or substituted by halogen, hydroxy, nitro, amino, C_1-C_4-alkylamino, di-C_1-C_4-alkylamino, cyano, C_1-C_4-alkyl, C_1-C_4-alkoxy, C_1-C_4-haloalkoxy, C_1-C_4-haloalkyl, C_1-C_4-alkylthio or C_1-C_4-haloalkylthio, or unsubstituted or halogen-substituted benzyl, and

R^2, R^3, R^4 and R^5 are identical or different and each denotes hydrogen, halogen, nitro, cyano, hydroxy, amino, C_1-C_4-alkylamino, di-C_1-C_4-alkylamino, C_1-C_6-alkyl, C_1-C_5-haloalkyl, C_1-C_5-alkoxy, C_1-C_5-haloalkoxy, C_1-C_5-alkylthio, C_1-C_5-haloalkylthio, C_2-C_{10}-alkoxyalkyl, carboxyl, C_2-C_6alkoxycarbonyl, C_2-C_6-alkanoyloxy, C_2-C_6-haloalkanoyloxy, C_1-C_4-alkyl-carbonylamino, C_1-C_4-alkylaminocarbonyl, di-(C_1-C_4-alkyl)-aminocarbonyl, or phenyl or heteroaryl, each of which is unsubstituted or substituted by halogen, trifluoromethyl, nitro, cyano, amino, C_1-C_4-alkoxy, C_1-C_4-alkylthio or C_1-C_5-haloalkylthio,

and

R^3 and R^4, together with the two carbon atoms of the phenyl ring to which they are attached, form a heterocyclic ring or a benzene or naphthalene ring which is unsubstituted or substituted by halogen, nitro, cyano, amino, hydroxy, trifluoromethyl, C_1-C_5-alkyl, C_1-C_5-alkoxy, C_1-C_5-haloalkylthio, C_1-C_5-haloalkoxy or C_1-C_5-alkylthio,

to unwanted plants and/or their habitat.

5,007,955

CATIONIC HERBICIDES

Akira Taniuchi, Kyoto; Hironori Kataoka, Ikoma, and Etsuo Ito, Kyoto, all of Japan, assignors to Dai-Ichi Kogyo Seiyaku Co., Ltd., Kyoto, Japan

Continuation of Ser. No. 110,389, Oct. 20, 1987, abandoned. This application Nov. 4, 1988, Ser. No. 267,705

Int. Cl.[5] A01N *41/04*

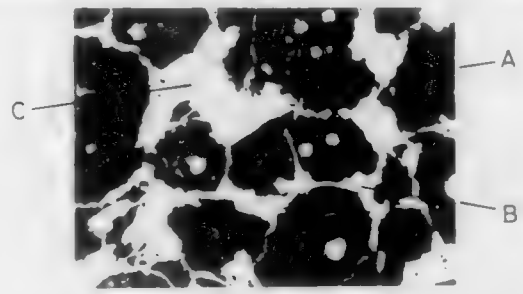
U.S. Cl. 71—103 **18 Claims**

1. A method of combatting weeds which comprises applying thereto a herbicidally effective amount of a cationic herbicidal composition which contains as an active ingredient a quaternary ammonium salt of the general formula:

wherein R_1 is an alkyl or alkenyl group of up to 22 carbon atoms; R_2 and R_3 each is an alkyl or alkenyl group of up to 22 carbon atoms, a benzyl group or a hydroxyalkyl group of up to 4 carbon atoms; R_4 is a hydroxyalkyl group of up to 4 carbon atoms; and R_5 is an alkyl group of 1 to 22 carbon atoms, a phenyl group, a C_{1-22} alkyl- or hydroxy-substituted phenyl group, or a naphthyl group.

5,007,956

ASSEMBLED CAM SHAFT



Yoshiaki Fujita, Saitama; Satoshi Kawai, and Shunsuke Takeguchi, both of Tochighi, all of Japan, assignors to Nippon Piston Ring Co., Ltd., Tokyo, Japan

Continuation of Ser. No. 35,780, Apr. 8, 1987, abandoned. This application Oct. 27, 1988, Ser. No. 263,967

Claims priority, application Japan, Apr. 11, 1986, 61-83580

Int. Cl.[5] C22C *29/04*

U.S. Cl. 75—238 **4 Claims**

1. An assembled cam shaft member whose assembled portion, except for a cam lobe is made of sintered material, said sintered material consisting essentially of 0.5 to 4.0% by weight of carbon, 0.1 to 80% by weight of phosphorus, 5 to 50% by weight of copper, at least one of 0.11 to 1% by weight of magnasese and 0.02 to 2% by weight of silicon, and the substantial balance being iron and impurities, said copper acting to braze each assembled portion to the shaft member.

5,007,957

METHOD FOR PRODUCING TUNGSTEN CARBIDE GRADE POWDERS SUITABLE FOR ISOSTATIC COMPACTION

Joseph J. Penkunas, and Theodore E. Smith, Jr., both of Sayre, Pa., assignors to GTE Products Corporation, Stamford, Conn.

Filed Sep. 10, 1990, Ser. No. 579,518

Int. Cl.[5] B22F *1/00*

U.S. Cl. 75—252 **5 Claims**

1. A method for producing metal carbide grade powders suitable for isostatic compaction, said method comprising:

(a) combining a binder metal powder with an esterified wax and heating said wax to a temperature above the melting point of said wax to melt said wax and maintain said wax in the molten state to form a first mixture, with the amount of wax being sufficient to result in a level of wax in the subsequently produced second mixture of no greater than about ½% by weight;

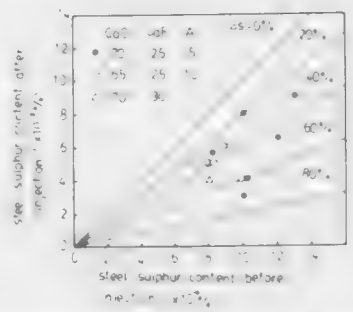
(b) combining a metal carbide powder component with said first mixture while maintaining said wax in said molten state;

(c) forming a slurry of said second mixture and water;

(d) attritor milling said slurry at a temperature below the melting point of said wax; and

(e) removing water from the resulting attritor milled mixture to form said metal carbide grade powder.

5,007,958



LIME-BASED INJECTION POWDER FOR STEEL-REFINING

Yeong-Huei Chung, Kaohsiung, and Der-Shyang Cheng, Kaohsiung Hsien, both of Taiwan, assignors to China Steel Corporation, Kaohsiung, Taiwan

Filed Feb. 8, 1990, Ser. No. 476,791

Int. Cl.[5] C21C *7/02, 7/04*

U.S. Cl. 75—330 **2 Claims**

1. A method of making a lime-based injection powder for use in a steel-refining, said powder having excellent waterproofing and desulphurization effects, the method comprising the steps of preparing a powder which consists of (a) more than 65% by weight of calcium oxide, (b) less than 30% by weight of fluorite, and 5-10% by weight of Al powder, and converting 5%-7% by weight of the calcium oxide into CaCO3 by reacting the calcium oxide with carbon dioxide.

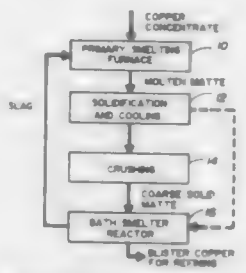
5,007,959

PROCESS FOR CONVERTING OF SOLID HIGH-GRADE COPPER MATTE

Marc Reist, Notre Dame de l'Ile Perrot; Hans Persson, and Daniel Poggi, both of Pointe-Claire, all of Canada, assignors to Noranda Inc., Toronto, Canada

Filed Feb. 23, 1989, Ser. No. 313,884

Claims priority, application Canada, Apr. 29, 1988, 565626



Int. Cl.[5] C22B *15/00*

U.S. Cl. 75—645 **6 Claims**

1. A process for the production of blister copper from high-grade copper matte or similar copper sulphide consisting of the steps:

(a) solidifying and cooling molten copper matte produced in a primary smelting furnace followed by crushing of the solidified matte if necessary to produce coarse particles of solid copper matte less than about fifteen centimeters in size;

(b) heating a bath smelting reactor to a temperature at which converting reactions take place and providing a bath of molten copper;

(c) continuously feeding measured quantities of said coarse particles of solid copper matte and flux into the bath smelting reactor;

(d) continuously introducing sufficient quantities of oxygen or oxygen enriched air through submerged fluid protected tuyeres such that the iron and sulphur present in the copper matte are oxidized; and

(e) periodically withdrawing molten blister copper, liquid slag and continuously withdrawing off-gas from the bath smelting reactor.

5,007,960

METHOD FOR REMOVING CHROMIUM FROM CHROMIUM CONTAINING WASTE MATERIAL

Omar Baturay, City Island, N.Y.; James E. Shirk, Jersey City, and Adam L. Sigerson, Sussex, both of N.J., assignors to Chrome Technology Inc., Trenton, N.J.

Filed Oct. 13, 1989, Ser. No. 421,136
Int. Cl.[5] C01G *37/00*
U.S. Cl. 75—743 **19 Claims**

1. A method for extracting chromium is the form of chromate from material containing chromium, said method comprising:

drying by indirect heating said material containing chromium;

sizing said dried material containing chromium to a particle size of less than 0.105 mm;

mixing said sized material containing chromium with an alkaline reactant;

reacting said mixed sized material containing chromium and alkaline reactant with oxygen by heating said mixed sized material in the presence of oxygen by indirect heating in an enclosed reaction vessel for a time and at a temperature to react substantially all the chromium to water soluble chromate thereby forming a reaction material containing water soluble chromate;

limiting the oxygen present in said enclosed reaction vessel during said reacting step to approximately stoichiometric oxygen requirements of said reaction;

removing said reaction material containing water soluble chromate from said reaction vessel and resizing and cooling said reaction material,said resized reaction material having a particle size of less than 0.105 mm; thereafter,

extracting said water soluble chromate from said reaction material using an aqueous solvent thereby providing an aqueous phase containing water soluble chromate and a clean solid phase substantially free from chromium;

evaporating said water soluble chromate containing aqueous phase thereby providing a concentrated chromate phase

AQUEOUS ADDITIVE SYSTEMS, METHODS AND POLYMERIC PARTICLES

Kenneth W. Hyche, and William C. Gose, both of Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N.Y.

Continuation-in-part of Ser. No. 197,946, May 24, 1988, which is a continuation-in-part of Ser. No. 827,042, Feb. 7, 1986, Pat. No. 4,898,616, which is a continuation-in-part of Ser. No. 701,888, Feb. 15, 1985, abandoned. This application Sep. 6, 1988, Ser. No. 240,503
Int. Cl.[5] C08L *91/06*; C09D *191/06*, *191/08*
U.S. Cl. 106—18 **15 Claims**

1. Aqueous application system for applying additives to polymeric particles, the system being characterized by freedom from in situ formation of color producing complexes, said system comprising

(a) an emulsified wax,

(b) in the range of 0.025 up to 60 parts by weight of surfactant per part of emulsified wax,

(c) in the range of 0.0005 up to 2 parts by weight of a base with a pH in the range of greater than 7 to equal to or less than about 12,

(d) in the range of 0.05 up to 160 parts by weight of at least one processing, stabilizing or other functional polymer additive, and

(e) at least enough water to render the resulting combination fluid

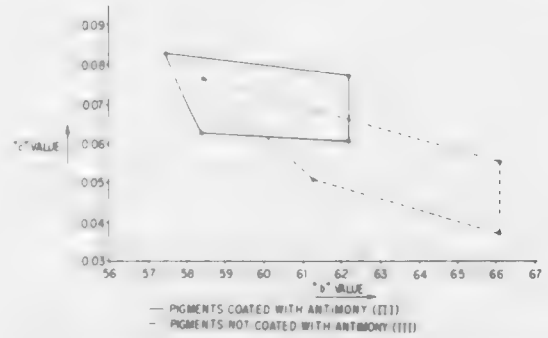
---

5,007,962

BORON NITRIDE COATINGS

Timothy W. Osborne, Brooklyn, Ohio, assignor to Union Carbide Corporation, Danbury, Conn.

Filed Sep. 19, 1989, Ser. No. 409,057
Int. Cl.[5] C04B *35/68*; B28B *7/38*
U.S. Cl. 106—38.22 **16 Claims**



1. A boron nitride-containing composition for use as a film-forming coating comprising particulate boron nitride containing B_2O_3 dispersed in a solution of methyl chloroform and at least one solvent and wherein said particulate boron nitride containing B_2O_3 is from 1.5 to 50 weight percent, said methyl chloroform is from 10 to 70 weight percent and said solvent is from 5 to 30 weight percent, all based on the weight of the composition and wherein said particulate boron nitride is sized from 0.1 to 50 microns.

5,007,963

NOVEL PROCESS FOR THE PREPARATION OF LEAD MOLYBDATE PIGMENTS AND NOVEL LEAD MOLYBDATE PIGMENTS

Leonardus J. H. Erkens, CK Maastricht; Gerben P. Algra, RB Maastricht; Herman J. J. M. Geurts, AX Kerkrade, and Hubertus P. A. Gielkens, BD Amstenrade/Schinnen, all of Netherlands, assignors to Ciba-Geigy Corporation, Ardsley, N.Y.

Filed Oct. 17, 1988, Ser. No. 259,083
Claims priority, application Switzerland, Oct. 22, 1987, 4133875
Int. Cl.[5] C09C *1/20*
U.S. Cl. 106—433 **12 Claims**

1. In a process for the preparation of a lead molybdate pigment containing lead chromate, lead sulfate, and lead molybdate by (a) reaction of an aqueous solution of a lead salt with an aqueous solution containing chromate, molybdate and sulfate salts or (b) reaction of an aqueous solution of a lead salt with an aqueous solution of chromate salt, an aqueous solution of molybdate salt and an aqueous solution of sulfate salt, the improvement comprising

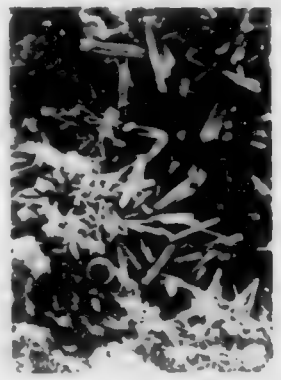
conducting said reaction in the presence of 2 to 5 mol % lead molybdate seed crystals based on the total molar amount of lead chromate, lead sulfate, and lead molybdate while keeping the pH in the acid range.

5,007,964

CALCIUM CARBONATE, CALCIUM CARBONATE PIGMENT, PROCESS FOR PREPARING SAME, COATING COMPOSITION FOR INFORMATION RECORDING PAPER AND INFORMATION RECORDING PAPER

Ryogo Tsukisaka, Takarazuka; Satoshi Kondo, Nishinomiya; Toshio Kaneguchi, Kobe, and Takashi Deguchi, Nishinomiya, all of Japan, assignors to Shiraishi Central Laboratories Co., Ltd., Hyogo, Japan

Filed Jan. 13, 1989, Ser. No. 296,963
Claims priority, application Japan, Mar. 9, 1988, 63-55476
Int. Cl.[5] C09C *1/02*
U.S. Cl. 106—464 **7 Claims**



1. A calcium carbonate which is 25 to 55 m^2/g in BET specific surface area, 5 to 110 in the ratio of BET specific surface area (m^2/g)/mean particle size (μm), at least 120 ml/100 g in oil absorption as determined by the Ogura method and at least 1.8 g/g in water absorption.

5,007,965

MATERIAL FOR TREATING HEAVY METALS AND METAL IONS

Taiichio Sasae, Nagaokakyo, and Yoshio Taguchi, Tokyo, both of Japan, assignors to Kansai Engineering Co., Ltd., Kyoto, Japan

Filed Mar. 17, 1989, Ser. No. 324,883
Int. Cl.[5] C04B *7/02*
U.S. Cl. 106—800 **3 Claims**

1. A material for mixing with water containing effluents shaving harmful heavy metals and heavy metal ions therein so as to securely confine the heavy metals and ions in a solidified continuous-pore structure, comprising:

(1) a mixture of quicklime and cement with the quicklime being 10 weight % to 100 weight % of the cement.

(2) based on the weight of the quicklime and cement,

(a) 0.05 to 0.35% by weight of potassium chloride, 0.03 to 0.20% by weight of magnesium chloride, 0.03 to 0.20% by weight of sodium chloride, 0.03 to 0.25% by weight of calcium chloride, 0.00002 to 0.01% by weight of cobalt chloride, 0.00002 to 0.01% by weight of citric acid, and 0.001 to 0.02% by weight of sodium sulfate; and wherein the balance is the cement-quicklime mixture.

5,007,966

CYCLODEXTRIN COMPLEXING METHOD

Allan Hedges, Crown Point, and Frank Tenbarge, Valparaiso, both of Ind., assignors to American Maize-Products Company, Stamford, Conn.

Filed Sep. 21, 1988, Ser. No. 247,251
Int. Cl.[5] C08B *30/00*
U.S. Cl. 127—34 **6 Claims**

1. A method for forming a complex between a cyclodextrin and a guest molecule comprising the steps of:

(a) forming a mix of a cyclodextrin having a moisture content between about 25% to about 65% by weight with a guest molecule;

(b) charging a shell of a ball mill with said mix of cyclodextrin and guest molecule and with a plurality of balls;

(c) horizontally rotating said shell with said plurality of balls and said mix therein for a period of about one half hour to about 24 hours at about 50% to about 80% of critical speed to form a complex between said cyclodextrin and said guest molecule; and

(d) scraping the sides of the ball mill during rotation of said shell to remove material that sticks to the sides of the shell.

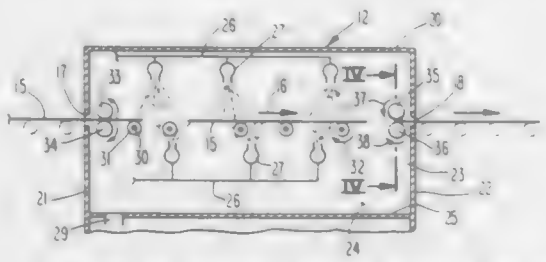
5,007,967

SEPARATION AND PURIFICATION OF BRANCHED BETA CYCLODEXTRINS

Robert N. Ammeraal, Worth, Ill., assignor to American Maize-Products Company, Hammond, Ind.

Filed Aug. 15, 1988, Ser. No. 232,307
Int. Cl.[4] C13D *3/14*; B01D *15/08*
U.S. Cl. 127—46.1 5 Claims

1. A method for sequentially separating branched beta cyclodextrins having branches of varying molecular weight into fractions of branched beta cyclodextrins having similar molecular weight branches from a solution containing branched beta cyclodextrins with varying molecular weight branches comprising: passing said solution containing branched beta cyclodextrins with varying molecular weight branches through a matrix upon which an inclusion compound is attached by means of a bridging compound thereby positioning said inclusion compound about 6 to about 18 Å from the surface of the matrix, and



eluting sequentially by fractions branched beta cyclodextrins having similar molecular weight branches wherein longer branched beta cyclodextrins are eluted before shorter branched beta cyclodextrins.

5,007,968

PROCESS AND APPARATUS FOR TREATING ARTICLES OF SUBSTANTIAL THICKNESS

Frederick E. Coffman, and Charles H. Pelton, both of State College, Pa., assignors to Chemcut Corporation, State College, Pa.

Filed Jul. 28, 1989, Ser. No. 387,333
Int. Cl.[4] B08B *9/20*, *3/00*
U.S. Cl. 134—25.4 19 Claims

1. A process for chemically treating generally flat thick articles in a chamber with a liquid treatment fluid, wherein the fluid is applied to articles being treated along a path of travel for the articles, the process including the steps of

(a) providing a substantially closed chamber for treating articles therein;

(b) delivering articles along a path of travel through the chamber;

(c) applying a liquid treatment fluid to articles being delivered along their path of travel through the chamber;

(d) providing opposed rotating cylindrical surfaced roller members normally in engagement with each other to form a closed nip therebetween when articles are not passing through the nip;

(e) positively rotatably driving at least one of the roller members of the nip;

(i) by providing a driven member having a first axis and being carried by the at least one roller member;

(ii) by providing a drive member having a second axis; and by

(iii) engaging the driven member with the drive member;

(f) engaging the articles in the nip between the opposed rotating roller members to keep treatment fluid that is being applied to articles in the chamber from passing beyond of the nip; and

(g) opening the nip by engaging the at least one of the roller members of the nip and transversely displacing the axis of the engaged roller member away from its opposed roller member by contacting the roller members with articles as the articles pass through the nip, while continuing to positively rotatably drive the at least one roller member in the same positive manner, and without separation of said axes of the drive and driven members.

8. An apparatus for chemically treating generally flat thick articles in a chamber with a liquid treatment fluid, wherein the fluid is applied to articles being treated along a path of travel for the articles, the apparatus including

(a) means providing a substantially closed chamber for treating articles therein,

(b) means for delivering articles along a path of travel through the chamber,

(c) means for applying a liquid treatment fluid to articles being delivered along their path of travel through the chamber,

(d) means providing opposed rotating cylindrical surfaced roller members normally in engagement with each other to form a closed nip therebetween when articles are not passing through the nip,

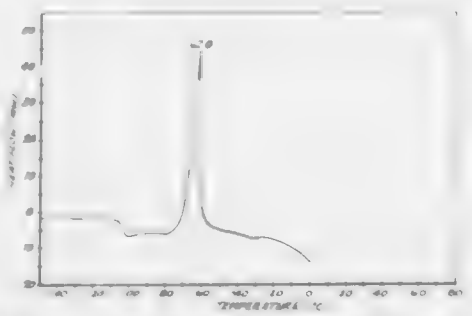
(e) driving means positively rotatably driving at least one of the roller members of the nip;

(i) including means providing a driven member having a first axis and being carried by the at least one said roller member,

(ii) including means providing a drive member having a second axis, and

(iii) with the driven member being in engagement with the drive member,

(f) the opposed rotating roller members being disposed to provide means for engaging the articles in the nip, to keep treatment fluid that is being applied to articles in the chamber from passing beyond the nip; and



(g) the opposed roller members including means for opening the nip by engaging the at least one of the roller members of the nip with articles being treated and transversely displacing the axis of the engaged roller member away from its opposed roller member as the articles pass through the nip while said driving means continue to positively rotatably drive the at least one roller member in the same positive manner, and without separation of said axes of said drive and driven members.

LOW TOXICITY LIQUID SOLVENT

Patrisha A. Doscher, Kent, Wash., assignor to The Boeing Company, Seattle, Wash.

Filed May 20, 1988, Ser. No. 196,903
Int. Cl.[5] C09D *9/00*; C11D *7/26*, *7/50*; C23G *5/02*
U.S. Cl. 134—38 8 Claims

1. A low toxicity solvent comprising 40–95 vol % ethylene diacetate and the remainder an alicyclic carbonate including an effective amount of ethylene carbonate, the solvent being aprotic and having a vapor pressure less than or equal to 1 mm Hg at 20° C.

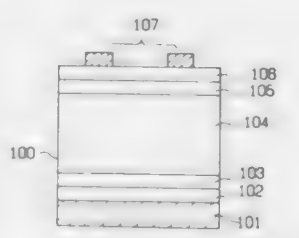
6. A method of removing a residue from a solid substrate comprising the step of contacting the residue with an effective amount of the solvent of claim 1.

5,007,970

PROCESS FOR THE CLEANING OF STEAM GENERATOR HEATING SURFACES

Hellmut A. Herrmann, Kassel, and Wolfgang Hubeler, Staufenberg, both of Fed. Rep. of Germany, assignors to Schmidt'sche Heissdampf GmbH, Kassel-Bettenhausen, Fed. Rep. of Germany

Filed May 2, 1988, Ser. No. 188,314
Claims priority, application Fed. Rep. of Germany, May 2, 1987, 3714673
Int. Cl.[5] B08B *3/14*
U.S. Cl. 134—42 8 Claims



1. In a process for causing the removal of deposits from the surface of a heat exchange device by mechanical cleaning, the improvement comprising lowering the temperature of the surface to be cleaned below the softening temperature of the deposited material to be removed therefrom, at least for a period at the beginning of a cleaning cycle whereby the deposits will be hardened so as to be capable of mechanical removal.

5,007,971

PIN HETEROJUNCTION PHOTOVOLTAIC ELEMENTS WITH POLYCRYSTAL BP(H,F) SEMICONDUCTOR FILM

Masahiro Kanai, Tokyo; Tatsuyuki Aoike; Koichi Matsuda, both of Nagahama, and Soichiro Kawakami, Hikone, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Filed Jan. 19, 1990, Ser. No. 467,537
Claims priority, application Japan, Jan. 21, 1989, 1-12509
Int. Cl.[5] H01L *31/075*, *31/0368*, *31/0376*
U.S. Cl. 136—258 4 Claims

1. A pin heterojunction photovoltaic element which generates photoelectromotive force by the junction of a p-type semiconductor layer, an i-type semiconductor layer and an n-type semiconductor layer, characterized in that at least one of said p-type and n-type semiconductor layers comprises a polycrystal semiconductor film comprised of boron atoms (B), phosphorus atoms (P), hydrogen atoms (H), and atoms (M) of a p-type or n-type dopant element, said polycrystal semiconductor film contains crystal grains of an average size in the range of 50 to 800 Å, and said polycrystal semiconductor film contains the hydrogen atoms (H) in an amount of 0.5 to 7 atomic %; and said i-type semiconductor layer comprises a non-single crystal semiconductor film containing silicon atoms (Si) as a matrix and at least one kind of atoms selected from the group consisting of hydrogen atoms (H) and fluorine atoms (F).

SAMARIUM-TRANSITION METAL MAGNET FORMATION

Kaplesh Kumar, Wellesley, and Herbert A. Newborn, Marblehead, both of Mass., assignors to The Charles Stark Draper Laboratory, Inc., Cambridge, Mass.

Filed Jun. 9, 1988, Ser. No. 204,633
Int. Cl.[5] H01F *1/08*
U.S. Cl. 148—102 10 Claims

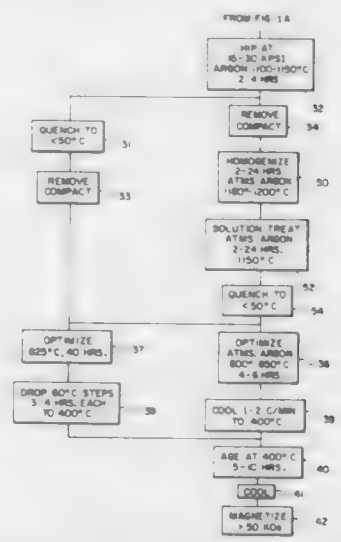
1. A process for fabricating high strength magnets; the process comprising the following steps in the order recited:

heating a rare earth transition metal alloy comprising samarium, at a temperature of about 1180°–1200° C. for 2–24 hours;

solution treating said alloy at a temperature of about 1150° C. for 2–24 hours;

quenching said alloy to less than 50° C.;

reducing said alloy to a powder having a particle size in the range of approximately 5–10 microns;



exposing said powder to a magnetic field to magnetically align said powder;

substantially immobilizing said aligned powder by cold-pressing to produce a cold compact;

hot isostatically pressing said cold compact to a densified compact;

optimizing, said densified compact by heat treatment according to one of the following sets of treatment conditions (a) and (b):

(a) a temperature of about 800°–850° C. for 4–6 hours;

(b) a temperature of approximately 825° C. for approximately 40 hours;

slow cooling said optimized densified compact as a function of its optimization treatment, as follows:

when optimizing is carried out according to optimizing treatment conditions (a) above, cooling is carried out at 1°–2° C. per minute to a temperature of approximately 400° C.; and

when optimizing is carried out according to optimizing treatment conditions (b) above, cooling is carried out in decrements of approximately 60° C. to approximately 375°–425° C., with the temperature being held for about 3–4 hours at each step;

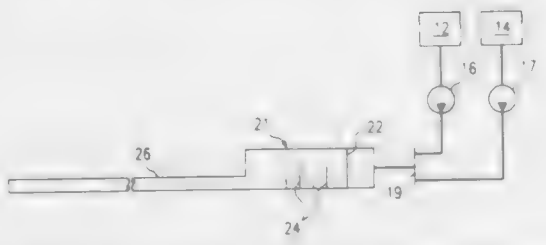
aging said densified compact at a temperature of 375°–425° C. for approximately 5–10 hours;

cooling the aged densified compact; and

thereafter magnetizing the aged densified compact.

5,007,973

MULTICOMPONENT EXPLOSIVES



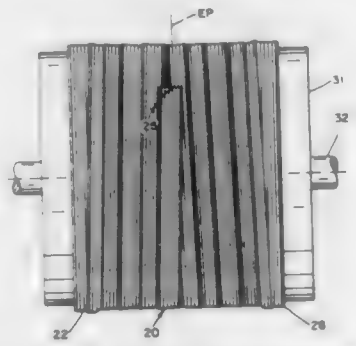
Richard E. Trapp; Gary L. Hansen, both of Salt Lake City; Robert B. Clay, Bountiful, all of Utah; Lawrence J. Dubetsky, Tamaqua, and Robert S. Olney, Bethlehem, both of Pa., assignors to Atlas Powder Company, Dallas, Tex.

Filed Oct. 12, 1989, Ser. No. 420,341
Int. Cl.[5] D03D *23/00*
U.S. Cl. 149—109.6 37 Claims

1. In a method for the formulation of an explosive composition, the steps comprising:

(a) providing a fuel component of said explosive composition comprising a suspension of a particulate metal fuel in a carrier liquid formed of a mixture of a water miscible

polyhydric alcohol and a pyrrolidone solvent and containing an amount of thixotropic thickening agent effective to provide a viscosity of said fuel component of at least 2000 centipoises at 20° C. and a shear rate of 20 rpm and no more than 100,000 centipoises at −20° C. and a shear rate of 10 rpm;



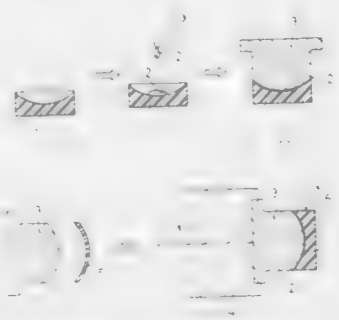
(b) providing an oxidizer component comprising an aqueous solution of an inorganic oxidizer salt; and
(c) mixing said fuel component and said oxidizer component to provide a liquid explosive composition.

5,007,974

METHOD OF MAKING A BELT OVERLAY FOR PNEUMATIC TIRES

Antonnis G. Maathuis, Fouhren, Netherlands; Jürgen Spielmann, Heisdorf, Luxembourg; Klaus Beer, Stow, and Thomas R. Oare, Suffield, both of Ohio, assignors to The Goodyear Tire & Rubber Company, Akron, Ohio

Division of Ser. No. 363,812, Jun. 9, 1989, Pat. No. 4,989,658. This application May 4, 1990, Ser. No. 519,083
Int. Cl.[5] B29D *30/16, 30/00;* **B60C** *9/28*
U.S. Cl. 156—117 **1 Claim**



1. A method of manufacturing an overlay structure for a pneumatic tire comprising the steps of:
a. providing a belt structure which is wrapped circumferentially about a cylinder drum which is secured to a rotatable shaft;
b. providing a ribbon which comprises an elastomeric substance containing side-by-side textile cords extending longitudinally of the ribbon;
c. supplying the ribbon to the drum by a let-off means and adhering a first end of the ribbon to a radially outermost belt ply of the belt structure in close proximity to an axial centerline of the belt structure;
d. rotating the drum and shaft while at the same time the let-off device supplying the ribbon traverses laterally to a first lateral edge of the belt structure;
e. when the ribbon is disposed radially outwardly of the first lateral edge of the belt structure stopping the lateral movement of the let-off means supplying the ribbon while the drum and shaft continue to rotate;
f. causing the let-off means supplying the ribbon to traverse laterally of the belt structure to a second lateral edge of the belt structure while the drum and shaft continue to rotate;
g. when the ribbon is disposed radially outwardly of the second lateral edge of the belt structure stopping the lateral movement of the let-off means supplying the ribbon while the drum and shaft continue to rotate;
h. causing the let-off means supplying the ribbon to traverse laterally of belt structure until the let-off means is aligned with the axial centerline of the belt structure while the drum and shaft continue to rotate; and then
i. stopping both the rotation of the drum and shaft and the lateral movement of the let-off means supplying the ribbon, cutting the ribbon, and adhering a second end of the ribbon to the underlying ribbon.

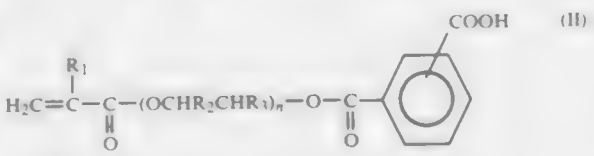
ULTRAVIOLET-HARDENABLE ADHESIVE AND BONDING METHOD EMPLOYING SAME

Yasuyoshi Yamamoto, Komaki; Yuzo Kaga, Nagoya; Toshiharu Yoshikawa, Nagoya, and Akira Moribe, Inazawa, all of Japan, assignors to Menicon Co., Ltd., Aichi, Japan

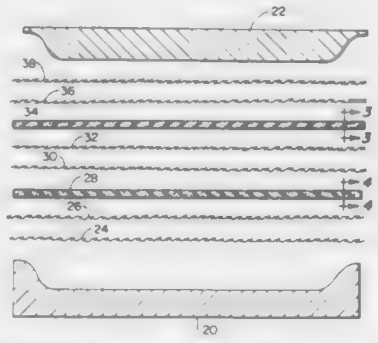


Filed Oct. 25, 1989, Ser. No. 426,203
Claims priority, application Japan, Nov. 13, 1986, 61-270650
Int. Cl.[5] B32B *31/00*
U.S. Cl. 156—154 **13 Claims**

1. A method of bonding a non-water swellable, ophthalmic-lens blank to a support member so as to subject said ophthalmic-lens blank to working and/or treatment, in producing a non-water swellable ophthalmic lens, comprising the steps of:
preparing an ultraviolet-hardenable adhesive comprising at least one photopolymerizing monomer and at least one photoinitiator, said at least one photopolymerizing monomer being selected from the group consisting of acrylates or methacrylates represented by following general formulas (I) and (II):

(I)

(II)



,wherein
R_1 is hydrogen or methyl,
R_2 is hydrogen or methyl,
R_3 is hydrogen or methyl,
m is a positive integer from 2 to 10;
n is a positive integer from 1 to 5; and
bonding said ophthalmic-lens blank to said support member with said ultraviolet-hardenable adhesive.

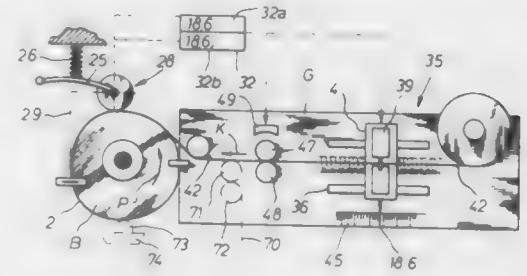
5,007,976

METHOD OF MAKING A HEADLINER

Marshall G. Satterfield, Johnstown; David M. Steinke, Baltimore, and Michael Blankenship, Pataskala, all of Ohio, assignors to Process Bonding, Inc., Johnstown, Ohio

Filed Oct. 16, 1989, Ser. No. 421,965
Int. Cl.[5] B32B *31/20*
U.S. Cl. 156—222 **70 Claims**

1 A process for forming a smooth contoured laminated panel from layers of compressible polyurethane foam, fiber glass, scrim and remay comprising,
supplying a mold having an upper part and a lower part, said parts including facing substantially mirror image, curved surfaces,
assembling on the curved surface of said mold lower part in sequence:
(a) a first layer of adhesive impregnated scrim,
(b) a first layer of open celled compressible polyurethane foam, said first polyurethane layer being impregnated with an adhesive in an amount to fill the open cells and make said polyurethane layer incompressible when heated to a curing temperature,
(c) a first layer of adhesive impregnated fiber glass,
(d) a second layer of open celled polyurethane foam,
(e) an adhesive impregnated remay, and
(f) a decorative layer,
bringing the curved surfaces of the two mold parts together to cause the assembled layers to conform to the facing mold surfaces,
heating the molds to cure the adhesive impregnating the layers, and
retracting the molds and removing the formed panel from the lower mold part.



5,007,977

METHOD AND APPARATUS FOR APPLYING A STRIP TO THE PLANAR CONTOUR-PREPARED EDGE OF A ROTATING LENS

Lutz Gottschald, AM Meerbusch, Fed. Rep. of Germany, assignor to Wernicke & Co. GmbH, Düsseldorf, Fed. Rep. of Germany

Filed Mar. 17, 1989, Ser. No. 324,897
Claims priority, application Fed. Rep. of Germany, Mar. 17, 1988, 3808929
Int. Cl.[5] B32B *31/18*
U.S. Cl. 156—353 **8 Claims**

1. An apparatus for applying a strip to the planar contour-prepared edge of a lens, comprising:
support means for said lens;
a register for determining the circumference of said lens;
a perforating mechanism for perforating said strip;
a braking and arresting mechanism, for said strip, disposed between said perforating mechanism and said lens; and

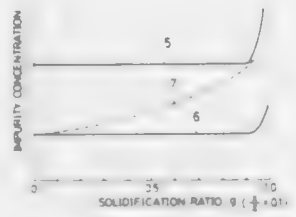
a guide roller for guiding said strip onto said lens edge, with said guide roller being spaced from said lens.

5,007,978

APPARATUS FOR TIRE RETREADING

Frederick J. Presti, Warrington, Pa., assignor to Presti Rubber Products, Inc., New Britain, Pa.

Filed Apr. 12, 1989, Ser. No. 336,758
Int. Cl.[5] B60C *5/00;* **B29C** *35/02*
U.S. Cl. 156—394.1 **17 Claims**



1. An inner curing envelope for use in a tire retreading process with an annular elastomeric outer envelope having an inwardly opening U-shaped radial cross-section for encasing a tread secured around the periphery and at least a portion of the side walls of a tire casing having annular beads, comprising:
first molded annular elastomeric means having an inwardly opening U-shaped continuous radial cross-section which in its unstressed state is form fit into a shape complementary to the shape of the inside of the tire casing, said shape having a peripheral portion and a pair of skirt portions integral therewith for contiguously contacting the interior surface of the tire casing; and
second seamless compression-molded annular elastomeric means attached to and contiguously extending outwardly from opposite ends of said skirt portions of said first annular means, each of said second annular means having an outwardly opening U-shaped radial cross-section form fit and reinforced adjacent to the tire bead and having an enlarged integral annular sealing rim for underlapping the outer envelope at the outer side walls of the tire casing.

5,007,979

METHOD OF FABRICATING GAAS SINGLE CRYSTAL

Seiji Mizuniwa; Akio Hattori; Tooru Kurihara, all of Hitachi; Seigi Aoyama, Kita-Ibaraki, and Konichi Nakamura, Hitachi, all of Japan, assignors to Hitachi Cable Limited, Tokyo, Japan

Continuation-in-part of Ser. No. 235,063, Aug. 22, 1988, abandoned. This application Jan. 26, 1990, Ser. No. 471,190
Claims priority, application Japan, Sep. 7, 1987, 62-221876
Int. Cl.[5] C30B *11/06*
U.S. Cl. 156—605 **36 Claims**

1. A method of fabricating an undoped or impurity-doped semi-insulating GaAs single crystal with use of a silica boat, comprising the steps of:

(A) preparing a melt of GaAs in the silica boat, said melt containing Si as an impurity;

(B) maintaining a seed crystal in said boat at a seed crystal side;

(c) in the presence of an oxygen source, letting said melt stand for a period of time sufficient to allow oxygen near said melt to dissolve in said melt;

(D) solidifying said melt gradually from the side opposite said seed crystal toward said seed crystal side to form a polycrystalline material from a portion of said melt and to form a melt zone of unsolidified material, said gradual solidification being at a rate sufficient to cause oxygen dissolved in said melt to segregate in said melt zone;

(E) seeding said melt zone when said melt zone reaches a melt zone width at said seed crystal side, said melt zone width not exceeding ½ the length of a GaAs single crystal formed from said melt;

(F) moving said melt zone away from said seed crystal while keeping the melt zone width unchanged such that a GaAs single crystal grows from said seed crystal behind said moving melt zone, said GaAs single crystal having a substantially homogeneous Si concentration along its longitudinal axis; and

(G) solidifying said melt zone.

5,007,980

LIQUID ENCAPSULATED ZONE MELTING CRYSTAL GROWTH METHOD AND APPARATUS

Edward M. Swiggard, Vienna, Va., assignor to SFA, Inc., Hyattsville, Md.

Filed Nov. 1, 1988, Ser. No. 265,533
Int. Cl.[5] B32B *00/00*
U.S. Cl. 156—620.7 **24 Claims**

1. A method of growing single crystals comprising the steps of:

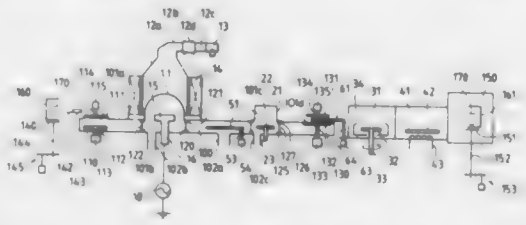
(a) introducing a seed crystal, an amount of crystal feed material, and an amount of boric oxide encapsulant material having a melting temperature lower than the melting temperature of said crystal feed material sufficient to encapsulate said crystal feed material when melted, into a non-reactive pyrolytic boron nitride vessel;

(b) heating said vessel in a furnace to a temperature above the melting point of said boric oxide encapsulant and below the melting point of said crystal feed material and said seed crystal, and melting said encapsulant to coat said pyrolytic boron nitride vessel and encapsulate said crystal feed material, said crystal feed material corresponding substantially to the shape of said vessel;

(c) passing said vessel along a substantially vertical path through a furnace zone having a length shorter than the length of said vessel and maintained at a temperature at least equal to the melting temperature of said crystal feed material to melt said crystal feed material to form a zone of molten crystal material conforming to the shape of said vessel and separated from said vessel only by a very thin layer of boric oxide encapsulant which preferentially wets the pyrolytic boron nitride vessel compared to said molten crystal material and prevents said molten crystal material

from contacting said pyrolytic boron nitride vessel, said vessel being passed into an adjacent furnace zone maintained at a temperature above the melting temperature of said encapsulant and below the melting temperature of said crystal material to crystallize said crystal material in contact with said seed crystal so as to form a single crystal of said crystal material;

(d) tipping said vessel while maintaining said vessel at a temperature above the melting point of said boric oxide encapsulant and below the melting point of the crystallized material to decant encapsulant from said vessel; and



(e) recovering said single crystal of said crystal material from said vessel.

5,007,981

METHOD OF REMOVING RESIDUAL CORROSIVE COMPOUNDS BY PLASMA ETCHING FOLLOWED BY WASHING

Yoshinao Kawasaki, Kumage; Hironobu Kawahara; Yoshiaki Sato, both of Kudamatsu; Ryooji Fukuyama, Kudamatsu; Kazuo Nojiri, Higashimurayama, and Yoshimi Torii, Tachikawa, all of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

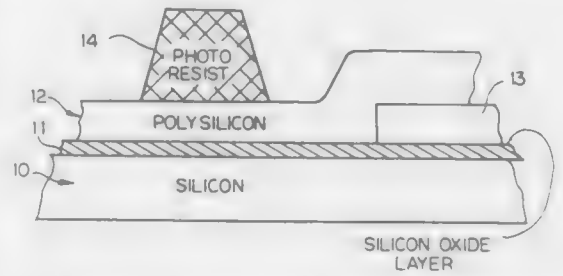
Filed Feb. 9, 1990, Ser. No. 477,474
Claims priority, application Japan, Feb. 27, 1989, 1-42976
Int. Cl.[5] H01L *21/306*
U.S. Cl. 156—643 **14 Claims**

1. A method of processing a sample comprising the steps of:

(i) etching the sample by means of a first plasma formed in a gas atmosphere,

(ii) after step (i), treating the sample by means of a second plasma to remove residual corrosive compounds formed in step (i), said second plasma being formed in a gas atmosphere different from the gas atmosphere in which the first plasma is formed,

(iii) contacting a surface of said sample etched in step (i) and treated in step (ii) with at least one liquid which effects at least one of (a) removal of residual corrosive compounds formed in step (i) which were not removed in step (ii) and (b) passivation of said surface etched in step (i) and treated in step (ii), and



(iv) after step (iii), drying the sample.

5,007,982

REACTIVE ION ETCHING OF SILICON WITH HYDROGEN BROMIDE

Len-Yan Tsou, New City, N.Y., assignor to North American Philips Corporation, New York, N.Y.

Filed Jul. 11, 1988, Ser. No. 217,536
Int. Cl.[5] H01L *21/306;* **B44C** *1/22*
U.S. Cl. 156—643 **13 Claims**

1. In a method of manufacturing semiconductor IC devices by etching comprising the steps of

(a) forming a composite structure by

(i) providing a silicon substrate,

(ii) forming a thin layer of silicon oxide on said silicon substrate,

(iii) forming a polysilicon layer on said oxide,

(iv) forming a mask of a photoresist on at least parts of said polysilicon layer,

(b) removing any surface oxides from said polysilicon layer with an oxide etching plasma, and

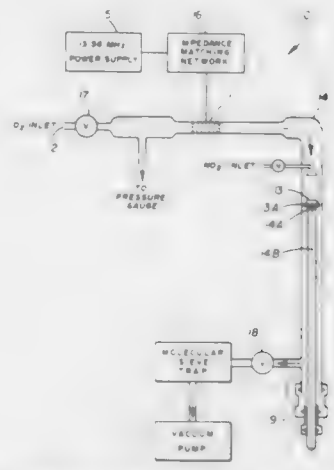
(c) then exposing the composite structure to a plasma containing only hydrogen bromide to selectively etch said polysilicon layer relative to said photoresist and said silicon oxide.

5,007,983

ETCHING METHOD FOR PHOTORESISTS OR POLYMERS

Narcinda R. Lerner, Woodside, and Theodore J. Wydeven, Jr., Sunnyvale, both of Calif., assignors to The United States of America as represented by the Administrator of National Aeronautics & Space Administration, Washington, D.C.

Continuation-in-part of Ser. No. 150,169, Jan. 29, 1988, abandoned. This application May 4, 1989, Ser. No. 347,591
Int. Cl.[5] H01L *21/306*
U.S. Cl. 156—643 **14 Claims**



1. A method for etching a sample which is a polymer or photoresist deposited on a semiconductor substrate thereof to remove said polymer or photoresist without damaging said substrate, which method comprises the steps of:

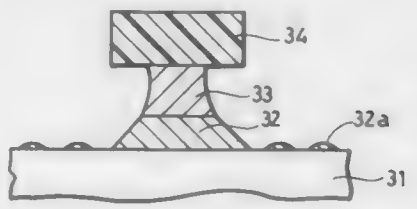
(a) locating said sample in the etching region of a plasma reactor having both a plasma region and a separate etching region spaced apart from said plasma region;

(b) locating in the etching region of said reactor a sacrificial organic solid material that has a substantially higher reactivity with the plasma-energized reactive gas generated in said plasma region than the polymer or photoresist being etched from said sample;

(c) producing a plasma in a reactive gas in said plasma region at a reactor pressure of from 0.1 to 10.0 Torr whereby said plasma-energized gas is formed;

(d) contacting said plasma-energized gas with said sacrificial

organic solid material whereby a highly reactive gas is formed said highly reactive gas having a substantially higher reaction rate with said polymer or photoresist than said plasma-energized gas; and



(e) contacting the sample with the resulting highly reactive gas at a sufficient concentration and for a sufficient time to etch said polymer or photoresist of said sample.

5,007,984

METHOD FOR ETCHING CHROMIUM FILM FORMED ON SUBSTRATE

Michinari Tsutsumi; Atsushi Endo, and Toshio Yada, all of Hyogo, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Sep. 27, 1988, Ser. No. 249,905
Claims priority, application Japan, Sep. 28, 1987, 62-245035; Oct. 7, 1987, 62-253423
Int. Cl.[5] B44C *1/22*
U.S. Cl. 156—656 **5 Claims**

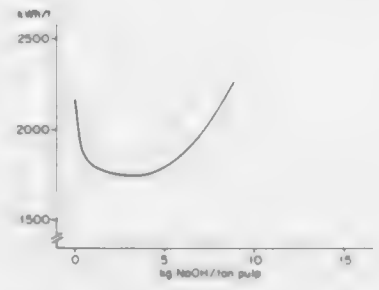
1. A method for etching a chromium film formed on a substrate, comprising the steps of:

providing a chromium film formed on a substrate,

forming a metal film of a material different from the chromium film on the chromium film,

forming a resist having a predetermined pattern on said metal film,

first etching said metal film and said chromium film using a first etchant with which both said chromium film and said metal film are etched and with which the etching rate of said metal film is higher than the etching rate of said chromium film, said etchant comprising an acid consisting essentially of phosphoric acid, whereby sidewall surfaces of a remaining pattern of the chromium film are tapered, and



second etching said metal film using a second etchant to remove said metal film.

5,007,985

METHOD OF REDUCING THE ENERGY CONSUMPTION AT THE REFINING OF CELLULOSE CONTAINING MATERIAL

Per O. Engstrand, Täby; Lars-Ake Hammar, Farsta; Myat T. Htun, Vällingby, and Rune L. Pettersson, Stockholm, all of Sweden, assignors to STFI, Stockholm, Sweden

Continuation of Ser. No. 235,893, Aug. 11, 1988, abandoned.
This application May 2, 1989, Ser. No. 346,270
Claims priority, application Sweden, Apr. 18, 1986, 8601779
Int. Cl.[4] D21B *1/16*
U.S. Cl. 162—26 1 Claim

1. A method of reducing the energy consumption at the refining or beating of cellulose containing material to predetermined strength properties and with reduced shieves and resin content which comprises adding alkali to the material for neutralizing acid groups bounded to the fibre wall, said alkali being added to the material in the refining zone or immediately before the material enters the refining zone, and said alkali being added as sodium hydroxide in an amount of about 1-4 kg per ton for neutralization without excess.

5,007,986

CREPING DOCTOR WITH TWO SUCTION CHAMBERS IN THE SUPPORT BEAM

Tord G. Gustavsson, Forshaga; Frans O. S. Lyxell, and Karl T. I. Silja, both of Karlstad, all of Sweden, assignors to Valmet Paper Machinery, Inc., Helsinki, Finland

Filed Feb. 28, 1990, Ser. No. 486,155
Claims priority, application Sweden, Mar. 15, 1989, 8900912
Int. Cl.[4] D21G *3/04*
U.S. Cl. 162—281 9 Claims

1. A creping doctor for creping a soft paper web off a yankee cylinder, comprising a supporting beam adapted for mounting closely parallel to an envelope surface of a yankee cylinder, said supporting beam being provided with an internal space, said internal space being divided into a first longitudinal suction chamber and a second longitudinal suction chamber; a doctor blade; a doctor holder mounted to the supporting beam; means for producing a subatmospheric pressure in the internal space of the supporting beam; a first suction connection connecting said first suction chamber of the supporting beam to an external dust-generating space location between the doctor blade and the soft paper web to be creped off; and a second suction connection connecting said second suction chamber of the supporting beam for providing suction to an internal dust-generating space located between the doctor blade and the envelope surface of the yankee cylinder when said creping doctor is mounted closely parallel to the yankee cylinder

METHOD FOR PRODUCING NEEDLE COKE

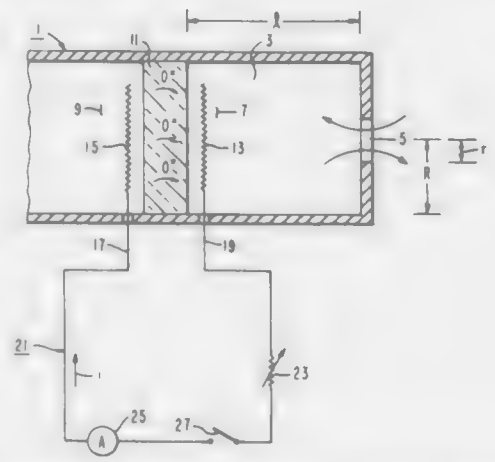
Michael J. Block, Fullerton; Arnold E. Kelley, Orange, and Milan Skripek, Fullerton, all of Calif., assignors to Union Oil Company of California, Los Angeles, Calif.

Continuation of Ser. No. 14,022, Feb. 12, 1987, abandoned, which is a continuation of Ser. No. 713,332, Mar. 18, 1985, abandoned, which is a continuation-in-part of Ser. No. 488,731, Apr. 26, 1983, Pat. No. 4,521,278, and a continuation-in-part of Ser. No. 489,217, Apr. 27, 1983, Pat. No. 4,545,859. This application Nov. 22, 1988, Ser. No. 274,622
The portion of the term of this patent subsequent to Jun. 4, 2002, has been disclaimed.
Int. Cl.[5] C10B *49/06*
U.S. Cl. 201—17 2 Claims

1. A method for reducing the friability of green needle coke made in a coking zone, said green needle coke having a Hardgrove Grindability Index above about 90 which method comprises:

(a) heating said green needle coke at temperatures between 875° F. and 1100° F. for a time between about 10 minutes and about 24 hours sufficient to effect a reduction in the friability of said green needle coke as determined by a decrease in said Hardgrove Grindability Index;

(b) cooling said heated green needle coke; and



(c) recovering said cooled green needle coke without subjecting said heated or cooked green needle coke to a calcination step at a temperature above about 2000° F. said recovered green needle coke having a Hardgrove Grindability Index less than about 85.

5,007,988

METHOD FOR DETERMINING THE CONCENTRATION OF A PLURALITY OF COMBUSTIBLE GASES IN A STREAM

David H. Archer, Ross Township, and Mohammed M. Ahmed, Wilkins Township, both of Allegheny County, Pa., assignors to Westinghouse Electric Corp., Pittsburgh, Pa.

Filed Sep. 8, 1987, Ser. No. 95,382
Int. Cl.[5] B01D *59/40*
U.S. Cl. 204—153.18 13 Claims

1. A method for determining the concentration of a plurality of combustible gases in a gas stream comprising the steps of:

(a) providing an electrochemical cell apparatus including a generally cylindrical electrochemical cell formed of a ceramic material in which a cavity is formed having a diffusion limiting port forming the entrance to said cavity, and having a process side in flow communication with a portion of said gas stream flowing into said cavity through said diffusion limiting port, a reference side in fluid flow communication with a reference gas, and an electrolyte separating said process side and said reference side of said electrochemical cell;

(b) adjusting the potential difference across said electrochemical cell to create a steady state electrical current flow whereby the flow of oxygen ions from said reference side of said electrochemical cell through said electrolyte to said process side of said cell is equal to the flow of combustible gases from said gas stream through the diffusion limiting port into said cell cavity;

(c) obtaining a number of the following electrical current flow measurements, wherein said number of electrical current flow measurements is equal to the number of combustible gases in said gas stream:

1. determining the value of said steady state electrical current flowing through said electrolyte; and

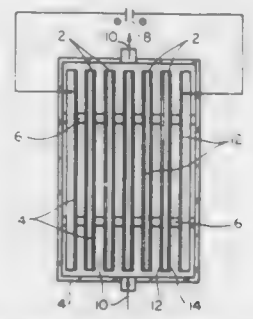
2. determining the surge of electrical current flowing through said electrolyte after said flow of electrical current is interrupted and then restored, by:

interrupting said electrical current flowing through said electrolyte for a time period, t,

after said time period, t, restoring said flow of electrical current through said electrolyte; and

measuring the surge of electrical current flowing through said electrolyte over and above said steady state electrical current flow until the electrical current flow attains its steady state value;

(d) determining the total pressure of the gases in said gas stream; and



(e) converting said total pressure and said electrical current flow measurements into an indication of the concentration of each of the n combustible gases in said gas stream.

METHOD AND ARTICLES EMPLOYING ION EXCHANGE MATERIAL

Eric D. Nyberg, Belmont; Ken A. Klingman, Menlo Park; Jeff Curtis, San Francisco, and Ray F. Stewart, Redwood City, all of Calif., assignors to Raychem Corporation, Menlo Park, Calif.

Continuation of Ser. No. 17,375, Feb. 20, 1987, Pat. No. 4,888,098, which is a continuation-in-part of Ser. No. 932,763, Nov. 19, 1986, abandoned, which is a continuation-in-part of Ser. No. 931,758, Feb. 20, 1986, abandoned. This application Oct. 17, 1989, Ser. No. 422,707
The portion of the term of this patent subsequent to Dec. 9, 2006, has been disclaimed.
Int. Cl.[5] G01N *27/26*
U.S. Cl. 204—1.11 9 Claims

1. A method of replacing an ionic species in an ion exchange material containing the ionic species, which method comprises passing a current through an electrochemical cell which comprises:

(1) a first electrode;

(2) an ioon exchange material A which

(a) contains anionic species I_{1A}, and

(b) is secured to and in electrical and physical contact with the first electrode and substantially surrounds all surfaces of the first electrode;

(3) a second electrode; and

(4) an electrolyte which electrically connects the first and second electrodes;

and in which cell an electrochemical reaction takes place at the interface between the first electrode and the ion species I_{1A} to be replaced by another ionic species, substantially all the ionic species I_{2A} sogenerated passing through the ion exchange material A.

ELECTROPLATING PROCESS

John J. Bladon, Wayland, Mass., assignor to Shipley Company Inc., Newton, Mass.

Continuation-in-part of Ser. No. 71,865, Jul. 10, 1987, abandoned. This application Feb. 8, 1988, Ser. No. 153,357
The portion of the term of this patent subsequent to Aug. 28, 2006, has been disclaimed.
Int. Cl.[5] C25D *5/54*
U.S. Cl. 204—15 15 Claims

1. A method for electroplating an article of manufacture comprising an electrically nonconductive body portion having a surface comprising metallic areas and nonmetallic nonconductive areas adjacent to and in contact with each other, said method comprising the steps of:

a. treating the surface of said article with an acid solution of a reduced noble metal electroless metal plating catalyst to form a deposit of the reduced noble metal plating catalyst on said nonconductive surface areas;

b. treating the surface of the article with a solution containing a dissolved chalcogen capable of reacting with the electroless metal plating catalyst to form a chalcogenide of said plating catalyst; and

c. metal plating the surface of the article by passing a current

between said article and an electrode immersed in a current between said article and an electrode immersed in an electolyte containing dissolved plating metal.

ORGANOALUMINUM ELECTROLYTES FOR THE ELECTROLYTIC DEPOSITION OF HIGH-PURITY ALUMINUM

Herbert Lehmkuhl, and Klaus-Dieter Mehler, both of Mülheim/Buhr, Fed. Rep. of Germany, assignors to Studiengesellschaft Kohle mbH, Mulheim/Ruhr, Fed. Rep. of Germany

Filed Jun. 5, 1990, Ser. No. 533,321

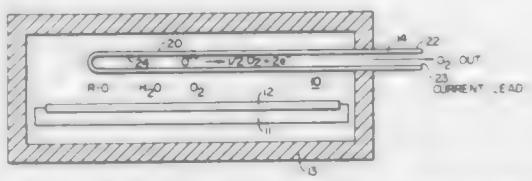
Claims priority, application Fed. Rep. of Germany, Jun. 10, 1989, 3919068

Int. Cl.[5] C25C *3/18*

U.S. Cl. 204—58.5 **12 Claims**

1. In the electrolytic deposition of highly pure aluminum employing an organoaluminum electrolyte, the improvement which comprises effecting the deposition in a toluene solution of an electrolyte at a temperature of from 90° C. to 105° C. or in a xylene solution of an electrolyte at a temperature of from 80° C. to 135° C. and employing as the electrolyte mixtures of organoaluminum complex compounds of the formula $MF_2AlR(A)$, wherein M represents potassium or mixtures of potassium with a maximum of about 15% by mole of sodium, as well as trialkylaluminum AlR (B) which has not been complexed to an alkali metal fluoride in a molar ration of A:B of from 4:0.6 to 4.2, as well as a polyfunctional Lewis base of the formula $R'\text{-}OCH_2CH_2\text{-}OR''$ (C) in a molar ratio of B:C of from 1:0.5 to 1.1, wherein R is an alkyl group, and R' and R'' are alkyl, aryl or OCH_2CH_2OR''' with R''' being an alkyl or aryl group.

5,007,992



METHOD AND APPARATUS FOR REMOVING OXYGEN FROM A SEMICONDUCTOR PROCESSING REACTOR

Daniel K. Weber, 1243 Bordeaux St., Livermore, Calif. 94550

Filed May 15, 1989, Ser. No. 351,739

Int. Cl.[5] C25B *1/02*; **H01L** *21/22*

U.S. Cl. 204—59 R **20 Claims**

14. A method of removing oxygen from a process enclosure of semiconductor processing reactor comprising

disposing an electrolytic, ceramic cell within said enclosure such that said cell has a first surface exposed to said enclosure and a second surface removed from said enclosure;

disposing at least one semiconductor wafer in said enclosure;

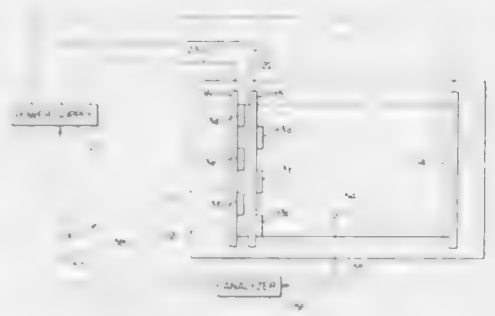
activating said cell by heating said cell, and

passing an electric current through said cell;

whereby said cell removes oxygen from said enclosure through said first surface and releases said oxygen to said second surface.

5,007,993

ELECTROLYTIC PROCESSING APPARATUS AND METHOD WITH TIME MULTIPLEXED POWER SUPPLY



Harry F. Hull, Rau Sao Benedito, 761, 04735 Sao Paulo, and Ivan P. Da Silva, R. Dos Mainas, 30, 09790 Sao Bernardo Do Campo, SP, both of Brazil

Continuation-in-part of Ser. No. 368,666, Jun. 20, 1989. This application Jul. 5, 1989, Ser. No. 375,605

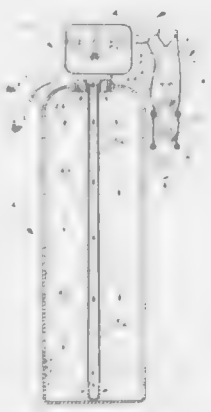
Int. Cl.[5] C25D *17/00, 21/12*

U.S. Cl. 204—228 **32 Claims**

1. Apparatus for electrolytic processing of materials, comprising an electrolytic processing bath, plural first electrodes, at least one second electrode, and computerized power supply means for supplying time multiplexed power to said electrodes

so as to selectively supply power at different times to said plural electrodes and said at least one second electrode.

5,007,994



WATER PURIFICATION SYSTEM

Thomas M. Snee, 1561 Rustic Hills Dr., Eagan, Minn. 55121

Filed Nov. 18, 1988, Ser. No. 273,463

Int. Cl.[5] C02F *1/461*

U.S. Cl. 204—240 **8 Claims**

1. A water purification apparatus, comprising:

an ionization chamber containing two spaced apart ion-producing electrodes and having an inlet port and an outlet port, said inlet port being connected to an incoming water line for supplying pressurized water to be purified to said chamber, and said inlet port and said outlet port being so arranged in separate, fluid flow communication with said chamber that pressurized water to be purified from said incoming water line will pass through said inlet port and circulate about said ion-producing electrodes before flowing out of said chamber through said outlet port;

said ion-producing electrodes of said ionization chamber are made of pure copper;

a tubular connecting means having a first end and a second end, said first end communicating with said outlet port of said ionization chamber; and

a filter tank containing a first layer of granular activated carbon and a second layer comprised of gravel, said gravel including calcites mixed therewith, said filter tank having at least one inlet port and at least one outlet port and flow passage means directing water first through said layer of granular activated carbon and thereafter through said second layer, said second end of said connecting means communicating with said inlet port of said filter tank, whereby said water to be purified from said incoming water line passes through said ionization chamber before entering said filter tank, and then passes first through said layer of granular activated carbon and thence through said second layer before being discharged from said filter tank in a purified state.

DEVICE FOR ELECTROFUSION OF CELLS

Yasuo Takahashi, Drexelhill, Pa.; Kazuo Suzuki, Stony Brook, N.Y.; Toshinobu Niimura, Port Jefferson, N.Y., and Tokio Kano, Nesconset, N.Y., assignors to Olympus Optical Co., Ltd., Tokyo, Japan

Filed May 11, 1989, Ser. No. 350,715

Int. Cl.[5] C12N *13/00*

U.S. Cl. 204—299 R **6 Claims**

1. A device for fusing biological cells in a solution by applying a voltage, comprising:

a tube having an upper open end, a lower open end, and a side wall between the upper and lower open ends;

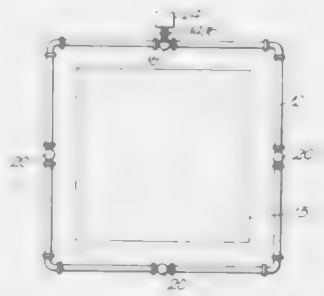
a lower electrode having a flat surface attached tightly to the lower open end of the tube;

a cover mounted tightly and detachably on the upper open end of the tube; and

an upper electrode penetrating through the cover and extending to the vicinity of the flat surface of the lower electrode with a space remaining between the upper electrode and the side wall of the tube.

5,007,996

DETECTION SYSTEM



John R. P. Clarke, Cheadle, England, assignor to Imperial Chemical Industries PLC, London, England

Filed Oct. 16, 1989, Ser. No. 422,120

Claims priority, application United Kingdom, Oct. 24, 1988, 8824895; Oct. 24, 1988, 8824896

Int. Cl.[5] G01N *27/403, 27/404*

U.S. Cl. 204—409 **25 Claims**

1. An electrochemical system for detection of a fluid component, comprising:

at least two electrodes;

an elongated element adapted to hold an electrolyte which combines with the fluid component to be detected to cause a change in an electrical parameter detectable by means of the electrodes, and disposed so that the electrodes are in contact with the electrolyte, the electrolyte being distributed along the length of the elongated element, which extends at least partly around a periphery of a zone containing a source from which said fluid component may be emitted or discharged;

means for maintaining electrolyte distributed over said elongated element; and

means for routing said element in a loop extending around the periphery of said zone such that the element is exposed to fluid flow directed outwardly from said zone and laterally towards the element at different points along its length.

ZEOLITE SSZ-26

Stacy I. Zones, San Francisco; Donald S. Santilli, Larkspur; James Ziemer, Hercules; Dennis L. Holtermann, Crockett; Theresa A. Pecoraro, Danville, and Robert A. Innes, San Rafael, all of Calif., assignors to Chevron Research Company, San Francisco, Calif.

Division of Ser. No. 172,737, Mar. 23, 1988, Pat. No. 4,910,006. This application Dec. 20, 1989, Ser. No. 454,106

Int. Cl.[5] C10G *11/05, 45/12*

U.S. Cl. 208—46 **19 Claims**

1. A process for converting hydrocarbons comprising contacting a hydrocarbonaceous feed at hydrocarbon converting conditions with a zeolite having a mole ratio of an oxide selected from silicon oxide, germanium oxide and mixtures thereof to an oxide selected from aluminum oxide, gallium oxide, iron oxide, and mixtures thereof greater than about 10:1, and having the X-ray diffraction lines of Table 1.

5,007,998

PROCESS FOR REFRACTORY COMPOUND CONVERSION IN A HYDROCRACKER RECYCLE LIQUID

Adrian J. Gruia, Lake Bluff, Ill., assignor to UOP, Des Plaines, Ill.

Filed Mar. 26, 1990, Ser. No. 499,866

Int. Cl.[5] C10G *65/10*

U.S. Cl. 208—59 **20 Claims**

11. A catalytic hydrocracking process which comprises:

(a) contacting a hydrocarbonaceous feedstock having a propensity to form 11^+ ring heavy polynuclear aromatic compounds and a liquid recycle stream in a hydrocracking zone with added hydrogen and a metal promoted hydrocracking catalyst at elevated temperature and pressure sufficient to gain a substantial conversion to lower boiling products;

(b) partially condensing the hydrocarbon effluent from said hydrocracking zone and separating the same into a hydrogen-rich gaseous stream and a first normally liquid hydrocarbonaceous stream comprising lower boiling hydrocarbons, unconverted hydrocarbons boiling above about 400° F. (204° C.) and trace quantities of 11^+ ring heavy polynuclear aromatic compounds;

(c) introducing said first normally liquid hydrocarbonaceous stream recovered in step (b) into a fractionation zone to produce a second normally liquid hydrocarbonaceous stream comprising unconverted hydrocarbons boiling above about 400° F. (204° C.) and trace quantities of 11^+ ring heavy polynuclear aromatic compounds, and a vaporous hydrocarbonaceous stream comprising said lower boiling hydrocarbons;

(d) introducing at least a portion of said second normally liquid hydrocarbonaceous stream comprising unconverted hydrocarbons boiling above about 400° F. (204° C.) and trace quantities of 11^+ ring heavy polynuclear aromatic compounds recovered in step (c) into a 11^+ ring heavy polynuclear aromatic compound conversion zone containing a zeolitic hydrogenation catalyst having pore openings in the range from about 8 to about 15 Angstroms (10^{-10} meters), a hydrogenation component and an intercalated clay component operated at conditions to selec-

tively reduce the concentration of 11+ ring heavy polynuclear aromatic compounds;

(e) condensing at least a portion of the resulting effluent from said conversion zone in admixture with said effluent from said hydrocracking zone to produce a liquid stream comprising hydrogenated hydrocarbonaceous compounds and having a reduced concentration of 11+ ring heavy polynuclear aromatic compounds compared to said unconverted hydrocarbon stream introduced into said 11+ ring heavy polynuclear aromatic compound conversion zone; and

(f) recycling at least a portion of said liquid stream comprising hydrogenated hydrocarbonaceous compounds produced in step (e) to said hydrocracking zone in step (a) as at least a portion of said liquid recycle stream.

5,007,999

METHOD FOR REDUCING SULFUR OXIDE EMISSION DURING AN FCC OPERATION

Arthur A. Chin, Cherry Hill, N.J., assignor to Mobil Oil Corp., Fairfax, Va.

Filed Apr. 13, 1989, Ser. No. 337,680

The portion of the term of this patent subsequent to Jan. 22, 2008, has been disclaimed.

Int. Cl.[5] **C10G** *11/18*

U.S. Cl. 208—113 **10 Claims**

1. In a process for reducing sulfur oxide production during an FCC cracking operation, comprising the steps of:

(a) passivating metals contaminating on an FCC catalyst by contacting the FCC catalyst with a sulfur-containing compound under conditions that enable association of the sulfur with the metals contaminants;

(b) cracking hydrocarbons with the passivated FCC catalyst in an FCC cracking zone;

(c) oxidatively regenerating the catalyst in a regeneration zone whereby the carbonaceous material deposited on the FCC catalyst in step (b) is burned off and the sulfur deposited on the FCC catalyst in step (a) is converted to sulfur oxides;

(d) reacting the sulfur oxides with a sulfur oxide adsorption additive capable of adsorbing the sulfur oxides under sulfur oxides adsorbing conditions; and

(e) converting the adsorbed sulfur oxides from step (d) to hydrogen sulfide by contacting the adsorbed sulfur oxides with a reducing gas before the regenerated FCC catalyst and sulfur oxides adsorption additive enter the FCC cracking zone;

the improvements comprising contacting the adsorbed sulfur oxides with the reducing gas in a separate treatment vessel and preventing at least 25% by weight, of the hydrogen sulfide from step (e) from entering the cracking zone.

5,008,000

CRACKING CATALYST FOR HYDROCARBON CHARGES COMPRISING AN OFFRETITE, A ZEOLITE AND A MATRIX

Christian Marcilly, Houilles; Jean-Marie Deves, and Francis Raatz, both of Rueil Malmaison, all of France, assignors to Institut Francais du Petrole, Rueil-Malmaison, France

Division of Ser. No. 154,258, Feb. 10, 1988. This application Mar. 15, 1990, Ser. No. 493,601

Claims priority, application France, Feb. 11, 1987, 87 01802; Nov. 30, 1987, 87 16691

Int. Cl.[5] **C10G** *11/05*

U.S. Cl. 208—120 **12 Claims**

1. In a process for catalytic cracking of a hydrocarbon charge, comprising subjecting said charge to cracking conditions in the presence of a catalyst, the improvement wherein the catalyst contains:

(a) 20–95% by weight of at least one matrix, selected from the group consisting of alumina, silica, magnesia, clay, titanium oxide, zirconia, combinations of at least two of these compounds and alumina-boron oxide combinations,

(b) 1–60% by weight of at least one zeolite of open structure whose main dodecagonal channels have openings of at least 7 Angströms, said zeolite of open structure being selected from the group formed of X, Y, L, omega and beta zeolites,

(c) 0.5–60% by weight of at least one dealuminated offretite whose main dodecagonal channels have openings smaller than 7 Angströms and which has a SiO_2/Al_2O_3 molar ratio from about 15 to about 500, the crystalline parameters a and c of elementary mesh ranging respectively from 1.285 to 1.315 nm for a and from 0.748 to 0.757 nm for c and has a potassium content lower than 1.5% by weight, and is prepared by a process comprising:

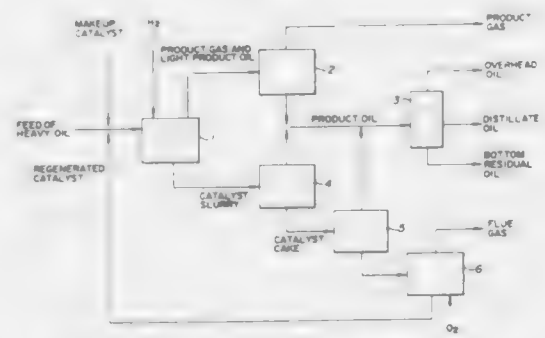
(1) preparing a mixture of offretite with a matrix,

(2) preparing a mixture of a zeolite of open structure with a matrix, and

(3) admixing the product of (1) with the product of (2)

5,008,001

PROCESS FOR HYDROGENATION OF HEAVY OIL



Toru Kitamura; Yoshio Ohashi; Masami Sekino, and Kenichi Murakawa, all of Sodegaura, Japan, assignors to Research Association for Petroleum Alternatives Development, Tokyo, Japan

Filed Jul. 25, 1988, Ser. No. 224,067

Claims priority, application Japan, Aug. 3, 1987, 62-192702; Mar. 7, 1988, 63-51551

Int. Cl.[5] **C10G** *45/00*

U.S. Cl. 208—143 **10 Claims**

1. A method for improving the yield of product oil in a process for hydrogenating a heavy oil in a suspension bed hydrogenation reactor having a particulate catalyst, wherein a catalyst slurry comprising used catalyst and product oil is withdrawn from the hydrogenation reactor and subjected to solid/liquid separation using heat drying to recover the product oil, followed by oxidative regeneration of the used catalyst, said heat drying carried out by

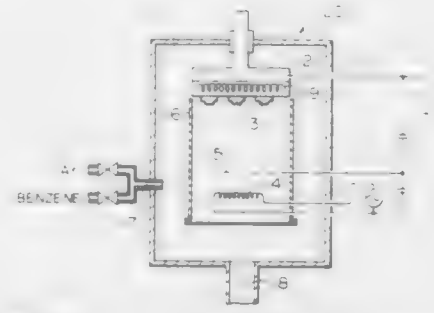
(a) a conductive heating-type drier at a temperature of 150° to 300° C. for a residence time of 0.25 to 5 hours with an oil content in the catalyst slurry of 10 to 60% by weight,

(b) a spray drier at a temperature of 350° to 500° C. for a residence time of 1 to 10 seconds with an oil content in the catalyst slurry of 50 to 95% by weight, or

(c) a riser-type drier at a temperature of 350° to 520° C. with a catalyst content in the catalyst slurry of 5 to 50% by weight.

5,008,002

PROCESS FOR PRODUCING MOLD USED FOR OBTAINING PRESS MOLDED GLASS ARTICLE



Ken Uno, Fussa; Takuo Fujino, Akishima, and Hideki Nakamori, Kashiwa, all of Japan, assignors to Hoya Corporation and Prometron Technics Corporation, both of Tokyo, Japan

Filed Jan. 19, 1990, Ser. No. 467,248

Claims priority, application Japan, Jan. 30, 1989, 1-20545

Int. Cl.[5] **B05D** *3/06*; **C23C** *14/00*

U.S. Cl. 204—192.31 **5 Claims**

1. A process for producing a mold used for obtaining a press molded glass article, which comprises a step of forming an i-carbon film on a mold base for obtaining a press molded glass article, according to an ion plating method, wherein said ion plating method is effected by, in an ion plating apparatus comprising an anode electrode, a first cathode electrode, a holder for holding said mold base and a reflector extending as far as the vicinity of the mold base holder in such a shape that it surrounds the two electrodes, applying a low voltage between the anode electrode and the first cathode electrode to generate a plasma of ions of a hydrocarbon having a C/H ratio of ½ or more, and further applying a voltage of 0.5–2.5 KV between the mold base holder and the anode electrode so that the mold base holder becomes a second cathode electrode relative to the anode electrode while keeping the reflector at the same potential as the first cathode electrode to accelerate the hydrocarbon ions to the direction of the mold base which is being kept at 200°–400° C

5,008,003

START-UP OF A HYDROREFINING PHOCESS

John A. Smegal; Robert C. Ryan, and Richard M. Nash, all of Houston, Tex., assignors to Shell Oil Company, Houston, Tex.

Filed Jun. 5, 1989, Ser. No. 361,196

The portion of the term of this patent subsequent to Apr. 16, 2008, has been disclaimed.

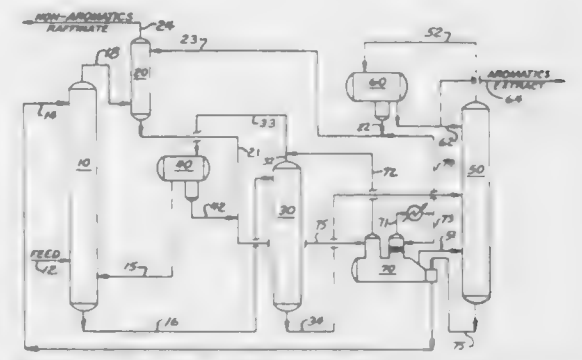
Int. Cl.[5] **C10G** *23/00*

U.S. Cl. 208—254 H **38 Claims**

1. In a hydrorefining process which comprises contacting hydrocarbonaceous oil feed and hydrogen with a catalyst comprising a hydrogenation component selected from the group consisting of Group VIB metal component, Group VIII non-noble metal component and mixtures thereof, and an alumina-containing support, at hydrorefining conditions, the improvement which comprises heating the catalyst in substantially non-sulfided form at initial start-up from a temperature below about 450° F. to hydrorefining temperature at an average rate of less than about 10° F. per hour in the presence of hydrogen and a start-up hydrocarbonaceous oil feed having a sulfur content in the form of organosulfides of greater than 0.5 moles (basis elemental sulfur) per kilogram of start-up feed.

5,008,004

AROMATICS EXTRACTION PROCESS HAVING IMPROVED WATER STRIPPER



William H. Maier, Hoffman Estates, and Martin F. Bentham, Chicago, both of Ill., assignors to UOP, Des Plaines, Ill.

Continuation-in-part of Ser. No. 252,616, Oct. 3, 1988, Pat. No. 4,897,182. This application Dec. 29, 1989, Ser. No. 459,163

The portion of the term of this patent subsequent to Jan. 30, 2007, has been disclaimed.

Int. Cl.[5] **C10G** *21/28*

U.S. Cl. 208—321 **16 Claims**

1. A process for the recovery of an aromatic extraction solvent from a raffinate phase containing non-aromatic hydrocarbons and said aromatic extraction solvent of an extraction zone of an aromatics extraction process, said process comprising:

(a) contacting the raffinate phase with a wash water stream in a water-washing zone and recovering a raffinate product stream and a spent raffinate wash water stream comprising water and said aromatic extraction solvent;

(b) passing the spent raffinate wash water stream to a steam generation zone to provide steam and a lean solvent stream comprising said aromatic extraction solvent;

(c) contacting a process stream comprising aromatic hydrocarbons and said aromatic extraction solvent with a first portion of said steam in a steam distillation zone to provide a bottoms stream comprising said aromatic extraction solvent, and at least one of an overhead or a side-cut comprising an aqueous phase and a hydrocarbon phase comprising aromatic hydrocarbons;

(d) condensing a second portion of said steam and recycling a portion of said second portion to provide reflux in said steam generation zone, and

(e) combining said aqueous phase with the remaining portion of said second portion to provide said wash water stream.

5,008,005

INTEGRATED COKE, ASPHALT AND JET FUEL PRODUCTION PROCESS AND APPARATUS

Jer Y. Shang, McLean, Va., assignor to The United States of America as represented by the Department of Energy, Washington, D.C.

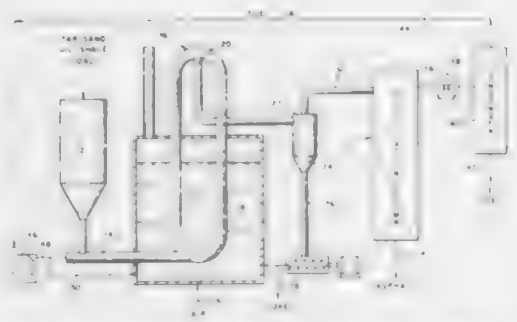
Filed Oct. 17, 1989, Ser. No. 422,479

Int. Cl.[5] **C10G** *1/00*

U.S. Cl. 208—407 **8 Claims**

1. A process for the production of coke, asphalt and jet fuel from a feed of fossil fuels containing volatile carbon compounds therein comprising the steps of:

pyrolyzing the feed in an entrained bed pyrolyzing means,



separating the volatile pyrolysis products from the solid pyrolysis products;

removing at least some coke as a result from the solid pyrolysis products;

fractionating the volatile pyrolysis products to produce an overhead stream and a bottom stream which is useful as asphalt for road pavement;

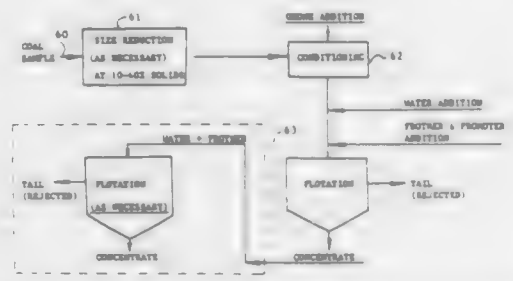
condensing the overhead stream to produce a condensed

liquid fraction and a noncondensable, gaseous fraction; and

removing water from the condensed liquid fraction to produce a jet fuel-containing product.

5,008,006

CHEMICAL CONDITIONING OF FINE COAL FOR IMPROVED FLOTATION AND PYRITE REJECTION



Jan D. Miller, and Yi Ye, both of Salt Lake City, Utah

Division of Ser. No. 58,909, Jun. 5, 1987, Pat. No. 4,828,686. This application Feb. 27, 1989, Ser. No. 316,081

The portion of the term of this patent subsequent to May 9, 2006, has been disclaimed.

Int. Cl.[5] **B03D** *1/002, 1/008, 1/018, 1/02*

U.S. Cl. 209—167 **9 Claims**

1. A method for separating ash and sulfur contaminants from feed coal in a flotation process, said method comprising, without limitation as to order, the steps of:

(a) grinding the feed coal to a particulate size;

(b) forming a slurry of the ground coal with water;

(c) mixing the slurry of coal with at least one compound selected from the group consisting of inorganic peroxy compounds, unorganic peroxides and inorganic superoxides in the absence of polymerization, said at least one compound being present in an amount sufficient to depress the sulfur and ash contaminants;

said steps being followed by the froth flotation of the coal wherein cleaned coal is collected with froth and sulfur and ash contaminants report to underflow.

5,008,007

APPARATUS FOR FILTERING INDUSTRIAL PROCESS LIQUIDS

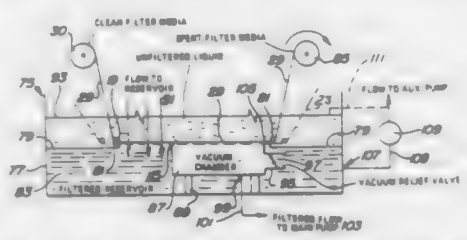
Raymond L. Anderson, Walled Lake, Mich., assignor to H. R. Black Company, Warren, Mich.

Division of Ser. No. 338,944, Apr. 17, 1989. This application Apr. 16, 1990, Ser. No. 509,725

Int. Cl.[5] **B01D** *29/09, 33/04*

U.S. Cl. 210—111 **7 Claims**

1. In a filter apparatus for industrial process liquids, a tank, a continuous conveyor screen guidably and sealingly mounted within the tank and projecting therefrom, the improvement comprising:



a horizontal partition spanning the tank walls and having an elongated aperture therethrough;

media sealing means upon the partition surrounding said aperture;

a continuous filter media; one side of said conveyor screen overlying the tank guidably retained for sealing engagement with said sealing means, and the other side of the conveyor screen operatively engaging said filter media, said filter media and conveyor screen spanning said aperture.

said filter media providing upon the underside of said partition an enclosed filtered liquid reservoir and upon its other side an open unfiltered liquid reservoir for receiving unfiltered liquid,

an elongated open-top vacuum chamber supported within said filtered liquid reservoir with its peripheral edge in

sealing registry with said conveyor screen and having a first outlet connected to a pump for delivering filtered liquid to a process area;

a second outlet upon said vacuum chamber communicating with said filtered liquid reservoir;

a normally closed vacuum release valve within said second outlet;

said media overlying said vacuum chamber when blocked by debris substantially stopping liquid flow through the vacuum chamber and creating a vacuum within said vacuum chamber; and

said vacuum release valve upon a preset vacuum build-up automatically opening said second outlet and simultaneously energizing said conveyor screen and media for an increment of longitudinal feed thereof until the vacuum chamber is no longer blocked with debris, re-establishing flow therethrough.

MECHANISM FOR FILTER CAKE REMOVAL

James L. Ciaffoni, Nevada City, Calif., assignor to Baker Hughes Incorporated, Houston, Tex.

Filed Jul. 17, 1989, Ser. No. 380,[illegible]1

Int. Cl.[5] **B01D** *35/20*

U.S. Cl. 210—193 **12 Claims**

1. A mechanism for discharging filter cake from a cross flow filter element wherein sullied solution traverses through said element and deposits a filter cake on said element and clean filtrate passes through and exits from said element, said mechanism comprising:

a fixed non-flexible closure partition extending across a chamber forming an upper chamber and lower closed filter chamber, said partition having at least one aperture extending therethrough, said filter element being contained in said lower filter chamber;

an inlet pipe conveying sullied solution and attached to said lower filter chamber;

means for mounting said filter element in said lower chamber, said means including at least one filtrate exit tube movably positioned through said at least one partition aperture and in flow communication with a filter element interior portion;

an outlet housing in said upper chamber surrounding and rigidly attached to said exit tube;

spring means interposed between an annular portion of said housing and an annular member which is fixed with respect to said partition; and

rapping means mounted independently of said outlet housing extending from a position above said outlet housing constructed and arranged to contact and drive said outlet housing downward by impact, forcedly compressing said spring means, whereby said outlet housing is caused to bottom against said spring means such that filter cake deposited on an exterior surface of said filter element in said lower chamber is shaken therefrom, and wherein said spring means, upon removal of said compressing force, is designed to release its resultant stored energy to return said housing and said filter element to a pre-rapped position spaced from said rapping means.

ROTATING CYLINDRICAL SCREEN WITH FINE MESH MODULAR PANELS

Herbert G. J. Langner, R.R. #1, Shallow Lake, Ont., Canada N0H 2K0

Filed May 9, 1989, Ser. No. 349,429

Int. Cl.[4] **B01D** *33/067*

U.S. Cl. 210—232 **2 Claims**

1. In a rotary screening device comprising:

a hollow cylinder journalled for rotation about its central, generally horizontally disposed, axis,

cylindrical walls of the cylinder, comprising, substantially in their entirety, screening surfaces of a screen member,

the cylinder having an inlet end and an outlet end at opposite ends of its interior,

means for rotating the cylinder,

means for directing influent to be screened into the interior of the cylinder via the inlet end and onto the screening surface,

trough means under the cylinder to collect filtrate from the influent which passes through the screen member,

wherein on rotation of the cylinder, portions of the influent which do not pass through the screen member are moved along the cylinder from the inlet end towards the discharge end,

the improvement wherein:

the screen member comprises a radially inner layer of fine mesh screening with mesh sizes in the range of 150 to 500 microns supported on a radially outer layer of supportive sheeting means having apertures therethrough larger than apertures of the fine mesh screening,

the cylinder having a framework of circular end frame members jointed by a plurality of parallel straight frame members connecting the end frame members at circumferentially spaced locations to define circumferentially spaced open segments between straight frame members,

the supportive sheeting means are permanently secured to said framework forming a cylindrical shape therewith,

longitudinally extending slot forming means on the parallel straight frame members being provided radially inwardly of the supportive sheeting means on either side of each open segment,

said fine mesh screening comprises a plurality of similar modular panels,

each panel is sized to cover one of the open segments with edge portions of the panel being axially slidably received in the slot forming means and is constructed and arranged to be separately removable by sliding axially out of the interior of the cylinder via the discharge end.

SHOWER DECHLORINATOR USING GRANULATED COPPER ALLOY FILTER MATERIAL

David T. Underwood, 1239 E. Brentrup, Tempe, Ariz. 85283

Filed Oct. 20, 1989, Ser. No. 424,823

Int. Cl.[5] E03C *1/08*; B01D *27/02*

U.S. Cl. 210—232 **15 Claims**

11. A dechlorinator for attachment between a water supply pipe and a shower head including in combination:

a housing unit having first and second ends;

first and second end caps for closing the first and second ends, respectively, of said housing unit;

first means on said first end cap for attachment to a water supply pipe;

second means on said second end cap for attachment to a shower head to deliver water from said housing unit to the shower head after the water passes through said housing unit from said first means on said first end cap; and

chlorine removal filter material in the form of randomly oriented elongated fine metallic fibers of a copper-zinc alloy substantially filling said housing unit for chemically combining with chlorine.

5,008,012

COMPACT PLASMA SEPARATOR AND AN APPARATUS CONTAINING THE SAME

Takeaki Hagihara, and Satoshi Aoki, both of Oita, Japan, assignors to Asahi Medical Co., Ltd., Tokyo, Japan

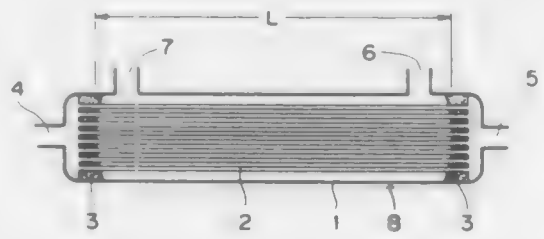
Filed May 25, 1989, Ser. No. 357,167

Int. Cl.[5] B01D *63/02*

U.S. Cl. 210—321.8 **10 Claims**

1. A compact plasma separator comprising:

a casing provided with blood introduction means for introducing blood to the casing, blood withdrawal means for withdrawing blood from the casing and at least one opening for plasma withdrawal; and



a plurality of porous hollow fibers substantially equal in length, said fibers being arranged in a substantially parallel relationship and being bonded together at both end portions thereof to form a bundle, each porous hollow fiber of said bundle having openings at both ends thereof,

said bundle being disposed in said casing along the length of said casing,

said both end portions of the hollow fibers of said bundle being fluid-tightly connected to said blood introduction means and said blood withdrawal means, respectively, said blood introduction means and said blood withdrawal means thereby being in communication through said bundle of hollow fibers,

said porous hollow fibers having an average effective length (L mm) not greater than 200 mm and a membrane surface area (S m^2) not greater than 0.3 m^2,

said average effective length (L mm) being defined as an average of the lengths of said porous hollow fibers minus the lengths of said both end portions of said porous hollow fibers at which the fibers are bonded together and fluid-

tightly connected to said blood introduction means and said blood withdrawal means, respectively,

said membrane surface area (S m^2) being defined by the formula:

$$S = n\pi DL \times 10^{-6}$$

wherein

n is the number of porous hollow fibers,

L is the average effective length and D is an average inner diameter (mm) of said porous hollow fibers,

said average effective length (L mm) and said average inner diameter (D mm) satisfying the following relationship.

$$L/D^2(mm^{-1}) \geq 2000$$

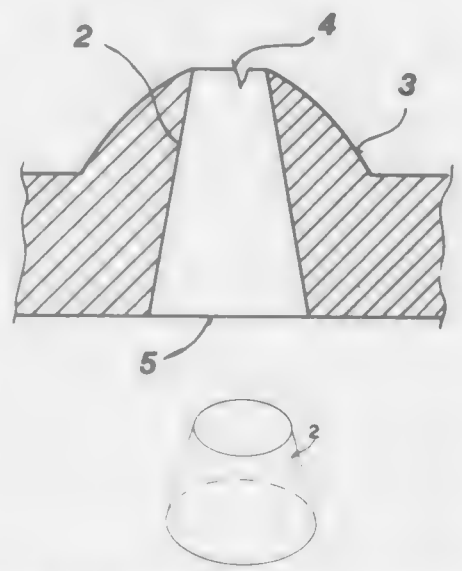
FILTER FOR USE IN A CARTRIDGE FOR THE PREPARATION OF A BEVERAGE

Eric Favre, Saint-Barthelemy; Petr Masek, Yverdon, and Bernard Truchement, La Tour-de-Peilz, all of Switzerland, assignors to Nestec S.A., Vevey, Switzerland

Filed Sep. 16, 1988, Ser. No. 245,755

Claims priority, application Switzerland, Oct. 1, 1987, 3815/87



Int. Cl.[5] A47J *31/00*; B01D *39/10*

U.S. Cl. 210—482 **19 Claims**

1. A filter for preparation of extracted beverages comprising a single planar sheet of material including two planar surfaces having a plurality of uniformly distributed openings extending through the sheet and having a plurality of nipples, equal in number to the number of openings, projecting from and out of at least one of the planar surfaces to a nipple end disposed away from the planar surface from which the nipple projects, wherein each nipple is associated with one of the openings through the sheet, wherein each opening extends through each nipple, wherein each opening at the end of each nipple forms a minor base of an opening shape, wherein each opening at the other planar surface forms a major base of the opening shape and wherein the opening shape defined about the openings by the sheet and each nipple is a shape selected from a group of shapes consisting of

(i) a frustoconical shape wherein the minor base opening has a diameter of between 0.1 m and 0.3 mm and the major base opening has a diameter of between 0.2 mm and 0.5 mm

(ii) a frustopyramidal shape wherein a diagonal of a square of the minor base opening is between 0.1 mm and 0.3 mm and wherein a diagonal of a square of the major base opening is between 0.2 mm and 0.5 mm; and

(iii) a shape in a form of an equilateral truncated tetrahedron wherein sides of a triangle of the minor base opening define an opening of between 0.1 mm and 0.3 mm and wherein sides of the major base opening define an opening of between 0.2 mm and 0.5 mm.

PURIFICATION OF PHOSPHORUS COMPOUNDS

Paul M. Davies, Birmingham, and Raymond A. Smith, Walsall, both of England, assignors to Albright & Wilson Limited, Warley, England

Filed Oct. 31, 1989, Ser. No. 429,389

Claims priority, application United Kingdom, Nov. 2, 1988, 8825589

Int. Cl.[5] B01D *11/04*

U.S. Cl. 210—634 **29 Claims**

1. A process for reducing the chloride content of a crude amino organic phosphonic acid which comprises contacting an aqueous feed comprising an amino organic phosphonic acid and hydrogen chloride with a liquid hydroxylic solvent to produce an organic solution containing hydrogen chloride, and an aqueous composition comprising the amino organic phosphonic acid of reduced hydrogen chloride content, and separating the aqueous composition from the organic solution.

5,008,016

LIQUID/LIQUID EXTRACTION OF GALLIUM VALUES FROM BASIC AQUEOUS SOLUTIONS THEREOF

Alfred Altorfer, Freienstein; Ernst Wohler, Seuzach, both of Switzerland, and Nicholas P. Wynn, Toronto, Canada, assignors to Rhone-Poulenc Chimie, Courbevoie, France

Filed Mar. 27, 1989, Ser. No. 328,673

Claims priority, application Switzerland, Mar. 25, 1988, 01155/88

Int. Cl.[5] B01D *11/00*

U.S. Cl. 210—634 **3 Claims**

1. A process for the liquid/liquid extraction and recovery of gallium values from basic aqueous solutions thereof, comprising liquid/liquid extracting such basic aqueous solution with an organic phase which comprises a substituted hydroxyquinoline gallium extractant dissolved in an organic solvent, and whereby the gallium values, as well as sodium and aluminum values, are transferred into said organic phase, separating said organic phase from said basic aqueous phase, next contacting the organic phase with a medium consisting essentially of water to convert said coextracted sodium values into caustic soda, separating such caustic soda from said organic phase, and then recovering the gallium values from said organic phase thus stripped of sodium values.

5,008,017

METHOD FOR RECOVERING METALS FROM WASTE LIQUORS

Gary G. Kiehl, Hilton, and Robert G. Surash, Rochester, both of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

Filed Dec. 8, 1989, Ser. No. 447,943

Int. Cl.[5] C02F *1/52*

U.S. Cl. 210—710 **8 Claims**

1. In the method of recovering silver by (1) treating a waste liquor containing silver halide salts with aluminum sulfate as a flocculating agent to form a silver bearing sludge, and (2) reducing the volume of the silver bearing sludge by the addi-

tion of an acid, the improvement which comprises subsequent to step 1 mixing the silver bearing sludge with a metal bicarbonate and a metal carbonate, the weight ratio of bicarbonate to carbonate being from about ¼ to about 3/1, the total weight of bicarbonate and carbonate being from about 1 to about 3 parts per part of silver bearing sludge, wherein said silver bearing sludge is converted to a free flowing powder.

5,008,018

PROCESS FOR THE REDUCTION IN SIZE OF THE PORES OF A FILTER MEDIUM FOR BEVERAGES

Karl Raible, Grafelfing, Fed. Rep. of Germany, assignor to Stabifix Brauerei-Technik GmbH & Co. OHG, Fed. Rep. of Germany

Filed Jan. 18, 1989, Ser. No. 298,518
Claims priority, application Fed. Rep. of Germany, Jan. 18, 1988, 3801215; Jun. 15, 1988, 3820393
Int. Cl.[5] B01D *37/02*
U.S. Cl. 210—717 24 Claims

1. A process for filtering a beverage wherein a stabilized silica sol is used for reducing the size of the pores of the filter medium without sealing them comprising adding a stabilized silica sol continuously or batchwise to the beer to be filtered upstream of the filter medium through which the beer passes, in a quantity and control such that the silicic acid precipitation, which is the transition from SiO_2 primary particles to SiO_2 secondary particles, takes place before the beer leaves the filter medium but without the settling of the silicic acid secondary particle, wherein primary particle are SiO_2 particle of the silica sol and secondary particles are a silici acid hydrogel, whereby the resultant silicic acid precipitation reduces the size of the pores without sealing them.

5,008,019

DECONTAMINATION OF EARTH FORMATIONS

Paul B. Trost, Golden, Colo., assignor to Waste-Tech Services, Inc., Golden, Colo.

Filed May 15, 1989, Ser. No. 351,463
Int. Cl.[5] B01D *12/00*
U.S. Cl. 210—747 2 Claims

1. A decontamination process consisting essentially of displacing through a formation contaminated with organic materials fluids including amounts of an aqueous alkaline polymer solution comprising solutions selected from the group consisting of (a) sodium silicate, sodium carbonate, sodium bicarbonate, xanthan gum polymer and monochloroamine, (b) sodium carbonate, ethoxylated nonylphenol, xanthan gum polymer and sodium hypochlorite, and (c) mixtures of the components of (a) and (b); sufficient to substantially decontaminate the formation and recovering the displaced fluids.

5,008,020

TREATMENT OF DOMESTIC AND INDUSTRIAL WASTE WATERS

Robert G. Surash, Rochester, and Gary G. Kiehl, Holton, both of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

Filed Dec. 8, 1989, Ser. No. 447,944
Int. Cl.[5] C02F *1/66*
U.S. Cl. 210—751 7 Claims

1. A method of treating waste water which comprises mixing the waste water with a metal bicarbonate and a metal carbonate, the weight ratio of bicarbonate to carbonate being from about 1/3 to about 3/1, the total weight of bicarbonate and carbonate being from about 1 to 3 parts per part of waste water wherein said waste water solidifies into a particulate form.

5,008,021

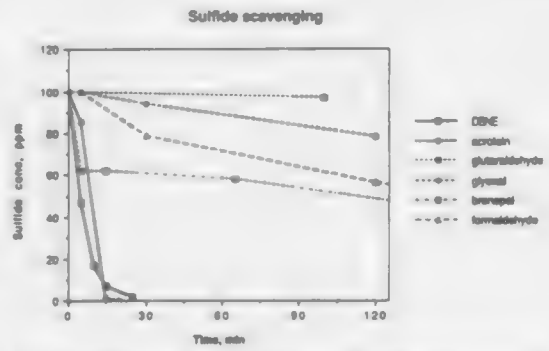
IN-SITU FORMATION OF SOLUBLE SILICATES FROM BIOGENETIC SILICA IN CHEMICAL FIXATION/SOLIDIFICATION TREATMENT OF WASTES

Jesse R. Conner, Darien, Ill., and Roy S. Rieber, Houston, Tex., assignors to enviroGuard, Inc., Houston, Tex.

Continuation-in-part of Ser. No. 224,857, Jul. 27, 1988, abandoned. This application Jan. 26, 1990, Ser. No. 470,815
Claims priority, application United Kingdom, Jul. 28, 1987, 8717860
Int. Cl.[5] C02F *1/68, 11/14*
U.S. Cl. 210—751 14 Claims

1. A method of solidification and chemical fixation of a waste comprising:

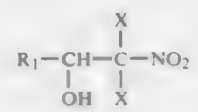
adding to the waste at ambient-temperature and pressure biogenetic silica in the presence of a strong alkali on the order of about pH 12 and higher sufficient to form a soluble silicate with the biogenetic silica in the waste and sufficient water to form the soluble silicate, and



in the presence of at least one polyvalent metal ion sufficient to form a cementitious product with the resulting soluble silicate effective to solidify and chemically fix the liquid waste and to allow said strong alkali to continuously reform to react with the biogenetic silica.

5,008,022

PROCESS FOR SCAVENGING SULFIDES



Jonathan Leder, Flemington, N.J., assignor to Union Carbide Chemicals and Plastics Technology Corporation, Danbury, Conn.

Division of Ser. No. 251,362, Sep. 30, 1988, Pat. No. 4,844,877. This application Mar. 27, 1989, Ser. No. 328,878
Int. Cl.[5] B01D *57/00;* B08B *9/02*
U.S. Cl. 210—755 24 Claims

1. A process for the scavenging of at least one sulfide from solids and liquids which comprises the steps of:

(a) contacting a solid or liquid containing at least one sulfide with a sulfide-scavenging amount of a dihalonitroalkanol of the formula:

wherein:

X represents bromo or chloro; and

R_1 represents hydrogen or substituted or unsubstituted alkyl or aryl of up to about 18 carbon atoms, and wherein any substituents are selected from the group consisting of X, hydroxyl or lower alkyl; and

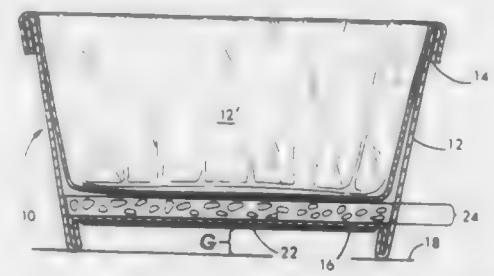
(b) allowing said dihalonitroalkanol to react with said sulfide.

5,008,023

BIOCIDAL COMPOSITIONS AND USE THEREOF CONTAINING A SYNERGISTIC MIXTURE OF GLUTARALDEHYDE AND 2-(DECYLTHIO) ENTHANAMINE

John T. Conlan, Ventura, Calif., and Wilson K. Whitekettle, Conroe, Tex., assignors to Betz Laboratories, Inc., Trevose, Pa.

Filed Aug. 13, 1990, Ser. No. 566,637
Int. Cl.[5] C02F *1/50;* A01N *33/08*
U.S. Cl. 210—764 5 Claims



1. A method for controlling the growth of *Klebsiella pneumoniae* bacteria in an aqueous system which comprises adding to said system from about 0.1 to 200 parts per weight of a composition per one million parts per weight of said aqueous system, said composition comprising a synergistic mixture of (a) glutaraldehyde and (b) 2-(decylthio) ethanamine ratio of (a) to (b) being from about 285:1 to 1.11:1.

5,008,024

MICROWAVE CORN POPPING PACKAGE

James D. Watkins, Prior Lake, Minn., assignor to Golden Valley Microwave Foods Inc., Edina, Minn.

Filed Mar. 22, 1990, Ser. No. 497,190
Int. Cl.[5] H05B *6/80*
U.S. Cl. 219—10.55 E 5 Claims

1. A nestable and disposable corn-popping package which requires no manipulation prior to popping corn in a microwave oven comprising,

a tub-shaped container comprising a sheet of stiff or semi-flexible paper or paperboard closed upon itself in the form of an upright tube which defines upstanding side walls that slope outwardly toward the top to permit nesting of a plurality of such packages within one another during shipment and storage, the side wall terminates at the top in a free edge which defines an upper open wide mouth for the package,

the side wall has a lower edge which rests on the floor of the microwave oven during cooking,

a generally horizontal bottom wall having an edge connected to the side wall at an elevation spaced upwardly from the bottom edge of the side wall to define an upper food containing compartment and a lower compartment within the confines of the side wall between the bottom wall of the package and the floor of the microwave oven,

a layer of microwave interactive suseptor material connected to the bottom wall and being distributed thereacross,

the lower edge of the side wall is substantially continuous and uninterrupted to provide sealing engagement with the floor of the microwave oven to define a sealed compartment containing air which during cooking becomes heated above the temperature of the surrounding air in the oven,

a layer of popcorn resting on the bottom wall within the upper compartment of the tub in heat conductive relationship with the suseptor and,

a flexible cover formed from a microwave transparent material having a peripheral edge sealed to the upper wide mouth,

said flexible cover being secured only to the upper free edge of the side wall and depending downwardly therefrom into the package, the flexible cover conforming to the inner aspect of the side wall and conforming substantially to the upper surface of the popcorn to provide a hollow space of substantial size within the package into which a similar container can be nested during stacking of said containers.

5,008,025

SULFONATE-CONTAINING POLYMER/POLYANIONIC CELLULOSE COMBINATION FOR HIGH TEMPERATURE/HIGH PRESSURE FILTRATION CONTROL IN WATER BASE DRILLING FLUIDS

John Hen, Skillman, N.J., assignor to Mobil Oil Corporation, Fairfax, Va.

Filed Nov. 16, 1989, Ser. No. 437,419
Int. Cl.[5] C09K *7/02*
U.S. Cl. 252—8.51 25 Claims

11. A composition for improving filtration control of a water based drilling fluid comprising:

(a) a polyanionic cellulose or carboxymethyl cellulose in an amount of about 0.25 to about 10 lbs/bbl.; and

(b) a synthetic sulfonate containing polymer in an amount of about 0.25 to about 10 lbs/bbl. that has a molecular weight range of about 300,000 to about 10 million wherein the weight ratio of component (a) to said polymer is about 10:1 to about 1:1 which polymer comprises a vinyl polymer or copolymer in which one of the components is based on a sulfonic acid monomer or where the sulfonate is derived by sulfonating an existing vinyl polymer or copolymer which results in a drilling fluid additive having filtration control qualities substantially equal to those expected for said synthetic sulfonate containing polymer alone.

17. A method for minimizing fluid loss when drilling a well comprising:

(a) adding to a water based drilling fluid a drilling fluid additive comprising

(i) about 0.25 to about 10 lbs. per barrel of a hydroxyalkyl cellulose or an alkyl ether substituted cellulose; and

(ii) about 0.25 to about 10 lbs. per barrel of a synthetic sulfonate-containing vinyl polymer having a molecular weight range of about 300,000 to about 10 million wherein the weight ratio of component (i) to (ii) is about 10:1 to about 1:1;

(b) circulating the drilling fluid from a well while drilling at a temperature up to about 300° F. thereby substantially reducing filter loss from said fluid via said additive as expected from said synthetic sulfonate-containing vinyl polymer alone.

5,008,026

WELL TREATMENT COMPOSITIONS AND METHOD

Tommy R. Gardner; Walter R. Dill; William G. F. Ford, and Karen L. King, all of Duncan, Okla., assignors to Halliburton Company, Duncan, Okla.

Continuation-in-part of Ser. No. 303,873, Jan. 30, 1989, abandoned. This application Jan. 12, 1990, Ser. No. 464,277
Int. Cl.[5] E21B *43/27*
U.S. Cl. 252—8.553 34 Claims

10. An acid and/or water external microemulsion well treatment composition comprising:

(a) a treatment fluid selected from the group consisting of acid, an aqueous acid solution and an aqueous non-acid solution;

(b) an alkyl alcohol having in the range of from 4 to 18 carbon atoms microemulsified into said treatment fluid;

(c) an emulsifying agent present in an amount sufficient to form and maintain a stable microemulsified dispersion of said alkyl alcohol in said treatment fluid;

(d) a mutual solvent selected from the group consisting of glycol ethers and alkyoxylates of glycol ethers; and

(e) a co-solvent selected from the group consisting of polyethylene glycol, primary alcohols and alkyoxylates of alkyl alcohols, each of said components (a)–(e) being different compounds or different mixtures of compounds.

18. A method of treating a subterranean formation to increase the production of hydrocarbons therefrom comprising contacting said formation with an acid and/or water external microemulsion well treatment composition comprising:

(a) a treatment fluid selected from the group consisting of acid, an aqueous acid solution and an aqueous non-acid solution;

(b) an alkyl alcohol having in the range of from 4 to 18 carbon atoms microemulsified into said treatment fluid;

(c) an emulsifying agent present in an amount sufficient to form and maintain a stable microemulsified dispersion of said alkyl alcohol in said treatment fluid;

(d) a mutual solvent selected from the group consisting of glycol ethers and alkyoxylates of glycol ethers; and

(e) a co-solvent selected from the group consisting of polyethylene glycol, primary alcohols and alkyoxylates of alkyl alcohols, each of said components (a)–(e) being different compounds or different mixtures of compounds.

LIQUID COMPOSITIONS CONTAINING CARBOXYLIC ESTERS

Scott T. Jolley, Mentor, and Arturs Grava, Mayfield Heights, both of Ohio, assignors to The Lubrizol Corporation, Wickliffe, Ohio

Continuation of Ser. No. 284,315, Dec. 14, 1988, abandoned. This application Jul. 19, 1990, Ser. No. 559,525

Int. Cl.[5] C09K *5/04*

U.S. Cl. 252—68 **30 Claims**

1. A liquid composition comprising

(A) a major amount of a fluorine containing hydrocarbon containing one or two carbon atoms, and

(B) a minor amount of a soluble organic lubricant comprising at least one carboxylic ester compound represented by one of the formulae

$$RO(R^1O)_nC(O)R^2 \quad (I)$$

and

$$R^3OC(O)R^2 \quad (II)$$

wherein R is a hydrocarbyl group of at least 2 carbon atoms, provided that when R^2 is H or hydrocarbyl, R contains at least 6 carbon atoms,

R^1 is a hydrocarbylene group,

R^2 is H, hydrocarbyl, $-CF_3$, $-R^4CN$, $-R^4-NO_2$, or $R^5OCH(R^6)$-,

R^3 is a $-R^4CF_3$, $-R^4CN$ or $-R^4NO_2$ group, provided that R^3 is a hydrocarbyl group when R^2 is $-R^4CN$,

n is an integer from 1 to about 50,

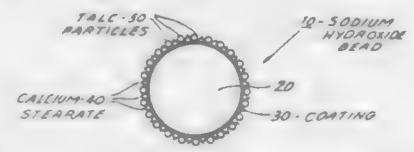
R^4 is a hydrocarbylene group,

R^5 is H, a lower hydrocarbyl group or $R^7C(O)$- where R^7 is a hydrocarbyl group, and

R^6 is H or a lower hydrocarbyl group.

5,008,029

DELAYED ACTION DRAIN CLEANER COMPOSITIONS



Robert Carmello, Dumont, and Richard D. Miller, Union Beach, both of N.J., assignors to Block Drug Company Inc., Jersey City, N.J.

Filed Nov. 20, 1989, Ser. No. 439,190

Int. Cl.[5] C11D *7/06, 17/00*

U.S. Cl. 252—91 **16 Claims**

1. A drain cleaner composition comprising a plurality of granules, said granules comprising an alkali metal hydroxide core having a first coating thereon and a second coating on the first coating, said first coating comprising an ethoxylated surfactant, said second coating comprising a mixture of hydrophobic components having varying hydrophobicity individually selected from the group consisting of an alkali metal salt of a C_8–C_{18} fatty acid, colloidal clay, synthetic clay, metal oxide, alkaline earth metal carbonate, bentonite, feldspar, calcite,

dolomite, diatomaceous earth, talc, pumice, silica and silicate, such that the contact of water with said first coating when the granule is contacted with water is retarded for a finite period of time.

USE OF PARTIALLY ESTERIFIED COPOLYMERS IN LIQUID DETERGENTS

Paul Diessel, Mutterstadt; Johannes Perner, Neustadt; Walter Denzinger, Speyer; Heinrich Hartmann, Limburgerhof, and Hans-Juergen Raubenheimer, Ketsch, all of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany

Filed Oct. 5, 1989, Ser. No. 417,474

Claims priority, application Fed. Rep. of Germany, Oct. 31, 1988, 3837013

Int. Cl.[5] C11D *3/37*

U.S. Cl. 252—174.24 **13 Claims**

1. A liquid, alkaline detergent formulation, containing as essential constituents:

(1) about 10 to 50% by weight of one or more anionic surfactants, one or more nonionic surfactants or a mixture thereof,

(2) 0.1–20% by weight of a partially esterified copolymer obtainable by copolymerization of

(a) one or more C_4–C_{28}-olefins or a mixture of one or more C_4–C_{28}-olefins with up to 20 mol % of a C_1–C_{28}-alkyl vinyl ether and

(b) an ethylenically unsaturated dicarboxylic anhydride of from 4 to 8 carbon atoms

in a molar ratio of 1:1 to give a copolymer having a K value of from 6 to 100 (determined by the method of H. Fikentscher in tetrahydrofuran at 25° C. and a polymer concentration of 1% by weight) and subsequent partial esterification of the copolymer with a reaction product of

(A) a C_1–C_{30}-alcohol, a C_8–C_{22}-fatty acid, a C_1–C_{12}-alkyl-phenol, a secondary C_2–C_{30}-amine or a mixture thereof with

(B) one or more C_2–C_4-alkylene oxides or tetrahydrofuran in a molar ratio of (A):(B) of from 1:2 to 1:50 and hydrolysis of the anhydride groups of the copolymer to carboxyl groups, the partial esterification of the copolymer being carried on until more than about 9% of the carboxyl groups of the copolymer have been converted, and

(3) water.

INTERNAL MOLD RELEASE COMPOSITIONS

Louis W. Meyer, Livingston, Tex.; J. Alan Vanderhider, Fruthwilen, Switzerland, and Robert Carswell, Lake Jackson, Tex., assignors to The Dow Chemical Company, Midland, Mich.

Continuation-in-part of Ser. No. 466,826, Feb. 16, 1983, abandoned, and Ser. No. 570,141, Jan. 12, 1984, Pat. No. 4,876,019. This application Jun. 12, 1989, Ser. No. 365,625

Int. Cl.[5] C08K *5/09;* **C08L** *75/12, 75/02*

U.S. Cl. 252—182.13 **54 Claims**

1. An active hydrogen-containing composition comprising

(A) a material having an average of at least about 2 active hydrogen-containing groups per molecule and a weight from about 500 to about 5000 per active hydrogen-containing group, said composition having dissolved therein

(B) from about 0.5 to about 10 parts by weight per 100 parts by weight of component (A) of a metal salt of an organic material containing at least one carboxylic acid group and a saturated or unsaturated aliphatic hydrocarbon chain having at least about 7 carbon atoms wherein said metal is selected from Groups I-B, II-B, III-A, IV-B, V-B, VI-B, VII-B or VIII of the Periodic Table of the Elements, Sn, Pb, Sb or Bi:

said composition containing a sufficient quantity of at least one aliphatic primary and/or secondary amine-containing material such that component (B) is soluble in said composition, wherein

said composition is devoid of an organic material containing at least one carboxylic acid group, phosphorus-containing acid group or boron-containing acid group or mixture of such materials wherein said organic material contains a siloxane chain or contains at least one terminal or pendant saturated or unsaturated aliphatic hydrocarbon chain containing at least about 7 carbon atoms.

TITANIUM ACTIVATED HAFNIA AND/OR ZIRCONIA HOST PHOSPHOR CONTAINING NEODYMIUM

Philip S. Bryan, Webster; Patrick M. Lambert, Rochester; Christine M. Towers, Rochester, and Gregory S. Jarrold, Henrietta, all of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

Division of Ser. No. 437,464, Nov. 16, 1989, which is a continuation-in-part of Ser. No. 305,222, Feb. 3, 1989. This application Jun. 29, 1990, Ser. No. 546,215

Int. Cl.[5] C09K *11/67*

U.S. Cl. 252—301.40 F **13 Claims**

1. A phosphor capable of absorbing X-radiation and emitting longer wavelength radiation comprised of monoclinic crystals of a titanium activated hafnium dioxide and/or zirconium dioxide host consisting essentially of oxygen and combined elements satisfying the relationship

$$DT_{i_x}M_yNd_w$$

wherein

D represents at least one or zirconium and hafnium ions;

M represents at least one alkali metal;

w is in the range of from 5×10^{-8} to 5×10^{-4};

x is in the range of from 3×10^{-4} to 1.0; and

y is up to 1;

the phosphor exhibiting reduced afterglow when excited by X-radiation as compared to the phosphor as defined above absent neodymium.

2. A phosphor capable of absorbing X-radiation and emitting longer wavelength radiation comprised of monoclinic crystals of a titanium activated hafnium dioxide and/or zirconium dioxide host consisting essentially of oxygen and combined elements satisfying the relationship

$$DT_{i_x}M_yNd_wL_v$$

wherein

D represents at least one of zirconium and hafnium ions;

L represents at least one of samarium and europium;

M represents at least one alkali metal;

v is up to 5×10^{-4};

w is in the range of from 5×10^{-8} to 5×10^{-4};

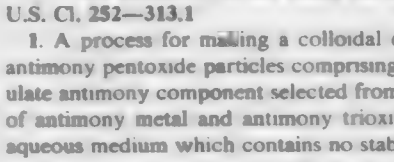
x is in the range of from 3×10^{-4} to 1.0; and

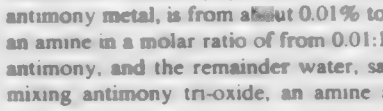
y is up to 1;

the phosphor exhibiting (a) reduced afterglow when excited by X-radiation as compared to the phosphor as defined above absent neodumium, samarium and europium and (b) a higher prompt emission intensity when sararium and/or europium are present as compared to the phosphor defined above absent samarium and europium.

5,008,035

FLUIDIZATION OF HEAVY SLURRIES





Henry T. Broom, Richmond, Tex., assignor to Nalco Chemical Company, Naperville, Ill.

Division of Ser. No. 132,836, Dec. 14, 1987, Pat. No. 4,949,743. This application May 11, 1990, Ser. No. 521,954

Int. Cl.[5] B01J *13/00;* **B01F** *17/14, 17/42*

U.S. Cl. 252—312 **2 Claims**

1. A composition useful for fluidizing oily heavy slurries, which comprises:

Ingredient	Wt. Percent
(a) water	15–85
(b) an ethoxylated nonyl phenol-formaldehyde resin having a molecular weight ranging between about 1000–25,000	40–5
(c) an alkanolamide condensate represented by  wherein R' is a hydrocarbonaceous bridging group having from 1–20 carbon atoms and chosen from linear or branched alkylene, alkaryl, aralkyl, cyclic and mixtures thereof, x and y are, individually, from 0–8, provided that the sum of x + y is at least 1.	20–2.5
(d) an alkoxylated fatty alcohol phosphate represented by  wherein: R_f is a fatty alkyl group having from 6–30 carbons and being linear or branched, R is H, CH_3, or mixture thereof, z is between 1–12, n is from 1–3; m is 3 − n, and the sum of n + m is 3	20–2.5
(e) A hydrocarbon solvent chosen from the group consisting of naphthas, aromatic naphthas, heavy aromatic naphthas, alkylated aromatics, light aromatic petroleum distillates, turpentines, dipentene rich turpentine, and mixtures thereof.	75–5

COLLOIDAL SOLS OF ANTIMONY PENTOXIDE IN AN AQUEOUS MEDIUM AND THEIR PREPARATION

Charles E. Crompton, Arlington Heights, Ill.; Abdulla M. Z. Kazi, Euclid, and Inderjit S. Soni, Bedford Heights, both of Ohio, assignors to Laurel Industries, Inc., Cleveland, Ohio

Filed Aug. 18, 1975, Ser. No. 605,607

The portion of the term of this patent subsequent to Sep. 7, 2009, has been disclaimed.

Int. Cl.[5] B01J *13/00*; C01G *30/00*; C09K *21/02*

U.S. Cl. 252—313.1 35 Claims

1. A process for making a colloidal dispersion of hydrous antimony pentoxide particles comprising introducing a particulate antimony component selected from the group consisting of antimony metal and antimony trioxide into an essentially aqueous medium which contains no stabilizers and contacting said antimony component with hydrogen peroxide in the aqueous medium, at a temperature of from about 0° C. to about the decomposition temperature of the reaction mixture for a length of time sufficient to convert at least a portion of the antimony component to colloidal particles of hydrous antimony pentoxide.

32. A stable aqueous antimony pentoxide sol comprising an amount of antimony pentoxide which, when expressed as antimony metal, is from about 0.01% to about 40% by weight, an amine in a molar ratio of from 0.01:1 to about 4:1, based on antimony, and the remainder water, said sol prepared by admixing antimony tri-oxide, an amine and water and to said mixture, adding H_2O_2 with refluxing, then cooling the mixture, thus forming the stable sol said amine being diethanolamine

5,008,037

EMULSIFIER FOR WATER-IN-OIL EMULSIONS

John D. Weete, Opelika, Ala., and George L. Griffith, Bethlehem, Pa., assignors to Emulsion Technology, Inc., Parrish, Ala.

Division of Ser. No. 177,956, Apr. 4, 1988, Pat. No. 4,943,389. This application Jun. 26, 1990, Ser. No. 543,531

Int. Cl.[5] B01F *17/14*; B01J *13/00*; A23J *7/00*; C07F *9/10*

U.S. Cl. 252—314 9 Claims

1. A process for preparing a water-in-oil emulsion, which comprises the steps of

(i) heating a component consisting essentially of lecithin at a temperature in the range of from about 100° C. to about 250° C. for a period of time ranging from about 15 to about 480 minutes,

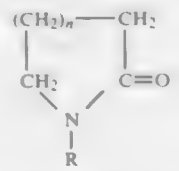
(ii) mixing the product of (i) with an oil, and

(iii) adding to the product of (ii) an aqueous phase with agitation to thereby yield a water-in-oil emulsion.

5,008,038

SOLUBILIZATION OF LACTAM AND CHLORHEXIDINE IN WATER

John J. Merianos, Middletown, and Robert B. Login, Oakland, both of N.J., assignors to GAF Chemicals Corporation, Wayne, N.J.



Filed Oct. 10, 1989, Ser. No. 419,176

Int. Cl.[5] B01F *3/20*; A61K *31/155*

U.S. Cl. 252—363.5 10 Claims

1. A composition of matter comprising an aqueous solution containing between about 1 and about 25 wt. % based on water of a complex of:

(a) an N-hydrocarbon substituted lactam defined by the formula

wherein n is an integer having a value of from 1 to 3 and R is a linear alkyl radical containing from 10 to 14 carbon atoms; and

(b) between about 0.08 and about 0.25 wt. % chlorhexidine based on lactam

5. Method of making the composition of claim 1 which comprises:

(a) dissolving chlorhexidine free base in lactam in an amount between about 3 and about 15 wt. % chlorhexidine free base based on lactam; and

(b) then mixing the solution of chlorhexidine free base in lactam with water to form an aqueous solution containing between about 1 and about 25 wt. % of the solution of lactam and chlorhexidine.

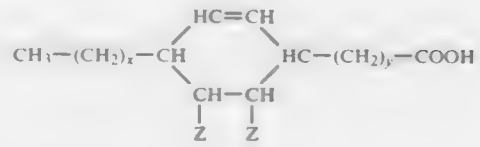
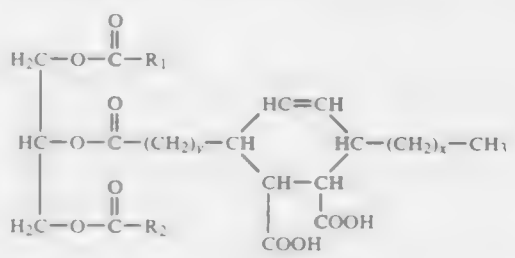
LOW FOAMING RUST INHIBITING COMPOSITION



Fred E. Woodward, Palm Beach, and Alice P. Hudson, Lake Park, both of Fla., assignors to Westvaco Corporation, New York, N.Y.

Continuation of Ser. No. 169,214, Mar. 15, 1988, Pat. No. 4,956,106. This application Jun. 29, 1990, Ser. No. 545,819



Int. Cl.[5] C23F *11/10*

U.S. Cl. 252—392 6 Claims

1. An improved method of inhibiting corrosion of metals exposed to aqueous media comprising contacting said metals with a water-soluble corrosion inhibiting composition comprising a corrosion inhibiting amount of a water-soluble dicarboxylic acid of the formula:

wherein Z is COOH or H, and one of each is present, and x and y are from 3 to 9 with x+y=12, wherein the improvement comprises reducing the foaming tendencies of said composition by the addition thereto of (1) a foam inhibiting amount of a vegetable oil adduct of the formula:

wherein x and y are integers from 3 to 9, x and y together equal 12 and R_1 and R_2 are saturated or unsaturated hydrocarbon radicals and (2) a base to adjust the pH of the composition to from about 6.5 to about 10.5.

5,008,040

PROCESS FOR PREPARATION OF POLYACETYLENE FILM

Jun Tsukamoto, Otsu, and Akio Takahashi, Kusatsu, both of Japan, assignors to Director-General of Agency of Industrial Science and Technology, Tokyo, Japan

Filed Sep. 29, 1988, Ser. No. 250,735

Claims priority, application Japan, Feb. 9, 1988, 63-26537; Apr. 19, 1988, 63-94504

Int. Cl.[5] H01B *1/00, 1/06*

U.S. Cl. 252—500 8 Claims

1. A process for the preparation of a polyacetylene film, which comprises (a) heating a Ziegler-Natta catalyst comprising an alkylaluminum compound and a titanium compound at a temperature not lower than 150° C. but below the decomposition temperature of the catalyst in an organic solvent and then, cooling the catalyst-organic solvent mixture said organic solvent having a boiling point of from 150° C. to 300° C. and being selected from the group consisting of saturated hydrocarbons, aromatic hydrocarbons and organic silicon compounds, (b) removing coarse catalyst particles having a diameter larger than 1 μm from the catalyst-organic solvent mixture to form a catalyst dispersion for polymerization, (c) contacting acetylene with the catalyst dispersion at a temperature of from −78° C. to 50° C. to effect polymerization of acetylene, and (d) drawing the formed polyacetylene film.

5,008,041

PREPARATION OF CONDUCTIVE POLYANILINE HAVING CONTROLLED MOLECULAR WEIGHT

Randy E. Cameron, Pacific Palisades, and Sandra K. Clement, Canyon Country, both of Calif., assignors to Lockheed Corporation, Calabasas, Calif.

Filed Jan. 30, 1990, Ser. No. 471,979

Int. Cl.[5] H01B *1/06*

U.S. Cl. 252—500 14 Claims

1. A process for producing conductive polyaniline which comprises

providing a mixture of aniline and dianiline in a molar proportion of aniline to dianiline in said mixture in the range of about 1 to about 100,

reacting said mixture in the presence of an oxidant and a protonic acid to polymerize said mixture of aniline and dianiline, and

forming conductive polyaniline.

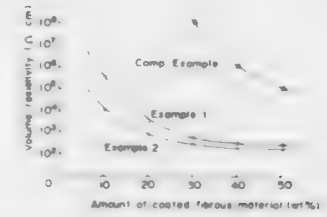
FLUORORESIN-CONTAINING COATING COMPOSITION AND USE THEREOF



Norimasa Honda, Ibaraki, and Masahiro Sano, Minoo, both of Japan, assignors to Daikin Industries Ltd., Osaka, Japan

Filed Oct. 27, 1987, Ser. No. 113,122

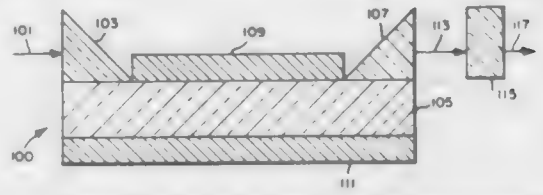
Claims priority, application Japan, Oct. 28, 1986, 61-257181

Int. Cl.[5] H01B *1/20*; C08K *9/02*

U.S. Cl. 252—518 9 Claims

1. A fluororesin-containing coating composition comprising a fluororesin, a fibrous material selected from the group consisting of fibrous potassium titanate, fibrous silicon nitride, fibrous α-alumina and fibrous boron carbide coated by an electrically conductive oxide and having a diameter of 0.01 to 10 micrometers and a length of 1 to 100 micrometers, an acrylic resin selected from the group consisting of polymethyl methacrylate, polymethyl acrylate and polyethyl acrylate and a liquid medium wherein the weight ration of the fluororesin to the fibrous material is from 95:5 to 50:50, and the weight ratio of the fluororesin to the acrylic resin is from 100:0 to 85:15.

5,008,043



OPTICAL ARTICLE EXHIBITING A HIGH LEVEL OF SECOND ORDER POLARIZATION SUSCEPTIBILITY

Douglas R. Robello, Webster; Abraham Ulman, Brighton; Edward J. Urankar, Rochester, and Craig S. Willand, Pittsford, all of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

Filed Mar. 16, 1990, Ser. No. 494,376

Int. Cl.[5] F21V *9/00*; G02B *6/00, 6/10*

U.S. Cl. 252—582 20 Claims

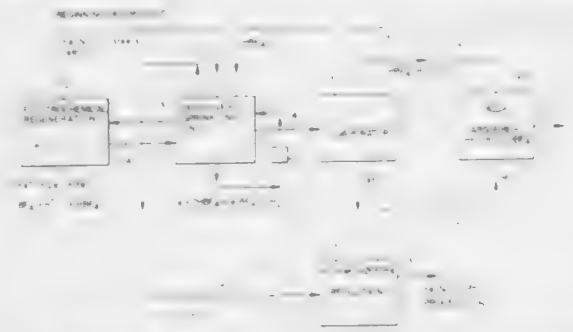
1. An optical article containing, for the transmission of electromagnetic radiation, a medium exhibiting a second order polarization susceptibility greater than 10^{-9} electrostatic units comprised of polar aligned noncentrosymmetric molecular dipoles having a hydrophobic electron donor moiety linked through a conjugated π bonding system to a sulfonyl electron acceptor moiety to permit oscillation of the molecular dipole between a lower polarity ground state and a higher polarity excited state,

characterized in that the sulfonyl electron acceptor moiety includes at least two halogen substituents of its α carbon atom.

5,008,044

PROCESS FOR DECONTAMINATING RADIOACTIVELY CONTAMINATED METAL OR CEMENT-CONTAINING MATERIALS

Jozef Hanulik, Zurich, Switzerland, assignor to Recytec SA, Switzerland



Continuation-in-part of Ser. No. 19,799, filed as PCT CH 86/00069 on May 27, 1986, Pat. No. 4,828,759. This application May 9, 1989, Ser. No 349,586

Claims priority, application Switzerland, May 28, 1985, 02238/85; May 28, 1985, 02239/85; Jun. 3, 1985, 02328/85

The portion of the term of this patent subsequent to May 9, 2006, has been disclaimed.

Int. Cl.[5] G21F *9/16, 9/08;* **C09K** *13/08;* **B08B** *9/00*

U.S. Cl. 252—628 **18 Claims**

1. A process for decontaminating radioactively contaminated porous materials using a decontamination agent selected from the group consisting of fluoroboric acid; hexafluorosilicate acid; water soluble salts of fluoroboric acid; and mixtures thereof in aqueous solution, said decontamination agent having a concentration of about 0.05 to about 50 mol/liter in said solution, said process comprising contacting said radioactively contaminated porous materials to be decontaminated with said decontamination agent; dissolving surface layers of said radioactively contaminated porous materials by said contacting with said decontamination agent, and separating said decontamination agent from radioactive contaminants and impurities by distillation.

5,008,045

METHOD AND APPARATUS FOR CENTRIFUGALLY CASTING HAZARDOUS WASTE

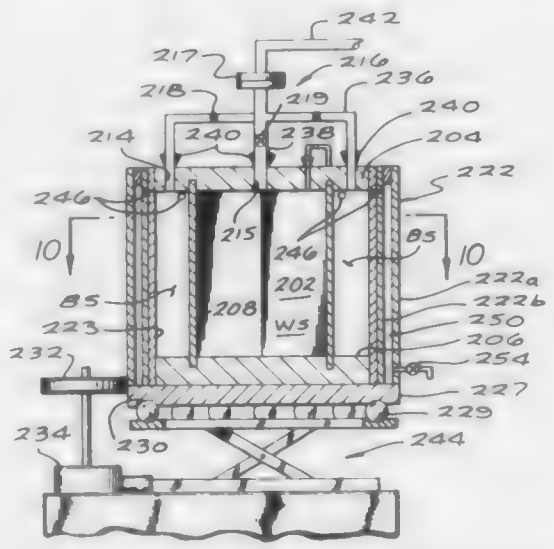
Frank Manchak, Jr.; Frank E. Manchak, II; Michael E. Manchak, and Peter J. Manchak, all of Goleta, Calif., assignors to Alternative Technologies for Waste, Inc., Goleta, Calif.

Continuation-in-part of Ser. No. 328,020, Mar. 23, 1989. This application Jul. 21, 1989, Ser. No. 384,087

Int. Cl.[5] G21F *9/12*

U.S. Cl. 252—633 **10 Claims**

1. A method of compacting hazardous waste materials into a stable rigid form comprising the steps of:



(a) placing a mold liner into a casting mold which is rotatable around a longitudinal axis, said liner having a polygonal cross section;

(b) placing a cage comprised of a pair of contaminant barrier end walls spaced from each other and a peripheral wall interconnecting said end walls into said mold liner and affixing said cage in position therein, said cage having a polygonal cross section, said mold liner and said cage defining a casting space therebetween for casting a peripheral contaminant barrier wall of polygonal cross section and substantially constant thickness;

(c) rotating said mold, mold liner and cage about said longitudinal axis;

(d) injecting a castable contaminant barrier material into said polygonal wall casting space to centrifugally cast said peripheral contaminant barrier wall of a desired wall thickness;

(e) injecting a castable hazardous waste material into the interior of said cage and centrifugally casting same therein, and

(f) removing the resulting casting comprised of said cage and said castable materials from said mold.

5,008,046

PROCESS FOR THE CONTINUOUS ESTERIFICATION OF FATTY ACIDS

Norbert Bremus, Langenfeld; Bernhard Gutsche, Hilden; Lutz Jeromin, Hilden; Eberhard Peukert, Hilden, and Bernard Schleper, Duesseldorf, all of Fed. Rep. of Germany, assignors to Henkel Kommanditgesellschaft auf Aktien, Duesseldorf, Fed. Rep. of Germany

Filed Mar. 21, 1989, Ser. No. 326,592

Claims priority, application Fed. Rep. of Germany, Mar. 21, 1988, 3809417

Int. Cl.[5] C11C *3/00;* **C07C** *67/08*

U.S. Cl. 260—410.6 **14 Claims**

1. A continuous process for esterification of C_2-C_{24} fatty acid with C_1-C_5 monohydric alkanol or C_2-C_3 dihydric alkanol in a liquid phase in the presence of a catalyst which comprises:

(a) introducing heated fatty acid and catalyst onto the top plate of a multiple plate reaction column, operated at a top pressure of from about 200 to about 900 hPa, the top of the reaction column is in communication with a rectifying column;

(b) introducing the alkanol, in a vapor phase, below the lowest plate of the reaction column;

(c) reacting the fatty acid and the alkanol in the liquid phase.

(d) removing a water-alkanol vapor mixture through the rectifying column; and

(e) removing an esterified fatty acid mixture from the column below the lowest plate.

5,008,047

PROCEDURE FOR THE REFINING OF OILS

Laurent Martens, Ranst, Belgium, assignor to Schelde-Delta, Antwerp, Belgium

Filed Jun. 26, 1989, Ser. No. 371,272

Claims priority, application Belgium, Jun. 29, 1988, 8800749

Int. Cl.[5] C11B *3/04*

U.S. Cl. 260—424 **18 Claims**

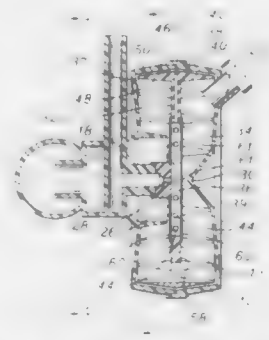
1. A process for refining an oil containing unhydratable phospholipids, said process comprising the steps of:

forcing a stream of oil through an immobilized solid Lewis acid catalyst in the presence of water to catalytically convert the unhydratable phospholipids into hydratable phospholipids; then

hydrating the hydratable phospholipids; and then

separating the hydrated phospholipids from the oil.

5,008,048



POSITION INSENSITIVE ASPIRATOR

Steven L. Ryder, 1334 Woodcrest, Fullerton, Calif. 92633

Continuation-in-part of Ser. No. 279,657, Dec. 5, 1988, abandoned, and a continuation-in-part of Ser. No. 415,914, Oct. 2, 1989. This application Mar. 15, 1990, Ser. No. 493,888

Int. Cl.[5] B01F *3/04*

U.S. Cl. 261—78.2 **18 Claims**

1. In a device for aspirating a liquid comprising a hollow housing having end walls and side walls and defining a reservoir for a liquid to be aspirated, said housing having inlet means for a carrier gas and a pressurized gas, and an outlet for said carrier gas and aspirated fluid, nozzle means within said housing communicating with said inlet means for said pressurized gas and communicating with said reservoir for producing reduced pressure within said housing and for aspirating said liquid, the improvement comprising:

an entrainment member disposed in said housing and capable of conveying liquid in said reservoir to said nozzle means for aspiration irrespective of the position and orientation of said device, said entrainment member defining a peripheral surface spaced from said housing side walls and disposed parallel thereto to provide a flow path for fluid communication between said peripheral surface and said reservoir and means providing fluid communication between said peripheral surface and said nozzle means,

whereby liquid in said reservoir is entrained in said flow path and is drawn to said nozzle outlet for aspiration due to the reduced pressure in said housing caused by a stream of gas exiting said nozzle irrespective of the position and orientation of said device.

5,008,049

METHOD FOR SEALING AN ELECTRONIC DEVICE CONTAINING A FLUID MATERIAL

James W. Rose, Delmar, and Theresa A. Sitnik, Scotia, both of N.Y., assignors to General Electric Company, Schenectady, N.Y.

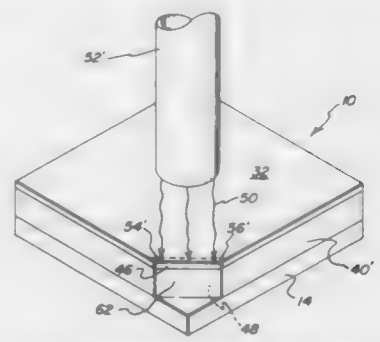
Filed Sep. 21, 1989, Ser. No. 410,398

Int. Cl.[5] B29C *39/38, 39/10*

U.S. Cl. 264—4 **24 Claims**

1. A method for sealing a fluid between spaced apart first and second members of a device, comprising the steps of:

forming a seal of sealant material across a space between the first and second members and essentially completely around the periphery of the device;



forming an aperture through the seal to provide access to an interior of the device;

introducing the fluid into the device interior through the aperture;

filling the aperture with a plug of thermoplastic material;

selectively heat treating substantially only the plug to cause at least an exterior portion of the plug to soften and flow; and

terminating the heat treatment after a duration sufficiently short to avoid contamination of said fluid, to cause the plug to resolidify and bind to a boundary of the aperture and complete the peripheral seal to completely enclose the fluid.

EXTRUSION TECHNIQUE FOR PRODUCING UNILAMELLAR VESICLES

Pieter R. Cullis; Michael J. Hope, and Marcel B. Bally, all of Vancouver, Canada, assignors to The Liposome Company, Inc., Princeton, N.J.

Continuation of Ser. No. 788,017, Oct. 16, 1965, abandoned, which is a division of Ser. No. 622,690, Jun. 20, 1984, abandoned. This application Feb. 13, 1989, Ser. No. 310,495

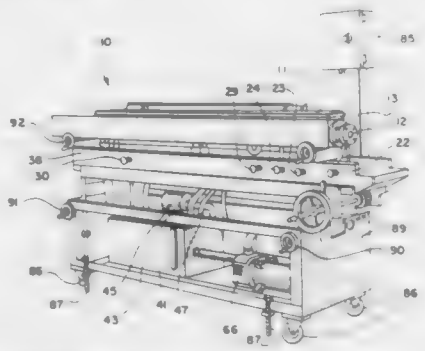
Int. Cl.[5] A61K *9/133, 37/22*

U.S. Cl. 264—4.3 **29 Claims**

1. A method for reducing the lamellarity of a population of liposomes comprising repeatedly passing the liposomes under pressure through a filter which has a pore size (equal to or less than) no larger than about 100 nm.

10. A method for preparing a population of substantially unilamellar liposomes comprising the steps of:

(a) preparing multilamellar liposomes; and



(b) repeatedly passing the liposomes under pressure through a filter which has a pore size no larger than about 100 nm.

5,008,051

VACUUM SIZING TANK WITH ELECTRONICALLY CONTROLLED VACUUM PRESSURE

Robert T. DeCoursey, 199 Euclid, Bloomingdale, Ill. 60108, and Mikel J. Messick, 784 Red Oak Dr., Bartlett, Ill. 60103

Filed Mar. 1, 1989, Ser. No. 317,681
Int. Cl.[5] B29C *43/22*
U.S. Cl. 264—40.3 16 Claims

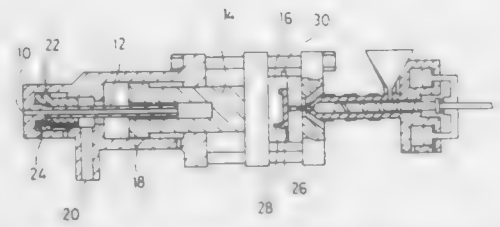
1. In a vacuum sizing tank substantially closed to the atmosphere including:

(a) an enclosed trough capable of holding water and a vacuum, said trough having a first opening for the ingress of a molten plastic extrudate and a second opening for the egress of a cooled plastic extrudate; and

(b) vacuum means for applying a vacuum to said trough,

the improvement (1) wherein said vacuum means applies any one of a plurality of different vacuums to said trough and (2) comprising:

(A) detector means, coupled to said trough, for determining the pressure within said trough;



(B) control means, coupled to said detector means and said vacuum means, for (1), when said detector means determines that the pressure has fallen below a predetermined value, causing said vacuum means to decrease the vacuum applied to said trough and (2), when said detector means determines that the pressure in said trough has risen above said predetermined value, causing said vacuum means to increase the vacuum applied to said trough.

MOLD CLAMPING PRESSURE CONTROL METHOD FOR INJECTION COMPRESSION MOLDING AND INJECTION COMPRESSION MOLDING MACHINE

Susumu Harada, Numazu, Japan, assignor to Toshiba Machine Co., Ltd., Tokyo, Japan

Filed Dec. 2, 1988, Ser. No. 279,197
Claims priority, application Japan, Dec. 3, 1987, 62-304439
Int. Cl.[5] B29C *45/80*
U.S. Cl. 264—40.5 2 Claims

1. A mold clamping pressure control method for injection compression molding of resin through adjustments of oil pressure in a mold clamping cylinder by means of a mold clamping pressure control valve, comprising:

detecting a resin temperature in a cavity in a mold by a resin temperature sensor;

converting detected values thereof into electric signals by a converter;

comparing in turn said electric signals with a series of preset pressure changeover temperature setting values to output one pressure changeover signal whenever said detected values correspond to said setting values; and

converting said pressure changeover signal corresponding to any of a series of pressure setting values which are predetermined according to the resin temperatures, into a valve opening-shutting amount before outputting valve opening-shutting directing signals, thereby controlling an opening-shutting amount of said mold clamping pressure control valve, whereby a plurality of different mold clamping pressures are successively applied in response to the detection of a plurality of successively different resin temperatures.

PROCESS FOR PRODUCING A CERAMIC PRODUCT USING SLUDGE ASHES

Ryusuke Hashimoto, Fuso; Mitsuru Iwata; Junichi Sugihara, both of Mitake, and Minoru Iwase, Mitake, all of Japan, assignors to Fujimi Ceramic Co., Ltd., Nagoya, Japan

Continuation-in-part of Ser. No. 71,273, Jun. 9, 1987, Pat. No. 4,874,153. This application Oct. 6, 1989, Ser. No. 418,141
Claims priority, application Japan, Aug. 8, 1989, 1-2051[illegible]
Int. Cl.[5] C04B *35/64*
U.S. Cl. 264—60 2 Claims

1. A process for producing a ceramic product using sludge ashes, comprising the steps of

(a) mixing at least (i) ashes obtained by burning a sludge which as been obtained by the treatment of sewage and (ii) a plastic ceramic raw material to prepare a first body,

(b) mixing at least a plastic ceramic raw material and a fusible material to prepare a second body,

(c) supplying the first and second bodies into a matrix of a molding machine such that the first and second bodies form a lower, major layer and an upper, surface layer which covers the lower layer, respectively,

(d) molding the first and second bodies as one body into an object with a desired shape, and

(e) firing a molding obtained in the step (d), thereby producing a two-layer ceramic product whereby the effects of different sewage treatments on the quality of the resultant product is largely mitigated.

5,008,054

CERAMIC INJECTION MOLDED BODY AND METHOD OF INJECTION MOLDING THE SAME

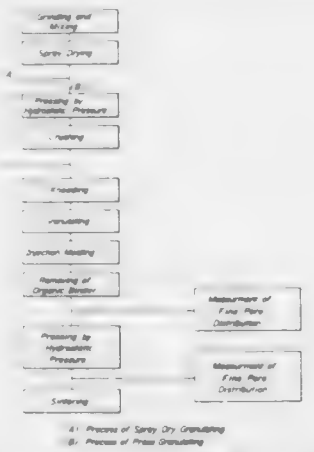
Shigeki Kato, Nagoya, and Katsuhiro Inoue, Aichi, both of Japan, assignors to NGK Insulators, Ltd., Japan

Filed Dec. 22, 1989, Ser. No. 455,229
Claims priority, application Japan, Dec. 24, 1988, 63-326932
Int. Cl.[5] C04B *35/64*
U.S. Cl. 264—63 2 Claims

1. A method of producing a sintered ceramic body, comprising the steps of:

granulating a ceramic powder to form granulated particles;

kneading the granulated particles with the addition of at least one organic binder;



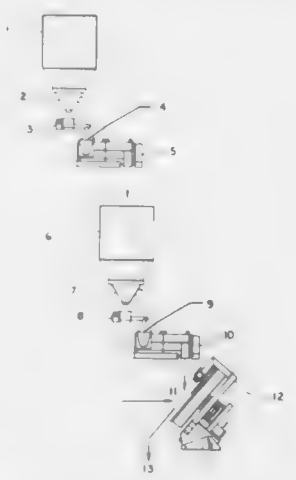
injection molding the kneaded particles to form a molded body;

heating the molded body to burnout said organic binder;

hydrostatically pressing the molded body; and

sintering the hydrostatically pressed, molded body;

wherein the granulating and kneading steps are performed under conditions selected to prevent crushing of the granulated particles during kneading, such that at least 30% of



the total volume of pores in the molded body after the heating step have a diameter of at least 0.1 μm, and wherein the hydrostatic pressing step is performed under conditions selected to crush the granulated particles contained in the molded body, such that at least 50% of the total volume of pores in the hydrostatically pressed, molded body after the hydrostatic pressing step have a diameter of at most 0.1 μm.

PROCESS FOR PELLETIZING HIGHLY REACTIVE POWDERS

Carl A. Holley, 14315 Tall Oaks, Riverview, Mich. 48192

Filed Sep. 4, 1990, Ser. No. 577,281
Int. Cl.[5] C04B *2/02, 11/28;* B29B *9/08*
U.S. Cl. 264—117 8 Claims

1. The method of forming strong and durable pellets from dust collected from stack gases, the dust including CaSO2, CaSO4 and unreacted CaO, comprising blending a portion of water required for a total hydration with a first mixer, storing the moistened dust in a conditioning container wherein some compounds in the moistened dust are chemically reacted with said water to form hydroxides, adding more water to the reacted dust, subjecting the wetted dust to an intense second mixer, and thereafter pelletizing the wetted dust in a pelletizer.

5,008,056

REDUCTION IN DIE DROOL IN FILLED RESINS AND PRODUCT IMPROVEMENT

Stuart J. Kurtz, Martinsville, N.J., and Steve R. Szaniszlo, Laval, Canada, assignors to Union Carbide Chemicals and Plastics Technology Corporation, Danbury, Conn.

Continuation-in-part of Ser. No. 249,778, Sep. 26, 1988, abandoned. This application Dec. 21, 1989, Ser. No. 454,458
Int. Cl.[5] B29C *47/12*
U.S. Cl. 264—130 3 Claims

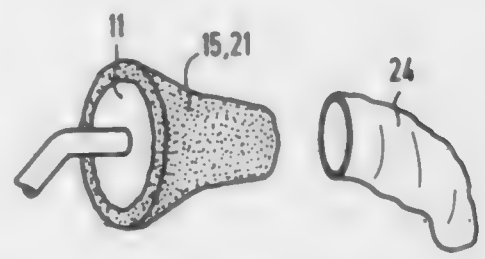
1. A process for reducing die drool during the die extrusion of highly filled polyolefinic resins for production of jacketing insulators for wire and cable which comprises anchoring into the surface of the die submicron particles of a fluorinated hydrocarbon polymer said anchoring being effected by creating pores in the surface of the die in contact with the polymeric resins and thereafter infusing said pores with said submicron particles of fluorinated hydrocarbon polymer.

5,008,057

METHOD OF PRODUCING A STRUCTURE, MORE PARTICULARLY A WOODEN STRUCTURE, IN THE SURFACE OF A HARDENED FIBREBOARD

Harald Risius, Aurich, and Wilhelm Oldemeyer, Meppen, both of Fed. Rep. of Germany, assignors to Glunz Aktiengesellschaft, Hamm, Fed. Rep. of Germany

Filed Nov. 29, 1989, Ser. No. 443,654
Claims priority, application Fed. Rep. of Germany, Nov. 30, 1988, 3840292
Int. Cl.[5] B29C *59/02*
U.S. Cl. 264—134 7 Claims



1. A method for producing a wooden structure in an initially uncoated surface of a hardened fibreboard, comprising the steps of: applying an initial coating of a resin-water mix to the uncoated surface of the fibreboard on one or both sides to soften and penetrate into the surface of the fibreboard; molding the wooden structure into the surface of the softened fibreboard by pressing said fibreboard with a short cycle press, under the action of pressure and heat, and using a structured pressure-plate to evaporate the water-part of the resin-water mix and to cure the resin part, whereby the structure of the pressure-plate is molded into the surface of the fibreboard.

5,008,058

METHOD FOR MANUFACTURING AN OTOPLASTIC OR AN EAR ADAPTOR MEMBER

Hans Henneberger, Effeltrich, and Rainer Basel, Erlangen, both of Fed. Rep. of Germany, assignors to Siemens Aktiengesellschaft, Berlin and Munich, Fed. Rep. of Germany

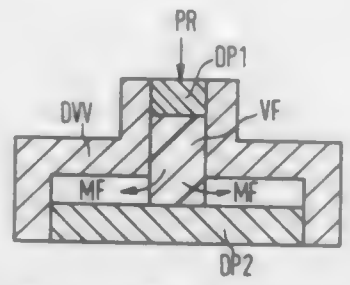
Filed Jan. 19, 1989, Ser. No. 299,069
Claims priority, application Fed. Rep. of Germany, Jan. 19, 1988, 3801392
Int. Cl.[5] B29C *41/22*
U.S. Cl. 264—134 14 Claims

1. A method for manufacturing a customized ear adaptor

member including an otoplastic and adaptor member, said adaptor member having an elastic-shaped part of a desired shaped placed on a carrier part, said method comprising the steps of providing an open-celled porous deformable part on a carrier part, said deformable part being slightly larger than an auditory canal of an ear of a hearing impaired person, at least partially saturating the deformable part with a liquid hardenable material so that said material is retained in said deformable part, then inserting the at least partially saturated deformable part and the carrier part into the auditory canal of the ear of the hearing impaired person and allowing the at least partially saturated deformable part to confirm to the canal as the hardenable material hardens to permanently conform the deformable part to the shape of the auditory canal of the ear of the person to form a permanently shaped part of the desired shape and then removing the formed, shaped part from the ear.

5,008,059

METHOD FOR MANUFACTURING A PLASTIC PART HAVING A SHAPE MEMORY



Helmut Kaeufer, Mettmann; Christian Kipfelsberger, Hepberg, and Karl-Heinz Leyrer, Bobfingen, all of Fed. Rep. of Germany, assignors to R X S Schrumpftechnik-Garnituren GmbH, Fed. Rep. of Germany

Continuation of Ser. No. 38,236, Apr. 14, 1987, abandoned. This application Oct. 23, 1989, Ser. No. 425,437

Claims priority, application Fed. Rep. of Germany, Apr. 14, 1986, 3612518

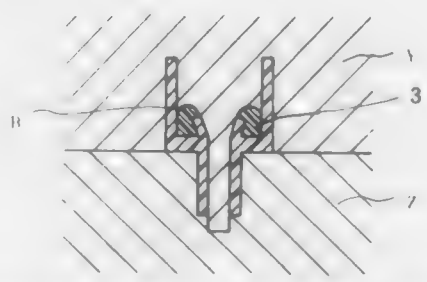
Int. Cl.[5] **B29C** *43/04, 61/06*

U.S. Cl. 264—230 **25 Claims**

1. A method for the manufacture of plastic parts of a thermal plastic synthetic material having a crystallite melting point and a softening point, said parts having a shape memory and being restored by the application of energy to an original shape from a second shape, the method comprising the steps of providing a preform of the original shape for the part in an apparatus having a cavity of the second shape of the part, said preform being free of cross-linked material, heating the preform to a first elevated temperature below the temperature of the crystallite melting point and softening point for the synthetic material, applying pressure to said heated preform in said cavity to change the original shape to said second shape and to introduce molecular orientations into the preform to change the preform into the part, maintaining the pressure on the part and cooling the part to a second elevated temperature below the first elevated temperature to fix the molecular orientations therein, removing the pressure after reaching the second elevated temperature, removing the part from said cavity and subsequently applying energy to cancel the molecular orientations and create restoring forces to return the part back to the original shape.

5,008,060

METHOD OF MOLDING A MULTI-INJECTION MOLDED BODY



Toshiyuki Kanai, and Nobuo Shinnoh, both of Sakaki, Japan, assignors to Nissei Jushi Kogyo Kabushiki Kaisha, Nagano, Japan

Division of Ser. No. 347,908, May 5, 1989, abandoned. This application Jul. 17, 1989, Ser. No. 380,297

Claims priority, application Japan, Nov. 5, 1988, 63-114453

Int. Cl.[5] **B29C** *65/56*

U.S. Cl. 264—255 **11 Claims**

1. A method of molding a multi-injection molded body, which comprises at least a first molded body consisting essentially of a first resin and a second molded body consisting essentially of a second resin, the method comprising:

injection molding the first body so that on a surface thereof which is to be joined to the second body, there exists a concave section which opens on said surface;

reshaping the first body and thereby projecting at least a portion of a sidewall of said concave section inward to form an undercut section in the concave section;

and injecting said second resin into the concave section having said undercut section therein and into a cavity of a mold, in order to mold the second body tightly fixed to the first body by the undercut section.

PROCESS FOR THE MANUFACTURE OF SEAMLESS METAL-CLAD FIBER-REINFORCED ORGANIC MATRIX COMPOSITE STRUCTURES

Raymond M. Bluck, San Jose, Calif.; Harold G. Bush, Yorktown, Va., and Robert R. Johnson, Saratoga, Calif., assignors to The United States of America as represented by the Administrator of the National Aeronautics and Space Administration, Washington, D.C.

Division of Ser. No. 921,572, Oct. 21, 1986, Pat. No. 4,923,761. This application Feb. 28, 1990, Ser. No. 486,668

Int. Cl.[5] **B29C** *45/14*

U.S. Cl. 264—257 **3 Claims**

1. A process for producing metal seamless clad composite structures comprising:

providing a hollow, metallic inner member;

providing an outer sleeve to surround the inner member and define an inner space therebetween;

attaching to the distal end of the outside diameter of said inner member a plurality of continuous reinforcing fibers;

introducing the inner member, distal end first, into one end of the outer sleeve;

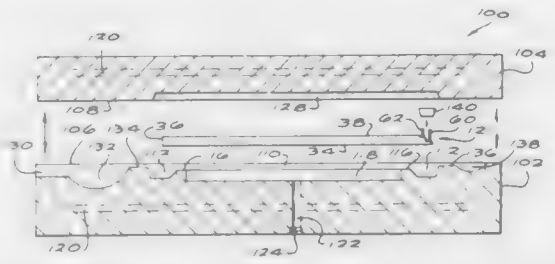
sliding said inner member, distal end first, into the outer sleeve until the inner member is completely enveloped by the outer sleeve;

injecting a liquid matrix material into the space containing the reinforcing fibers between the inner member and the outer sleeve;

flowing a pressurized heat transfer medium through said inner member, to cure said matrix material and to provide structural support; and

reducing the wall thicknesses of both the inner member and the outer sleeve to the appropriate dimensions to adjust the thermal expansion coefficient of the metal-clad composite structure to the desired value.

5,008,062



METHOD OF FABRICATING PHOTOVOLTAIC MODULE

A. Jerome Anderson, Newbury Park, and Norman L. Beze, Simi Valley, both of Calif., assignors to Siemens Solar Industries, L.P., Camarillo, Calif.

Division of Ser. No. 145,931, Jan. 20, 1988, Pat. No. 4,830,038. This application Mar. 2, 1989, Ser. No. 318,785

Int. Cl.[4] **B29C** *45/14*

U.S. Cl. 264—272.15 **7 Claims**

1. A method for forming an elastomeric casing on a predetermined portion of a thin film photovoltaic panel having front and back sides and edges forming a perimeter, and at least one thin film photovoltaic cell capable of converting radiation incident the front side of the panel to electrical energy, the method comprising the steps of:

placing the thin film photovoltaic panel in a mold having interior walls which cooperate with said predetermined portion of the panel to define a cavity encompassing the perimeter and the back side of the panel; and

introducing a flowable reaction injection molding material into the cavity and curing said material to form a unitary elastomeric casing which encapsulates the entire back side and perimeter edges of the panel and forms a seal against a portion of the front side of the panel bordering the perimeter.

5,008,063

METHOD FOR PRESS MOLDING PLASTICS ARTICLES, IN PARTICULAR THERMOPLASTIC, THERMOSETTING AND POLYURETHANE PLYMERIC ARTICLES

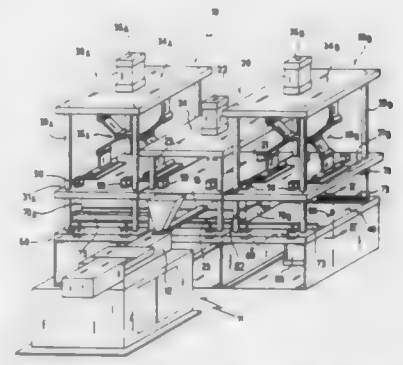
Giorgio Margiaria, Moncalieri, and Giuseppe Brizio, Fossano, both of Italy, assignors to Fiat Auto S.p.A., Turin, Italy

Division of Ser. No. 118,903, Nov. 9, 1987, Pat. No. 4,861,258. This application Aug. 28, 1989, Ser. No. 405,791

Claims priority, application Italy, Nov. 20, 1986, 67862 A/86

Int. Cl.[5] **B29C** *45/04*

U.S. Cl. 264—297.2 **1 Claim**



1. A method for molding plastic articles comprising:

arranging a first mold at a central molding station and a second mold at one of two cooling and extraction stations located adjacent said molding station on opposite sides thereof,

simultaneously molding an article in said first mold at the central station while applying a pressure by a first pressure applying means and cooling and extracting a molded article from said second mold at said one of two cooling and extraction stations,

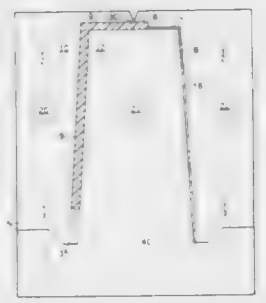
positioning second pressure applying means to define an elongated transfer path for said first and second molds,

applying a closure pressure to the molds by means of said second pressure applying means,

moving the molds relative to said second pressure applying means to maintain said closure pressure to bring the second mold into the central molding station and the first mold into another of the two cooling and extraction stations, and

alternately repeating the above operations by shifting the respective molds simultaneously back and forth between the molding stations and the respective cooling and extraction stations.

5,008,064



INJECTION-MOLDING DIMENSION-CONTROL AND CLAMP-REDUCTION

Jens O. Sorensen, Rancho Santa Fe, Calif., assignor to Primtec, Rancho Santa Fe, Calif.

Filed Jun. 5, 1989, Ser. No. 361,275

Int. Cl.[5] **B29C** *45/16, 45/37*

U.S. Cl. 264—308 **10 Claims**

1. A method of controlling the dimensions of a hollow plastic product injection molded within the cavity of a mold having a core section and a cavity section defining the mold cavity therebetween and separated by a parting line, comprising stabilizing the core section in relation to the cavity section and comprising the steps of:

(a) injecting a first plastic material into the mold cavity so that only a part of the mold cavity is filled;

(b) cooling the injected first plastic material in the mold cavity;

(c) injecting subsequent to injecting the first plastic material, a second plastic material into the mold cavity so that the

cooled injected first plastic material extending between the core section and the cavity section in said part of the mold cavity is sufficiently solidified to stabilize the core section in relation to the cavity section by impeding movement of the core section in relation to the cavity section caused by injecting the second plastic material, whereby the injected second plastic material fills the mold cavity; and

(d) cooling the injected plastic material in the mold cavity to thereby solidify the product;

the method being characterized by the following additional steps,

step (a) comprising the step of:

(e) continuing the injection of the first plastic material by the second plastic material without intermission;

step (b) comprising the step of:

(f) cooling a portion of the first plastic material so that it is at least partially solidified and so that another portion of the first plastic material remains fluid;

step (c) comprising the step of:

(g) injecting the second plastic material so that the second plastic material displaces some of the fluid first plastic material to thereby provide at least one flow path for the second plastic material to fill the mold cavity and so that some of the at least partially solidified first plastic material stabilizes the core section in relation to the cavity section.

CONTAINER WITH A UNITARY CLOSURE AND METHOD FOR MAKING SAME

Bruce M. Mueller, Crystal Lake, Ill., assignor to Seaquist Closures, Crystal Lake, Ill.

Filed Apr. 6, 1989, Ser. No. 334,301

Int. Cl.[4] B29C *49/06*; **B65D** *55/16*

U.S. Cl. 264—537 **5 Claims**

1. A method for forming a container having a unitary hollow receptacle and closure comprising the sequential steps of:

(A) molding a preform of thermoplastic material, said molding of the preform including the injection molding of (1) a hollow body, (2) a closure base at one end of said hollow body to define an opening into said hollow body, and (3) a closure cover complementary to and spaced from said closure base opening but connected to said closure base to permit said closure cover to be swung about an axis between (1) a closed position engaged with said closure base for occluding said opening and (2) an open position disengaged from said closure base in the region over said opening when a substance is to be loaded into, or dispensed out of, said opening, said injection molding including providing an initially open assembly of first mold parts including a core and an open split mold having spaced-apart injection mold halves adapted to be positioned about said core relative to an injection mold parting plane, each said injection mold half being movable along a common line of action away from the other mold half to an open position and being movable along said common line of action toward the other mold half to a closed position in which said closed injection mold halves define a flow channel gate and a communicating forming cavity for said preform hollow body, closure base, and closure cover, said core including a first projecting core portion for defining the inside surfaces of said preform hollow body and closure base and having a second projecting core portion for defining the inside surfaces of said closure cover, said injection molding further including subsequently closing said injection mold halves about said first and second projecting core portions and injecting said thermoplastic material through said flow channel gate to mold said preform hollow body, closure base, and closure cover together from a single injection of said material, each said complementary closure base and closure cover being of completed finish, shape, and size upon the completion of step (A); and

(B) after the completion of step (A), blow molding said preform hollow body to form said hollow receptacle extending from said closure base and having a configuration different than said preform hollow body, said blow molding step including (1) providing second mold parts in the form of a blow molding assembly of split blow mold halves initially positioned in an open position about said preform hollow body relative to a blow mold parting plane which has the same planar orientation with respect to said preform as does the injection mold parting plane and, (2) closing said blow mold halves by moving them in opposing directions perpendicular to the blow mold parting plane and parallel to the directions of movement of said injection mold halves.

5,008,067

METHOD OF DOWNHOLE NEUTRON MONITORING

John B. Czirr, 1830 E. 400 North, Mapleton, Utah 84663

Continuation of Ser. No. 76,508, Jul. 22, 1987, abandoned. This application Mar. 7, 1990, Ser. No. 492,395

Int. Cl.[5] G01T *3/00*; **G01V** *5/00*; **G21G** *1/06*

U.S. Cl. 376—159 **2 Claims**

1. A method of downhole monitoring neutrons emanating from a pulsed-type neutron source, said neutron source having beam-on and beam-off time periods and positioned in a downhole apparatus comprising the steps of:

(a) using an oxygen containing scintillating material in a detector to monitor neutrons from said neutron source by generating scintillator light as a function of electrons and gamma rays emitted from the product of the ^{16}O (n,p) reaction, said neutron source emitting neutrons having energies greater than 11 MeV;

(b) positioning said detector in said downhole apparatus and within a borehole surrounded by a formation to be studied;

(c) reducing the effects of background gamma radiation from the ^{16}O (n,p) reaction occurring in the formation surrounding said detector by:

(1) setting the bias level of said detector to an energy level of at least 6.7 MeV; and

(2) after setting the bias level, and during the beam-off time period of said neutron source, measuring the combined energy deposition within said scintillating material from both said electrons and said gammas which equals or exceeds said 6.7 MeV bias level, said scintillating material generating scintillator light corresponding to said combined energy deposition;

(d) converting the generated scintillator light to an electrical signal; and

(e) using the electrical signal to record the flux of said neutrons from said neutron source.

U.S. Cl. 376—230 **15 Claims**

1. In a nuclear reactor plant, the combination comprising

a pressure vessel for receiving a coolant;

a reactor core in said vessel including a plurality of vertical fuel elements containing fissile material;

tubular vertically movable control rods between said fuel elements, each rod having a coaxial blind bore therein;

absorber plates secured to said control rods and extending between said fuel elements;

a plurality of fixed hollow guide rods, each guide rod being disposed within said bore of a respective control rod to define a first pressure chamber between an upper end of said guide rod and said respective control rod and a first annular gap therebetween communicating said chamber with an interior of said pressure vessel;

a plurality of vertical spindles, each spindle being secured to and within a respective control rod and depending into a respective guide rod to define a second pressure chamber below a lower end of said spindle within said guide rod and a second annular gap communicating said second chamber with said first chamber;

a first restrictor in said first gap to restrict a flow of coolant therethrough;

a second restrictor in said second gap to restrict a flow of coolant therethrough;

conveying means for delivering a flow of pressurized coolant from within said vessel into said second pressure chamber below each respective spindle to vertically move said control rod connected thereto relative to said fuel elements; and

control means for producing pressure surges in said second pressure chamber.

METHOD FOR PRODUCING IMPROVED TUNGSTEN NICKEL IRON ALLOYS

James R. Spencer, Sayre, and James A. Mullendore, Towanda, both of Pa., assignors to GTE Products Corporation, Stamford, Conn.

Division of Ser. No. 140,504, Jan. 4, 1988, abandoned. This application Nov. 25, 1988, Ser. No. 275,820
Int. Cl.[5] B22F *3/24*
U.S. Cl. 419—28 1 Claim

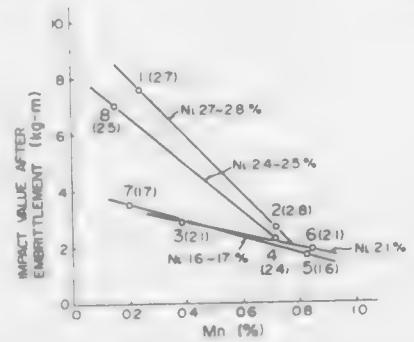
1. A process for producing rolled sheets of tungsten heavy metal alloy having improved tensile elongation comprising:

(a) forming a relatively uniform blend of elemental metal powders, wherein the blend consists essentially of 93% by weight of tungsten, balance nickel and iron in essentially an 8:2 weight ratio of nickel to iron,

(b) pressing the powder to form a green body in the shape of a bar,

(c) sintering the green body in a reducing atmosphere at a temperature below about 1425° C. for a time sufficient to achieve a partially dense body containing sufficient strength to enable handling, and

(d) sintering the partially dense body to full density and a microstructure consisting essentially of rounded tungsten grains in a continuous second phase containing iron and nickel by liquid phase sintering in a reducing atmosphere at temperature sufficiently elevated and above the melting point of both iron and nickel to achieve liquid phase sintering, said temperature being in the range of from about 1540–1545° C. said sintering of said partially dense body forming a resulting sintered body, and



(e) forming rolled sheets from said resulting sintered body wherein said rolled sheets has a tensile elongation of about 25 percent.

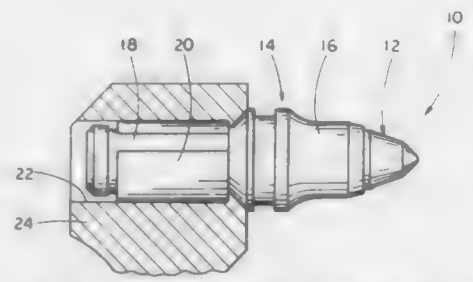
U.S. Cl. 420—69 15 Claims



1. A heat resistant steel containing 0.05 to 0.2 wt. % of C, less than 0.5 wt. % of Si, less than 0.6 wt. % of Mn, 8 to 13 wt. % of Cr, 1.5 to 3 wt. % of Mo, 2.2 to 3 wt. % of Ni, 0.05 to 0.3 wt. % of V, 0.02 to 0.2 wt. % in total of either or both of Nb and Ta, 0.02 to 0.1 wt. % of N, a ratio (Mn/Ni) of said Mn to Ni being less than 0.11, and the balance substantially Fe.

5,008,073

MN-B STEEL ALLOY COMPOSITION

Mark S. Greenfield, Cary, N.C., assignor to Kennametal Inc., Latrobe, Pa.

Division of Ser. No. 39,208, Apr. 16, 1987, Pat. No. 4,886,710.
This application Sep. 8, 1989, Ser. No. 404,703
Int. Cl.[5] C22C *38/02*
U.S. Cl. 420—121 2 Claims

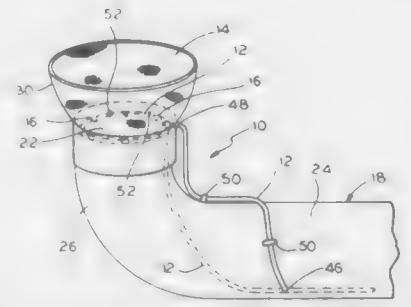
1. In a Mn-B steel alloy composition, the alloy content is percents by weight consisting essentially of: carbon, 0.33–0.38; manganese, 1.10–1.35; boron, 0.0005 minimum up to an effective amount to improve hardenability; silicon 0.15–0.30; sulfur, 0.045 maximum; and phosphorus, 0.035 maximum, wherein said composition has a minimum hardenability of 47 Rockwell C at the Jominy 6/16 position and a maximum as-rolled hardness of 22 Rockwell C such that without anneal said composition meets hardenability and machinability requirements that make it useful for fabricating mining and construction bit bodies of all sizes.

5,008,074

INOCULANT FOR GRAY CAST IRON

Rodney L. Naro, Worthington, Ohio; James M. Csonka, Valencia, Pa., and Michael A. Merritt, New Haven, W. Va., assignors to American Alloys, Inc., New Haven, W. Va.

Filed Apr. 26, 1990, Ser. No. 514,871
Int. Cl.[5] C22C *33/00*
U.S. Cl. 420—578 5 Claims



1. An inoculating alloy for gray iron, said alloy consisting essentially of 65.0–70.0% silicon, 8.0–10.0% titanium, 0 to 5% manganese, 2.0–2.5% barium, 1.0–1.5% calcium, 0 to 1.5% aluminum, the balance being iron and incidental impurities.

5,008,075

PREVENTATIVE MAINTENANCE SYSTEM FOR UNDERWATER PIPES

Paul G. Rufolo, 149 Gregory St., Mt. Prospect, Ill. 60056

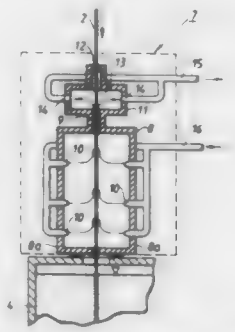
Continuation-in-part of Ser. No. 464,958, Jan. 16, 1990, abandoned. This application Feb. 13, 1990, Ser. No. 479,337
Int. Cl.[5] B08B *17/02*
U.S. Cl. 422—6 33 Claims

1. An apparatus for the unattended dispersement of chemicals to be mixed into a flowing liquid passing into an underwater pipe, said apparatus comprising a first chemical feed pipe, a second chemical feed pipe, and a water intake pipe, said feed pipes being mounted to said intake pipe and said intake pipe forming part of said underwater pipe, said first feed pipe extending along the length of said intake pipe and being connected to said second feed pipe, said second feed pipe being mounted to said intake pipe at that portion of said intake pipe adjacent an intake opening of said pipe, said second feed pipe including a plurality of dispensing valves extending closely adjacent an entrance of said intake pipe to release chemicals in an unattended manner directly into liquid passed into said intake pipe, sufficient to dispense toxic chemicals substantially throughout the length of said pipe and onto organisms within said pipe, said chemicals being delivered to said second feed pipe through said first feed pipe.

5,008,076

METHOD AND AN ARRANGEMENT FOR THE PRETREATMENT OF A MOVING MATERIAL WEB

Göran Johansson, Harlösa, and Pär Olanders, Lund, both of Sweden, assignors to Roby Teknik Aktiebolag, Lund, Sweden



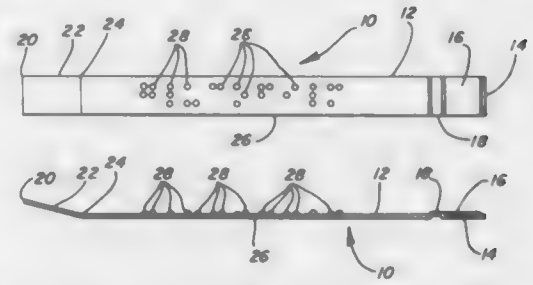
Filed May 3, 1989, Ser. No. 346,658
Claims priority, application Sweden, May 31, 1988, 8802019
Int. Cl.[5] A61L *2/00*
U.S. Cl. 422—28 15 Claims

1. A method for sterilization of a moving material web comprising the steps of:

providing a deep bath containing sterilization liquid heated to a predetermined temperature;

guiding the material web into and out of the bath in a continuous manner; and

applying heat to the material web prior to its entry into the bath containing the heated sterilizing liquid by advancing, the material web through a heating chamber to raise the



temperature of the material web to a temperature that is at least equal to said predetermined temperature.

5,008,077

EASY HANDLING REAGENT STRIP

Mohammad A. Kheiri, Elkhart, Ind., assignor to Miles Inc., Elkhart, Ind.

Filed Dec. 26, 1989, Ser. No. 457,106
Int. Cl.[5] G01N *31/22*
U.S. Cl. 422—56 7 Claims

1. A reagent strip, comprising:

an elongated carrier,

a diffusion reagent area on a first portion of said elongated carrier, and

an elongated handle constituting a second portion of said elongated carrier;

wherein said elongated handle includes at least one projection extending downwardly from said plane to render said reagent strip susceptible to tipping on a flat surface.

5. A method of forming a reagent strip, comprising the steps of:

forming an elongated planar carrier defining a body of a reagent strip, said elongated planar carrier having a first end portion and a second end portion;

securing a dry reagent pad to said first end portion of said elongated planar carrier; and

forming at least one projection on said second end portion to extend downwardly from the plane of said elongated planar carrier to render the reagent strip susceptible to tipping on a flat surface.

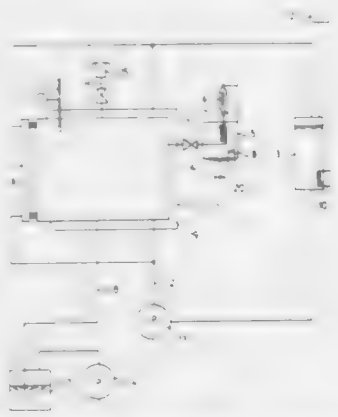
5,008,078

INTEGRAL MULTI-LAYER ANALYSIS ELEMENT

Nakatsugu Yaginuma, and Takaki Arai, both of Saitama, Japan, assignors to Fuji Photo Film Co., Ltd., Kanagawa, Japan

Filed Apr. 18, 1988, Ser. No. 182,707
Claims priority, application Japan, Apr. 16, 1987, 62-94138
Int. Cl.[5] G01N *31/22*
U.S. Cl. 422—56 7 Claims

1. A multi-layer analysis element comprising an endogenous ammonia trapping layer, an ammonia producing layer comprising a reagent capable of reacting with an ammonia producing



substance to produce gaseous ammonia, and at least one layer essentially incapable of trapping ammonia and essentially incapable of producing ammonia and capable of preventing the diffusion of gaseous ammonia, disposed between said endogenous ammonia trapping layer and said ammonia producing layer.

5,008,079

APPARATUS AND METHOD FOR STERILIZING OR DISINFECTING OBJECTS

Peter Wutzler; Horst Mücke, both of Erfurt, German Democratic Rep., and Lauri Santasalo, Helsinki, Finland, assignors to OY Santasalo-Sohlberg AB, Finland

Filed Jan. 19, 1989, Ser. No. 299,968
Claims priority, application Finland, Jan. 19, 1988, 880221
Int. Cl.[5] A61L *2/18*
U.S. Cl. 422—28 **13 Claims**

1. Method for sterilizing or disinfecting instruments in a closed chamber, comprising

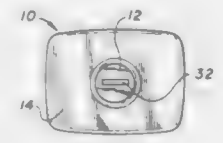
carrying out said disinfecting or sterilizing with an organic peracid in a concentration of more than about 7 up to about 50% in aqueous solution, said organic peracid being a powerful oxidizing agent and wherein said disinfecting or sterilizing is additionally carried out with a quantity of agent of about 1 to 100 mg per liter of chamber volume.

5,008,080

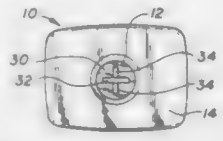
SOLID-PHASE ANALYTICAL DEVICE AND METHOD FOR USING SAME

William E. Brown, III, Grayslake; Sarah E. Safford, Libertyville, and John M. Clemens, Gurnee, all of Ill., assignors to Abbott Laboratories, Abbott Park, Ill.

Continuation of Ser. No. 173,979, Mar. 28, 1988, Pat. No. 4,916,056, which is a continuation-in-part of Ser. No. 831,013, Feb. 18, 1986, abandoned, which is a continuation-in-part of Ser. No. 784,416, Oct. 4, 1985, abandoned. This application Feb. 6, 1990, Ser. No. 475,591
This portion of the term of this patent subsequent to Apr. 10, 2007, has been disclaimed.
Int. Cl.[5] G01N *31/22, 33/58*
U.S. Cl. 422—56 **12 Claims**



1. A solid phase assay device for use in a binding assay to determine the presence or amount of an analyte in a fluid sample through the use of a label capable of producing a detectable response, said device comprising a reaction site having:

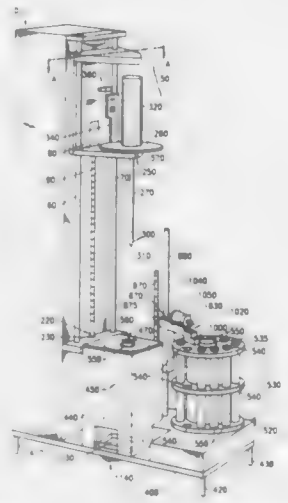


a negative control area,

a positive control area within said negative control area containing immobilized binding reagent for said label, and

an analyte binding area within said negative control area containing immobilized binding reagent for analyte in the sample,

said positive control area being shaped such that, in the presence or absence of analyte in the sample, a minus symbol is displayed representing a negative result of a valid assay, and



said analyte binding area being shaped such that, taken together with said minus symbol in the presence of said label and analyte, a plus symbol is formed representing a positive result of a valid assay.

5,008,081

METHOD AND APPARATUS FOR AUTOMATIC MELT INDEXING

David A. Blau, Cupertino; John Meadows; Thomas M. Sherlock, both of Los Altos Hills; Fred Stengel, Redwood City; Robert M. Studholme, Saratoga; Kenneth R. Wada, and Christopher J. Kepner, both of San Jose, all of Calif., assignors to KD Group, Mountain View, Calif.

Filed Oct. 11, 1988, Ser. No. 256,022
Int. Cl.[5] G01N *35/00*
U.S. Cl. 422—64 **11 Claims**

1. An apparatus for automatically carrying out a melt indexing test relating to a substance, comprising:

a plurality of cartridges, where each cartridge includes a bore for receiving a quantity of the substance to be tested and further includes a plug disposed at a first end of the bore, with each plug having an orifice;

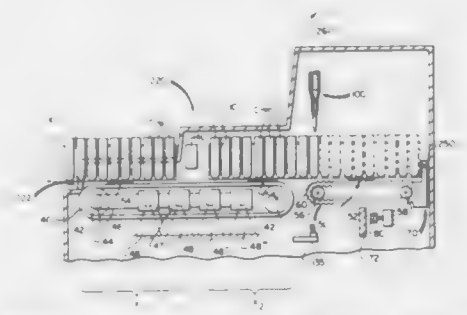
a piston adapted for placement within said each said bore of said cartridges, each said piston for resting adjacent said quantity of the substance;

a heater having a receptacle for receiving a cartridge and for heating the cartridge and the substance within the cartridge, for melting the substance, thus forming a resin;

means for holding said plurality of cartridges;

means for grasping each cartridge and transferring the cartridge to the receptacle;

means for applying a force to said piston for tamping the substance when the substance is in a solid state and for driving said resin through said orifice as an extrudate; and



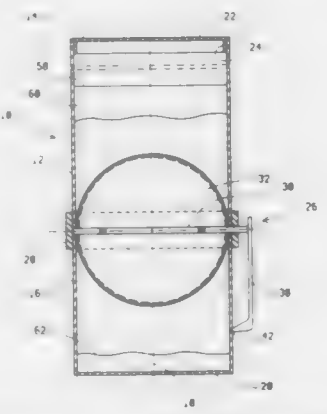
processor means having a memory for storing a predetermined sequence of commands relating to the melt index test, for automatically controlling said holding means, said grasping and transferring means, and said force applying means.

5,008,082

ANALYZERS USING LINEAR SAMPLE TRAYS WITH RANDOM ACCESS

James D. Shaw, Hilton, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.

Filed Aug. 25, 1988, Ser. No. 236,588
Int. Cl.[5] G01N *35/02, 35/04, 35/06*
U.S. Cl. 422—65 **11 Claims**



1. In an analyzer comprising supply means for supplying patient sample, aspirating and dispensing means for aspirating sample from said supply means and dispensing sample onto a test element, supply means for supplying test elements, and means for moving said aspirating and dispensing means in the analyzer relative to said supply means along a predetermined path and into operative association with said sample and a test element, respectively; the improvement wherein said supply means comprise (a) a plurality of trays each comprising means for holding a plurality of sample containers in a linear array, (b) a separate linear track for each of said trays, in which said trays are mounted, and (c) means for reciprocating each of said trays within its respective track and positioning each of said trays so that each said tray intersects said path of said aspirating and dispensing means.

5,008,083

APPARATUS FOR CENTRIFUGAL SEPARATION OF COAL PARTICLES

William Dickie, New Eagle; Joseph A. Cavallaro, Mt. Keesport, and Richard P. Killmeyer, Pleasant Hills, all of Pa., assignors to The United States of America as represented by the United States Department of Energy, Washington, D.C.

Filed Aug. 30, 1988, Ser. No. 238,213
Int. Cl.[5] B01L *11/00;* **B65D** *25/06;* **B03B** *5/32*
U.S. Cl. 422—101 **5 Claims**

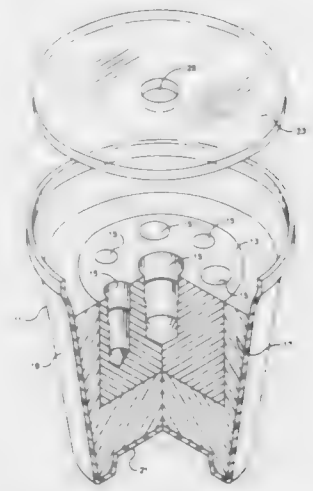
1. Apparatus for separating by centrifugation relatively high density particles from relatively low density particles suspended in a solution which includes a liquid having a density intermediate of the densities of the high and low density particles comprising:

a cell configured for placement in a centrifuge having a lower portion in which the high density particles reside and form a sink layer when they are separated from the low density particles, an upper portion in which the low density particles reside and form a float layer after separation from the high density particles, a central portion between said lower portion and said upper portion, and an open top;

means for selectively sealing and unsealing said open top to prevent hazardous fumes from escaping;

means for selectively isolating the sink layer from the float layer when said top is sealed, without unsealing said top, and without disturbing either layer;

means for locking for maintaining the isolating means in an open position; and



said isolating means including a rod extending horizontally through the cell, and a closure means secured to the rod.

5,008,084

INSULATED CONTAINER FOR BIOLOGICAL SAMPLES

Louis E. Kelley, Wyncote, Pa., assignor to Instruments for Research and Industry I[2]R, Inc., Cheltenham, Pa.

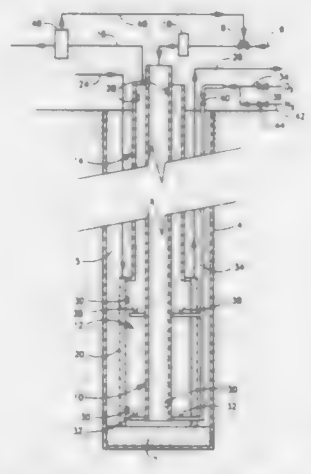
Filed Aug. 13, 1990, Ser. No. 565,939
Int. Cl.[5] B01L *3/00*
U.S. Cl. 422—102 **10 Claims**

1. An insulated container comprising a container having a central metal core, said core having a multiplicity of drilled holes constructed so as to receive a multiplicity of microfuge tubes in said core and foamed thermal insulation surrounding said core.

5,008,085

APPARATUS FOR THERMAL TREATMENT OF A HYDROCARBON STREAM

Richard L. Bain, Golden, and John R. Larson, Boulder, both of Colo., assignors to Resource Technology Associates, Tulsa, Okla.



Continuation-in-part of Ser. No. 58,878, Jun. 5, 1987, Pat. No. 4,818,371. This application Mar. 31, 1989, Ser. No. 332,508
Int. Cl.[5] G05D *7/00*
U.S. Cl. 422—109 **3 Claims**

1. A vertical tube reactor apparatus disposed within a substantially vertical well bore, said apparatus being suitable for reducing the viscosity of hydrocarbons, said apparatus comprising:

(a) an influent conduit in fluid communication with an efflu-

ent conduit comprising concentrically arranged inner and outer conduits, each having an upper and a lower zone, wherein said influent conduit is said inner conduit and said effluent conduit is said outer conduit, said influent conduit adapted to receive an influent hydrocarbon stream and conduct said influent stream substantially downward, and said effluent conduit adapted to conduct an effluent product stream substantially upward, wherein said conduits provide heat-exchange contact between influent stream and said effluent product stream to produce a heated influent stream;

(b) an oxidant injection nozzle located within said effluent conduit so as to introduce oxidant into the core portion of said heated influent stream substantially parallel to the flow of said stream to produce an effluent product stream,

(c) means for sensing temperature located within at least one of said lower zones downstream from said nozzle, said means producing an output proportional to said temperature;

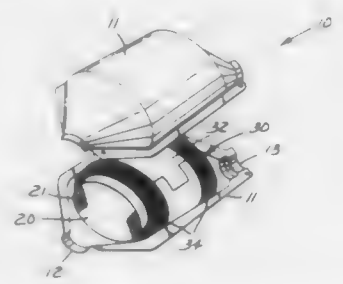
(d) a conduit extending to the surface of the well bore and being connected to the nozzle for conducting oxidant from the surface of the well bore to said nozzle, said oxidant conduit including a flow metering means and being located within said well bore and travelling substantially parallel to said influent and effluent conduits, and,

(e) a means for controlling the flow rate of said oxidant within said oxidant conduit, said control means being operatively associated with said metering means and said temperature sensing means so as to be responsive to the output from said temperature sensing means and adjust said oxidant flow rate in a preselected proportion to said output.

5,008,086

EROSION RESISTANT MOUNTING COMPOSITE FOR CATALYTIC CONVERTER

Richard P. Merry, White Bear Lake, Minn., assignor to Minnesota Mining and Manufacturing Company, St. Paul, Minn.



Filed Oct. 28, 1988, Ser. No. 263,683

Int. Cl.[5] B01D *50/00*

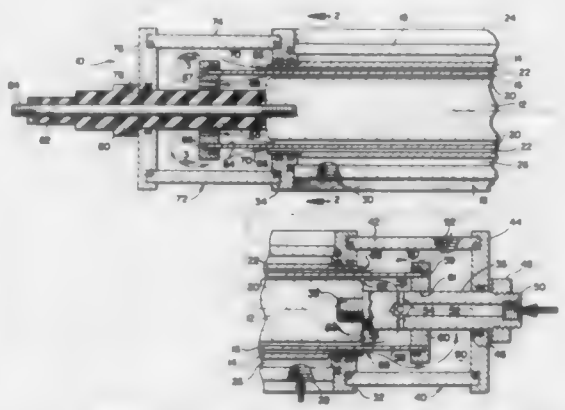
U.S. Cl. 422—180 **18 Claims**

1. An improved catalytic converter including a metallic casing, a ceramic catalytic element disposed within the casing, and a mounting composite disposed between the catalytic element and the metallic casing for positioning the catalytic element within the casing and for absorbing mechanical and thermal shock, said mounting composite comprising a resilient, flexible, high temperature resistant intumescent mounting mat having a lateral edge, wherein the improvement comprises:

a strip of metal fabric positioned between at least a portion of the lateral edge of said mounting mat and said casing so to

cover the lateral edge in order to prevent erosion of said mounting composite.

5,008,087



OZONE GENERATOR APPARATUS AND METHOD

Douglas R. Batchelor, Chicago, Ill., assignor to American Ozone Systems, Inc., Chicago, Ill.

Filed Jun. 6, 1990, Ser. No. 534,035

Int. Cl.[5] B01J *19/08*

U.S. Cl. 422—186.22 **13 Claims**

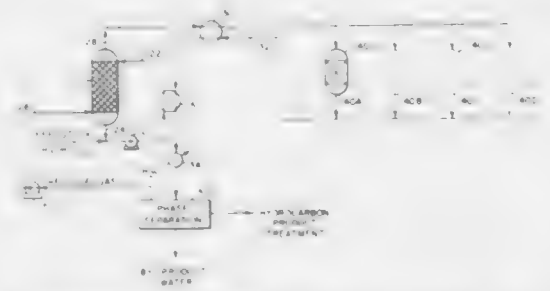
1. In a tubular type ozone generator having elongated inner and outer concentrically spaced electrodes with an elongated tubular dielectric member spaced between the electrodes for developing ozone from a gas, the improvement comprising:

means for supplying said gas under pressure between one of the electrodes and the dielectric member and enabling said gas to traverse the space therebetween from a first end of the ozone generator to a second end of the ozone generator for developing ozone;

sealing means at the second end of said ozone generator for receiving all of said gas and the developed ozone and directing same to the space between said dielectric member and the other of said electrodes and enabling said gas and ozone to pass therebetween from said second end of the ozone generator to said first end for developing more ozone; and

ozone outlet means at said first end for communicating ozone from said ozone generator.

5,008,088



METHANOL-GAS SATURATOR FOR CATALYTIC CONVERSION SYSTEM

Dietmar R. A. Fremuth, Plainsboro, N.J.; Alan E. Rogers, Wycombe, Pa., and John C. Zahner, Princeton, N.J., assignors to Mobil Oil Corporation, New York, N.Y.

Division of Ser. No. 484,656, Apr. 13, 1983, Pat. No. 4,808,764. This application Jul. 13, 1988, Ser. No. 218,184

Int. Cl.[5] B01J *8/00*

U.S. Cl. 422—234 **7 Claims**

1 A reactor system for catalytically converting methanol to gasoline boiling range hydrocarbons by contacting methanol in a gaseous stream with an acid medium pore crystalline zeolite catalyst in a reaction zone comprising:

(a) means for feeding a heated liquid methanol feedstream to a multi-phase gas-liquid saturator contact unit at an inlet temperature substantially below the feedstock boiling point under superatmospheric process pressure;

(b) means for contacting the feedstock in a contact tower with sufficient compressed recycle gas from the reactor system to partially vaporize feedstock, thereby forming a gaseous methanol-recycle stream, said contact tower having an upper liquid reactant feedstream inlet above a counter-current contact section, a lower recycle gas inlet, an upper gas outlet for removing vaporized methanol in mixture with recycle gas, and a lower liquid outlet for unvaporized methanol, whereby vaporized methanol can enter the reaction zone only with recycle diluent gas;

(c) adiabatic reactor means for contacting a heated gaseous methanol-recycle stream directly with a fixed catalyst bed in the reaction zone to convert methanol to gasoline hydrocarbon product and a gaseous by-product;

(d) means for cooling reactor system effluent in heat exchange relationship with the liquid methanol feedstream to heat the liquid methanol and recover liquid hydrocarbon product;

(e) separator means for separating gaseous by-product from the liquid hydrocarbon product; and

(f) means for compressing and recycling gaseous by-product from separator means (e) to reactor means (b).

5,008,089

RECOVERY OF ALUMINA FROM BAUXITE

Gillian M. Moody, Brighouse, and Christine A. Rushforth, Bradford, both of England, assignors to Allied Colloids Limited, Great Britain

Filed Oct. 13, 1989, Ser. No. 421,165

Claims priority, application United Kingdom, Oct. 14, 1988, 8824176

Int. Cl.[5] C01F *7/06*

U.S. Cl. 423—121 **15 Claims**

1 In a process in which bauxite is digested in an aqueous alkaline liquor and the resultant red mud is flocculated with a flocculating agent and separated from the digestion liquor in a primary separation stage, the overflow liquor of the primary separation stage is optionally subjected to a secondary clarification stage in which suspended red mud particles are flocculated and separated from the liquor, and the red mud from the said primary separation stage and optional secondary clarification stage is then washed in a plurality of sequential wash stages in each of which the mud is washed with a wash liquor, flocculated with a flocculating agent and separated from the wash liquor, and the flocculating agent in at least one stage selected from the said primary separation stage, secondary clarification stage and the wash stages comprises a synthetic anionic polymeric flocculant, the improvement wherein the flocculating agent further comprises at least about 0.02 mg/l of a dextran having a molecular weight of at least about 500,000, wherein said synthetic anionic polymeric flocculant has a molecular weight of at least about 0.5 million, and is a water soluble polymer formed from 40–100% anionic monomer and 60–0% non-ionic monomer, and wherein the anionic monomer is selected from the group consisting of (meth) acrylic acid, (meth) allylsulfonic acid, vinyl sulfonic acid and 2-acrylamido-2-methyl propane sulfonic acid.

5,008,090

CATALYTIC PROCESS FOR MINIMIZING THE H_2S EMISSIONS FROM AUTOMOTIVE EXHAUST

George C. Joy, III, Arlington Heights; George R. Lester, Park Ridge, and Richard E. Marinangeli, Arlington Heights, all of Ill., assignors to Allied-Signal Inc., Morris Township, Morris County, N.J.

Continuation-in-part of Ser. No. 62,024, Jun. 15, 1987, Pat. No. 4,760,044. This application May 23, 1988, Ser. No. 197,172

Int. Cl.[5] B01D *47/00;* **B01J** *8/02*

U.S. Cl. 423—212 **18 Claims**

1. A method of minimizing the formation of hydrogen sulfide when automotive exhaust is contacted with a catalytic composite comprising contacting said exhaust with a catalytic composite comprising a mixture of (1) a primary refractory inorganic oxide support having dispersed thereon at least one of a first active component selected from the group consisting of rare-earth oxides and (2) a secondary refractory inorganic oxide support selected from the group consisting of zirconia, titania, ceria, silica, magnesia, natural and synthetic zeolites having dispersed thereon at least one of a second active component which is an oxide of a metal, the metal selected from the group of metals which form a stable sulfide under fuel rich conditions, said second active component which is dispersed on the secondary support before formation of the mixture to effect a separation between the second active component and the primary support, and said mixture having at least one main catalytic metal selected from the group consisting of platinum, palladium, rhodium, ruthenium and iridium deposited thereon.

5,008,091

METHOD FOR PURIFYING AIR

Pawan K. Bassi, Benicia, Calif.; Kenneth C. Eastwell, Penticton, Canada; James S. Goudey, Calgary, Canada, and Mary E. Spencer, Edmonton, Canada, assignors to Governors of the University of Alberta, Edmonton, Canada

Filed Nov. 29, 1988, Ser. No. 277,254

Int. Cl.[5] B01J *8/00;* **C07C** *11/24;* **B01D** *47/00*

U.S. Cl. 423—245.1 **9 Claims**

1. A method of removing low molecular weight hydrocarbons selected from the group consisting of methane, ethane and ethylene from air, comprising the steps:

(a) preheating the air;

(b) passing the preheated air through a heated catalytic bed comprising a mixture of platinized, heat-conductive pellets and metal turnings, the volume ratio of metal turnings to platinized pellets lying between about 1:2 and about 2:1; and

(c) the bed being contained in an annular space defined between two substantially vertically oriented and substantially concentric tubes made of heat-conductive material, having heating means applied against the exterior of the outermost tube, in which step (a) is performed by passing the air downwardly through the innermost of the two tubes to the bottom thereof, and in which step (b) is performed by passing the air upwardly through the bed between the tubes.

5,008,092

HOMOGENEOUS POWDERS OF YTTRIUM-STABILIZED QUADRATIC ZIRCONIA

Azzdddine Samdi, Casablanca; Rene Paris, Lyons, and Marc Roubin, Meyzieu, all of France, assignors to Rhone-Poulenc Chimie, Courbevoie, France

Filed Sep. 29, 1988, Ser. No. 250,835
Claims priority, application France, Sep. 29, 1987, 87 13421
Int. Cl.[5] C01F 17/00
U.S. Cl. 423—263 23 Claims

1. A process for the preparation of a homogeneous powder of yttrium-stabilized, substantially quadratic zirconia, comprising (a) adjusting the pH of a mixed aqueous solution of zirconyl and yttrium acetates to a value of at least 5 so as to form a soluble mixed acetate of yttrium and zirconium, (b) eliminating solvent from such mixed aqueous solution so as to produce a solid residue of zirconium/yttrium acetate, and (c) pyrolyzing the solid residue resulting from said step (b) so as to produce a homogeneous powder of yttrium-stabilized, substantially quadratic zirconia.

5,008,093

ANHYDROUS COMPLEXES OF PVP AND HYDROGEN PEROXIDE

John J. Merianos, Middletown, N.J., assignor to GAF Chemicals Corporation, Wayne, N.J.

Filed Nov. 8, 1989, Ser. No. 434,943
Int. Cl.[5] C01B 15/01
U.S. Cl. 423—272 14 Claims

1. A high purity product which is stable complex of PVP and H_2O_2 in a molar ratio of between about 2:1 and about 1:1, respectively, and which is obtained directly as a uniform, free-flowing, fine, white powder with essentially little or no water or free hydrogen peroxide contained therein by reaction in a substantially anhydrous solvent between PVP and H_2O_2 in substantially the molar ratio predetermined for the complex and removing the solvent therefrom.

5. An anhydrous process of preparing a substantially anhydrous complex of PVP and H_2O_2 which is a uniform, fine white powder comprising reacting PVP and H_2O_2 in an anhydrous organic solvent.

5,008,094

CRYSTALLINE (METALLO)SILICATES AND PROCESS FOR PREPARING SUCH (METALLO)SILICATES

Johannes J. Keijsper; Munro Mackay, and Martin F. M. Post, all of Amsterdam, Netherlands, assignors to Shell Oil Company, Houston, Tex.

Filed Aug. 28, 1989, Ser. No. 399,189
Claims priority, application United Kingdom, Sep. 9, 1988, 8821237
Int. Cl.[5] C01B 33/34
U.S. Cl. 423—328 12 Claims

1. A crystalline (metallo)silicates having in the as-synthesized, anhydrous form a molar composition expressed by the formula:

$$(0\text{–}9)M_{2/n}O\ (4\text{–}9)R_2)\cdot 100SiO_2\ (0\text{–}2)Al_2O_3,$$

wherein M represents an alkali or alkaline earth metal ion of valency n R represents a tetremthylammonium cation, and having an X-ray diffraction pattern containing at least the following lines:

d(A)	Intensity

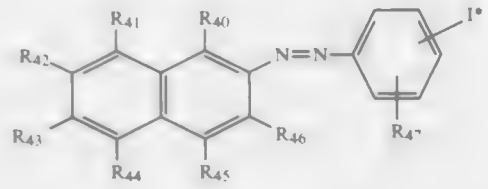
METHOD OF COMBUSTION NEUTRALIZATION OF LIQUID WASTE PRODUCTS

Mikhail Bernadiner, ulitsa Bakuleva, 12, kv. 24, and Vladimir V. Zhizhin, ulitsa Pervomaiskaya, 10, korpus 1, kv. 30, both of Moscow, U.S.S.R.

PCT No. PCT/SU87/00073, § 371 Date Mar. 1, 1988, § 102(e) Date Mar. 1, 1988, PCT Pub. No. WO88/00671, PCT Pub. Date Jan. 28, 1988
PCT Filed Jun. 19, 1987, Ser. No. 228,755
Claims priority, application U.S.S.R., Jul. 14, 1986, 4080495
Int. Cl.[5] F23C 5/00; F27B 3/22; C01B 7/00; F23G 7/00
U.S. Cl. 423—659 8 Claims

1. In a method of combustion neutralization of liquid waste products containing organohalides, comprising treating said liquid waste products with an alkali reagent, introducing the resulting mixture in the form of a spray along a path into a stream of high-temperature fuel combustion products and subsequently removing the exhaust gases, the improvement which comprises introducing sprayed water between the stream of the combustion products and the path of the sprayed mixture, the sprayed water consumption being no less than 1.2 kg per kg of said mixture of waste products with the alkali reagent and no more than 2.5 kg per kg of the fuel being used.

5,008,099



AMYLOIDOSIS AND ALZHEIMER'S DISEASE DIAGNOSTIC ASSAY AND REAGENTS THEREFOR

Steven C. Quay, Los Altos Hills; Scott M. Rocklage, Saratoga, and Warren K. Miller, Cupertino, all of Calif., assignors to Salutar, Inc., Sunnyvale, Calif.

Division of Ser. No. 178,402 Apr. 6, 1988 which is a continuation-in-part of Ser. No. 35,837 Apr. 8, 1987, abandoned.
Int. Cl.[5] A61K 49/02; C07C 245/00
U.S. Cl. 424—1.1 23 Claims

1. An amyloid binding diazo compound of Formula III or Formula IV or a water-soluble non-toxic salt thereof:

(III)

wherein:

I^* is a radioactive iodine moiety;

R_{40} R_{41} are hydrogen hydroxy or amino, and R_{40} and R_{41} are not the same group;

R_{42}, R_{43}, R_{44}, R_{45} and R_{46} are sulfo; and sulfo is not present on adjacent carbons, and

R_{47} is hydrogen, methyl or carboxy.

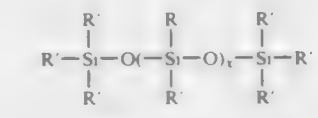
5,008,100

OIL-IN-WATER EMULSIONS CONTAINING POLYETHYLENE

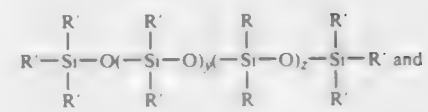
Julius R. Zecchino, Kinnelon, N.J.; Natrajan Krishnaswamy, Spring Valley, N.Y.; Pamela A. Clement, Clark, and Anthony Vargas, Mahwah, both of N.J., assignors to Elizabeth Arden Co., Division of Conopco, Inc., New York, N.Y.

Filed Aug. 11, 1989, Ser. No. 392,835
Int. Cl.[5] A61K 7/42
U.S. Cl. 424—59 9 Claims

1. A stable oil-in-water emulsion sunscreen composition comprising from about 20% by weight to about 80% by weight water, from about 0.5% by weight to about 20% by weight oil-in-water emulsion forming surfactants, from about 0.5% by weight to about 30% by weight propylene glycol myristyl ether acetate, from about 0.2% by weight to about 5% by weight polyethylene, from about 0.5% by weight to about 30% by weight sunscreen agents, from about 0.5% by weight to about 10% by weight absorbents selected from the group consisting of aluminum starch octenyl succinate and nylon, from about 0.1% by weight to about 10% by weight humectants, 0% to about 25% by weight skin compatible non-silicone oils and hydrocarbons, and 0% to about 30% by weight silicone oils.

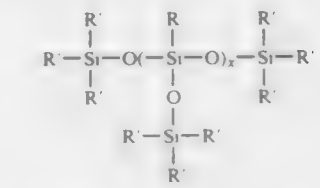


5,008,101



SUNSCREEN FORMULATION CONTAINING A PHENYL FUNCTIONAL ORGANOSILICON COMPOUND

Helen M. Klimisch, and Regina M. Malczewski, both of Midland County, Mich., assignors to Dow Corning Corporation, Midland, Mich.



Filed Dec. 5, 1989, Ser. No. 446,267
Int. Cl.[5] A61K 7/40, 7/42, 7/44
U.S. Cl. 424—59 21 Claims

1. A method of increasing the absorbance of ultraviolet light by ultraviolet light absorbing sunscreen compounds which are applied to skin to protect the skin from excessive exposure to sunlight comprising forming a mixture which includes at least one sunscreen compound and an effective amount of a phenyl functional siloxane, applying the mixture to the skin to be protected from excessive exposure to sunlight, and exposing the skin including the mixture of the sunscreen compound and the phenyl functional siloxane to light in the ultraviolet spectrum, the phenyl functional siloxane having the formula selected from the group consisting of

and

wherein R is a phenyl radical, R′ is an alkyl radical having from one to seven carbon atoms, x is an integer of from one to one thousand, x and y are integers the sum of which is between two and one thousand.

5,008,102

BIOCOMPATIBLE INTRAOCULAR LIGHT-SCREENING COMPOSITIONS AND METHODS OF INTRAOCULAR LIGHT SCREENING

Kenneth K. York, 2300 N. Edgemont, Los Angeles, Calif. 90027

Continuation-in-part of Ser. No. 833,896, Feb. 26, 1986, abandoned. This application Dec. 23, 1987, Ser. No. 137,247
Int. Cl.[5] A61K 7/40, 7/42
U.S. Cl. 424—59 10 Claims

1. A method of protecting ocular tissues such as, but not limited to, the lens, vitreous and retina of an eye from damage caused by light selected from the group consisting of ultraviolet light, short wavelength visible light, visible light, and infrared light, comprising placing intraocularly between the source of the light and said ocular tissues, in an amount sufficient to prevent a substantial amount of said light from reaching said tissues, a temporary light-absorbing or screening substance or composition substantially undamaging to intraocular eye tissues in an amount sufficient to absorb or screen said light, said substance or composition being adapted for elimination from

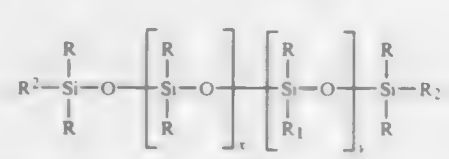
intraocular eye tissues over a relatively short period of time after said placement.

5,008,103

SILICONE SURFACTANTS

William J. Raleigh, Rensselaer; Raymond J. Thimineur, Scotia, and Anthony A. Zotto, Troy, all of N.Y., assignors to General Electric Company, Waterford, N.Y.

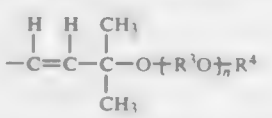
Filed Dec. 29, 1988, Ser. No. 291,909
Int. Cl.[5] A61K *7/32, 7/34, 7/38*
U.S. Cl. 424—66 1 Claim



1. An antiperspirant emulsion composition comprising (a) polar liquid, containing an aqueous solution of an antiperspirant salt as a discontinuous phase;

(b) a volatile liquid having a normal boiling point less than 250° C. as a continuous phase, said volatile liquid being selected from the group consisting of methylsiloxane fluids having the average unit formula

$$(CH_3)_aSiO_{(4-a)/2}$$



wherein a has an average value of from 2 to 3 inclusive and paraffinic hydrocarbon fluids;

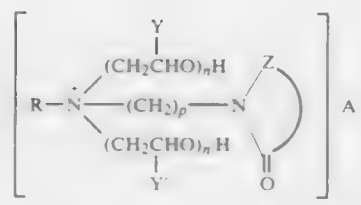
(c) a polysiloxane surface active agent comprising polymers of the formula (I):

(I)

wherein each R individually is chosen from the group consisting of alkyl having from 1 to 4 carbon atoms; R^1 is a polyoxyalkylene radical of the formula

(II)

wherein each R^3 individually is an alkylene having from 2 to 6 carbon atoms, R^4 is chosen from the group consisting of R, acyl groups having at least 2 carbon atoms, and hydrogen, and n has a value from at least 1 to about 200; each R^2 individually is chosen from the group consisting of R and R^1; x has a value from about 5 to about 400; and y has a value of at least 1 except that when R^2 is R^1, y may be zero, and (d) an organic oil-in-water type surfactant having an HLB value of from 8 to 18 inclusive, which may or may not be present.



5,008,104

QUATERNIZED NITROGEN CONTAINING COMPOUNDS

Ratan K. Chaudhuri, Butler; David J. Tracy, Lincoln Park, and Robert B. Login, Oakland, all of N.J., assignors to GAF Chemicals Corporation, Wayne, N.J.

Filed Jun. 22, 1989, Ser. No. 370,226
Int. Cl.[5] C07D *223/10, 211/76, 207/26;* A61K *7/06*
U.S. Cl. 424—70 5 Claims

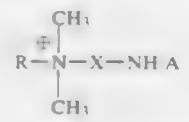
1. A quaternized compound having the formula

wherein n and n' are each independently integers having a value of from 1 to 25; p is an integer having a value of from 1 to 4; Y and Y' are each independently H or CH_3; R is linear alkyl, alkenyl, or amidoalkyl having from 8 to 22 carbon atoms and is optionally substituted with C_1 to C_4 alkyl; Z is linear alkylene having from 3 to 8 carbon atoms and is optionally substituted with lower alkyl and A^- is an anion.

5 A composition containing the compound of claim 1 and an inert carrier therefor.

5,008,105

COMPOSITION AND PROCESS FOR TREATING KERATINIC SUBSTANCES WITH AT LEAST ONE ANIONIC POLYMER AND AT LEAST ONE QUATERNIZED PROTEIN



Jean F. Grollier, Paris, and Claude Dubief, Le Chesnay, both of France, assignors to L'Oreal, Paris, France

Division of Ser. No. 665,386, Oct. 26, 1984, Pat. No. 4,796,646.
This application Dec. 15, 1988, Ser. No. 284,683
Claims priority, application Luxembourg, Oct. 28, 1983, 85067
Int. Cl.[5] A61K *7/06, 7/075, 7/13, 7/135*
U.S. Cl. 424—70 31 Claims

6. A composition for the cosmetic treatment of hair, comprising, in a cosmetically acceptable medium which is suitable for application to said hair a strongly cationic quaternised protein and either an anionic latex or an amphoteric polymer, wherein:

the anionic functional groups of said anionic latex are provided either by polymerisation or copolymerisation of anionic monomers, said polymerisation or copolymerisation is effected either by combination of an anionic free radical originating from the reaction initiator with the monomer or the monomers during the initiation of polymerisation of said monomers or by juxtaposition of these two processes of synthesis or alternatively by the introduction of end groups by a chain transfer reaction in the second process employing a reaction initiator;

said strongly cationic quaternised protein has the formula

(I)

in which A denotes a protein residue derived from hydrolysates of collagen protein, R denotes a lipophilic group containing up to 30 carbon atoms;,

said amophoteric polymer contains two moieties, moiety A and moiety B, which are distributed statistically in said amphoteric polymer chain such that

moiety A is derived from a monomer that contains at least one basic nitrogen atom and moiety B is derived from an acidic monomer that contains at least one carboxylic or sulphonic group, or

moieties A and B are groups that are derived from zwitterionic monomers of caroboxybetaines or are cationic polymer chains that contain secondary, tertiary or quaternary amine groups such that at least one of said amine groups includes a carboxylic or sulphonic group

connected to said amine group via a hydrocarbon radical, or

moieties A and B form part of a chain of a polymer that contains an α, β-ethylenedicarboxylate moiety in which one of the carboxylic groups has reacted with a polyamine that contains one or more primary, secondary, or tertiary amine groups; and

the concentration of said strongly cationic quaternised protein and said anionic latex or amphoteric polymer is between 0.01 and 10% by weight.

5,008,106

METHOD FOR REDUCING THE MICROBIAL CONTENT OF SURFACES WITH A MICROBIOCIDAL, ANHYDROUS COMPLEX OF PVP-H_2O_2

John J. Merianos, Middletown; Herbert A. Lieberman, Livingston, and Robert B. Login, Oakland, all of N.J., assignors to GAF Chemicals Corporation, Wayne, N.J.

Filed Dec. 14, 1989, Ser. No. 450,695
Int. Cl.[5] A61K *31/79;* C01B *15/01*
U.S. Cl. 424—80 29 Claims

1. A method for reducing the microbial content of surfaces which comprises contacting said surface with a microbiocidal amount of a stable complex of PVP and H_2O_2 containing between about 3 and 24% by weight of H_2O_2 in an anhydrous organic solvent which is obtained directly as a uniform, free-flowing, fine white powder by reaction between PVP and H_2O_2 in substantially the same weight ratio as predetermined for the complex.

5,008,107

ATTRACTANT COMPOSITION FOR SYNANTHROPIC FLIES

William B. Warner, Phoenix, Ariz., assignor to Farnam Companies, Inc., Phoenix, Ariz.

Continuation-in-part of Ser. No. 472,708, Jan. 31, 1990, abandoned, which is a continuation-in-part of Ser. No. 197,696, May 23, 1988, abandoned, which is a continuation of Ser. No. 889,217, Jul. 25, 1986, abandoned. This application Jun. 6, 1990, Ser. No. 534,292
Int. Cl.[5] A01N *25/00*
U.S. Cl. 424—84 10 Claims

1. A synergistic attractant composition for synanthropic flies which comprises:

(a) a feeding attractant selected from the group consisting of indole and skatole; said attractant being presented in a quantity within the approximate range of 0.01 to 0.10 weight percent;

(b) cis-9-tricosene present in a quantity within the approximate range of 0.025 to 1.44 weight percent;

(c) trimethylamine hydrochloride;

(d) alcohol to serve as a solvent for said feeding attractant; and

(e) a suitable carrier.

5,008,108

COMPOSITIONS UTILIZING AN EXOCELLULAR POLYSACCHARIDE ISOLATED FROM *ZOOGLOEA RAMIGERA*

ChoKyun Rha, Boston; Pasawadee Pradipasena, Brookline; TetsuHisa Nakamura; Donald D. Easson, Jr., both of Cambridge, and Anthony J. Sinskey, Boston, all of Mass., assignors to Massachusetts Institute of Technology, Cambridge, Mass.

Continuation of Ser. No. 890,864, Jul. 28, 1986, Pat. No. 4,851,393. This application Mar. 28, 1989, Ser. No. 329,593
Int. Cl.[5] A61K *7/00, 7/08, 7/16, 31/715*
U.S. Cl. 424—401 5 Claims

1. A physiological lubricant with a pH between 2 and 9 and a salt concentration between 0 and 1.0 M, comprising between approximately 0.001 to 0.3% exocellular polysaccharide produced by *Zoogloea ramigera*, having a purity of greater than about 95% and a chain stiffness parameter of up to about 0.02, wherein the particular and metal ion content, ionic strength, pH and concentration of polysaccharide and composition produce a specific charge density on the polysaccharide to yield an intrinsic viscosity of the polymer in solution of between 10.0 and 20 dl/g as calculated by the Yuan Dougherty-Stivala equation and an intrinsic viscosity of polymer in solution of between 16 and 167 dl/g as calculated by the Fuoss equation, in combination with a physiological lubricant.

4. A pharmaceutical or cosmetic product having a pH between 4 and 9, an ionic strength equivalent to between 0M and 0.2M and comprising between approximately 0.001 and 1.0% exocellular polysaccharide produced by *Zoogloea ramigera*, having a purity of greater than about 95% and a chain stiffness parameter of up to about 0.02, wherein the particular and metal ion content, ionic strength, pH and concentration of polysaccharide and composition produce a specific charge density on the polysaccharide to yield an intrinsic viscosity of the polymer in solution of between 10.0 and 20 dl/g as calculated by the Yuan Dougherty-Stivala equation and an intrinsic viscosity of polymer in solution of between 16 and 167 dl/g as calculated by the Fuoss equation, in combination with a pharmaceutical or cosmetic product selected from the group consisting of skin lotions, skin cleansers, contact lens cleansers, eye drop lubricants, cosmetic gels, cosmetic ointments, makeup, hair gels, hair conditioners, and tooth paste gels.

5,008,109

VESICLE STABILIZATION

George W. Tin, Arcadia, Calif., assignor to Vestar, Inc., San Dimas, Calif.

Continuation of Ser. No. 63,780, Jun. 18, 1987, abandoned, which is a continuation of Ser. No. 815,773, Jan. 2, 1986, abandoned, which is a continuation of Ser. No. 614,255, May 25, 1984, abandoned. This application Oct. 11, 1988, Ser. No. 257,155
Int. Cl.[5] A61F *13/00;* A61K *9/127, 47/36, 47/42*
U.S. Cl. 424—422 12 Claims

1. A method for the storage and use of small micellular particles, comprising the steps of: suspending said micellular particles in a pharmaceutically acceptable polymeric gel solution to form a suspension with a protective gel surface about said micellular particles; cooling the suspension to form a gel matrix which restricts movement of the particles; and warming the gel matrix to at least about room temperature, thereby transforming the gel matrix into an aqueous suspension suitable for use.

8. The method of claim 1 further comprising injecting the aqueous suspension in vivo after it has been transformed from a gel matrix to an aqueous suspension.

5,008,110

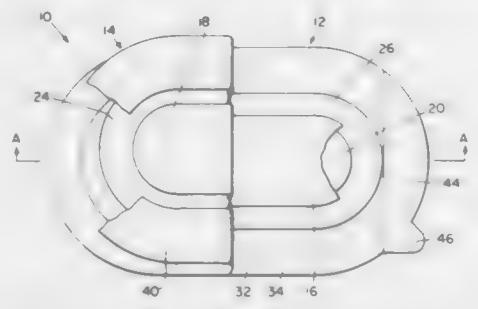
STORAGE-STABLE TRANSDERMAL PATCH

Arnold G. Benecke, Hamilton; Daniel J. Kinne, Cincinnati, and Andrew J. Wnuk, Wyoming, all of Ohio, assignors to The Procter & Gamble Company, Cincinnati, Ohio

Filed Nov. 10, 1988, Ser. No. 269,513
Int. Cl.[5] A61K *9/00*
U.S. Cl. 424—448 20 Claims

1. A storage-stable device for the transferal delivery of an active pharmaceutical, said device comprising:

(a) a drug reservoir containing a mixtured of said pharmaceutical and a skin permeation enhancer, said reservoir having an upper surface and a lower surface;



(b) a lower barrier film which is resistant to permeation by and absorption of said pharmaceutical and said skin permeation enhancer in contact with said lower surface of said reservoir;

(c) an upper barrier film which is resistant to permeation by and absorption of said pharmaceutical and said skin permeation enhance in contact with said upper surface of said reservoir;

(d) a compartment containing said drug reservoir and said

lower and said upper barrier films, said compartment comprising a top cover located adjacent and secured to said upper barrier film and a bottom cover located adjacent and secured to said lower barrier film, each of said covers being comprised of a material which is resistant to permeation by moisture, oxygen and light, said top cover and aid bottom cover being hermetically sealed together smear their peripheral edges;

(e) an outermost coverstock attached to said bottom cover of said outer compartment, said coverstock having an adhesive coating thereon, said hermetically-sealed compartment and said upper and lower barrier films together

preventing said mixture of said pharmaceutical and said skin permeation enhancer from coming into contact with said adhesive coating on said outermost coverstock as well as the entry of moisture, oxygen and light from the surrounding environment into said reservoir; and

(f) a release liner attached to said top cover of said compartment, said release liner being in contact with the periphery of said outermost coverstock, whereby peeling said release liner from said coverstock breaks said hermetic seal between said top cover and said bottom cover o said compartment, thereby exposing the adhesive at the periphery of said outermost coverstock and the upper surface of said drug reservoir.

5,008,111

PHYSIOLOGICAL MEANS OF ENHANCING TRANSDERMAL DELIVERY OF DRUGS

Nicholas Bodor, Gainesville, Fla., assignor to Schering Corporation, Kenilworth, N.J.

Division of Ser. No. 14,317, Feb. 13, 1987, Pat. No. 4,824,676, which is a continuation-in-part of Ser. No. 659,919, Oct. 11, 1984, abandoned. This application Dec. 14, 1988, Ser. No. 284,032

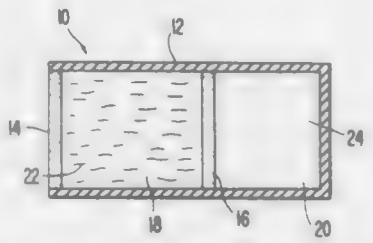
Int. Cl.[5] **A61F** *13/00*

U.S. Cl. 424—449 **6 Claims**

1. In an improved method of transdermally delivering a pharmaceutically active non-anticholinergic drug from a transdermal delivery system applied to an area of skin to provide transdermal delivery of said active drug through said area of skin, the improvement comprising:

pre-treating said area of skin with an anhidrotic agent in an amount sufficient to have a local antiperspirant effect on the area treated but insufficient o cause a significant systemic effect, whereby the transdermal delivery of said pharmaceutically active drug is enhanced and wherein said anhidrotic agent is an anticholinergic quaternary ammonium salt compound.

5,008,112



DEVICE FOR THE EXTENDED DELIVERY OF DIFFUSIBLE AGENTS

Randolph B. DePrince, and Ravi Viswanathan, both of Terre Haute, Ind., assignors to International Minerals & Chem. Corporation, Northbrook, Ill.

Filed Dec. 16, 1985, Ser. No. 809,437

Int. Cl.[5] **A61K** *9/22*

U.S. Cl. 424—468 **38 Claims**

1. A device for the continuous administration to a fluid medium of at least two agents having different rates of diffusion, said agents characterized as an agent having a relatively rapid rate of diffusion and an agent having a relatively slow rate of diffusion, which comprises: a wall, formed at least in part by a porous membrane, the remainder of said wall formed by a material impermeable to said agents and to said fluid medium, which completely surrounds and defines a reservoir, the reservoir comprising:

(a) a compartment which comprises said agent having the relatively slow rate of diffusion, wherein said compartment is partly formed by said porous membrane part of said wall permitting said agents to diffuse, and partly formed by a permeable partition, and

(b) at least one compartment which comprises said agent having the relatively rapid rate of diffusion, wherein said compartment is not in direct contact with said porous membrane part of said wall, said compartment is in contact with the portion of said wall formed by a material impermeable to said agents and to said fluid medium and is separated by said permeable partition from the compartment comprising said agent having the relatively slow rate of diffusion, such that when said device is exposed to said fluid medium, said agents having different rates of diffusion will diffuse through the porous membrane part of said wall at a substantially steady rate for a prolonged period of time.

U.S. Cl. 424—491 **11 Claims**

1. A macroporous microsphere comprising a particle and an antigenic component, selected from the group consisting of whole inactivated pathogens and submits thereof, RDNA derived polyreptides, recombinant viruses, synthesized polypeptides and anti-idiotypes, and whole microorganisms or animal cells wherein said antigenic component is physically entrapped in or chemically crosslinked, to the interior of said particle, said particle being comprised of a polymer, and said microsphere having size of 1 to 1000 μm, and pores with a mean pore diameter of 0.1 to 100 μm.

5,008,117

FORMULATION FOR PREPARING EXTEMPORANEOUS HOMOGENEOUS MICROCAPSULE SUSPENSION

Massimo Calanchi, Monza; Leonardo Gentilini, Milano, and Marco Marconi, Cinisello Balsamo, all of Italy, assignors to Eurand Italia SPA, Milano, Italy

Continuation-in-part of Ser. No. 2,660, Nov. 26, 1986, abandoned. This application Dec. 20, 1988, Ser. No. 287,401

Claims priority, application Italy, May 2, 1986, European Pat. Off. 8600280

Int. Cl.[5] **A61K** *9/16, 9/50, 9/62;* **B01J** *13/02*

U.S. Cl. 424—494 **22 Claims**

1. Method of preparing a drug microcapsule formulation consisting essentially of the drug microcapsules and a thickening or suspending agent and a binder and a solid particulate excipient, having the property of being readily dispersible and readily dissolvable in water or aqueous vehicles without clot formation so as to place the drug microcapsules in homogeneous suspension, consisting essentially of the following steps:

(a) providing a thickening or suspending agent having a grain size less than 100 mesh (Tyler) which is insoluble or only slightly soluble in a solvent in which a binder is dissolved in step (b);

(b) suspending the suspending or thickening agent in a dilute organic solvent solution of a solvent-soluble and water-soluble binder; wherein the weight of thickening or suspending agent in relation to the binder is about 4:1 to about 20:1;

(c) coating the suspension around particles of a water-soluble solid sweetener;

(d) drying to evaporate solvent and sieving the obtained product; and

(e) mixing the said product with drug microcapsules having a water-insoluble membrane-coating to provide the desired readily-dispersible formulation.

11. A dry formulation for preparing a homogeneous suspension of drug microcapsules, when it is poured into water or an aqueous base liquid, consisting essentially of (A) drug microcapsules having a polymeric membrane coating which is permeable by gastrointestinal juices, admixed with (B) coated particles consisting essentially of (a), (b), and (c), (a) being a solvent-soluble and water-soluble binder; and (b) being a thickening or suspending agent having a grain size less than 100 mesh (Tyler) which is insoluble or only slightly soluble in a dilute organic solvent solution in which the binder is soluble; the weight of thickening or suspending agent in relation to the weight of the binder being about 4:1 to about 20:1; a suspension of (a) and (b) being coated around (c), (c) being particles of a water-soluble solid sweetener; the admixture being sieved to a particle size of 870 microns or less.

METHOD FOR PRODUCING ORGANIC AGENT COATED WITH POWDERS OF COATING AGENT

Koichi Iwanami, Yokohama, and Masatsugu Ito, Tokyo, both of Japan, assignors to Nippon Oil and Fats, Tokyo, Japan

Filed Jun. 17, 1988, Ser. No. 208,996

Claims priority, application Japan, Jun. 23, 1987, 62-154398

Int. Cl.[5] **A61K** *9/16*

U.S. Cl. 424—498 **14 Claims**

1. A method for producing a coated organic agent comprising contacting a coating agent with core powders of an organic substance at a temperature less than the melting temperature of either the coating agent or core powder, so that said coating agent collides against said core powders with sufficient resultant frictional heating to cause adhesive binding of the coating agent of the core powder, said coating agent containing at least lipid powders having a melting point not lower than 40° C., and attaching said coating agent onto the overall surface of each of said core powders, whereby said core powders are coated by said coating agent, wherein said core powders of said organic substance are selected from the group consisting of powders of organic acids, powders of salts of organic acids,

powders of water-soluble vitamins and/or salts and/or esters thereof, powders of amino acids and/or salts and/or esters thereof and mixtures thereof, wherein said organic acids are selected from the group consisting of sorbic acid, propionic acid, fumaric acid, maleic acid, dehydroacetic acid, benzoic acid, citric acid, malic acid, succinic acid, tartaric acid, oxalic acid, L-ascorbic acid, lactic acid, acetic acid, butyric acid, adipic acid, tannic acid, gallic acid, phytic acid and mixtures thereof,

wherein said salts of organic acids are selected from the group consisting of sodium, calcium potassium, magnesium, iron, copper and zinc salts and mixtures thereof of organic acids selected from the group consisting of sorbic acid, propionic acid, fumaric acid, maleic acid, dehydroacetic acid, benzoic acid, citric acid, malic acid, succinic acid, tartaric acid, oxalic acid, L-ascorbic acid, lactic acid, acetic acid, butyric acid, adipic acid, tannic acid, gallic acid, phytic acid and mixtures thereof,

wherein said water-soluble vitamins and/or salts and/or esters thereof are selected from the group consisting of vitamin B_1, vitamin B_2, vitamin B_6, vitamin B_{12}, vitamin B_{13}, vitamin B_{14}, vitamin B_{15}, lipoic acid, nicotinic acid, nicotinamide, pantothenic acid, folic acid, p-aminobenzoic acid, biotin, choline, inositol, vitamin L, vitamin U, vitamin C, vitamin P, calcium salts of said vitamins, sodium salts of said vitamins, potassium salts of said vitamins, magnesium salts of said vitamins, iron salts of said vitamins, copper salts of said vitamins, zinc salts of said vitamins, hydrochlorates of said vitamins, nitrates of said vitamins, esters of phosphoric acid with said vitamins, esters of acetic acid with said vitamins, esters of succinic acid with said vitamins, esters of maleic acid with said vitamins, esters of glutamic acid with said vitamins, and mixtures thereof,

wherein said esters of said water-soluble vitamins are selected from the group consisting of esters of phosphoric acid, acetic acid, succinic acid, maleic acid and glutamic acid and mixtures thereof of oil-soluble vitamins selected from the group consisting of vitamin A, vitamin D, vitamin E, vitamin K and mixtures thereof, and

wherein said amino acids and/or salts and/or esters thereof are selected from the group consisting of DL-alanine, L-valine, leucine, L-isoleucine, L-phenylalanine, tyrosine, diiodetyrosine, DL-threonine, L-threonine, DL-tryptophan, L-tryptophan, serine, proline, hydroxyproline, thyroxine, DL-methionine, L-methionine, cystine, cysteine, aspartic acid, L-glutamic acid, asparagine, glutamine, D-lysine, L-lysine, hydroxylysine, arginine, histidine, β-alanine, β-aminobutyric acid, γ-aminobutyric acid, δ-amino-n-valeric acid, calcium salts of said amino acids, sodium salts of said amino acids, potassium salts of said amino acids, magnesium salts of said amino acids, iron salts of said amino acids, copper salts of said amino acids, zinc salts of said amino acids, hydrochlorates of said amino acids, nitrates of said amino acids, esters of phosphoric acid with said amino acids, esters of acetic acid with said amino acids, and mixtures thereof

METHOD OF USING MANGANESE TO PROTECT AN ANIMAL FROM RADIATION DAMAGE

Junko Matsubara, c/o Department of Epidemiology, School of Medicine, University of Tokyo, No. 3-1, Hongo 7-chome, Bunkyo-Ku, Tokyo 113, Japan

PCT No. PCT/JP86/00510, § 371 Date Aug. 10, 1987, § 102(e) Date Aug. 10, 1987, PCT Pub. No. WO87/02245, PCT Pub. Date Apr. 23, 1987

PCT Filed Oct. 6, 1986, Ser. No. 62,180

Claims priority, application Japan, Oct. 14, 1985, 60-228536; Oct. 6, 1986, 61-236255

Int. Cl.[5] A61K *33/32*

U.S. Cl. 424—639 **4 Claims**

1. A method of protecting a host from radiation damage, comprising administering to a host in need thereof an effective radiation damage protecting amount of a water-soluble manganese salt in an amount effective to increase the liver metallothionein level in the host by at least fivefold within about one day following the administration.

5,008,120

METHOD OF PREPARING IRON-FORTIFIED BEVERAGE

Maki Tanaka; Telichi Tojima; Shun-ichi Dousako, and Kiyoshi Tatsumi, all of Saitama, Japan, assignors to Snow Brand Milk Products Co., Ltd., Hokkaido, Japan

Filed Jul. 12, 1990, Ser. No. 551,922

Claims priority, application Japan, Jul. 21, 1989, 1-189563; Apr. 26, 1990, 2-110953

Int. Cl.[5] A23L *1/304*

U.S. Cl. 426—74 **4 Claims**

1. A method of preparing an iron-fortified beverage containing lactoferrin capable of binding iron, comprising adjusting either an aqueous solution containing lactoferrin, iron preparation and sodium bicarbonate, or aqueous solution of iron lactoferrin to a desired ionic strength (I) sterilizing said iron lactoferrin by heat, cooling mixing said iron lactoferrin solution with a solution of beverage ingredients which has been also sterilized by heat and cooled wherein said desired ionic strength is determined by the following formula:

$$\log I \leqq -T/66.7 - 0.1$$

(wherein $60 \leqq T \leqq 80$)

$$\log I \leqq -1.3$$

($T \geqq 80$)

(T indicates temperature of sterilization in degrees Celsius.)

5,008,121

STORAGE STABLE, READILY RECONSTITUTED COMESTIBLE

Donald B. Bernacchi; Robert J. Loewe, both of Chicago, and Donna L. Immel, Green Oaks, all of Ill., assignors to Griffith Laboratories Worldwide, Inc., Alsip, Ill.

Continuation of Ser. No. 232,910, Aug. 16, 1988, which is a continuation-in-part of Ser. No. 941,690, Dec. 15, 1986, Pat. No. 4,764,386, which is a continuation-in-part of Ser. No. 779,657, Sep. 24, 1985, Pat. No. 4,744,994. This application Oct. 3, 1989, Ser. No. 416,601

Int. Cl.[5] A23P *1/08*

U.S. Cl. 426—89 **1 Claim**

1. A storage stable comestible comprising:

a comestible chosen from the group consisting of poultry, fish, red meats, egg products, vegetables, cheeses, fruits and fabricated foods having a generally continuous gelatinized starch membrane around the comestible.

5,008,122

PROCESS AND APPARATUS FOR CONTINUOUSLY REMOVING CONTAMINATES FROM EDIBLE COOKING OIL

Ellen M. Rosnack, Virginia Beach; Larry A. Pray, Suffolk; Alger C. Marable, Virginia Beach, and Gerry C. Zekert, Suffolk, all of Va., assignors to Nabisco Brands, Inc., East Hanover, N.J.

Filed Jun. 10, 1988, Ser. No. 205,215

Int. Cl.[5] A23D *5/04*

U.S. Cl. 426—417 **15 Claims**

1. A process for continuously removing contaminates from edible oil in a cooking bath having a temperature in excess of 250° F. comprising:

withdrawing a continuous stream comprising oil and contaminates from said bath;

providing a continuous stream comprising substantially clean liquid solvent for at least a portion of said contaminates, said solvent having a specific gravity different than the specific gravity of said solvent consisting essentially of tap water without substantial added acid;

mixing said oil and solvent streams in a volume flow ratio between about 1% and 40% solvent to form a mixture having a temperature in excess of about 200° F. to provide for enhanced solubility of said contaminates in said solvent and to transfer at least a portion of said contaminates from said oil to said solvent under a pressure sufficient to substantially inhibit vaporization of said liquid solvent;

separating said oil and solvent mixture by specific gravity into a stream comprising cleaned oil and a stream comprising solvent and contaminates;

returning said cleaned oil stream to said bath; and

disposing of said stream comprising solvent and contaminates.

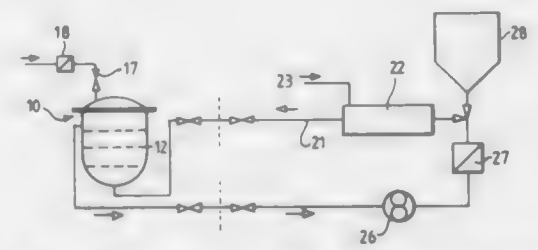
FOOD PROCESSING METHOD



David R. Bewley, Middlesex, Great Britain; Christopher J. B. Brimelow, New Milford, Conn., and Kenneth W. Wright, Twyford, Great Britain, assignors to Nestec S.A., Vevey, Switzerland

Filed Jun. 4, 1990, Ser. No. 532,371

Claims priority, application United Kingdom, Jun. 15, 1989, 8913738

Int. Cl.[5] A23L *1/00*

U.S. Cl. 426—509 **13 Claims**

1. A method for processing meat comprising introducing meat into a mobile cooking vessel, sealing the meat-containing vessel from the atmosphere, heating a stock liquor with a heat exchanger to a cooking temperature of at least 60° C. and circulating the heated stock liquor through the vessel and the heat exchanger for a period of time sufficient to heat the meat to a cooking temperature and to cook the meat, and after cooking the meat, cooling the circulating stock liquor with the heat exchanger to a temperature suitable to cool the cooked meat to a temperature of no more than 15° C. within 45 minutes.

5,008,124

DRY MIX FOR PREPARATION OF IN-SITU SAUCE FOR FOODSTUFFS

Mildred N. Wilson, Wilton, Conn., assignor to Nabisco Brands, Inc., East Hanover, N.J.

Continuation of Ser. No. 222,719, Jul. 21, 1988, abandoned. This application Dec. 4, 1989, Ser. No. 445,915

Int. Cl.[5] A23L *1/522, 1/54*

U.S. Cl. 426—589 **5 Claims**

1. A dry mix preparation suitable for application to uncooked or partially cooked meat as either a dry mix or a liquefied dry mix, and which develops into a thickened sauce for the meat during the meat cooking process, said dry mix comprising xanthan gum, in an amount which will provide from about 0.003 to about 0.005 grams/ml. of xanthan gum based upon dissolution of the mix in one cup of water, and an ungelatinized food-grade starch, in an amount which will provide from about 0.01 to about 0.02 grams/ml. of said starch based upon dissolution of the mix in one cup of water, and further comprising flavorants and additional ingredients necessary to provide the particular type of sauce desired and such that an aqueous solution of said dry mix has a pH of from about 3.0 to about 4.5

5,008,125

SOLUBLE COFFEE WITH AROMA RECOVERED FROM THE THERMAL HYDROLYSIS OF SPENT GROUNDS

Kenneth W. Cale, Marlboro, N.J.; Naoto Imura, Yokkaichi, Japan; George A. Jasovsky, Bayonne, N.J., and Saul N. Katz, Monsey, N.Y., assignors to Kraft General Foods, Inc., Glenview, Ill.

Division of Ser. No. 339,290, Apr. 17, 1989, Pat. No. 4,900,575. This application Sep. 26, 1989, Ser. No. 412,372

Int. Cl.[5] A23F *5/48*

U.S. Cl. 426—594 **3 Claims**

1. A soluble coffee aromatized with a collected fraction of beneficial natural aromas and flavors released from the thermal hydrolysis of partially extracted roasted and ground coffee, said partially roasted and ground coffee having been subjected to atmospheric extraction to extract a majority of the arabinogalactan therefrom, which comprises:

25 to 125 ppm acetaldehyde, 10 to 40 ppm diacetyl, greater than 175 ppm total aromatics, a ratio of (acetaldehyde + diacetyl)/3-methyl butanol of 1.75 to 10 and a ratio of acetaldehyde/3-methyl butanol of 1.5 to 10.

5,008,126

LONG CHAIN DIOL DIESTERS AS LOW CALORIE FAT MIMETICS

Lawrence P. Klemann, Somerville; John W. Finley, Whippany, and Anthony Scimone, Cedar Grove, all of N.J., assignors to Nabisco Brands, Inc., East Hanover, N.J.

Filed Jun. 27, 1989, Ser. No. 372,056

Int. Cl.[5] A23D *7/00*

U.S. Cl. 426—611 **54 Claims**

1. An edible composition comprising, in addition to other edible materials, an edible fat mimetic compound of the formula

$$\begin{array}{l} A-CH-O-(CO)-F_1 \\ \quad | \\ \quad (CH_2)_n \\ \quad | \\ \quad CH_2-O-(CO)-F_2, \end{array}$$

where

A is an aliphatic chain having 7 to 28 carbon atoms,

n=0 to 2, and

F_1 and F_2 are aliphatic groups having 1 to 30 carbon atoms.

5,008,127

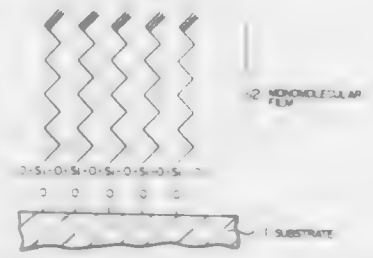
PROCESS FOR THE PRODUCTION OF A HIGHLY-ORIENTATED ULTRALONG CONJUGATED POLYMER

Kazufumi Ogawa, Hirakata, Japan, assignor to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Filed Feb. 22, 1990, Ser. No. 482,965

Claims priority, application Japan, Feb. 27, 1989, 1-045993; Feb. 27, 1989, 1-45994; Feb. 27, 1989, 1-45995; Feb. 27, 1989, 1-45996

Int. Cl.[5] B05D *3/06*



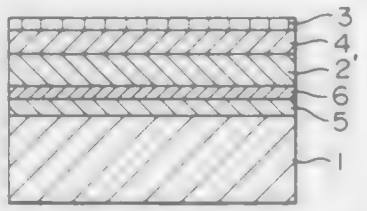
U.S. Cl. 427—36 **34 Claims**

1. A process for the production of a highly-orientated ultralong conjugated polymer, which comprises:

a step of immersing a substrate having a hydrophilic surface in a nonaqueous organic solvent containing a compound having at least an unsaturated group, such as an acetylenic group (—C≡C—), etc., and a group represented by the formula ($-SiA_xH_{3-x}$) in which A denotes a chloro or lower alkyl group and x is an integer of from 1 to 3, whereby forming a monomolecular film of the above compound on the substrate by chemisorption,

a step of selectively and linearly inactivating unsaturated

groups of the monomolecular film by means of writing with STM (scanning tunneling microscope), exposure to electron beam or exposure to X-ray, and



a step of irradiating the entire surface of the substrate with radiation in an inert gas atmosphere to polymerize that remaining portion of the monomolecular film which has not been inactivated.

5,008,128

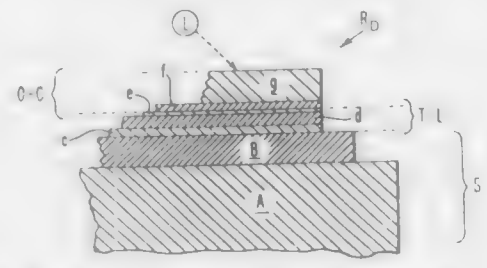
PROCESS FOR PRODUCING INFORMATION RECORDING MEDIUM

Takanori Kudo, Hachioji, and Heigo Ishihara, Tokyo, both of Japan, assignors to Hitachi, Ltd., Japan

Filed Jan. 31, 1989, Ser. No. 304,086
Claims priority, application Japan, Feb. 3, 1988, 63-21956; Jul. 18, 1988, 63-177156
Int. Cl.[5] H01F *10/02*
U.S. Cl. 427—130 10 Claims

1. A process for producing an information recording medium comprising a substrate, a magnetic layer formed on the substrate and a lubricant layer formed on the magnetic layer, which comprises forming the lubricant layer by applying a fluorine-containing isocyanate derivative, whose isocyano group is protected, to the magnetic layer, then reproducing the isocyano group and subjecting the reproduced isocyano group to polymerization, thereby forming a fluorine-containing isocyanate polymer layer.

5,008,129



METHODS OF FABRICATING OPTICAL RECORDS WITH OVERCOATING

Norman L. Boling; Thomas Mayer, and James D. Rancourt, all of Santa Rosa, Calif., assignors to Unisys Corp., Detroit, Mich.

Division of Ser. No. 450,804, Dec. 17, 1982. This application Jan. 14, 1985, Ser. No. 691,047
Int. Cl.[5] B05D *5/00;* G03C *1/76*
U.S. Cl. 427—160 10 Claims

1. In a method for fabricating a radiation recording unit, the steps of:

depositing a radiation-sensitive record layer of metallic absorber material on a smooth optical disk substrate for recording digital data, this layer being adapted to be activated by a prescribed radiation beam to a prescribed recorded transition state at prescribed bit sites thereon; said transition state involving at least some minor deformation and/or minor translation of the record layer material at each bit site; applying buffer supercoat means upon this layer, or upon thin film means thereon, this supercoat means being adapted to isolate this layer and comprising a buffer layer of relatively soft yielding material, selected and applied so as to enhance the recording-sensitivity of the record layer while so protecting it; said buffer material being selected to be highly transparent to said beam and adapted to be relatively weakly-bonded to said record

layer such as to accommodate said deformation and/or translation, presenting little or no resistance thereto; and then applying a relatively hard protective outer-seal coating over the "soft" buffer layer, relatively strongly bonded thereto.

5,008,130

METHOD OF PRODUCING A PATTERNED FLOCKED WEB OF MATERIAL

Gerhard F. Lenarts, Mönchengladbach, Fed. Rep. of Germany, assignor to Uniroyal Textilcord, S.A., Steinfort

Filed Jun. 22, 1989, Ser. No. 369,775
Claims priority, application Fed. Rep. of Germany, Jun. 22, 1988, 3820992
Int. Cl.[5] B05D *5/00, 1/16, 1/36*
U.S. Cl. 427—206 6 Claims

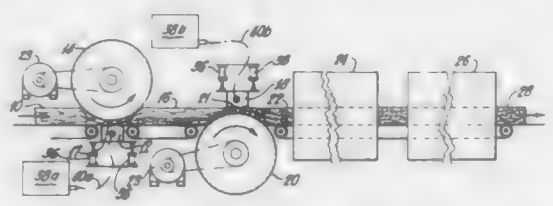
1. In a method of producing a patterned flocked web of material, the improvement therewith comprising the steps of:

first providing a patterned carrier web in the form of a textile web that has a patterned surface;

secondly applying a transparent adhesive layer to said patterned surface in such a way as to cover the same although allowing the patterned surface to appear through the transparent adhesive layer;

then covering said transparent adhesive layer with light, single-color flock to a predetermined extent;

thereupon drying and fixing the resulting arrangement; and



finally removing excess flock so that the pattern of the web stands out from the background in a muted and softened manner.

5,008,131

METHOD AND APPARATUS FOR IMPREGNATING A POROUS SUBSTRATE WITH FOAM

Shiv K. Bakhshi, Columbus, Ohio, assignor to Owens-Corning Fiberglas Corporation, Toledo, Ohio

Filed Jun. 14, 1982, Ser. No. 388,283
Int. Cl.[5] B05D *1/26, 3/06;* B05C *3/00, 3/18*
U.S. Cl. 427—209 29 Claims

1. Apparatus for impregnating a porous substrate with a foam comprising a foam discharge head having a surface plate adapted with one or more discharge openings for the discharge of foam therefrom, a foraminous surface positioned opposite said discharge openings to define a nip region having a thickness less than the thickness of the porous substrate so that the porous substrate is urged into sealed relation with said surface plate so that foam is substantially prevented from accumulating at the interface of said surface plate and the porous substrate as the porous substrate is transported through said nip region, a surface support conveyor positioned between said foraminous surface and the porous substrate, means for driving said foraminous surface to transport the porous substrate through said nip region, and means for supplying foam to said foam discharge head with pressure sufficient to impregnate the porous substrate.

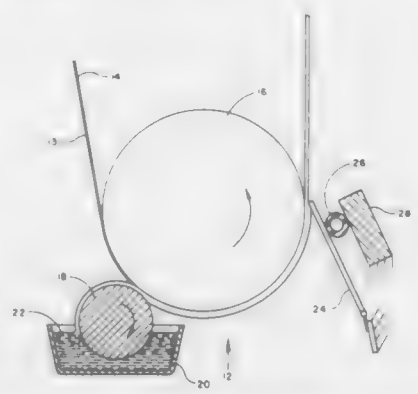
13. A method for impregnating a porous substrate with a foam comprising transporting the porous substrate through a nip region defined by a foraminous surface and a foam discharge head, said foam discharge head comprising a surface plate having one or more discharge openings, where the transport of the porous substrate through said nip region compresses the porous substrate, thereby pressing the porous substrate into sealed relation with said surface plate to substantially prevent foam from accumulating at the interface between said surface plate and the porous substrate as the porous substrate is transported through said nip region, providing a surface support conveyor positioned between said foraminous surface and the porous substrate, and supplying foam to said discharge head with pressure sufficient to impregnate the porous substrate.

5,008,132

PROCESS FOR PREPARING TITANIUM NITRIDE COATED SILICON CARBIDE MATERIALS

Shih-Yee Kuo; Hyun-Sam Cho, and Jeffrey D. Bright, all of Salt Lake City, Utah, assignors to Norton Company, Worcester, Mass.

Filed Jun. 6, 1989, Ser. No. 362,188
Int. Cl.[5] C23C *16/08, 16/14, 16/56, 8/24*
U.S. Cl. 427—217 12 Claims



1. A process of coating silicon carbide materials selected from the group consisting of individual particles having an average particle size of about 0.5 to about 1000 microns, whiskers, and fibers with titanium nitride which comprises the steps of (i) placing a coating having a low diffusivity for carbon atop the silicon carbide materials, (ii) placing a titanium metal coating atop the low diffusivity coating, and (iii) nitriding the titanium metal to form titanium nitride.

5,008,133

METHOD OF COATING A WEB WITH A COATING MIXTURE INCLUDING MICROCAPSULES CRUSHED BY A BACK-UP MEMBER

Albert J. Herbet, 6 E. Spring, Oxford, Ohio 45056; Ronald L. Hart, 1650 E. Slater Ct., Xenia, Ohio 45385-9525, and Dale E. Work, 115 N. Madison Rd., London, Ohio 43140

Filed Jun. 6, 1990, Ser. No. 534,033
Int. Cl.[5] B05D *3/12*
U.S. Cl. 427—333 6 Claims

1. A method of forming a coating on a web which comprises forming a coating mixture including a continuous phase of a first material and a second material contained in microcapsules, the first material and the second material being adapted to interact to form the coating, applying the coating mixture to a face of the web, and passing the web between a back-up member and a doctor blade so that the doctor blade levels the coating on the web and crushes the microcapsules to cause mixing of the materials on the web.

5,008,134

ELECTROCONDUCTIVE COATING COMPOSITION

Kelvin P. Adkins, Elmstead Market, England, assignor to Imperial Chemical Industries PLC, London, England

Division of Ser. No. 400,794, Aug. 30, 1989, Pat. No. 4,957,816, which is a division of Ser. No. 69,701, Jun. 30, 1987, Pat. No. 4,879,064. This application Jul. 19, 1990, Ser. No. 554,426
Claims priority, application United Kingdom, Jul. 2, 1986, 8616186
Int. Cl.[5] B05D *3/02;* B32B *27/36, 27/38*
U.S. Cl. 427—386 2 Claims

1. A method of producing a coated article comprising applying to at least one surface of a polymeric substrate a coating composition comprising a polymeric electrolyte and a polyepoxy resin in a weight ratio from 1:20 to 1:0.5, the polymeric electrolyte being a cationic electroconductive polymer capable of conducting a current through ionization.

5,008,135

EPOXY FLUOROCARBON COATING COMPOSITIONS AND THE PROCESS TO MAKE THE SAME

Paul J. Giordano, Hudson, and Richard C. Smierciak, Streetsboro, both of Ohio, assignors to The Standard Oil Company, Cleveland, Ohio

Continuation of Ser. No. 334,736, Apr. 7, 1989, abandoned, which is a continuation of Ser. No. 186,673, Apr. 21. 1988, abandoned, which is a continuation of Ser. No. 856,625, Apr. 25, 1986, abandoned, which is a continuation-in-part of Ser. No. 777,890, Sep. 19, 1985, abandoned. This application Jul. 18, 1990, Ser. No. 554,933
Int. Cl.[5] C08L *63/00, 27/18*
U.S. Cl. 427—386 31 Claims

1. A fluid coating composition comprising about 5 to about 24 percent by weight of a powdered fluorocarbon polymer wherein said florocarbon is non-melt processable and wherein said fluorocarbon has a particle size of less than 500 microns, dispersed in about 95 percent to about 70 percent by weight of an epoxy resin and an effective amount of a fluorosurfactant.

5,008,136

TEMPERATURE INDICATING PAINT AND METHOD OF PREPARING A SPECIMEN WITH THE SAME

John R. Chamberlain, Bristol, England, assignor to Rolls Royce plc, London, England

Continuation-in-part of Ser. No. 189,758, May 3, 1988, abandoned. This application Aug. 17, 1989, Ser. No. 395,360
Claims priority, application United Kingdom, May 19, 1987, 8711815
Int. Cl.[5] B05D *3/02*
U.S. Cl. 427—388.1 20 Claims

19. A method of preparing a part of a gas turbine engine with a temperature indicating paint comprising the steps of applying to the part a temperature indicating paint comprising a silver containing paste dispersed in 10% to 70% by weight of a volatile solvent, the paste comprising:

(a) 50–60% by weight of a metal particle pigment, at least a proportion of which is silver,
(b) 10–12% by weight of a chemically stable glass frit binder that is essentially non-volatile to a temperature of at least 1100° C., and
(c) an organic binder, being the remainder of the paste, volatile at a temperature less than 750° C., permitting the solvent to volatile, and stoving the part for up to five minutes at a temperature of between 750° C. and 850° C. so as to burn off the organic binder.

5,008,137

BARRIER COATINGS

Richard M. Nugent, Jr.; Ken W. Niederst, both of Allison Park, and Jerome A. Seiner, Pittsburgh, all of Pa., assignors to PPG Industries, Inc., Pittsburgh, Pa.

Continuation of Ser. No. 152,176, Feb. 4, 1988, abandoned. This application Jun. 19, 1989, Ser. No. 367,992
Int. Cl.[5] B65D *25/00*; B32B *27/08*
U.S. Cl. 428—35.4 26 Claims

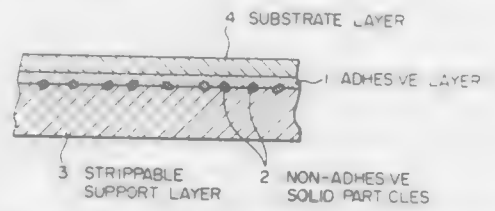
1. A multilayer packaging material comprising:
(a) at least one layer of a gas-permeable polymeric material; and
(b) at least one layer of a thermoset barrier material comprised of a reaction product of: (i) an ungelled amine-functional polymeric resin which is a reaction product of a polyamine and a polyepoxide, the polyamine and the polyepoxide present in the reaction mixture at a ratio of from about 1.4:1 to about 0.83:1 based upon moles of polyamine to moles of polyepoxide, the ungelled polymeric resin further containing an average of greater than two polyamine moieties per molecule within said resin; and (ii) a material selected from the group consisting of a polyepoxide, a polyoxalate and mixtures thereof, the polymeric barrier material further characterized as containing at least about seven percent by weight amine nitrogen based on the total weight of polymeric barrier material and having an oxygen permeability of less than about 3 cc-mil/100 in^2-day-atmosphere and a carbon dioxide permeability of less than about 15 cc-mil/100 in^2-day-atmosphere at 23° C. and zero percent relative humidity.

5,008,138

PLATEN ROLLER

Jun Murata, Kawagoe, Japan, assignor to Canon Kabushiki Kaisha, Tokyo, Japan

Continuation of Ser. No. 55,058, May 28, 1987, abandoned. This application Jun. 19, 1989, Ser. No. 368,936
Claims priority, application Japan, Jun. 5, 1986, 61-129291
Int. Cl.[5] B41J *11/057*
U.S. Cl. 428—36.4 5 Claims



1. An impact typewriter comprising a platen roller, comprising:
a cylindrical rubber member having a glass transition temperature within the range of −10° C., with said cylindrical member being formed from a rubber material synthesized by using a polymer, carbon, an inorganic filler, an oil, sulfur, a vulcanization aid, a vulcanization accelerator and stearic acid as starting materials; and
support means for supporting said cylindrical rubber member, wherein said rubber member is mounted around said support means.

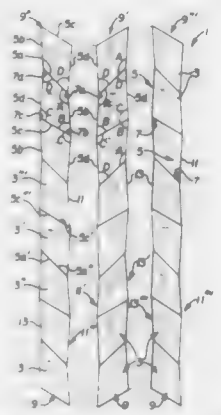
PRESSURE-SENSITIVE ADHESIVE LAYER

Katsura Ochi; Yasuaki Oonishi, and Kazuhisa Kinsen, all of Uozu, Japan, assignors to Nippon Carbide Kogyo Kabushiki Kaisha, Tokyo, Japan

Filed Oct. 31, 1988, Ser. No. 264,784
Claims priority, application Japan, Oct. 31, 1987, 62-274640
Int. Cl.[5] B32B *5/16, 7/06, 7/12*
U.S. Cl. 428—40 4 Claims



1. A pressure-sensitive adhesive sheet structure comprising
(A) a pressure-sensitive adhesive layer having, on at least one surface thereof, a layer of evenly dispersed non-adhesive solid particles having an average particle diameter of 10 to 60 microns, wherein at least about half of the solid particles project from the surface of the adhesive layer to a height corresponding to at least about one-fourth of the average particle diameter of the solid particles, and if the solid particles are hollow particles, the walls of the hollow particles are not rupturable by the pressure of bonding,
(B) a strippable support layer contacting the projecting portions of the non-adhesive solid particles on the surface of the adhesive layer and having depressions on the surface intimately receiving the projecting portions of the solid particles, and
(C) a substrate layer laminated to that surface of the pressure-sensitive adhesive layer which does not have the layer of the dispersed solid particles.

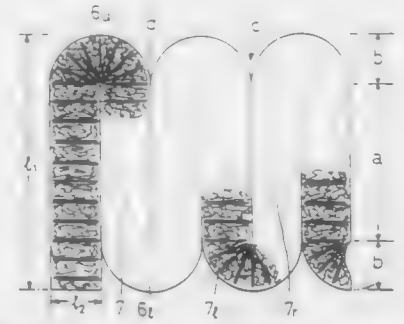
BIAXIALLY CORRUGATED FLEXIBLE SHEET MATERIAL

John C. Schmertz, 5308 Ellsworth Ave., Pittsburgh, Pa. 15232

Filed Jun. 1, 1989, Ser. No. 359,540
Int. Cl.[5] B32B *3/28*
U.S. Cl. 428—179 4 Claims



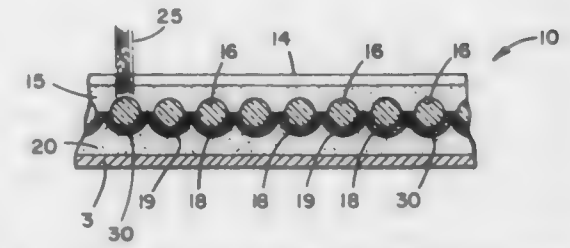
1. A biaxially flexible corrugated sheet material comprising a plurality of identical trapezium segments,
each said trapezium segment having four edges and four corners formed at the juncture of said edges, two said edges meeting at an angle to form each said corner;
said trapezium segments being arranged in a plurality of elongated strips, each said strip being a single trapezium segment wide and having first and second opposed sides formed by the free edges of said trapezium segments in said strip;
adjacent said strips being mirror images of each other and being connected to each other along their adjoining sides so that the edges of adjacent said trapezium segments meet and four said corners of four adjacent trapezium segments meet at a point, the sum of the angles of said four corners at each said point being alternately less than 360° and greater than 360° along the length of said adjacent strips;
whereby said sheet material has an undulating configuration of alternating ridges and valleys, is inherently curved, and cannot lie in a flat plane.

5,008,141

CUSHIONING MATERIAL FOR MATTRESSES

Tokihito Shinozuka, Tokyo, Japan, assignor to Paramount Bed Co., Ltd., Tokyo, Japan

Filed May 16, 1989, Ser. No. 353,329
Claims priority, application Japan, May 27, 1988, 63-129710
Int. Cl.[4] B32B *3/28, 5/06*; A47C *27/00*
U.S. Cl. 428—182 6 Claims



1. A cushioning material for mattresses, comprising:
a corrugated web having opposite cushioning surfaces, said corrugated web comprising means for providing a relatively soft portion at said opposite cushioning surfaces and a moderately rigid portion between said opposite cushioning surfaces, said means for providing composed of an elongated flat board continuously and alternately bent to form a plurality of consecutive side-by-side contact portions and a plurality of bent portions interconnecting said plurality of side-by-side contact portions, wherein said corrugated web extends substantially in a plane and said plurality of consecutive side-by-side contact portions extend substantially perpendicular relative to said plane, and wherein said elongated flat board is composed of a pile of crimped fibers and said flat board has a plurality of needle punctures therein, extending in a thickness direction of said flat board substantially perpendicular to the direction of elongation of said elongated flat board, formed by needling said pile of crimped fibers, such that said bent portions are relatively soft in a direction generally perpendicular to said plane of said corrugated web and said side-by-side contact portions are moderately rigid relative to said bent portions in said direction generally perpendicular to said plane of said corrugated web; and
holding means for holding said corrugated web together so as to maintain the shape of said corrugated web.
4. A cushioning material for mattresses, comprising:
a corrugated web having opposite cushioning surfaces, said corrugated web comprising means for providing a relatively soft portion at said opposite cushioning surfaces and a moderately rigid portion between said opposite cushioning surfaces, said means for providing composed of an elongated flat board continuously and alternately bent to form a plurality of consecutive side-by-side contact portions and a plurality of bent portions interconnecting said plurality of side-by-side contact portions, wherein said corrugated web extends substantially in a plane and said plurality of consecutive side-by-side contact portions extend obliquely relative to said plane, and wherein said elongated flat board is composed of a pile of crimped fibers and said flat board has a plurality of needle punctures therein, extending in a thickness direction of said flat board substantially perpendicular to the direction of elongation of said elongated flat board, formed by needling said pile of crimped fibers, such that said bent portions are relatively soft in a direction generally perpendicular to said plane of said corrugated web and said side-by-side contact portions are moderately rigid relative to said bent portions in said direction generally perpendicular to said plane of said corrugated web; and
holding means for holding said corrugated web together so as to maintain the shape of said corrugated web.

5,008,142

EMBEDDED LENS RETROREFLECTIVE SHEETING WITH FLEXIBLE, DIMENSIONALLY STABLE COATING

Bruce B. Wilson, Mounds View, and Raymond E. Grunzinger, New Scandia Township, Washington County, both of Minn., assignors to Minnesota Mining and Manufacturing Company, St. Paul, Minn.

Filed Sep. 2, 1988, Ser. No. 239,950
Int. Cl.[4] G02B *5/128*; B05D *5/06*
U.S. Cl. 428—203 3 Claims

1. An embedded lens retroeflective sheeting comprising a resin matrix layer in which is partially embedded a plurality of bead lenses, a spacecoat comprising a light transmissive, polymeric layer on the side of the lenses not embedded in the resin matrix layer, and a reflective surface on the side of the spacecoat opposite the lenses; said spacecoat comprising a semi-interpenetrating polymer network which comprises:
(a) a cross-linked reactive polymer component
(b) a cross-linking agent which is at least di-functional with respect to reaction with reactive polymer component; and
(c) a non-reactive polymer component having a weight average molecular weight of between about 7,000 and 30,000, and at least 40% of which can be extracted by solvent from said spacecoat.

5,008,143

DECORATIVE OBJECTS WITH MULTI-COLOR EFFECTS

Louis Armanini, Pleasantville, N.Y., assignor to The Mearl Corporation, Ossining, N.Y.

Continuation of Ser. No. 70,022, Jul. 6, 1987, abandoned. This application Dec. 7, 1989, Ser. No. 453,385
Int. Cl.[5] C09D *5/29*
U.S. Cl. 428—207 10 Claims

1. An article exhibiting a multicolor effect consisting essentially of a transparent body, an interference pigment and an absorption colorant in which said absorption colorant is of a color which is different from the reflection color of the interference pigment or the complement thereof and in which the interference pigment and absorption colorant have the same order of magnitude of color intensity.

5,008,144

OVERPRINT AQUEOUS VARNISH

Timothy J. Baker, Claremore, and John H. Woods, Tulsa, both of Okla., assignors to Petrolite Corporation, St. Louis, Mo.

Continuation-in-part of Ser. No. 267,064, Nov. 4, 1988, Pat. No. 4,908,063. This application Nov. 28, 1989, Ser. No. 442,890

Int. Cl.[5] B32B *3/00*

U.S. Cl. 428—211 18 Claims

1. A product bearing print ink indicia protected by an overprint aqueous varnish having formulation enhancing additive comprising a mixture of

a. A finely divided mostly linear aliphatic hydrocarbon and/or modified hydrocarbon having a molecular weight of about 300–3,000; and

b. a compound represented by the formula:

wherein R and R_1 are independently hydrogen or C_1–C_{10} alkyls; R_2 is hydrogen or methyl, x is about 8 to about 75; and n is about 2 to about 65.

5,008,145

GLASS FIBER REINFORCED POLY(VINYL CHLORIDE) BLEND WITH IMPROVED HEAT DISTORTION AND TENSILE STRENGTH

Philip L. Kinson, Brecksville, and Edward M. Faber, Avon, both of Ohio, assignors to The B.F. Goodrich Company, Brecksville, Ohio

Division of Ser. No. 112,793, Oct. 23, 1987, Pat. No. 4,870,126. This application Sep. 7, 1989, Ser. No. 404,011

Int. Cl.[5] B32B *27/00*; C08K *9/00, 9/06*; D04H *1/58*

U.S. Cl. 428—288 4 Claims

1. In a shaped article formed from a glass fiber reinforced composite of a stabilized blend of poly(vinyl chloride) and a copolymer blended therewith, the improvement consisting essentially of

(a) from about 60 parts to about 85 parts by wt of poly(vinyl chloride) resin per 100 parts of said blend in which the vinyl chloride portion of each repeating unit contains from about 57% to about 67% by wt of chlorine,

(b) from 15 to 40 parts by wt of a copolymer of 20% to 30% by wt acrylonitrile with 80% to 70% by wt of a mixture comprising a major portion by wt alpha-methyl styrene and a minor portion of styrene, said copolymer forming a single phase with said poly(vinyl chloride),

(c) from 5 to about 20 parts by wt, combined, of a stabilizer, lubricant, processing aid and impact modifier, and,

(d) from about 10% to about 30% by wt of glass fibers having a diameter less than about 20 microns, wherein said glass fibers are coated with a size consisting essentially of (i) an aminosilane coupling agent having a reactive amine moiety which upon reaction with said poly(vinyl chloride) results in a compound having a peak in a proton magnetic resonance spectra at 5.65 ppm, and (ii) a polymer film former having a basicity greater than that of poly(vinyl acetate) and sufficient to leave enough said resin coupled to said fibers after thermoforming, to yield a ratio of total chlorine to carbon Cl(2p)/C(ls) of at least 0.91, measured as the ratio of areas under the peaks, after extraction of said composition, after thermoforming, with tetrahydrofuran,

whereby a glass fiber reinforced composite molded from said blend has a heat distortion temperature (HDT) of at least 80° C. and a tensile strength at least 10,000 psi (1.82 MPa).

5,008,146

ZINC-CARBON ANTIFOULING COATING

Francis L. Keohan, Plymouth, Mass., assignor to Cape Cod Research, Inc., Buzzards Bay, Mass.

Continuation of Ser. No. 267,350, Nov. 4, 1988, abandoned. This application Oct. 10, 1989, Ser. No. 419,143

Int. Cl.[5] B05D *5/00*

U.S. Cl. 428—328 5 Claims

1. A method for rendering underwater structures resistant to fouling by pestiferous organisms which comprises contacting said structures with a composition comprising 10 to 60 percent by weight metallic zinc in combination with 5 to 40 percent carbon.

5,008,147

MAGNETIC RECORDING MEDIUM

Katsumi Ryoke; Masatoshi Takahashi; Akihiro Hashimoto, and Kazuo Hasumi, all of Kanagawa, Japan, assignors to Fuji Photo Film Co., Ltd., Kanagawa, Japan

Filed Jul. 8, 1988, Ser. No. 216,566

Claims priority, application Japan, Jul. 8, 1987, 62-170511

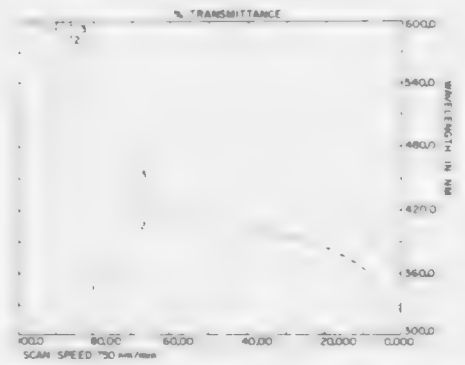
Int. Cl.[5] G11B *23/00*

U.S. Cl. 428—323 10 Claims

1. A magnetic recording medium comprising a nonmagnetic support having on one surface thereof a magnetic layer and on the opposite surface thereof a backing layer comprising nonmagnetic particles dispersed in a binder, wherein said binder of said backing layer comprises from about 20 to 90 wt % of polycarbonate polyurethane, and said backing layer comprises from about 40 to 200 parts by weight of said binder per 100 parts by weight of said nonmagnetic particles.

5,008,148

PROCESS FOR THE PRODUCTION OF PLASTIC MOULDED ARTICLES WITH IMPROVED WEATHERING RESISTANCE



Siegfried Thurm, Meerbusch; Reimer Holm, Bergisch-Gladbach; Christian Leuschke, Dormagen; Dietrich Rathmann, Leverkusen, and Lutz Schrader, Krefeld, all of Fed. Rep. of Germany, assignors to Bayer Aktiengesellschaft, Bayerwerk, Fed. Rep. of Germany

Filed Jun. 12, 1989, Ser. No. 366,719

Claims priority, application Fed. Rep. of Germany, Jun. 23, 1988, 3821131

Int. Cl.[5] B32B *27/36*

U.S. Cl. 428—336 14 Claims

1. Process for coating moulded plastic articles of thermoplastic polycarbonates or thermoplastic polyarylene sulphides, characterised in that the moulded plastic articles are directly coated with metal oxides which absorb electromagnetic radiation at wave lengths of from 250 nm to 400 nm.

5,008,149

CERAMIC SUBSTRATE HAVING A METALLIC LAYER THEREON AND A PROCESS FOR MANUFACTURING THE SAME

Yasunori Taga; Hideya Yamadera, both of Nagoya; Keiji Aoki, Susono, and Tadashi Hattori, Okazaki, all of Japan, assignors to Kabushiki Kaisha Toyota Chuo Kenkyusho, Aichi and Nippon Soken Inc., Nishio, both of, Japan

Filed Nov. 22, 1988, Ser. No. 274,481

Claims priority, application Japan, Nov. 24, 1987, 62-295823

Int. Cl.[5] B32B *15/04, 15/20*

U.S. Cl. 428—336 5 Claims

1. A ceramic substrate having a metallic layer thereon comprising:

a ceramic substrate comprising alumina;

a metallic layer containing at least molybdenum (Mo), and formed on said ceramic substrate; and

a bonding layer comprising composite oxides composed of aluminum (Al) and at least one metal selected from the group consisting of titanium (Ti), zirconium (Zr) and niobium (Nb), and formed between said ceramic substrate and said metallic layer by chemical reaction between said alumina of said ceramic substrate and said bonding layer;

in which said ceramic substrate and said metallic layer is bonded by means of said bonding layer.

3. The ceramic substrate having a metallic layer thereon according to claim 1, wherein the thickness of said bonding layer is in the range of 0.005 to 0.5 μm.

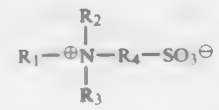
5,008,150

PHOTOGRAPHIC SUPPORT WITH AN UNDERCOATING LAYER ON A RESIN COATED BASE SHEET

Tetsuya Ashida, Tokyo, and Touru Noda, Matsudo, both of Japan, assignors to Mitsubishi Paper Mills Limited, Tokyo, Japan

Filed Oct. 3, 1988, Ser. No. 252,130

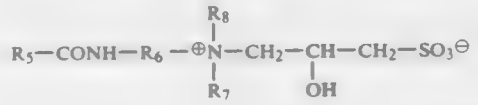
Claims priority, application Japan, Oct. 2, 1987, 62-250466; Oct. 16, 1987, 62-261417; Dec. 22, 1987, 62-324965



Int. Cl.[5] B32B *27/08*; G03C *1/37*; C08L *89/00*

U.S. Cl. 428—340 9 Claims

1. A photographic support comprising a resin coated base sheet and formed thereon an undercoating layer comprising



(a) a hydrophilic colloid, and

(b) at least one compound selected from the group consisting of a compound of the formula:

(I)

wherein R_1, R_2 and R_3 are independently hydrogen or an alkyl group; and R_4 is an alkylene group, and a compound of the formula:

(II)

wherein R_5, R_7 and R_8 are independently hydrogen or an alkyl group; and R_6 is an alkylene group, the coating amount of said undercoating layer being 0.01 g/m^2 to 1.0 g/m^2 on dry basis.

5,008,151

GLASS POWDER ADHESIVE SHEET

Takashi Tominaga; Souji Nishiyama; Takahumi Sakuramoto, and Makoto Honda, all of Osaka, Japan, assignors to Nitto Denko Corporation, Osaka, Japan

Filed Aug. 12, 1988, Ser. No. 231,560

Claims priority, application Japan, Sep. 11, 1987, 62-228934

Int. Cl.[5] B32B *7/12*

U.S. Cl. 428—343 12 Claims

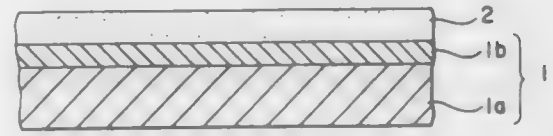
1. A multilayer glass powder adhesive sheet comprising:

a glass powder molding layer consisting essentially of glass powder and a resin binder; and

an adhesive layer having a thermal decomposition initiation temperature higher than that of said resin binder, provided on the surface of the glass powder molding layer wherein the difference between the thermal decomposition initiation temperature of said adhesive layer and that of said resin binder is at least 10° C.

5,008,152

INK COMPOSITION FOR THERMAL TRANSFER PRINTING AND FILM FOR THERMAL TRANSFER PRINTING



Hisanobu Mikamo, Ibaraki; Noboru Odani, and Akio Shimizu, both of Takatsuki, all of Japan, assignors to Hitachi Maxell Ltd., Osaka, Japan

Filed Jul. 11, 1989, Ser. No. 377,968

Claims priority, application Japan, Jul. 14, 1988, 63-175532; Apr. 25, 1989, 64-106954

Int. Cl.[5] B41M *5/26*; C09D *11/00*

U.S. Cl. 428—423.1 8 Claims

1. An ink composition for thermal printing, which composition comprises a coloring agent and a mixture of an thermoplastic material selected from the group consisting of thermoplastic resins and waxes as a binder.

5. A film for thermal transfer printing comprising a substrate and an ink layer which is formed on a surface of the substrate from an ink composition comprising a coloring agent and a mixture of an aromatic ester-containing polyurethane and at least one thermoplastic material selected from the group consisting of thermoplastic resins and waxes as a binder.

5,008,153

CORROSION INHIBITIVE PRETREATMENT FOR "COPPER-FREE" MIRRORS

Deborah E. Hayes, Verona, Pa., assignor to PPG Industries, Inc., Pittsburgh, Pa.

Filed Dec. 8, 1988, Ser. No. 281,358

Int. Cl.[5] C23C *26/00*

U.S. Cl. 428—429 11 Claims

1. An improved process of depositing a thin metallic film on a substrate by applying to the substrate a thin metallic film the improvement comprising pretreating the surface of the substrate with a pretreatment composition comprising a protective material before applying the thin metallic film to the substrate, said pretreatment composition comprising

(A) an adhesion promoter bonding or coupling to the interface of the substrate and the thin metallic film and

(B) a corrosion inhibitor wherein (A) is selected from the group consisting of a silane compound, a titanium compound, a zirconium compound, and a mixture thereof, and (B) is selected from the group consisting of a nitrogen containing heterocyclic compound, a corrosion inhibitive

metallic compound other than recited in (A) and a mixture thereof.

7. An article of matter which is prepared by the process of claim 1.

5,008,154

COMPOSITION AND METHOD FOR PRIMING AND COATING SILICONE SUBSTRATES

Michael D. Meddaugh, Midland, Mich., assignor to Dow Corning Corporation, Midland, Mich.

Division of Ser. No. 283,423, Dec. 12, 1988, Pat. No. 4,923,946.
This application Jan. 2, 1990, Ser. No. 459,858
Int. Cl.[5] B32B *9/04*; B05D *3/10*
U.S. Cl. 428—447 10 Claims

1. A method comprising applying a continuous layer of a primer composition to a moisture-cured silicone substrate, said primer composition consisting essentially of a partial hydrolyzate of an aminoalkyl-susbstituted trialkoxysilane, prepared by mixing an aminoalkyl-substituted trialkoxysilane and less than one mol of water per mol of silicon-bonded alkoxy radical in the silane, from 0.1 to 10 percent by weight, based on the weight of said partial hydrolyzate, of a carboxylic acid salt of tin and the balance a solvent component; and evaporating the solvent component from the continuous layer of primer composition to provide a primed silicone substrate.

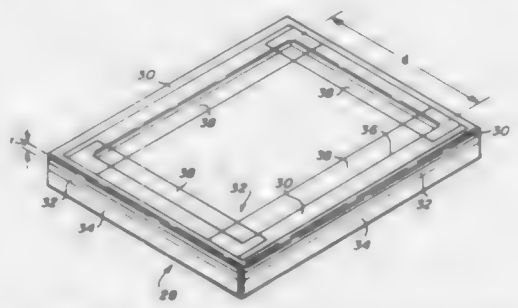
6. An article comprising a moisture-cured silicone substrate bearing a coating composition durably adhered thereto with a continuous primer layer consisting essentially of the composition obtained by drying a primer composition consisting essentially of a partial hydrolyzate of an aminoalkyl-substituted trialkoxysilane prepared by mixing an aminoalkyl-substituted trialkoxysilane and less than one mol of water per mol of silicon-bonded alkoxy radical in the silane, from 0.1 to 10 percent by weight, based on the weight of said partial hydrolyzate, of a carboxylic acid salt of tin and the balance a solvent component.

5,008,155

AQUEOUS DISPERSIONS FOR THE PREPARATION OF CROSSLINKABLE COATINGS

Dieter Engel, Kelsterbach; Josef Mondt, Königstein/Taunus, and Klaus Zimmerschied, Wiesbaden, all of Fed. Rep. of Germany, assignors to Hoechst Aktiengesellschaft, Frankfurt am Main, Fed. Rep. of Germany

Division of Ser. No. 143,346, Jan. 5, 1988, abandoned, which is a continuation of Ser. No. 714,046, Mar. 19, 1985, abandoned.
This application Sep. 19, 1989, Ser. No. 409,082
Claims priority, application Fed. Rep. of Germany, Mar. 21, 1984, 3410234
Int. Cl.[5] B32B *15/08, 27/00*
U.S. Cl. 428—463 10 Claims



9. A solid substrate having a bake-coated surface coating thereon in the form of a crack-free film, the composition of which is that of a dried and baked aqueous dispersion, wherein the aqueous dispersion is one which is useful for producing a crosslinkable surface coating and which contains, as binder, a crosslinkable dispersion copolymer formed from olefinically-unsaturated monomers and, optionally, further comprising a member selected from the group consisting of pigment, dyestuff, extender, water-soluble and/or water-dispersible resin, extraneous crosslinking agent, crosslinking catalyst, thickener, thixotropic agent, wetting agent, anti-corrosion agent, anti-freeze agent, light stabilizer, anti-oxidant and anti-foaming agent; dispersed copolymer particles of the dispersion having average particle diameters of from 0.5 to 10 microns; the proportion of monomer units carrying crosslinkable groups in the dispersion copolymer being greater than 10% by weight, relative to the dispersion copolymer.

5,008,156

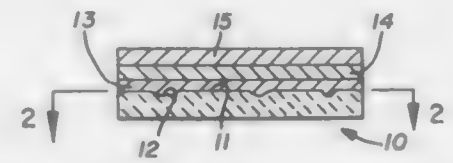
PHOTOCHEMICALLY STABLE MID AND DEEP ULTRAVIOLET PELLICLES

Gilbert H. Hong, Los Altos Hills, Calif., assignor to Exion Technology, Inc., San Jose, Calif.

Continuation-in-part of Ser. No. 929,060, Nov. 7, 1986,. This application Dec. 6, 1988, Ser. No. 280,702
Int. Cl.[5] B32B *27/08*
U.S. Cl. 428—506 18 Claims

1. A pellicle for transmitting mid and deep ultraviolet light for use in a projection printing process comprising.

a core layer selected from the group consisting of polymethylmethacrylate polymer and polyglycidylemethacrylte, and



at least one antireflective layer selected from the group consisting of poly-1H, 1H Pentadecafluorooctyl methacrylate and poly-1H, 1H Pentadecafluorooctyl acrylate coated on a surface in close physical proximity to the core layer.

5,008,157

METALLIZED ARTICLE AND PROCESS FOR METALLIZING A NON-CONDUCTIVE ARTICLE

Michael N. Paxos, 1667 Pinecone, NW., North Canton, Ohio 44720

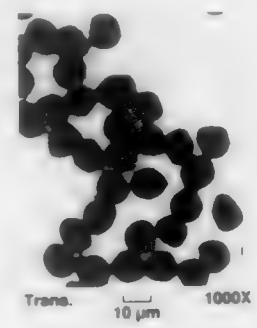
Filed Nov. 22, 1989, Ser. No. 440,252
Int. Cl.[5] B32B *15/04*
U.S. Cl. 428—612 4 Claims

1. A metallized article having an exterior surface comprising:

a substrate being of a material selected from the group consisting of ceramic, glass, porcelain and clay, said substrate containing a plurality of depressions on its exterior surface;

a first layer of palladium metal mechanically bonded to the surface of said substrate, said mechanical bond being enhanced by the interaction of said first layer with said depressions;

an intermediate layer of metal bonded to said first layer, said intermediate layer being a metal selected from the group consisting of copper and nickel; and



a finish layer of metal bonded to said intermediate layer, said finish layer comprising a metal selected from the group consisting of gold, platinum, rhodium, palladium, silver, bronze, brass, copper, nickel, iron, chromium, tin, zinc, and mixtures thereof.

5,008,158

PRODUCTION OF METAL MATRIX COMPOSITES REINFORCED WITH POLYMER FIBERS

Que-Tsang Fang, Murrysville, and Caroline Wei-Berk, Monroeville, both of Pa., assignors to Aluminum Company of America, Pittsburgh, Pa.

Filed Nov. 7, 1988, Ser. No. 267,[illegible]
Int. Cl.[5] C22C *1/09*
U.S. Cl. 428—614 16 Claims

1 A metal matrix composite comprising:
non-woven liquid crystal polymer fibers; and
a metal alloy matrix surrounding said fibers, said metal alloy matrix having been formed by infiltrating a liquid phase of said metal into a preform of said fibers having no coating or surface treatment.

3 A metal matrix composite comprising:
polymer fiber having lengths of less than two inches; and
a metal alloy matrix surrounding said polymer fiber.

5,008,159

METHOD OF PRODUCING SILICON CARBIDE-BASED BODIES

Ian Higgins, Preston, and Andrew Baxendale, Up Holland, both of United Kingdom, assignors to United Kingdom Atomic Energy Authority, London, England

Filed Nov. 3, 1989, Ser. No. 431,301
Claims priority, application United Kingdom, Nov. 10, 1988, 8826300
Int. Cl.[5] C04B *35/56*
U.S. Cl. 428—614 8 Claims

1 A method of producing a body comprising silicon carbide, the method comprising forming a porous compact comprising, silicon carbide, a carbide of a metal, and carbon, and infiltrating the compact with a mixture comprising molten said metal and molten silicon.

8. A reaction-sintered silicon carbide-based body comprising silicon carbide, metal carbide, and silicide of said metal, made by forming a porous compact comprising silicon carbide, a carbide of the metal, and carbon, and infiltrating the compact with a mixture comprising molten said metal and molten silicon.

5,008,160

METHOD OF SECURING ADHERENT COATINGS BY CVD FROM METAL CARBONYLS, AND ARTICLES THUS OBTAINED

William C. Jenkin, 382 Dorchester Rd., Akron, Ohio 44320

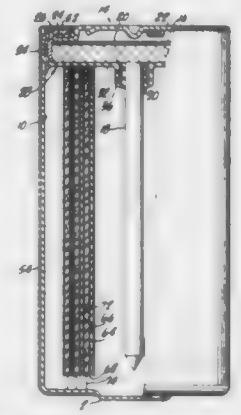
Division of Ser. No. 217,329, Jul. 11, 1988, Pat. No. 4,938,99.
This application Apr. 12, 1990, Ser. No. 508,356
Int. Cl.[5] B32B *15/00, 15/20*
U.S. Cl. 428—656 12 Claims

1. A composite article comprising:

(a) a substrate having a surface and comprising a metal which readily chemisorbs carbon monoxide, said metal forming at least the surface of said substrate;

(b) a thin undercoating layer of a metal which adheres to the substrate metal and which has little or no tendency to chemisorb carbon monoxide; and

(c) an outercoat layer of substantially uniform thickness, said outercoat being of a metal which adheres to the undercoat metal but does not readily adhere to the substrate metal when deposited directly thereon from a metal carbonyl;



(d) said outercoat layer having been deposited on said undercoat layer at from about 225° C. to about 275° C. from vaporized carbonyl of the outercoat metal; said undercoat layer being essentially free of metal oxide surface impurities.

5,008,161

BATTERY ASSEMBLY

Lowell E. Johnston, 11515 Welebir St., Loma Linda, Calif. 92354

Filed Feb. 1, 1989, Ser. No. 304,853
Int. Cl.[5] H01M *2/06, 2/08*
U.S. Cl. 429—7 17 Claims

1. A battery comprising
a container having an opening therein;
a plate positioned in said opening;
a terminal attached to said plate and extending into said container;
a sleeve concentrically positioned about said terminal;
a nonconductive seal positioned about said terminal against said plate and between said sleeve and said terminal and extending in substantially juxtaposition with said plate to about the periphery of said plate between said plate and said container in said opening, said sleeve being compressed about said terminal to seal said container at said terminal.

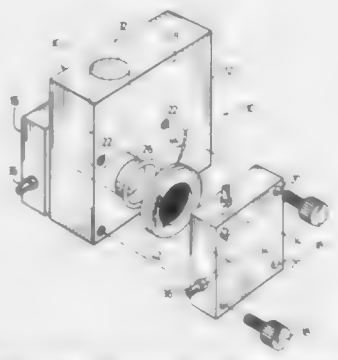
TEST CELL STRUCTURE

Klaus Tomantschger, 6197 Montevideo Rd., Mississauga, Ontario, Canada L5N 2E8 , and Josef Soltys, 246 Third Line, Oakville, Ontario, Canada L6L 4A1

Filed May 11, 1988, Ser. No. 192,537
Int. Cl.[5] H01H *8/04*
U.S. Cl. 429—34 20 Claims

1. A test cell structure for electrochemical cell technology, said test cell having a pair of electrodes, and being capable of easy assembly and dis-assembly; said test cell being of the type which requires a flow of reactant fluids, either gases or liquids, and liquid electrolyte, into and away from the vicinity of the electrodes, where said test cell structure comprises:

a body having two opposed side faces and an electrolyte chamber extending therebetween, and an electrolyte reservoir in fluid communication with said electrolyte chamber;



a pair of reactant fluid chamber blocks adapted for mounting to said body, one at each of said two opposed side faces thereof;

each of said reactant fluid chamber blocks having a cavity formed in a first face thereof, which cavity is open at said

first face and closed away from said first face so as to form a reactant fluid chamber adapted to face the end of said electrolyte chamber at the side face of said body to which each respective reactant fluid chamber block is mounted;

discrete means arranged for conducting reactant fluid to and away from each of said reactant fluid chambers;

and electrode mounting means for mounting a pair of substantially planar electrodes in interposed relation between

said reactant fluid chambers and said electrolyte chamber, one at each side face of said body;

said electrode mounting means each comprising a frame into which an electrode member may be placed, and having substantially fluid-tight sealing relationship with said body and said reactant fluid chamber blocks when said blocks are securely mounted to said body at each side face thereof.

ELECTROCHEMICAL CELL

Hans-Peter Schmöde, Brilon, Fed. Rep. of Germany, assignor to Accumulatorenwerke Hoppecke Carl Zoellner Sohn GmbH & Co. KG, Brilon, Fed. Rep. of Germany

Filed Aug. 31, 1989, Ser. No. 401,018

Claims priority, application Fed. Rep. of Germany, Aug. 31, 1988, 3829419

Int. Cl.[5] H01M *10/40, 2/16*

U.S. Cl. 429—94 **11 Claims**

1. In an electrochemical cell particularly of winding construction, where the electrodes, namely the anode and the cathode, accompanied by the respective interposition of separators, are disposed collectively in a circular arrangement in layers progressively from the inside toward the outside, comprising the improvement therewith wherein:

the most outwardly disposed electrode layer of said cell has a thickness that is less than the thickness of each respectively more inwardly disposed electrode layer of said cell;

said separators being comprised of microfibers that are set view a binder;

said electrochemical cell including an organic electrolyte, said electrolyte being an organic solvent mixture of ethylene carbonate and dioxolane in which is dissolved a conducting salt in the form of a salt of perchloric acid.

5,008,166

METHOD FOR MANUFACTURING A COLOR FILTER

Toshihiro Aoki, Tokyo, Japan, assignor to Casio Computer Co., Ltd., Tokyo, Japan

Continuation of Ser. No. 938,025, Dec. 4, 1986, abandoned. This application Nov. 8, 1989, Ser. No. 434,570

Claims priority, application Japan, Dec. 9, 1985, 60-276520

Int. Cl.[5] G03F *9/00*

U.S. Cl. 430—7 **19 Claims**

1. A method of manufacturing a color filter having color filter elements of the three primary colors which are arranged in a pattern employed in a liquid crystal display device, comprising the steps of:

a first step of forming a negative photosensitive and colorable one-layer film on at least one of a pair of substrates employed in the liquid crystal color display device and facing each other;

a second step including a first sub-step of positioning a mask having a predetermined pattern at a first position relative to said film and exposing said film at least one time, and a second sub-step of positioning said mask, substantially sequentially after said first sub-step, at a second position away from said first position and exposing said film at least one time;

a third step of removing portions of the film which are not exposed when said mask is in both of said first and said second positions in the second step, whereby preventing said portions from forming said color filter elements; and

a fourth step following either one of said first and said third steps, for coloring at least a part of said film in one of the three primary colors.

INTERNAL METAL OXIDE FILLED MATERIALS FOR ELECTROPHOTOGRAPHIC DEVICES

Robert C. U. Yu, Webster, N.Y., assignor to Xerox Corporation, Stamford, Conn.

Filed Dec. 15, 1989, Ser. No. 451,240

Int. Cl.[5] G03G *5/14*

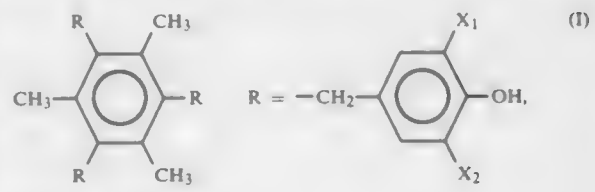
U.S. Cl. 430—56 **28 Claims**

1. An electrophotographic imaging member comprising a layer containing homogeneously dispersed metal oxide particles with a particle diameter of about 30 Angstroms to about 1000 Angstroms, said metal oxide particles having been produced through internal precipitation in a coating solution for said layer.

5,008,168

PHOTOSENSITIVE MEMBER FOR ELECTROPHOTOGRAPHY

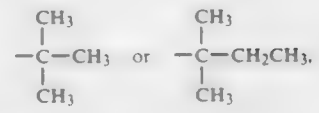
Masaru Nakagawa; Fumio Sumino, both of Yokohama; Masaaki Hiro, Kanagawa; Noboru Kashimura, Kawasaki, and Shin Nagahara, Tokyo, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan



Filed Apr. 17, 1989, Ser. No. 338,844

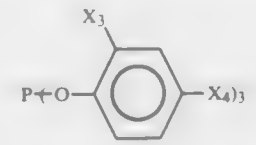
Claims priority, application Japan, Apr. 18, 1988, 63-95851; Mar. 2, 1989, 1-51729

Int. Cl.[5] G03G *5/06*



U.S. Cl. 430—56 **42 Claims**

1. A photosensitive member for electrophotography comprising: an electroconductive substrate, and a photosensitive layer disposed thereon comprising an organic photoconductor; said photosensitive layer containing, at least, a compound represented by the following formula (I):



(I)

wherein X_1 denotes

and X_2 denotes a hydrogen atom, an alkyl group having 1–10 carbon atoms or an alkenyl group having 2–10 carbon atoms; and

a compound represented by the following formula (II):

(II)

wherein X_3 and X_4 respectively denote an alkyl group having 1–10 carbon atoms or an alkenyl group having 2–10 carbon atoms.

5,008,169

PHOTOCONDUCTIVE IMAGING MEMBERS WITH POLYPHOSPHAZENES

Robert C. U. Yu, Webster, and Santokh S. Badesha, Pittsford, both of N.Y., assignors to Xerox Corporation, Stamford, Conn.

Filed Jul. 28, 1989, Ser. No. 386,321

Int. Cl.[5] G03G *5/047*

U.S. Cl. 430—59 **33 Claims**

1. A photoconductive imaging member comprised of a supporting substrate, a ground plane layer, a hole blocking-adhesive layer comprised of polyorganophosphazene, a photogenerating layer, and a hole transport layer.

5,008,170

PHOTORECEPTOR FOR ELECTROPHOTOGRAPHY

Kenichi Karakida; Shigeru Yagi; Yuzuru Fukuda; Masayuki Nishikawa; Te N. Roh; Noriyoshi Takahashi; Masato Ono; Masaki Yokoi, and Yumiko Komori, all of Kanagawa, Japan, assignors to Fuji Xerox Co., Ltd., Tokyo, Japan

Filed Jun. 23, 1989, Ser. No. 370,312

Claims priority, application Japan, Jun. 24, 1988, 63-154796

Int. Cl.[5] G03G *5/14*

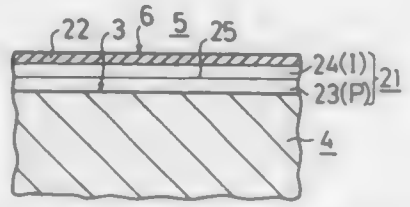
U.S. Cl. 430—65 **6 Claims**

1. A photoreceptor for electrography, comprising: a photoconductive layer, a first surface layer, a second surface layer and a third surface layer formed in sequence on a support, said photoconductive layer being substantially composed of amorphous silicon and said first, second and third surface layers being substantially composed of amorphous silicon added with nitrogen atoms, and wherein the film thicknesses d_1, d_2 and d_3 of said first, second and third surface layers and the nitrogen concentrations c_1, c_2 and c_3 of said first, second and third surface layers satisfy the following relation: $d_2>d_1$, $d_2>d_3$ and $c_3>c_2>c_1$.

5,008,171

PRINTING MEMBER FOR ELECTROSTATIC PHOTOCOPYING

Shunpei Yamazaki, Tokyo, Japan, assignor to Semiconductor Energy Laboratory Co., Ltd., Kanagawa, Japan



Continuation of Ser. No. 395,995, Aug. 21, 1989, which is a continuation of Ser. No. 335,708, Apr. 10, 1989, Pat. No. 4,889,782, which is a division of Ser. No. 814,083, Dec. 24, 1985, abandoned, which is a continuation of Ser. No. 502,583, Jul. 21, 1983, abandoned, which is a division of Ser. No. 276,503, Jun. 23, 1981, Pat. No. 4,418,132. This application Dec. 1, 1989, Ser. No. 444,307

Claims priority, application Japan, Jun. 25, 1980, 55-86801

The portion of the term of this patent subsequent to Dec. 26, 2006, has been disclaimed.

Int. Cl.[5] G03G *5/082, 5/147*

U.S. Cl. 430—67 **3 Claims**

1. A printing drum for an electrostatic photocopying machine comprising:

a conductive substrate;

a non-single-crystal p-type semiconductor layer formed on said conductive substrate;

a non-single-crystal intrinsic semiconductor layer formed on said p-type semiconductor layer in order to induce a built-in electric field across the interface therebetween an insulating layer formed on said intrinsic layer where the band gaps of the p-type layer and the intrinsic layer are substantially less than the band gap of an insulating layer formed on said intrinsic layer; and

said insulating layer having an external surface to permit the passage of charge photo-generated in said intrinsic layer so that charge on the external surface can be neutralized;

where said p-type layer, said intrinsic layer, and said insulating layer consist essentially of materials consisting principally of silicon, silicon with nitrogen, silicon with carbon and silicon with oxygen either in stoichiometric or non-stoichiometric amounts.

COLOR PROOFING SYSTEM HAVING A GRADUATED LAYER OF RESINS WITH DIFFERENT SOLUBILITIES

Stephan J. W. Platzer, Califon, N.J., assignor to Hoechst Celanese Corporation, Somerville, N.J.

Filed Oct. 21, 1989, Ser. No. 261,372

Int. Cl.[5] G03C *5/18, 7/00;* **G03F** *7/30*

U.S. Cl. 430—143 **11 Claims**

1. A method for forming a colored image which comprises

(A) providing a photosensitive element which comprises

(i) a substrate having a release surface; and

(ii) a coated and dried photosensitive solution, defining a photosensitive layer, on said release surface, which photosensitive layer comprises a photosensitizer selected from the group consisting of positive-working, naphthoquinone diazide compounds, and negative-working, polymeric diazonium compounds in a sufficient amount to photosensitize said photosensitive layer; and at least one pigment dispersion in sufficient amount to uniformly color said photosensitive layer, said pigment dispersion being formed by intimately pre-admixing at least one pigment and a first resinous binder compound which is the binder for the said pigment or pigments; and a second resinous binder which is different from the binder for the pigment or pigments, which second resinous binder is present in sufficient amount to uniformly bind the photosensitive layer components in a substantially uniform film and wherein said

second resinous binder is not intimately bound by pre-admixture to said pigment; and

(iii) a coated and dried a nonphotosensitive adhesive composition solution, defining an adhesive layer, directly on said photosensitive layer, which adhesive composition solution comprises one or more thermoplastic polymers and a solvent composition in which the first resinous binder and photosensitizer are insoluble or sparingly soluble and in which the second resinous binder is soluble such that after having coated and dried the adhesive composition solution on the photosensitive layer, the second resinous binder is more preferentially migrated toward the adhesive layer than toward the substrate; which adhesive layer is substantially nontacky at room temperature and can be transferred by lamination at temperatures of from about 60° C. and 180° C.; and

B. either

(a) laminating said element with heat and pressure via said adhesive layer to a developer resistant receiver sheet; and removing said substrate by the application of peeling forces; and imagewise exposing said photosensitive layer to actinic radiation to thereby form image areas in either the exposed or unexposed areas and oppositely nonimage areas in either the unexposed or exposed areas; or

(b) imagewise exposing said photosensitive layer to actinic radiation to thereby form image areas in either the exposed or unexposed areas and oppositely nonimage areas in either the unexposed or exposed areas; and laminating said element with heat and pressure via said adhesive layer to a developer resistant receiver sheet; and removing said substrate by the application of peeling forces; or

(c) laminating said element with heat and pressure via said adhesive layer to a developer resistant receiver sheet; and imagewise exposing said photosensitive layer to actinic radiation to thereby form image areas in either the exposed or unexposed areas and oppositely nonimage areas in either the unexposed or exposed areas; and removing said substrate by the application of peeling forces; and

C. thereafter removing the nonimage areas of said photosensitive layer with a liquid developer, which removing is conducted at a temperature at which said adhesive layer is substantially nontacky.

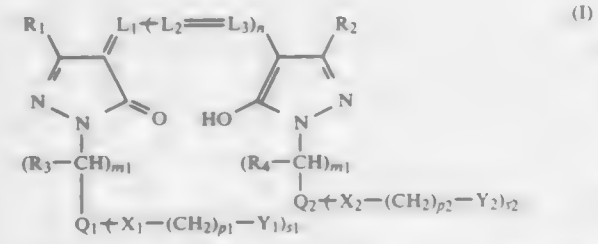
SILVER HALIDE PHOTOGRAPHIC MATERIALS

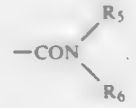
Kensuke Goda, and Shigeru Ohno, both of Kanagawa, Japan, assignors to Fuji Photo Film Co., Ltd., Kanagawa, Japan



Filed Dec. 9, 1988, Ser. No. 282,164

Claims priority, application Japan, Dec. 9, 1987, 62-311421

Int. Cl.[5] G03C *1/12, 1/30*



U.S. Cl. 430—522 **8 Claims**

1. A gelatino-silver halide photographic material comprising at least one light-sensitive silver halide emulsion layer and at least one non-emulsion auxiliary photographic layer provided on a support, wherein at least one of said layers comprises a compound represented by formula (I) and at least one hardener selected from the group consisting of compounds of formula (II) and formula (III);

(I)

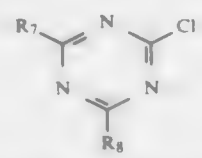
where R_1 and R_2 each independently represents $-COOR_5$ or

R_3 and R_4 each independently represents a hydrogen atom or an alkyl group;

R_5 and R_6 each independently represents a hydrogen atom, an alkyl group or an aryl group or together a 5-membered or 6-membered ring;

Q_1 and Q_2 each independently represents an aryl group; X_1 and X_2 each independently represents a divalent linking group or a bond;

Y_1 and Y_2 each independently represents a sulfo group or a carboxyl group;

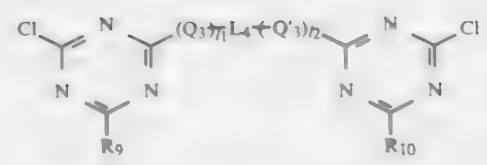


L_1, L_2 and L_3 each independently represents a methine group;

m_1 and m_2 each independently represents 1 or 2;

n represents 0, 1 or 2;

p_1 and p_2 each independently represents 0, 1, 2, 3 or 4; and



s_1 and s_2 each independently represents 1 or 2.

(II)

where R_7 represents a chlorine atom, a hydroxyl group, an alkyl group, an alkoxy group, an alkylthio group, —OM in which M is a monovalent metal atom, $-NR^IR^{II}$ or $-NHCOR^{III}$ wherein R^I, R^{II} and R^{III} are each independently a hydrogen atom, an alkyl group or an aryl group; and

R_8 has the same meaning as R_7 except that it does not represent a chlorine atom;

(III)

where R_9 and R_{10} each independently represents a chlorine atom, a hydroxyl group, an alkyl group, an alkoxy group or -OM in which M is a monovalent metal atom;

Q_3 and Q_3' each independently represents a linking group represented by —O—, —S— or —NH—;

L_4 represents an alkylene group or an arylene group; and

l_1 and l_2 each independently represents 0 or 1.

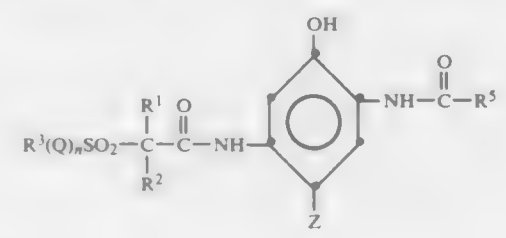
PHOTOGRAPHIC RECORDING MATERIAL CONTAINING A CYAN DYE-FORMING COUPLER



Paul B. Merkel, and David Hoke, both of Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

Continuation-in-part of Ser. No. 335,166, Apr. 7, 1989, abandoned. This application Feb. 2, 1990, Ser. No. 474,566

Int. Cl.[5] G03C *1/08, 7/34*

U.S. Cl. 430—552 **9 Claims**

1. A photographic recording material comprising a support and a photosensitive silver halide emulsion which has associated therewith a cyan dye-forming coupler compound having the structural formula:

wherein:

R^1 is an unsubstituted or a substituted, straight or branched chain alkyl group having from 1 to about 20 carbon atoms, an unsubstituted or a substituted cycloalkyl group having from 3 to about 8 carbon atoms in the ring or an unsubstituted or a substituted aryl group;

R^2 is as defined for R^1 or is hydrogen;

R^3 is an unsubstituted or a substituted alkyl group having from 1 to about 24 carbon atoms, an unsubstituted or substituted cycloalkyl group having from 3 to about 8 carbon atoms in the ring, an unsubstituted or a substituted aryl group having from 6 to about 24 carbon atoms or an unsubstituted or a substituted heterocyclic group having from 3 to about 8 atoms in the heterocyclic ring, wherein the hetero ring atoms can be nitrogen, oxygen, or sulfur;

with the proviso that when R^3 is a primary alkyl group R^1 must contain at least 2 carbon atoms;

Q is —O— or $-NR^4-$;

R^4 is hydrogen; an unsubstituted or a substituted alkyl group having from 1 to about 24 carbon atoms; and unsubstituted or a substituted cycloalkyl group having from 3 to about 8 carbon atoms in the ring; or an unsubstituted or a substituted aryl group having from 6 to about 24 carbon atoms;

R^5 is an unsubstituted or a substituted linear or branched chain alkyl group having from 1 to about 32 carbon atoms;

n is 0 or 1; and

Z is hydrogen or a coupling off group;

with the proviso that at least one of the R^1, R^2, R^3, R^4, R^5 or Z groups is of such size and configuration as to render the coupler compound substantially nondiffusible in the layer of the photographic recording material in which it is coated.

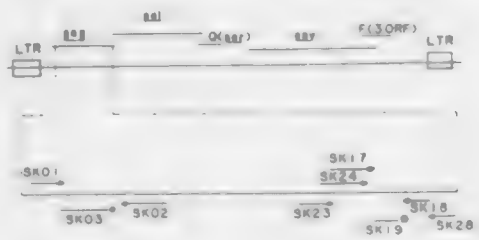
DETECTION OF AIDS ASSOCIATED VIRUS BY POLYMERASE CHAIN REACTION

John J. Sninsky, El Sobrante; Shirley Y. Kwok, San Ramon, and David H. Mack, Berkeley, all of Calif., assignors to Cetus Corporation, Emeryville, Calif.

Continuation of Ser. No. 935,581, Nov. 26, 1986, abandoned, which is a continuation-in-part of Ser. No. 818,127, Jan. 10, 1986, abandoned. This application Aug. 15, 1989, Ser. No. 394,276

Int. Cl.[5] C12Q *1/70, 1/68;* **G01N** *33/566;* **C07H** *15/12*



U.S. Cl. 435—5 **38 Claims**

1. A process for detecting or monitoring a nucleic acid sequence to the nucleic acids in AIDS viruses, which AIDS virus nucleic acid sequence is suspected of being contained in a sample, which process comprises:

(a) treating the sample with two oligonucleotide primers, four different nucleoside triphosphates, and an agent for polymerization, under hybridizing conditions, which primers are sufficiently complementary to substantially conserved regions among the nucleic acid sequences of AIDS viruses to hybridize therewith, such that for each

strand of the AIDS virus nucleic acid sequence an extension product of each primer is synthesized which is substantially complementary to a strand of the AIDS virus nucleic acid sequence being detected or monitored, such that the extension product synthesized from each primer, when separated from its complement, can serve as a template for syntheses of the extension product of the other primer;

(b) treating the sample under denaturing conditions to separate the primer extension products from their templates;

(c) treating the product of step (b) with oligonucleotide primers such that a primer extension product is synthesized using each of the single strands produced in step (b) as a template, resulting in amplification of the sequence specific to the nucleic acids in AIDS viruses.

(d) repeating steps (b) and (c) to synthesize detectable amounts of said AIDS virus nucleic acid sequence if present in said sample, providing an amplified nucleic acid sequence; and

(e) determining if amplification has occurred

5,008,183

ASSAY SYSTEM FOR DETECTING ANTIBODY AND A METHOD OF PRODUCING NON-HUMAN IMMUNE ANTIBODY

Kurt B. Osther, Dallas, Tex., assignor to Bio-Research Laboratories, Inc., Dallas, Tex.

Filed May 10, 1988, Ser. No. 192,241

Int. Cl.[5] G01N *33/569*

U.S. Cl. 435—5 **12 Claims**

1. In an assay for detecting the presence or absence of a human antibody which binds to an antigen of a virus or a bacteria, comprising the steps of:

(a) contacting a sample of the antigen with a test sample of human biological fluid for times and under conditions sufficient for the antigen and any antibody present in the human biological fluid to form antigen-antibody complexes;

(b) at the same time contacting another sample of the antigen with a positive control comprising a procine antibody to the antigen under the same times and conditions as in step (a), said times and conditions being sufficient for the antigen and the non-human antibody in the positive control to form antigen-antibody complexes; and

(c) detecting the formation of any antigen-antibody complexes in steps (a) and (b) by simultaneously contacting an anti-human antibody with any antigen-antibody complex as formed, for times and under conditions sufficient for any antigen-antibody complexes formed in step (a) and step (b) to react with the anti-human antibody.

5,008,184

KIT OR SYSTEM FOR DETECTING SIMA AND/OR LIMA ANTIGENS IN PHYSIOLOGICAL FLUID

Anthony W. Linnane, Camberwell, Australia, assignor to Mucan Diagnostics Pty. Ltd., Victoria, Australia

Division of Ser. No. 860,223, filed as PCT AU85/00136 on Jun. 21, 1985, published as WO86/00414 on Jan. 16, 1986, Pat. No. 4,818,682

This application Nov. 14, 1988, Ser. No. 270,765

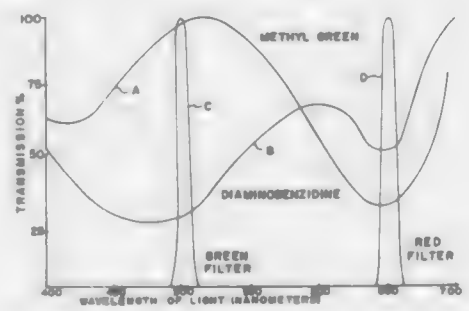
Claims priority, application Australia, Jun. 25, 1984, PG5672

Int. Cl.[5] C12Q *1/00;* **G01N** *33/53*

U.S. Cl. 435—7.23 **4 Claims**

1. An in vitro diagnostic kit or system for detecting the presence in a patient of cancer cells or other cells producing mucin antigens by detecting the presence of SIMA and/or LIMA in a sample of a physiological fluid selected from the group consisting of blood, blood serum and blood plasma taken from the patient, said kit or system comprising a solid support having linked thereto at least one monoclonal antibody capable of immunoreaction with SIMA and/or LIMA in said sample, or fragments thereof, together with indicator means for indicating the presence of an immunoreaction between said antibody or antibodies, or fragments thereof, and the corresponding antigen(s) in said sample, said support allowing for the application of physiological fluid to be tested.

5,008,185



METHODS AND APPARATUS FOR THE QUANTITATION OF NUCLEAR PROTEINS

James W. Bacus, Hinsdale, Ill., assignor to Cell Analysis Systems, Inc., Lombard, Ill.

Continuation-in-part of Ser. No. 794,937, Nov. 4, 1985, Pat. No. 4,741,043. This application Oct. 6, 1987, Ser. No. 106,717

Int. Cl.[5] C12Q *1/00;* **G01N** *33/53*

U.S. Cl. 435—7.23 **32 Claims**

1. A method for measuring a nuclear antigen in a tissue sample containing cells with an immunohistochemical technique using an antibody to said nuclear antigen and a microscopic digital image measuring means, said method comprising the steps of:

staining the sample with an immunohistochemical technique to optically enhance and to stain nuclear antigens with a first spectral stain material which varies with the quantity of the nuclear antigen contained in the sample,

optically enhancing the sample with a second spectral stain material which optically enhances nuclear material in the cells,

measuring the optically-enhanced nuclear material with a microscopic digital image measuring means at a first wavelength range which allows identification of all of the enhanced nuclear material,

measuring the optically-enhanced antigen with the microscopic digital image measuring means at a second wavelength range which substantially excludes the optically-enhanced nuclear material, and

quantitating the nuclear antigen using the measurements made.

5,008,186

DETECTION OF UNIQUE CHLAMYDIA STRAIN ASSOCIATED WITH ACUTE RESPIRATORY DISEASE

J. Thomas Grayston; Cho-chou Kuo, both of Seattle, and San-pin Wang, Redmond, all of Wash., assignors to The Board of Regents of the University of Washington, Seattle, Wash.

Continuation of Ser. No. 281,913, Dec. 7, 1988, abandoned, which is a continuation of Ser. No. 858,380, May 1, 1986, abandoned. This application Apr. 30, 1990, Ser. No. 517,390

Int. Cl.[5] G01N *33/53, 33/566;* **C12N** *15/08;* **C07K** *15/28*

U.S. Cl. 435—7.36 **29 Claims**

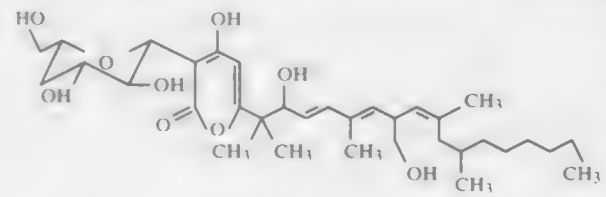
7. A method for detecting the presence of the TWAR strain of chlamydia, *Chlamydia pneumoniae*, in a biological sample, comprising:

exposing a biological sample suspected of containing the TWAR strain to a monoclonal antibody specific for elementary bodies of the TWAR strain; and

detecting the presence of immunocomplexes formed between the monoclonal antibody and the TWAR strain.

5,008,187

ANTIFUNGAL FERMENTATION PRODUCT



Louis Chaiet; Sheldon B. Zimmerman, both of Springfield; Richard L. Monaghan, Somerset, and George M. Garrity, Westfield, all of N.J., assignors to Merck & Co., Inc., Rahway, N.J.

Filed Dec. 1, 1988, Ser. No. 278,385

Int. Cl.[5] C12P *19/00, 17/00;* **A61K** *31/70;* **C13K** *13/00*

U.S. Cl. 435—72 **6 Claims**

1. An antifungal antibiotic compound having the formula

5,008,188

PROCESS FOR PRODUCING S-ADENOSYL-L-HOMOCYSTEINE

Hideaki Yamada; Yoshiki Tani; Sakayu Shimizu, all of Kyoto, and Shozo Shiozaki, Kawasaki, all of Japan, assignors to Nippon Zeon Co., Ltd., Tokyo, Japan

Continuation of Ser. No. 578,769, Feb. 9, 1984, abandoned. This application Nov. 4, 1987, Ser. No. 117,439

Claims priority, application Japan, Feb. 10, 1983, 58-28807

The portion of the term of this patent subsequent to Aug. 12, 2003, has been disclaimed.

Int. Cl.[5] C12P *14/40, 13/12, 19/18*

U.S. Cl. 435—88 **17 Claims**

1. A process for producing S-adenosyl-L-homocysteine, which comprises reacting adenosine with homocysteine by contacting them in an aqueous medium in the presence of cells, crushed cells or a cell-free extract of a microorganism having the ability to synthesize S-adenosyl-L-homocysteine from adenosine and homocysteine, wherein the microorganism is *Enterobacter cloacae* IFO 13535, *Streptoverticillium kentuchense* IFO 12880, *Micropolyspora angiospora* IFO 13155, or *Microellobospor violacea* IFO 12517, and collecting the synthesized S-adenosyl-L-homocysteine.

5,008,189

ENHANCED MEMBRANE SEPARATION OF MONOSACCHARIDES UTILIZING CONCENTRATION POLARIZATION

Anil R. Oroskar, Downers Grove, and James L. Johnson, Des Plaines, both of Ill., assignors to UOP, Des Plaines, Ill.

Continuation-in-part of Ser. No. 895,115, Aug. 11, 1986. This application Jun. 20, 1989, Ser. No. 369,433

Int. Cl.[5] C12P *19/02, 19/20;* **B01D** *61/00, 61/14*

U.S. Cl. 435—105 **13 Claims**

1. In the separation of monosaccharides from an aqueous stream containing a mixture of monosaccharides, disaccharides, trisaccharides, higher oligosaccharides, and a saccharifying enzyme by flowing the stream over a membrane through a channel and collecting the permeate enriched in monosaccharide, the improvement consisting of performing the separation under conditions where the flowing stream is characterized by a Reynolds number from about 20 to about 200 subject to the constraints that (1) the channel height is between about 0.02 and about 0.2 cm, and (2) the stream has a velocity between about 0.1 and about 2 feet per second.

5,008,190

METHOD FOR PRODUCTION OF L-PHENYLALANINE BY RECOMBINANT *E. COLI*

Sae Bae Lee; Chan H. Won; Chung Park, and Bun S. Lim, all of Seoul, Rep. of Korea, assignors to Miwon Co., Ltd., Seoul, Rep. of Korea

Filed Nov. 13, 1987, Ser. No. 120,461

Claims priority, application Rep. of Korea, Mar. 26, 1987, 87-2816

Int. Cl.[5] C12P *13/22;* **C12N** *15/52, 1/21, 15/70*

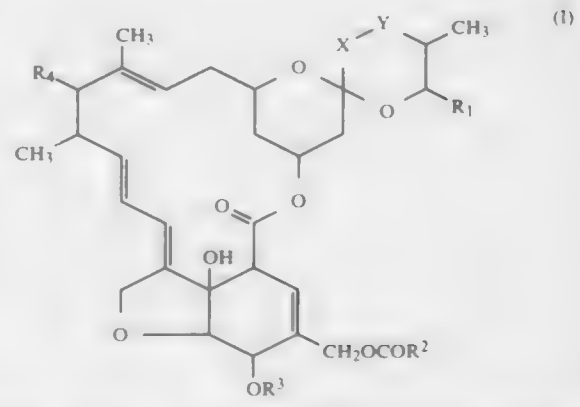
U.S. Cl. 435—108 **13 Claims**

1. The *E. coli* MWPEC 13-60 (ATCC 67459) which has an optimum phenylalanine production capability at a temperature of 30° to 32° C.

5,008,191

MACROLIDE COMPOUNDS, THEIR PREPARATION AND THEIR USE

Takao Okazaki; Shuji Takahashi; Seigo Iwado, all of Tokyo; Keiji Tanaka, Shiga; Toshiaki Yanai, Shiga, and Hisaki Kajino, Shiga, all of Japan, assignors to Sankyo Company Limited, Tokyo, Japan



Filed Dec. 10, 1987, Ser. No. 131,413

Claims priority, application Japan, Dec. 11, 1986, 61-295452

Int. Cl.[5] C12P *17/08;* **C12N** *1/20;* **A61K** *31/335*

U.S. Cl. 435—124 **7 Claims**

1. A culture of *Streptomyces hygroscopicus* subsp *aureolacrimosus* SANK 60286 FERM BP-1190 which, when cultured, produces recoverable amounts of a compound of formula (I)

(I)

wherein X is CH_2; Y is CH_2; R^1 is methyl or ethyl; R^2 is isobutyl, 2-methyl-1-propenyl or 2-methyl-1-butenyl; and R^3 and R^4 are both hydrogen.

5,008,192

ENZYMATIC PROCESS FOR THE PREPARATION OF OPTICALLY ACTIVE CYANOHYDRINS

Uwe Neidermeyer, Walberberg; Udo Kragl, Juelich; Maria R. Kula, Hambach-Neiderzier; Christian Wandrey, Juelich; Kyriakos Makrylaleas, and Karlheinz Drauz, both of Freigericht, all of Fed. Rep. of Germany, assignors to Kernforschungsanlage Juelich GmbH, Juelich and Degussa Aktiengesellschaft, Frankfurt am Main, both of, Fed. Rep. of Germany

Filed Jan. 30, 1989, Ser. No. 303,336

Claims priority, application Fed. Rep. of Germany, Jan. 29, 1988, 3802624; Jul. 14, 1988, 3823864

Int. Cl.[5] C12P *13/00*

U.S. Cl. 435—128 **27 Claims**

1. In a process for the preparation of an optically active (R)-cyanohydrin, which comprises the steps of reacting an aliphatic, aromatic or heteroaromatic aldehyde or ketone with hydrocyanic acid, in the presence of (R)-oxynitrilase and recovering resultant (R)-cyanohydrin, the improvement wherein said (R)-oxynitrilase is (R)-oxynitrilase (4.1.2.10) and the process is carried out in an aqueous medium, under acid conditions and at a temperature range of about −5° C. to +50° C. such that the amount of reactant undergoing a competing chemical reaction and racemization is significantly less than the amount of reactant undergoing the enzymatic synthesis, whereby said recovered resultant (R)-cyanohydrin has an improved optical purity.

5,008,193

ASCORBIC ACID INTERMEDIATES AND PROCESS ENZYMES

Stephen Anderson; David R. Light, both of San Mateo; Cara Marks, San Francisco, and William H. Rastetter, Rancho Santa Fe, all of Calif., assignors to Genentech, Inc., So. San Francisco, Calif.

Continuation-in-part of Ser. No. 620,585, Jun. 14, 1984, abandoned, which is a continuation-in-part of Ser. No. 508,410, Jun. 28, 1983, abandoned. This application May 21, 1987, Ser. No. 53,290

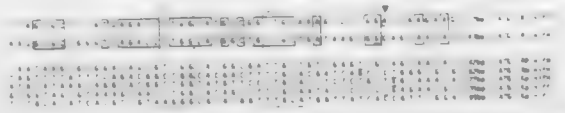
The portion of the term of this patent subsequent to Jul. 12, 2005, has been disclaimed.

Int. Cl.[5] C12P *7/60, 19/34;* **C12N** *9/04, 15/00, 1/00, 1/13*

U.S. Cl. 435—138 **12 Claims**

1. A process for converting glucose to 2-KLG which process comprises culturing in a medium containing glucose under suitable metabolic conditions, bacterial cells to which genetic material has been transferred wherein the transfer of said genetic material renders a bacterial host cell capable of converting glucose to 2,5-DKG but lacking the ability to convert 2,5-DKG to 2-KLG, capable of converting 2,5-DKG into 2-KLG.

5,008,194



NIFH PROMOTERS OF BRADYRHIZOBIUM

Barry G. Rolfe, Curtin; John Shine, Sydney; Kieran F. Scott, Page, all of Australia, and Hauke Hennecke, Zurich, Switzerland, assignors to Lubrizol Genetics, Inc., Wickliffe, Ohio

Continuation-in-part of Ser. No. 618,439, Jun. 8, 1984, abandoned, and a continuation-in-part of Ser. No. 900,270, Aug. 26, 1986, abandoned, which is a continuation of Ser. No. 506,676, Jun. 22, 1983, abandoned. This application Oct. 16, 1987, Ser. No. 109,869

CCT TCC CTT GAA CCC GTG TGC CCC CGT TTC TGC

GAG GGA AGC AAA GCT CGC AAA AGA AGC GCG CAA

CGT TTG GCA AAT CGG TTG ATG GAG AGC AGC 3′

which method comprises:

(a) introducing a DNA molecule comprising a foreign structural gene under control of said promoter into a rhizobial strain capable of forming nodules on a plant; and

(b) infecting a plant with said rhizobial strain wherein nodules are formed and expression of mRNA or protein coded by said foreign structural gene occurs within said nodules.

5,008,195

SOME NOVEL PRODUCERS OF CYCLODEXTRIN GLYCOSYLTRANSFERASES

Paul Allenza, Bartlett, Ill.; Christy G. Clifft, San Mateo, Calif., and Marie J. Morrell, Des Plaines, Ill., assignors to UOP, Des Plaines, Ill.

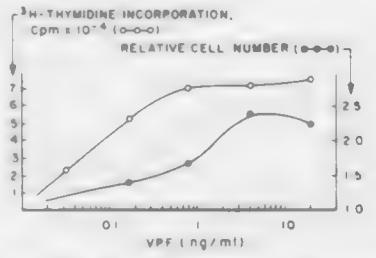
Filed Aug. 5, 1988, Ser. No. 228,411

Int. Cl.[5] C12N *9/10, 1/20, 1/00*

U.S. Cl. 435—193 **4 Claims**

4. A method of producing a cyclodextrin glycosyltransferase comprising growing aerobically Bacillus sp. NRRL B-18373, B-18374 or Pseudomonas sp. NRRL B-18375 in a medium containing an assimilable source of carbon, nitrogen, and mineral nutrients, at a temperature from about 20° to about 45° C., and recovering the cyclodextrin glycosyltransferase produced thereby.

5,008,196



STIMULATION OF ENDOTHELIAL CELL GROWTH

Daniel T. Connolly, Manchester, and Joseph Feder, University City, both of Mo., assignors to Monsanto Company, St. Louis, Mo.

Filed Aug. 21, 1987, Ser. No. 87,739

Int. Cl.[5] C12N *5/00;* **A61K** *37/00;* **C07K** *7/00*

U.S. Cl. 435—240.2 **1 Claim**

1. The method of stimulating endothelial cell growth in vitro comprising subjecting said cells to a growth stimulating amount of a highly purified vascular permeability factor having the following characteristics of guinea pig VPF:

(a) it has a M_r about 34,000–40,000 as determined by sodium dodecylsulfate polyacrylamide gel electrophoresis;

(b) it is a disulfide-linked protein dimer;

(c) it has a N-terminal amino acid sequence as follows:

1 5 10 15
AlaProMetAlaGluGlyGluGlnLysProArgGluValValLys

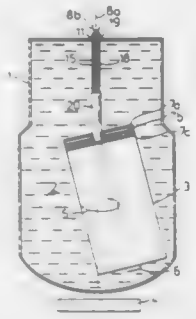
16 20 25 30
PheMetAspValTyrLysArgSerTyrCysArgProIleGluMet

31 35
LeuValAspIlePheGln; and

(d) it exhibits substantial mitogenic activity to endothelial cells in culture.

5,008,197

PROCESS AND A DEVICE FOR IMPROVED OXYGENATION OF BIOLOGICAL CULTURES



Ivar Wergeland, Granitvägen 19B, S-75243 Uppsala; Ingeborg C. Senstad, Ornevn. 51, N-1340 Bekkestua, both of Norway, and Eirik Nestaas, 70 High Rock Ter., Newton, Mass. 02167

Continuation of Ser. No. 758,667, Jul. 9, 1985, abandoned. This application Apr. 27, 1989, Ser. No. 343,662

Claims priority, application Sweden, Nov. 10, 1983, 8306190

Int. Cl.[5] C12N *5/02;* **C12M** *3/02*

U.S. Cl. 435—240.24 **9 Claims**

1 In a process for the oxygenation of biological cultures, comprising the steps of providing a liquid suspension of a biological culture in a closed reaction vessel and agitating said liquid suspension by means of a mechanical stirrer while supplying oxygen to said biological culture so as to promote the growth thereof, the improvement comprising supplying oxygen to said culture through at least one oxygen-permeable membrane carried by said stirrer, which is in direct contact with said liquid suspension.

5,008,198

MEROZOITE SURFACE GLYCOPROTEINS

Robert T. Reese, San Diego, and Harold A. Stanley, La Jolla, both of Calif., assignors to Scripps Clinic and Research Foundation, La Jolla, Calif.

Division of Ser. No. 650,810, Sep. 14, 1984, Pat. No. 4,835,259. This application May 30, 1989, Ser. No. 358,663

Int. Cl.[5] C12N *5/00;* **A61K** *35/14;* **C07K** *3/00, 13/00*

U.S. Cl. 435—240.27 **2 Claims**

1. A hybridoma cell line that produces monoclonal antibodies that bind to a merozoite surface glycoprotein of approximate molecular weight 56,000 that is present in the Geneva and FVO isolates of *Plasmodium falciparum*, said hybridoma cell line having the ATCC accession number HB 8938.

5,008,199

HYBRIDOMA CELL LINE AND MONOCLONAL ANTIBODIES TO *TREPONEMA DENTICOLA* ATCC 33520

Dou-Mei Wang, Randolph; Linda D. Sturdivant, East Orange; Thomas A. Biemer, Mine Hill, all of N.J., and Ronald Mink, Wilbraham, Mass., assignors to Warner-Lambert Company, Morris Plains, N.J.

Filed Nov. 19, 1987, Ser. No. 123,014

Int. Cl.[5] C12N *5/00*

U.S. Cl. 435—240.27 **5 Claims**

1. A hybridoma cell-line capable of producing antibody IgG_3 to *Treponema denticola* TCC 33520, wherein the cell line is formed by fusing a nonsecreting mouse myeloma cell with a spleen cell from a mouse immunized with cell fragments of the spirochete Treponema denticola ATCC 33520.

5,008,200

PROPAGATING MULTIPLE WHOLE FERTILE PLANTS FROM IMMATURE LEGUMINOUS

Jerome P. Ranch, and Julie A. Buchheim, both of Champaign, Ill., assignors to United AgriSeeds, Inc., Savoy, Ill.

Continuation-in-part of Ser. No. 860,979, May 8, 1988, abandoned. This application May 23, 1988, Ser. No. 197,355

Int. Cl.[5] C12N *5/00*

U.S. Cl. 435—240.49 **23 Claims**

1. A method of producing seeds from multiple whole fertile plants, said method comprising the steps of:

(a) culturing aseptic cotyledonary tissue on a culturing media to form immature somatic embryos, said aseptic cotyledonary tissue being of Glycine max or Glycine soja or hybrid thereof, in the form of whole zygotic embryo with cotyledons 4 to 8 in length for Glycine max or hybrid and 1 to 4 mm in length for Glycine soja or in the form of cotyledons excised from said embryo or from derivation product of said cotyledonary tissue, said culture media comprising a synthetic auxin in a concentration of from about 20 to about 40 ppm, said synthetic auxin being selected from the group consisting of 2,4,5-trichlorophenoxyacetic acid, para-chlorophenoxyacetic acid, 2-methyl-4-chlorophenoxyacetic acid, and 2,4-dichlorophenoxyacetic acid; and

(b) incubating the immature somatic embryo isolated from a step (a) on a maturation medium for a length of time sufficient to reduce the water content of the somatic embryo by an amount effective to bring about an increased conversion vigor, said maturation medium comprising 6% to about 12% sucrose to foster development of the immature somatic embryos into mature somatic embryos possessing well-formed cotyledons and radicle.

5,008,201

SIMULATED HUMAN PLATELETS FROM RED BLOOD CELLS

Wayne L. Ryan, Omaha, Nebr., assignor to Streck Laboratories, Inc., Omaha, Nebr.

Filed May 24, 1990, Ser. No. 527,828
Int. Cl.[5] G01N *31/00, 33/48*
U.S. Cl. 436—10 5 Claims

1. A method of preparing lysable, blood platelet reference control comprising treating animal red blood cells larger than or within the size range of human blood platelets with a fixing agent for red blood cells for a time sufficient to partially rigidify the red blood cell membrane enabling dividing said shrunk red blood cells into distinct groups and shrinking to a permanently shrunk condition, subjecting said distinct groups of said partially fixed red blood cells to hemolysis with a hemolytic agent to partially remove hemoglobin therefrom, the hemolysis of each distinct group of cells removing a different amount of hemoglobin, subjecting the resulting red blood cells to centrifugation to collapse the red blood cell membrane around the hemoglobin remaining in said cells, said distinct group of cells and the extent of hemolysis being selected so as to provide after said centrifugation a mixture of permanently shrunken lysable cells that simulate in number, size and volume distribution the platelets present in human whole blood.

5,008,202

BLOOD DILUENT FOR RED BLOOD CELL ANALYSIS

Sherburne M. Edmondson, Sunnyvale, and Carlos E. Luna, Campbell, both of Calif., assignors to Sequoia Turner Corporation, Mountain View, Calif.

Filed Nov. 29, 1988, Ser. No. 277,334
Int. Cl.[5] G01N *31/00*
U.S. Cl. 436—18 6 Claims

1. A blood diluent useful in analysis of red blood cell number, and the enumeration of white blood cell populations and sub-populations in a whole blood sample, said diluent comprising an aqueous solution of:

(a) sodium sulfate;
(b) sodium chloride;
(c) 1, 3 dimethylurea;
(d) 1-hydroxypyridine-2-thione;
(e) EDTA;
(f) ADA Buffer; and,
(g) sodium hydroxide to obtain pH 6.9,

wherein said diluent is an electrolyte capable of conducting current, stabilizing red blood cell volumes and having no adverse effect on white blood cells.

5,008,203

METHOD FOR THE DETERMINATION OF OXYGEN DEMAND IN SULFUR RECOVERY INSTALLATIONS

Manfred Mathews, Bad Nauheim, Fed. Rep. of Germany, assignor to Ametek, Inc., Pittsburgh, Pa.

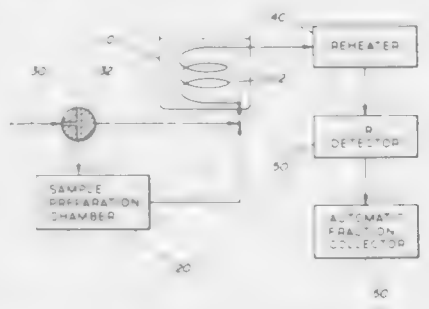
Continuation-in-part of Ser. No. 629,172, Jul. 9, 1984, abandoned. This application Aug. 2, 1988, Ser. No. 227,772
Int. Cl.[5] G01N *35/00*
U.S. Cl. 436—55 2 Claims

1. In the method for the combustion of hydrogen sulfide containing gas mixtures for sulfur recovery and gas purification by burning the gas mixture in a furnace with oxygen, wherein the improvement comprises;

(1) continuously and rapidly predetermining and monitoring the oxygen demand of the gas mixture by continuously removing a sample of the gas mixture before being fed into the furnace and rapidly feeding the sample into a second test furnace with at least a stoichiometric amount of oxygen and completely burning the sample of the gas mixture;

(2) continuously analyzing the resulting burned sample gas mixture by passing the burned mixture into analysis instruments that measure the oxygen and sulfur dioxide content of the burned sample mixture, said instrument each generating an output signal;

(3) feeding the output signals to a computer which uses the output signals independently to calculate and generate an output signal indicative of the amount of oxygen needed for the burning of the gas mixture and



(4) controlling a regulator that feeds oxygen to the furnace for the burning of the gas mixture by having the regulator receive the output signal from the computer thereby accurately regulating the amount of oxygen being fed to the furnace for the complete combustion of the gas mixture.

5,008,204

METHOD FOR DETERMINING THE COMPOSITIONAL DISTRIBUTION OF A CRYSTALLINE COPOLYMER

Ferdinand C. Stehling, Baytown, Tex., assignor to Exxon Chemical Patents Inc., Linden, N.J.

Filed Feb. 2, 1988, Ser. No. 151,350
Int. Cl.[5] G01N *25/00, 30/02, 31/02, 33/44*
U.S. Cl. 436—85 11 Claims

1. A method for determining the solubility distribution of a crystalline copolymer, comprising the steps of:

dissolving the copolymer in a solvent at elevated temperature;

filling a column with the solvent containing the dissolved copolymer;

crystallizing the copolymer within the column by reducing the temperature of the column to below ambient temperature;

passing pure solvent through the column at an increasing column temperature to gradually dissolve the copolymer; and

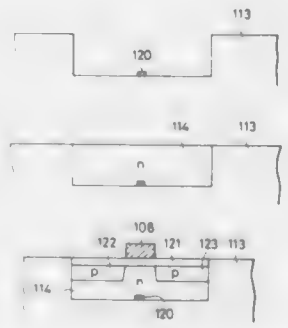
continuously measuring the concentration of the copolymer in the solvent exiting the column.

5,008,205

METHOD OF FACILITATING DETECTION OF AMINO ACID DERIVATIVES WITH ENHANCED SENSITIVITY

Marcus J. Horn, Arlington, Mass., assignor to Hewlett-Packard Company, Palo Alto, Calif.

Filed Aug. 10, 1988, Ser. No. 230,580
Int. Cl.[5] G01N *33/68*
U.S. Cl. 436—89 14 Claims



1. A method of enhancing the detectability of an amino acid in order to facilitate identification, comprising the steps of converting the amino acid to a 5-thiazolinone amino acid derivative and reacting the derivative with a mixture of an anhydrous acid and an alcohol to primarily produce a thiocarbamyl amino acid ester.

5,008,206

METHOD FOR MAKING A PHOTOELECTRIC CONVERSION DEVICE USING AN AMORPHOUS NUCLEATION SITE

Mahito Shinohara, Tokyo, and Takao Yonehara, Atsugi, both of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

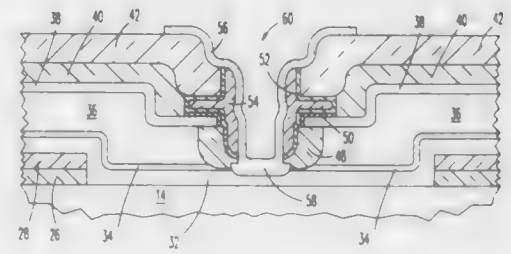
Continuation of Ser. No. 70,777, Jul. 7, 1987, abandoned. This application May 24, 1989, Ser. No. 357,635
Claims priority, application Japan, Jul. 11, 1986, 61-162128
Int. Cl.[5] H01L *21/20, 31/18*
U.S. Cl. 437—3 6 Claims

1. A method for forming a photoelectric conversion apparatus comprising a semiconductor substrate provided with a photoresponsive transistor, the photoresponsive transistor having an emitter region, a collector region, and a base region, the base region being allowed to float to store therein photo-excited carriers; the method comprising the steps of:

forming an electrically insulating layer disposed on said semiconductor substrate;

forming an amorphous nucleation surface on the electrically insulating layer, wherein the nucleation surface has a nucleation density larger than that of the surface of the electrically insulating layer;

forming a semiconductor region corresponding to the nucleation surface by a vapor deposition, wherein the nucleation surface is sufficiently fine to permit the semiconductor region to be formed as a single crystal; and



forming a semiconductor switching means within the semiconductor region for setting a potential of the base region at a predetermined level.

5,008,207

METHOD OF FABRICATING A NARROW BASE TRANSISTOR

Jeffrey L. Blouse, Stanfordville; Inge G. Fulton, Washingtonville; Russell C. Lange, Newburgh; Bernard S. Meyerson, Yorktown Heights; Karen A. Nummy, Newburgh; Martin Revitz, Poughkeepsie, and Robert Rosenberg, Peekskill, all of N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Sep. 11, 1989, Ser. No. 405,508
Int. Cl.[5] H01L *21/00*
U.S. Cl. 437—31 33 Claims

27. A method of forming a vertical bipolar transistor comprising the steps of:

providing a substrate of semiconductor material including a first device region of a first conductivity type;

forming a first layer of second conductivity type epitaxial semiconductor material over said first device region;

forming a second layer of second conductivity type epitaxial semiconductor material over said first layer, said second layer having a relatively higher dopant concentration than said first layer;

forming a third layer of protective material over said second layer;

etching said third layer to expose a portion of said second layer;

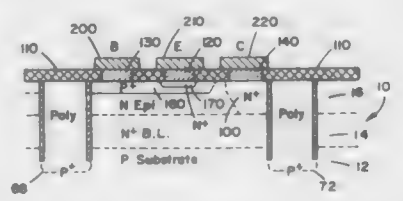
oxidizing the exposed portion of said second layer through to said first layer;

removing the oxidized portion of said second layer to expose a portion of said first layer;

forming a spacer of insulating material on the exposed edge of said second layer;

forming a second region of said first conductivity type in the surface of said exposed portion of said first layer; and

heating said substrate to drive dopant from the remaining portions of said second layer into said first layer;



whereby to form a vertical bipolar transistor.

5,008,208

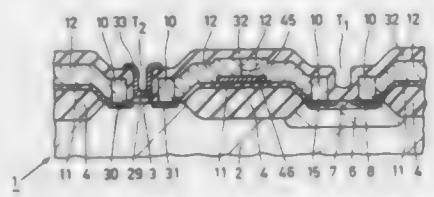
METHOD OF MAKING PLANARIZED, SELF-ALIGNED BIPOLAR INTEGRATED CIRCUITS

Michael S. Liu, Bloomington, and Huang-Joung Chen, Maple Grove, both of Minn., assignors to Honeywell Inc., Minneapolis, Minn.

Filed Dec. 7, 1988, Ser. No. 281,195
Int. Cl.[5] H01L *21/70*
U.S. Cl. 437—31 17 Claims

1. A method of making a bipolar integrated circuit structure comprising the steps of:

(a) forming three implantation openings in a layer of insulat-



ing material on the upper surface of a semiconductor substrate;
(b) selectively forming a polysilicon layer in each implantation opening formed in the insulating material layer by selective epitaxial growth;
(c) implanting into each polysilicon-filled opening a doping material capable of diffusing into the substrate material below each said polysilicon-filled opening; and
(d) etching the upper surface of each polysilicon-filled opening formed in the insulating material layer such that the upper surface of the semiconductor structure is substantially planarized.

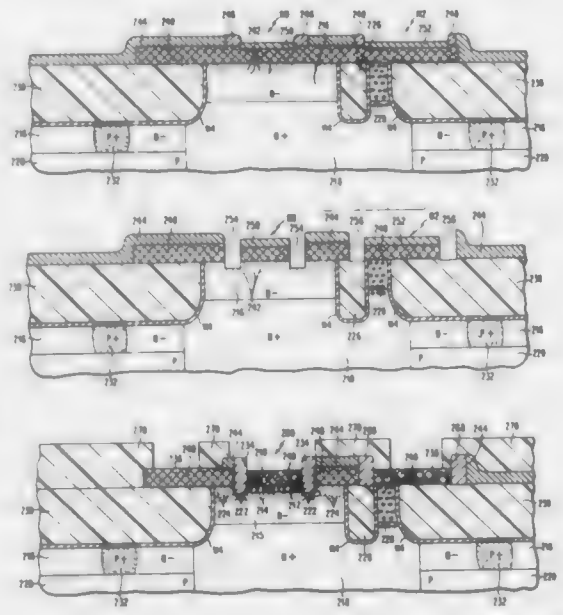
5,008,209

A METHOD OF MANUFACTURING A SEMICONDUCTOR DEVICE INCLUDING OUTDIFFUSION FROM POLYSILICON RIMS

Johannes A. Appels, and Henricus G. R. Maas, both of Eindhoven, Netherlands, assignors to U.S. Philips Corporation, New York, N.Y.

Division of Ser. No. 828,076, Feb. 3, 1986, abandoned, which is a continuation of Ser. No. 447,845, Dec. 8, 1982, abandoned. This application Jan. 10, 1990, Ser. No. 463,183
Claims priority, application Netherlands, Dec. 31, 1981, 8105920
Int. Cl.[5] H01L *21/225*
U.S. Cl. 437—31 **6 Claims**

1. A method of manufacturing a semiconductor device of a bipolar transistor characterized in that the starting member is a semiconductor body comprising an insulating layer which is present on a surface and in which at least an opening is provided while a layer pattern is formed which extends at least as far as an edge of the opening, whereupon at least at the area of the opening a layer is provided on the semiconductor body and on the layer pattern consisting of a material which is subjected impurities in the semiconductor body determining the first conductivity type diffuse through another part of the rim into the semiconductor body in order to form an emitter zone.



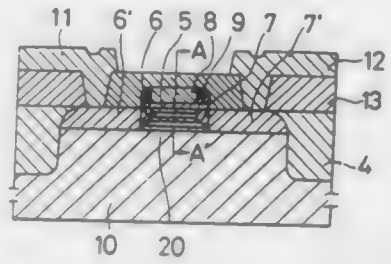
5,008,210

PROCESS OF MAKING A BIPOLAR TRANSISTOR WITH A TRENCH-ISOLATED EMITTER

Shang-yi Chiang, Walnut Creek; Wen-Ling M. Huang, Milpitas; Clifford I. Drowley, and Paul V. Voorde, both of Mountain View, all of Calif., assignors to Hewlett-Packard Company, Palo Alto, Calif.

Division of Ser. No. 307,876, Feb. 7, 1989. This application Apr. 18, 1990, Ser. No. 510,637
Int. Cl.[5] H01L *21/331*
U.S. Cl. 437—33 **7 Claims**

5. A method for fabricating a self-aligned, trench-isolated emitter structure which comprises a portion of a bipolar transistor, wherein said emitter structure is formed upon a semiconductor substrate region comprising at least one epitaxial layer, wherein at least the lower portion of said epitaxial layer is doped to serve as a collector for said bipolar transistor, and wherein the upper portion of said epitaxial layer is doped to serve as a base for said bipolar transistor, said base being divided into a relatively lightly-doped intrinsic base adjacent to said emitter structure and a relatively heavily-doped extrinsic base isolated from said emitter structure by a dielectric-filled trench, said method comprising the steps of:
(a) forming a first layer of conductive material over said semiconductor substrate region;
(b) implanting a base-type dopant into said first layer of conductive material;
(c) driving said base-type dopant into said epitaxial layer directly underlaying said first layer of conductive material so that said base-type dopant is adjacent to the portion of said epitaxial layer which serves as said collector;
(d) depositing a thin layer of silicon nitride over the surface of said layer of conductive material;
(e) depositing a second layer of conductive material over said layer of silicon nitride;
(f1) depositing a dielectric material upon said second layer of conductive material;
(f2) forming an aperture in said dielectric material over an area surrounded by an intended extrinsic base area, said aperture having a sidewall;
(f3) forming a sidewall spacer structure surrounding an intended emitter area and positioned upon the surface of said layer of conductive material, said sidewall spacer structure being formed on said sidewall;



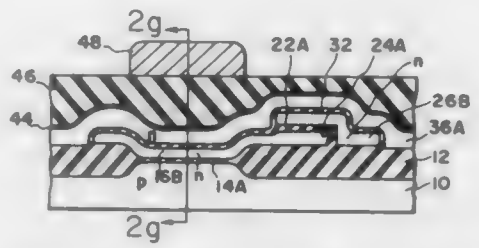
(g) creating an etch-masking layer on the portion of said conductive material surrounded by said sidewall spacer;
(h) removing said sidewall spacer structure;
(i) etching an isolation trench at the location previously occupied by said sidewall spacer structure, wherein said isolation trench extends through said second layer of conductive material, said silicon nitride layer, said first layer of conductive material, and into said portion of said epitaxial layer containing said base-type dopant, but does not extend substantially into the portion of said epitaxial layer which serves as said collector;
(j) introducing additional base-type dopant into the epilayer portion at the bottom of said isolation trench in a manner which leaves a portion of said epitaxial layer which serves as said collector essentially intact;
(k) depositing a dielectric material so as to fill said isolation trench;
(l) removing all material overlaying said first layer of conductive material surrounded by said isolation trench; and
(m) introducing an emitter dopant into said first layer of conductive material and into the upper portion of said epitaxial layer which underlays said first layer of conductive material so that a layer of emitter dopant overlays a layer of base-type dopant, forming said bipolar transistor emitter.

5,008,211

METHOD FOR FORMING FET WITH A SUPER LATTICE CHANNEL

Shunpei Yamazaki, Tokyo, Japan, assignor to Semiconductor Energy Laboratory Co., Ltd., Kanagawa, Japan

Continuation of Ser. No. 260,721, Oct. 21, 1988, abandoned, which is a division of Ser. No. 102,841, Sep. 30, 1987, abandoned. This application Sep. 14, 1989, Ser. No. 406,859
Claims priority, application Japan, Oct. 8, 1986, 61-240544; Oct. 8, 1986, 61-240545; Oct. 8, 1986, 61-240546
Int. Cl.[5] H01L *21/268, 21/335*
U.S. Cl. 437—40 **3 Claims**



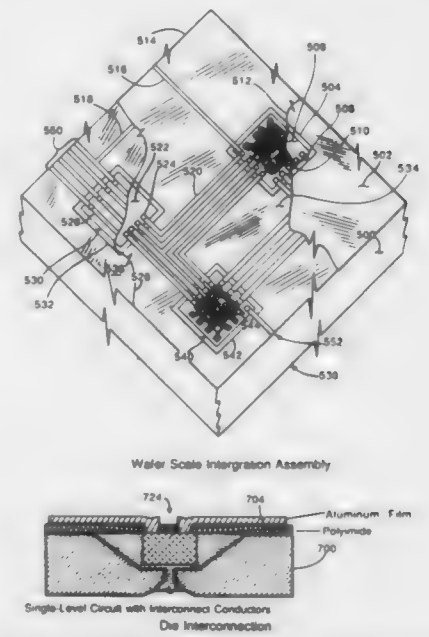
1. A method of manufacturing an insulated gate field effect transistor comprising:
forming silicon semsiconductor films and silicon compound films selected from the group consisting of Si_3N_{4-x} $(0<x<4)$, $SiO_{2-x}(0<x<2)$, and $Si_xC_{1-x}(0<x<1)$, said silicon semiconductor and silicon compound films being alternatively formed into a superlattice on a substrate be virtue of a photo CVD method where the superlattice is formed as the channel region;
forming a gate insulating film on said superlattice;
forming a gate electrode on said gate insulating film;
forming a source region and drain region adjacent to said superlattice; and
exposing said superlattice to light in order to selectively crystallize said semiconductor films to increase carrier mobility.

5,008,212

SELECTIVE ASPERITY DEFINITION TECHNIQUE SUITABLE FOR USE IN FABRICATING FLOATING-GATE TRANSISTOR

Teh-yi J. Chen, 22409 St. Andrews Ave., Cupertino, Calif. 95014

Filed Dec. 12, 1988, Ser. No. 283,340
Int. Cl.[5] H01L *21/265, 21/70*
U.S. Cl. 437—43 **20 Claims**



1. A method in which a first patterned layer of nonmonocrystalline semiconductor material is created on a substructure along its upper surface, characterized by the steps of:
performing a thermal oxidation to grow a main electrically insulating layer of oxide along the first patterned layer in such a way that the upper lateral edge of the remainder of the first patterned layer forms an asperity that protrudes outward, the thickness of the insulating layer along the asperity being less than the average thickness of the insulating layer;
forming a blanket layer over the insulating layer and over adjoining material of the substructure; and
selectively etching the blanket, insulating, and patterned layers with a primary etchant that attacks the material of the blanket and patterned layers more than the material of the insulating layer in order to remove (1) substantially the entire thickness of a specified section of the blanket layer located above the first patterned layer, (2) at least part of the underlying exposed section of the insulating layer including the portion located along the upper surface of the underlying part of the asperity, and (3) largely all of the underlying part of the asperity, whereby the remainder of the blanket layer forms a second patterned layer located above the remainder of the asperity.

5,008,213

HYBRID WAFER SCALE MICROCIRCUIT INTEGRATION

Edward S. Kolesar, Jr., Beavercreek, Ohio, assignor to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.

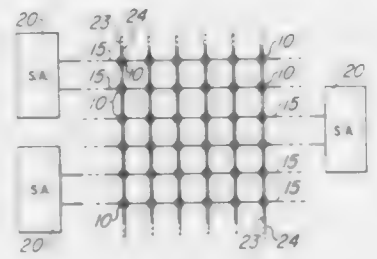
Division of Ser. No. 282,423, Dec. 9, 1988, abandoned. This application Apr. 13, 1990, Ser. No. 511,475
Int. Cl.[5] H01L *21/56, 21/60, 21/82*
U.S. Cl. 437—51 **20 Claims**

1. The method of fabricating a wafer scale integration multiple die integrated circuit comprising the steps of:
etching die receptacle wells into the planar top surface of a polished oxide coated semiconductor wafer, said receptacle wells each having a bottom area, sloping sidewall surfaces and rim portions;
depositing uncured liquid adhesive material in the bottom area of each said receptacle well;
inserting integrated circuit die having top, sidewall, and backside surfaces into said receptacle wells and said uncured adhesive resident therein to form a wafer and die assembly;
rotating said wafer and inserted die assembly into an inverted, top surface down, position wherein said liquid adhesive material is resident around said sidewall and backside surfaces of each said die;

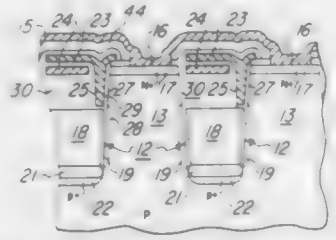
aligning the inverted top surfaces of said die and wafer into a planar condition wherein the inverted die top surface and wafer top surface rest against a flat planar tooling member; and

applying adhesive flow promoting and cure promoting elevated temperature to the inverted wafer and die assembly to encourage adhesive flow downward into the space between die sidewall and receptacle well sidewall surfaces, and the curing of said adhesive into a solidified mass conforming with the die and receptacle well surfaces and with the surface of said flat planar tooling member.

5,008,214



METHOD OF MAKING CROSSPOINT DYNAMIC RAM CELL ARRAY WITH OVERLAPPING WORDLINES AND FOLDED BITLINES



Donald J. Redwine, Houston, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex.

Continuation of Ser. No. 274,164, Nov. 21, 1988, abandoned, which is a division of Ser. No. 201,812, Jun. 3, 1988, abandoned. This application Jul. 21, 1989, Ser. No. 384,858

Int. Cl.[5] H01L *21/70*

U.S. Cl. 437—52 **26 Claims**

7. A method of forming first and second adjacent memory cells in a device comprising an array of memory cells created along a semiconductor surface wherein the first and second cells includes a storage capacitor and an access transistor, the method comprising the steps of:

forming a plurality of bit lines and a plurality of pairs of overlapping word lines with each overlapping pair crossing the bit lines;

creating a plurality of memory cells each positioned near a crossing of a bit line and a word line pair, for electrical association with a bit line and a word line, forming rows and columns of cells, each row of cells being positioned for electrical association with a word line pair and each memory cell comprising a transistor having a channel region and a gate for controlling conduction through the channel region; and

alternately connecting each word line of a first one of said pairs to gates of alternate transistors in a first one of said rows to effect electrical association of said first word line pair with said first row of cells.

5,008,215

PROCESS FOR PREPARING HIGH SENSITIVITY SEMICONDUCTIVE MAGNETORESISTANCE ELEMENT

Dain J. Chen; Guey F. Chi, and Ying C. Yeh, all of Chutung, Taiwan, assignors to Industrial Technology Research Institute, Hsinchu, Taiwan

Filed Jul. 7, 1989, Ser. No. 377,248

Int. Cl.[5] H01L *21/20*

U.S. Cl. 437—83 **6 Claims**

1. A process for preparing high sensitivity indium antimonide film magnetoresistance element comprising:

(1) forming a layer of silicon oxide on the surface of a silicon single crystal wafer by oxidizing the surface of said wafer under elevated temperature;

(2) growing a layer of indium antimonide film on the surface of said layer of silicon oxide, the indium to antimony weight ratio in said layer of indium antimonide film being from 0.8 to 2.0, and

(3) annealing said layer of indium antimonide film by a two-stage annealing treatment comprising a first stage carried out in a first protective atmosphere containing from 1 to 5 weight percent of oxygen and a second stage carried out in a second protective atmosphere containing essentially no oxygen, whereby a protective oxide layer is formed on the surface of said layer of indium antimonide film and evenly distributed fine needle-like indium precipitates are formed within said layer of indium antimonide film.

5,008,216

PROCESS FOR IMPROVED CONTACT STUD STRUCTURE FOR SEMICONDUCTOR DEVICES

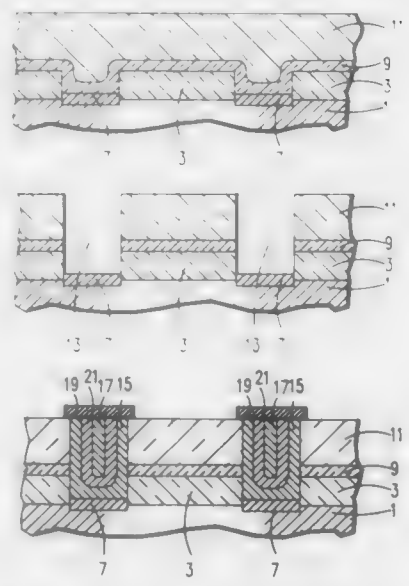
Hung-Chang W. Huang, San Jose, Calif., and Paul A. Totta, Poughkeepsie, N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Division of Ser. No. 252,836, Oct. 3, 1988, abandoned. This application Dec. 11, 1989, Ser. No. 448,484

Int. Cl.[5] H01L *21/90, 21/44*

U.S. Cl. 437—192 **17 Claims**

1. A process for making a contact stud structure for the connection of semiconductor device components formed in a substrate to the wiring for interconnecting said device components to other device components comprising:



(a) depositing an insulator material having an etch-stop layer on said device substrate,

(b) forming at least one opening in said insulator material and said etch-stop layer at said device component locations,

(c) depositing a first metal layer in said opening of said insulating layer and said etch-stop layer, said first metal layer being reactive with said substrate and adhesive thereto and lining said opening in said insulator and said etch-stop layer,

(d) depositing a second metal layer conformally onto said first metal layer,

(e) depositing a third metal layer conformally onto said second metal layer and filling said opening in said insulator layer and thereby forming said contact stud, and

(f) wherein said second and third metal layers being selected from the group comprising refractory metals.

5,008,217

PROCESS FOR FABRICATING INTEGRATED CIRCUITS HAVING SHALLOW JUNCTIONS

Christopher J. Case, New Providence; Kin P. Cheung, Hoboken; Ruichen Liu; Ronald J. Schutz, both of Warren, and Richard S. Wagner, Bernardsville, all of N.J., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed Jun. 8, 1990, Ser. No. 534,772

Int. Cl.[5] H01L *21/441*

U.S. Cl. 437—195 **6 Claims**

1. A process for fabricating a device comprising the steps of forming active regions of said device, forming a dielectric over said active regions, forming windows through said dielectric, electrically contacting said active region through said windows, and forming a metal pattern on said dielectric characterized in that a nucleation layer is formed between said dielectric and said metal pattern and said electrical contact and said metal for said metal pattern is deposited by chemical vapor deposition with a triisobutyl aluminum precursor wherein said nucleation layer comprises a material whose composition produces coverage by aluminum grains larger than 0.15 μm of at least 97.5% of said nucleating material surface before said aluminum has an average thickness of 120 Å.

5,008,218

METHOD FOR FABRICATING A THIN FILM TRANSISTOR USING A SILICIDE AS AN ETCH MASK

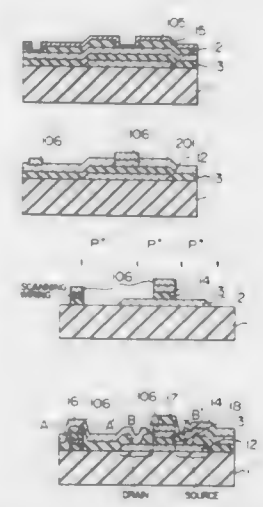
Genshiro Kawachi, Hitachi; Akio Mimura, Katsuta; Nobutake Konishi, Hitachiota; Kikuo Ono, and Takashi Suzuki, both of Hitachi, all of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Filed Sep. 18, 1989, Ser. No. 408,729

Claims priority, application Japan, Sep. 20, 1988, 63-233425

Int. Cl.[5] H01L *21/44*

U.S. Cl. 437—201 **14 Claims**



1. A method of fabricating an active matrix substrate comprising the steps of:

(a) forming an island region of a first semiconductor film on a prescribed insulating substrate;

(b) forming a first insulating film and a second semiconductor film on said first insulating film;

(c) forming a second insulating film on said second semiconductor film and thereafter forming a prescribed pattern of the second insulating film;

(d) depositing prescribed metal on the pattern and thereafter forming a compound of the second semiconductor film and the metal;

(e) removing unreacted portion of the metal and the second insulating film, and

(f) etching said second semiconductor film and said first insulating film using said compound as a mask.

5,008,219

PROCESS FOR PRODUCING GLASS

Koichi A. Hara, Ome, Japan, assignor to Hoya Corporation, Tokyo, Japan

Filed Dec. 11, 1989, Ser. No. 448,283

Claims priority, application Japan, Dec. 26, 1988, 63-326365

Int. Cl.[5] C03C *3/04*

U.S. Cl. 501—12 **4 Claims**

1. A process for producing a glass, comprising:

(a) hydrolyzing a metal alkoxide selected from the group consisting of silicon, aluminum, titanium and zirconium in the presence of an organic solvent and an aqueous ammonia solution to obtain a sol solution,

(b) concentrating the sol solution to 1.00–1.95 times the volume of the metal alkoxide used,

(c) adding a hydrofluoric or hydrosilicofluoric acid catalyst to the resulting concentrate to allow the concentrate to gel,

(d) drying the resulting gel, and

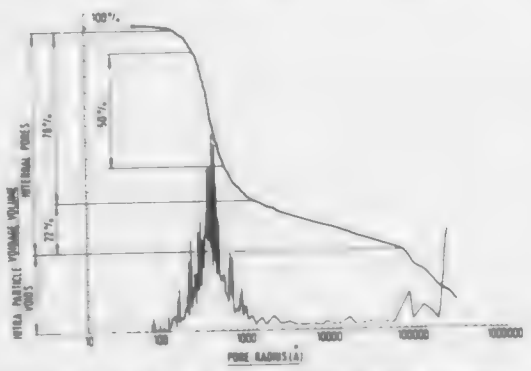
(e) heating the dried gel to obtain the desired glass.

5,008,220

BIOLOGICAL SUPPORT

Alan J. Brown, Milledgeville, Ga.; Roger James, Cornwall, and Nigel P. Glasson, Dorset, both of United Kingdom, assignors to ECC International Limited, United Kingdom

Filed Feb. 15, 1989, Ser. No. 311,221



Claims priority, application United Kingdom, Feb. 15, 1988, 8803413

Int. Cl.[5] C04B *38/06*

U.S. Cl. 501—81 **20 Claims**

1. A process for preparing a porous inorganic material suitable for use as a support for immobilising biological macromolecules, which process comprises: (a) calcining a kaolinitic clay in which there is distributed from 5% to 25%, by weight of the clay, of a carbonaceous material having a particle size no greater than about 1000 Å, at a temperature and for a time such that a substantial portion of the kaolinitic clay is converted to porous, defect aluminium-silicon spinel without appreciable

formation of mullite, the spinel having an interconnecting array of pores predominantly in the size range of from about

100 to about 1000 Å; and (b) recovering said porous defect aluminium-silicon spinel without further calcination.

5,008,221

HIGH TOUGHNESS CERAMIC ALLOYS

Thomas D. Ketcham, Big Flats, N.Y., assignor to Corning Incorporated, Corning, N.Y.

Continuation of Ser. No. 926,655, Nov. 4, 1986, abandoned, which is a continuation of Ser. No. 812,469, Dec. 23, 1985, abandoned, which is a continuation-in-part of Ser. No. 722,229, Apr. 11, 1985, abandoned. This application Jun. 12, 1990, Ser. No. 537,499

Int. Cl.[5] C04B *35/48*

U.S. Cl. 501—103 **11 Claims**

1. A ceramic alloy consisting essentially of at least one member selected from the group consisting of partially stabilized ZrO_2, partially stabilized ZrO_2-HfO_2 solid solution, and partially stabilized HfO_2 exhibiting high toughness through the inclusion of 0.5–5 mole %, as expressed on the oxide basis, of a toughening agent selected from the group of $YNbO_4$ and/or $YTaO_4$ and/or $MNbO_4$ and/or $MTaO_4$, wherein M represents Mg^{+2}, Ca^{+2}, Sc^{+2}, and/or a rare earth metal selected from the group consisting of La^{+3}, Ce^{+4}, Ce^{+3}, Pr^{+3}, Nd^{+3}, Sm^{+3}, Eu^{+3}, Gd^{+3}, Tb^{+3}, Dy^{+3}, Ho^{+3}, Er^{+3}, Tm^{+3}, Yb^{+3}, and Lu^{+3} which are substituted for Y^{+3}, one $+3$ cation being substituted for one Y^{+3} cation, three $+2$ cations being substituted for two Y^{+3} cations, three $+4$ cations for four Y^{+3} cations, in which said partial stabilization is produced through the inclusion of 1.1–4.5 mole % stabilizer where the amount of toughening agent is between 0.5–4.4 mole % and of 0.6–4.5 mole % stabilizer where the amount of toughening agent is between 4.4–5 mole %, the microstructure of said alloy consisting predominantly of crystals having a tetragonal structure.

5,008,222

ALUMINUM TITANATE CERAMIC SINTERED BODY

Tsuneji Kameda, Kanagawa, Japan, assignor to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Filed Mar. 31, 1989, Ser. No. 330,920

Claims priority, application Japan, Mar. 31, 1988, 63-76130

Int. Cl.[5] C04B *35/46*

U.S. Cl. 501—134 **9 Claims**

1. A ceramic sintered body having a thermal variation in length (L) of less than 0.33% and a Young's Modulus of not less than 1,600 kg/mm^2 produced by sintering 1 to 10 weight % of magnesium oxide, 0.5 to 10 weight % of silicon oxide, the remainder being substantially aluminum titanate having a mean particle diameter of from 0.6μm to 8μm, wherein the thermal variation in length is defined as $(l_{max}-l_{min})/l_0$, expressed as a percentage, where the original length of the sample is l_0, its maximum length when heated from 20° C. to 1,000° C. is l_{max}, and its minimum length is l_{min}.

GRAYISH-BLACK ENCAPSULATED PIGMENTS AND METHOD OF THEIR PRODUCTION

Dietrich Speer, Hanau; Akos Kiss, Wasserlos; Peter Kleinschmit, Hanau, and Juergen Hanich, Frankfurt am Main, all of Fed. Rep. of Germany, assignors to Degussa Aktiengesellschaft, Frankfurt am Main, Fed. Rep. of Germany

Filed Mar. 2, 1990, Ser. No. 487,295

Claims priority, application Fed. Rep. of Germany, Mar. 3, 1989, 3906818

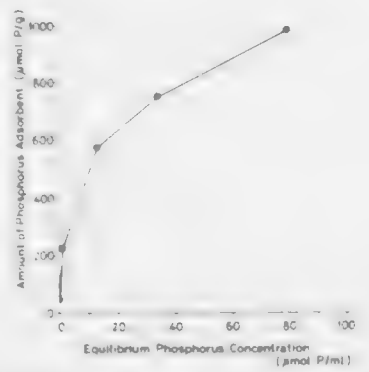
Int. Cl.[5] C09C *1/62, 1/48*

U.S. Cl. 106—450 **8 Claims**

1. An encapsulated pigment ranging in color from gray to black consisting essentially of a transparent crystal of zirconium silicate into which colored compounds are encapsulated as a discrete phase, said colored compound being carbon black particles with a specific surface area (according to BET) of 10 to 1000 m^2/g.

5,008,224

ADSORBENT FOR PHOSPHORUS AND METHOD FOR PRODUCTION OF ADSORBENT FOR PHOSPHORUS



Eiji Watanabe, Inokoshi; Nasakazu Horio, Konan, and Kenzi Suzuki, Aichi, all of Japan, assignors to Agency of Industrial Science & Technology and Ministry of International Trade & Industry, both of Tokyo, Japan

Filed Jun. 30, 1989, Ser. No. 373,587

Claims priority, application Japan, Jul. 7, 1988, 63-169920

Int. Cl.[5] B01J *20/12, 20/16;* **C02F** *1/28*

U.S. Cl. 502—63 **4 Claims**

1. A phosphorus adsorbent consisting essentially of a fired product obtained by comminuting volcanic ash, adding 0.6 to 1.5 part by weight, based on part by weight of the comminuted volcanic ash, of clay and water to the comminuted volcanic ash to obtain a mixture, and firing the mixture at a temperature in the range of 100° to 900° C.;

said fired product consisting substantially of alumino-silicate;

said aluminosilicate consisting essentially of at least 20% by weight of Al_2O_3, at least 40% by weight of SiO_2 and at least 1% by weight of Fe_2O_3.

5,008,225

CATALYTIC DEHYDROHALOGENATION CATALYST

Angelo J. Magistro, Brecksville, Ohio, assignor to The B. F. Goodrich Company, Akron, Ohio

Continuation-in-part of Ser. No. 72,324, Jul. 13, 1987, abandoned, Division of Ser. No. 613,551, May 24, 1984, abandoned. This application Jun. 27, 1989, Ser. No. 372,589

Int. Cl.[5] B01J *27/10, 29/06*

U.S. Cl. 502—73 **8 Claims**

1. A dehydrohalogenation catalyst comprising from about 0.1% to about 30% by weight based on the total weight of the catalyst of at least one rare earth metal chloride deposited on a solid synthetic zeolite having a pore opening of at least 5A.

5. The catalyst of claim 1 wherein the catalyst additionally contains about 5% by weight of an alkali and/or alkaline earth metal oxide or chloride.

5,008,226

PROCESS FOR MAKING ACID ACTIVATED BLEACHING EARTH USING HIGH SUSCEPTIBILITY SOURCE CLAY AND NOVEL BLEACHING EARTH PRODUCT

Dennis R. Taylor, Willoughby Hills, Ohio, and Charles B. Ungermann, Livermore, Calif., assignors to Engelhard Corporation, Iselin, N.J.

Filed May 16, 1989, Ser. No. 352,578

Int. Cl.[5] B01J *21/16, 20/12*

U.S. Cl. 502—81 **25 Claims**

16. A method for producing bleaching earth from naturally-occurring mixture of attapulgite and bentonite clays in which the attapulgite content is from 10% to 90% by weight, said clay mixture having a slurry pH in the range of at least 5 and below 7 and a pore volume in the range of 0.25–0.35 cc/gm, mixing said clay with a solution of sulfuric acid in amount corresponding to an acid dosage in the range of 1 to 10% by weight, heating said mixture to react said clay with said acid and, without washing the resulting reaction product, recovering it for use as a bleaching earth.

5,008,227

PROCESS FOR MAKING ACID ACTIVATED BLEACHING EARTH USING HIGH SUSCEPTIBILITY SOURCE CLAY AND NOVEL BLEACHING EARTH PRODUCT

Dennis R. Taylor, Willoughby Hills, Ohio, and Charles B. Ungermann, Livermore, Calif., assignors to Engelhard Corporation, Iselin, N.J.

Filed May 16, 1989, Ser. No. 352,790

Int. Cl.[5] B01J *20/12, 20/30*

U.S. Cl. 502—83 **9 Claims**

1. A method for producing bleaching earth which comprises selecting a naturally-occurring acidic attapulgite clay having a pH in the range of 5 to 7 and a pore volume in the range of 0.25–0.50 cc/gm, mixing said clay with an acid solution in amount corresponding to an acid dosage in the range of 10 to 30%, heating said mixture at a temperature in the range of 77° to 220° F. to react said clay with said acid and, without washing the resulting reaction product, recovering it for use as a bleaching earth.

8. The method of claim 1 wherein said acid is sulfuric.

9. The bleaching earth product obtained by the method of claim 1.

5,008,228

METHOD FOR PREPARING A SILICA GEL SUPPORTED METALLOCENE-ALUMOXANE CATALYST

Main Chang, Houston, Tex., assignor to Exxon Chemical Patents Inc., Linden, N.J.

Filed Mar. 29, 1988, Ser. No. 174,668

The portion of the term of this patent subsequent to Feb. 27, 2007, has been disclaimed.

Int. Cl.[5] C08F *4/648*

U.S. Cl. 502—111 **10 Claims**

1. A process for preparing a supported metallocene alumoxane catalyst for polymerization of olefins, comprising the steps of:

(a) adding a water-impregnated catalyst support to a stirred solution of an aluminum trialkyl in an amount sufficient to provide a mole ratio of aluminum trialkyl to water of from about 10:1 to about 1:1 and allowing the mixture to react; and

(b) adding a metallocene of a Group 4b or 5b transition metal to the reacted mixture in an amount sufficient to provide on said catalyst support a mole ratio of aluminum to transition metal of from about 1000:1 to about 1:1.

5,008,229

COMPOSITIONS CONTAINING PHOSPHONITRILE CHLORIDES

Johann Schuster, Emmerting; Martin Piehler, Mehring; Horst Müller, Emmerting, and Otto Schneider, Burghausen, all of Fed. Rep. of Germany, assignors to Wacker-Chemie GmbH, Munich, Fed. Rep. of Germany

Filed Dec. 7, 1989, Ser. No. 447,325

Claims priority, application Fed. Rep. of Germany, Feb. 2, 1989, 3903137

Int. Cl.[5] B01J *31/18*

U.S. Cl. 502—167 **8 Claims**

1. A composition which will accelerate the condensation and/or equilibration of organosiloxanes which comprises phosphonitrile chloride and/or reaction products of phosphonitrile chloride and organosiloxanes, a halogen-free organic solvent and a solubilizer.

5,008,230

CATALYST FOR PREPARING HIGH CLARITY, COLORLESS POLYETHYLENE TEREPHTHALATE

Carl S. Nichols, Charlotte, N.C., assignor to Hoechst Celanese Corporation, Somerville, N.J.

Filed May 22, 1989, Ser. No. 355,534

Int. Cl.[5] B01J *23/78, 23/80, 23/84*

U.S. Cl. 502—170 **11 Claims**

1. A terephthalic acid catalyst composition for making polyethylene terephthalate from terephthalic acid comprising:

(a) a first metal catalyst of at least one of cobalt and zinc, said first metal catalyst being present in a range of from about 5 to about 60 ppm;

(b) a second metal catalyst of at least one of zinc, manganese, magnesium and calcium, said second metal catalyst being present in a range of from about 10 to about 150 ppm; and

(c) antimony, being present in a range of from about 150 to 650 ppm; wherein said first metal catalyst, said second metal catalyst, and said antimony amounts are based on the theoretical yield of polyethylene terephthalate and result in a measurable increase in the rate of said terephthalic acid polymerization without causing degradation of said polyethylene terephthalate.

5,008,231

HEAT SENSITIVE RECORDING MATERIAL

Katsuaki Yoshizawa, Amagasaki, and Yoshitaka Oeda, Ikoma, both of Japan, assignors to Kanzaki Paper Manufacturing Company Limited, Tokyo, Japan

Filed May 25, 1989, Ser. No. 356,950

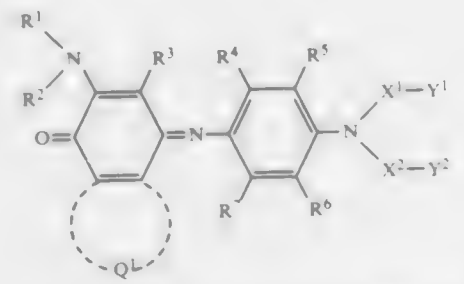
Claims priority, application Japan, May 31, 1988, 63-134808

Int. Cl.[5] B41M *5/18*

U.S. Cl. 503—207 **14 Claims**

1. A heat-sensitive recording material comprising a support; a heat-sensitive recording layer formed over the support and containing a color forming material, a color developing material which forms a color on contact with the color forming material and a pigment which is about 80 to about 400 ml/100 g in oil absorption according to JIS K 5101 and about 3 to about 15 μm in average particle size; and an overcoat layer formed over the heat-sensitive recording layer and comprising a binder and a pigment, wherein the pigment is used in an amount of about 0.5 to about 3.0 parts by weight per part by weight of the binder and the coating amount of the overcoat layer is about 0.3 to about 2.0 g/m^2 on dry basis.

5,008,232



THERMAL TRANSFER DYE DONATING MATERIAL

Mitsugu Tanaka, and Seiiti Kubodera, both of Kanagawa, Japan, assignors to Fuji Photo Film Co., Tokyo, Japan

Filed Jan. 8, 1990, Ser. No. 461,893
Claims priority, application Japan, Jan. 9, 1989, 1-2468
Int. Cl.[5] B41M *5/035, 5/26*
U.S. Cl. 503—227 10 Claims

1. A thermal transfer dye donating material comprising a color material layer formed on a support, said color material layer containing a binder resin or a wax, and a dye represented by the general formula (I) below:

(I)

wherein Q^1 is an atomic group having at least one nitrogen atom and forming a five- to seven-membered nitrogen-containing heterocycle together with the carbon atoms to be bonded; R^1 is an acyl group, an alkoxycarbonyl group, an aryloxycarbonyl group, an aminocarbonyl group, or a sulfonyl group; R^2 is a hydrogen atom or an alkyl group; R^3 to R^7 are independently a hydrogen atom, an alkyl group, an alkoxy group, or a halogen atom; X^1 and X^2 are independently an alkylene group; Y^1 is an alkoxy group, a halogen atom, an acylamino group, an alkoxycarbonyl group, an alkoxycarbonyloxy group, a cyano group, an alkoxycarbonylamino group, an aminocarbonylamino group, a carbamoyl group, an acyloxy group, an acyl group or a hydroxy group; Y^2 is a hydrogen atom or groups defined above as Y^1.

5,008,233

NOVEL CRYSTALLINE SILICON ENHANCED ALUMINAS

Susan L. Lambert, Rolling Meadows, Ill., assignor to UOP, Des Plaines, Ill.

Filed Sep. 7, 1989, Ser. No. 404,550
Int. Cl.[5] B01J *21/12, 27/12*
U.S. Cl. 502—231 15 Claims

1. A non-homogeneous crystalline silicon enhanced alumina (SEAL) having a bulk empirical formula of $Al_{2-x}Si_xO_3F_x$ where x varies from about 0.01 to about 0.5, the SEAL characterized in that it has a three-dimensional pore structure with the pores having diameters in the range of about 20 to about 300 Å, has a crystal structure characteristic of alumina and where the surface of the SEAL has a higher concentration of silicon than the interior of the SEAL.

7. A process for preparing a non-homogeous crystalline silicon enhanced alumina (SEAL) having a bulk empirical formula of $Al_{2-x}Si_xO_3F_x$ where x varies from about 0.01 to about 0.5 comprising contacting a crystalline alumina with a solution of a fluorosilicate salt at a temperature and for a time effective to produce a SEAL having a three-dimensional pore structure with the pores having diameters in the range of about 20 to about 300 Å, having a crystal structure characteristic of the crystalline alumina, and where the surface of the SEAL has a higher concentration of silicon than the interior of the SEAL.

5,008,234

PROCESS FOR THE PREPARATION OF CATALYTIC METAL CLUSTERS

Geoffrey A. Ozin, Toronto; Helmut X. Huber, Etobicoke; Richard A. Prokopowicz, and John Godber, both of Toronto, all of Canada, assignors to Her Majesty the Queen in the Right of Canada, as Represented by the Minister of Energy Mines and Resources Canada, Ottawa, Canada

Filed Jan. 13, 1989, Ser. No. 296,689
Claims priority, application Canada, Jun. 17, 1988, 569838
Int. Cl.[5] B01J *23/42, 23/89*
U.S. Cl. 502—326 8 Claims

1. A process of preparing catalyst compositions comprising at least one metal in monatomic or small cluster form, surface deposited on or in a support, which comprises:

vaporizing metal at low temperature and pressure in the presence of ethylene gas and gaseous solvent, to form a solvent stabilized metal-ethylene complex;

solidifying said stabilized complex;

warming the solid complex to liquid phase, removing excess ethylene, and impregnating a solid support with the solvent stabilized metal ethylene complex in the liquid phase, to deposit the complex on the support surface; and

removing solvent, decomposing the complex and forming monatomic or small cluster metal deposits on the support

5,008,235

CATALYSTS OF CU-AL-THIRD METAL FOR HYDROGENATION

Richard W. Wegman, and David R. Bryant, both of South Charleston, W. Va., assignors to Union Carbide Chemicals and Plastics Technology Corporation, Danbury, Conn.

Filed Dec. 21, 1989, Ser. No. 454,456
Int. Cl.[5] B01J *21/04, 21/06, 23/02, 23/72*
U.S. Cl. 502—342 1 Claim

1. A reduced catalyst composition comprising copper, aluminum, and a metal, X, selected from the group consisting of magnesium, zinc, titanium, and mixtures thereof; made by a process comprising:

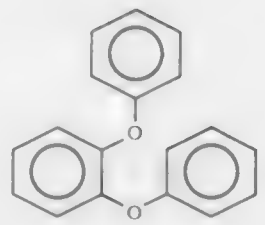
reducing a mixture of the oxides of copper, aluminum, and X by heating in the presence of a reducing gas under activating conditions which comprise gradually increasing the temperature from an initial temperature of about 50° C. to a final temperature of about 180° C. at a rate of about 3° C. to about 6° C. per hour.

5,008,236

HEAT-SENSITIVE RECORDING MATERIAL

Yoshiyuki Takahashi, Kawasaki; Kunitaka Toyofuku, Sakura, and Akiko Iwasaki, Urawa, all of Japan, assignors to Oji Paper Co., Ltd., Tokyo, Japan

Filed Dec. 28, 1989, Ser. No. 458,191
Claims priority, application Japan, Apr. 5, 1989, 1-84788
Int. Cl.[5] B41M *5/18*
U.S. Cl. 503—209 6 Claims



1. A heat-resistive recording material comprising:

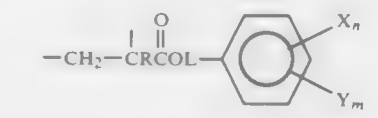
a substrate sheet, and

a heat sensitive color-forming layer formed on at least one surface of the substrate sheet and comprising a substantially colorless dye precursor, a color-developing agent reactive with the dye precursor upon heating to develop a color, and a binder,

said heat-sensitive color-forming layer further comprising a sensitizing agent consisting essentially of 1,2-diphenoxybenzene of the formula (I):

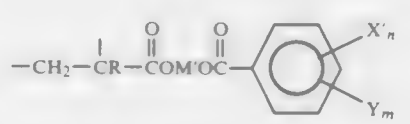
(I)

5,008,237



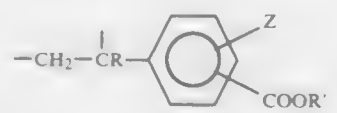
VINYL DEVELOPER RESINS

Rong-Chang Liang, Centerville; Karl A. Kintz, Kettering; Joseph G. O'Connor, and Paul C. Adair, both of Springboro, all of Ohio, assignors to The Mead Corporation, Dayton, Ohio



Continuation of Ser. No. 86,059, Aug. 14, 1987. This application Mar. 14, 1989, Ser. No. 323,571
The portion of the term of this patent subsequent to Oct. 31, 2006, has been disclaimed.
Int. Cl.[5] B41M *5/22;* G03C *1/68*
U.S. Cl. 503—212 23 Claims

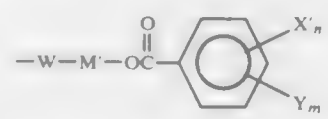
1. A developer sheet comprising a support having a layer of a color developer on the surface thereof, said color developer being a microparticle capable of reacting with a substantially colorless electron donating color former to produce a color image and being a polymer having a repeating unit of formulae (I), (II) or (III)



(I)

(II)

(III)



where R is a hydrogen atom or a methyl group;

L is a direct bond or a spacer group;

X is —OH, —COOH, —OM, COOR′ or a group of the formula (IV):

(IV)

Y is an alkyl group, an aryl group, or an aralkyl group;

X′ is —OH, —COOH, —OM, or —COOR′;

W is —O— or

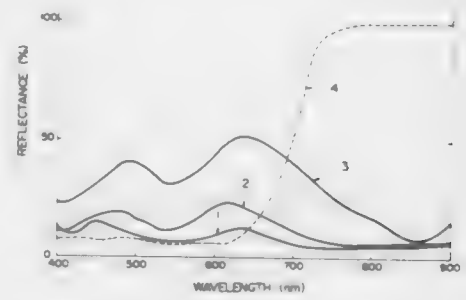
Z is —OH or a hydrogen atom;

M is a metal atom;

M′ is a divalent metal atom;

R′ is a hydrogen atom, an alkyl group, or a metal atom as defined for M;

n is 1 or 2 and when n is 2, x or X′ may be the same or different;

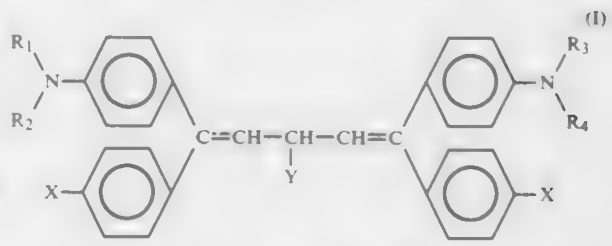


m is 0, 1, or 2 and when m is 2; Y may be the same or different.

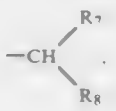
5,008,238

LEUCO DYES AND RECORDING MATERIAL EMPLOYING THE SAME

Hiroshi Gotoh, Fuji; Shigeru Kusakata, Susono, and Isao Shiojima, Mishima, all of Japan, assignors to Ricoh Company, Ltd., Tokyo, Japan

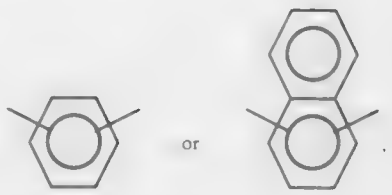


Filed Jun. 19, 1989, Ser. No. 367,684
Claims priority, application Japan, Jun. 20, 1988, 63-151964; Sep. 6, 1988, 63-223780; Sep. 16, 1988, 63-231785; Sep. 21, 1988, 63-234836
Int. Cl.[5] B41M *5/16, 5/18, 5/22*
U.S. Cl. 503—217 14 Claims



1. A recording material comprising:

a substrate and a recording layer formed thereon, said recording layer comprising a leuco dye of the formula (I):



(I)

wherein R_1, R_2, R_3 and R_4 each represent an alkyl group having 1 to 10 carbon atoms; X represents hydrogen, an alkyl group having 1 to 10 carbon atoms, an alkoxyl group having 1 to 10 carbon atoms or a halogen; and Y represents R_5—Z—SO_2NH—, R_6—ZCONH—, or

in which Z represents

R_5 and R_6 each represent hydrogen, an alkyl group having 1 to 10 carbon atoms, or a halogen; R_7 and R_8 each represent hydrogen, a cyano group, or —COR_9, in which R_9

represents a lower alkyl group, a lower alkoxyl group, or a phenyl group which may be substituted by an alkyl group having 1 to 4 carbon atoms, and alkoxyl group having 1 to 4 carbon atoms, or a halogen; or R_6 is a naphthyl group which may be substituted by an alkyl group having 1 to 4 carbon atoms, an alkoxy group having 1 to 4 carbon atoms or a halogen; with the proviso that R_7 and R_8 are not both hydrogen.

5,008,239

TRANSFER PRINTING OF NATURAL AND NATURAL/SYNTHETIC FIBRES

Henry Donenfeld, Brighton, and Eduard Lemanis, East Keilor, both of Australia, assignors to BASF Australia Ltd., Melbourne, Australia

Filed Aug. 22, 1988, Ser. No. 235,041
Claims priority, application Australia, Aug. 21, 1987, P13886
Int. Cl.[4] B41M *5/035, 5/26*
U.S. Cl. 503—227 25 Claims

1. A method of transfer printing an image onto natural or natural/synthetic blend fibres comprising the steps of:

(a) applying a disperse dyestuff in the form of an image to a temporary support, and applying a transfer agent comprising an aqueous dispersion of a powder selected from the group consisting of:
(1) a polyurethane powder;
(2) a copolyester powder;
(3) a polyamide powder;
(4) a copolyamide powder; and
(5) mixtures thereof
to the temporary support, thereby forming a dyestuff image- and transfer agent-carrying support,

(b) drying the dyestuff image- and transfer agent-carrying support to form a dried support; and

(c) transferring the dyestuff image and the transfer agent together from the dried support onto the fibres

5,008,240

METHOD OF TREATING INFLAMMATION

Hanne Bentz, Palo Alto; Larry Ellingsworth, San Jose, and Rosa Armstrong, Palo Alto, all of Calif., assignors to Collagen Corporation, Palo Alto, Calif.

Continuation of Ser. No. 836,672, Mar. 6, 1986, Pat. No. 4,806,523, which is a continuation-in-part of Ser. No. 763,337, Aug. 6, 1985, abandoned. This application Aug. 9, 1988, Ser. No. 230,330
The portion of the term of this patent subsequent to Feb. 21, 2006, has been disclaimed.
Int. Cl.[5] A61K *37/02*
U.S. Cl. 514—2 21 Claims

1. A method of treating a patient for the alleviation of a symptom or manifestation of a disease resulting in inflammation comprising administering an anti-inflammatorily effective amount of a protein having the amino acid sequence of cartilage inducing factor A or B or TGF-β or a functional equivalent thereof to the patient wherein any functional equivalent is a substantially homologous protein with the cartilage inducing factor protein A or B or TGF-β and wherein differences in sequences between the cartilage inducing factor protein A or B or TGF-β and any substantially homologous protein does not affect the anti-inflammatory activity of the cartilage inducing factor adversely.

5,008,241

NOVEL INSULIN PEPTIDES

Jan Markussen, Herlev; Kjeld Norris, Hellerup, and Liselotte Langkjaer, Klampenborg, all of Denmark, assignors to Novo Nordisk A/S, Bagsvaerd, Denmark

Continuation of Ser. No. 75,550, Jul. 20, 1987, abandoned, which is a continuation-in-part of Ser. No. 838,472, Mar. 11, 1986, abandoned. This application Oct. 20, 1989, Ser. No. 424,503
Claims priority, application Denmark, Mar. 12, 1985, 1135/85; Mar. 10, 1986, 1070/86; Jul. 21, 1986, 3470/86; Feb. 25, 1987, 0948/87
The portion of the term of this patent subsequent to Aug. 7, 2007, has been disclaimed.
Int. Cl.[5] A61K *37/26;* C07K *7/40, 7/42*
U.S. Cl. 514—3 10 Claims

10. An aqueous solution of a human insulin analog having an amino acid residue at A21, selected from the group consisting of Glu, Asp, Lys, Arg, His, Val, Gln, Ile, Phe, Tyr, Met, Gly, Ser, Thr, Ala, Leu, Trp and hSer, wherein at least one of the amino acid residues at A4, A17, B13, and B21 is a neutral amino acid reside selected from the group consisting of Gly, Val, Ile, Leu, Phe, Tyr, Met, Asn, Gln, Ala, Ser and Thr, wherein the B27 amino acid residue is Lys or Arg and wherein the C-terminal carboxyl group of the B-chain is amidated at a pH value of 2.5-5.8 and containing therein zinc ions in a concentration from 5 μg to 200 μg zinc per ml with the proviso that the insulin analog has at least one charge more than human insulin at a pH value of 7.

5,008,242

TREATMENT OF INFLAMMATION USING 1-ANTICHYMOTRYPSIN

John Lezdey, 976 Kingston Dr., Cherry Hill, N.J. 08034, and Allan Wachter, 9822 S. Grandview, Tempe, Ariz. 85284

Continuation-in-part of Ser. No. 181,707, Apr. 14, 1989, abandoned, and a continuation-in-part of Ser. No. 242,735, Sep. 9, 1988, abandoned, which is a continuation-in-part of Ser. No. 946,445, Dec. 24, 1986, abandoned. This application Dec. 4, 1989, Ser. No. 445,005
Int. Cl.[5] A61K *37/64*
U.S. Cl. 514—8 13 Claims

1. A method for topically treating inflammation in a human afflicted with an inflammatory condition which comprises administering to said human alpha 1-antichymotrypsin topically in an amount sufficient to inhibit human skin mast cell chymase.

5,008,243

PHARMACEUTICAL COMPOSITION CONTAINING A GLYCOPROTEIN

Masanori Ikuzawa; Yoshiharu Oguchi; Kenichi Matsunaga, all of Tokyo; Noriyuki Toyoda, Sagamihara; Takao Furusho, Tokyo; Takayoshi Fujii, Tokyo, and Chikao Yoshikumi, Tokyo, all of Japan, assignors to Kureha Kagaku Kogyo Kabushiki Kaisha, Tokyo, Japan

Division of Ser. No. 898,900, Aug. 22, 1986, Pat. No. 4,820,689, which is a continuation of Ser. No. 637,831, Aug. 6, 1984, abandoned. This application Dec. 16, 1988, Ser. No. 285,664
Claims priority, application Japan, Aug. 11, 1983, 58-147231; Aug. 11, 1983, 58-147232; Aug. 11, 1983, 58-147233; Aug. 11, 1983, 58-147234; Aug. 11, 1983, 58-147235; Aug. 11, 1983, 58-147236; Aug. 11, 1983, 58-147237; Aug. 11, 1983, 58-147238; Aug. 11, 1983, 58-147239; Aug. 11, 1983, 58-147240; Aug. 11, 1983, 58-147241
Int. Cl.[5] A61K *37/02*
U.S. Cl. 514—8 13 Claims

1. A method for increasing or decreasing the production or metabolism of prostaglandins in a human, which comprises: administering to a human in need thereof a prostaglandin increasing or decreasing effective amount of glycoprotein having a molecular weight of 5000 to 300,000, as determined by ultra-centrifugation and 18 to 38% by weight of proteins, produced by:

(a) culturing a basidiomycetous fungal species belonging to the genus Coriolus;

(b) extracting the thus proliferated mycelia or fruit bodies with hot water or an aqueous alkaline solution; and

(c) removing low molecular weight substances having a molecular weight of less than 5000 from the extract.

5,008,244

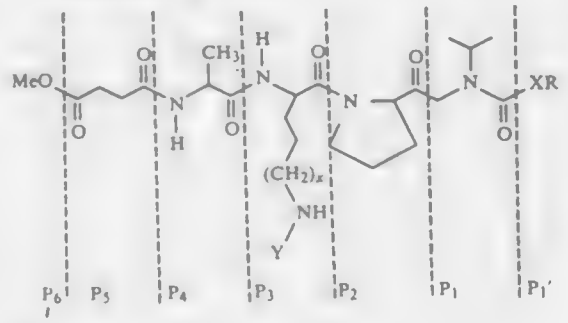
METHOD FOR INCREASING FERTILITY IN ANIMALS

Lindy F. Miller, West Terre Haute, and Peter J. Thomford, Terre Haute, both of Ind., assignors to Pitman-Moore, Inc., Lake Forest, Ill.

Filed May 15, 1989, Ser. No. 352,010
Int. Cl.[5] A61K *37/02*
U.S. Cl. 514—12 20 Claims

1. A method for increasing fertility in a food producing animal selected from the bovine, porcine or ovine species, comprising:

administering a fertility increasing amount of somatotropin to said animal in the finishing stage of growth thereby increasing embryonic survival and litter size during the reproductive stage of growth.



5,008,245

NOVEL PEPTIDYL CARBAMATE INHIBITORS OF THE ENZYME ELASTASE

George A. Digenis, Lexington, Ky., and Bushra J. Agha, Nanuet, N.Y., assignors to University of Kentucky Research Foundation, Lexington, Ky.

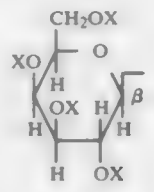
POLYSULFURIC ACID ESTERS OF BIS-ALDONAMIDES AND THEIR DERIVATIVES, PROCESS FOR THEIR PREPARATION AND MEDICAMENTS

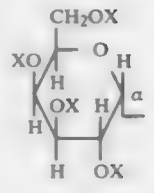
Eike Meinetsberger, Munich, Fed. Rep. of Germany, assignor to Luitpold-Werk Chemisch-pharmazeutische Fabrik GmbH & Co., Munich, Fed. Rep. of Germany

Filed Oct. 12, 1988, Ser. No. 256,624
Claims priority, application Fed. Rep. of Germany, Oct. 14, 1987, 3734815
Int. Cl.[5] C07H *15/04, 15/18, 11/00;* A61K *31/72*
U.S. Cl. 514—23 17 Claims

1. Polysulfuric acid exters of bisaldonamides an their derivatives of the formula (I):

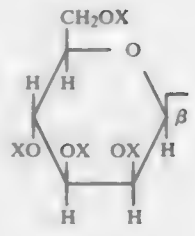


(I)

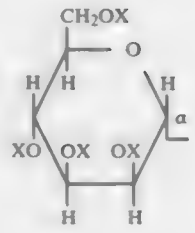


in which either

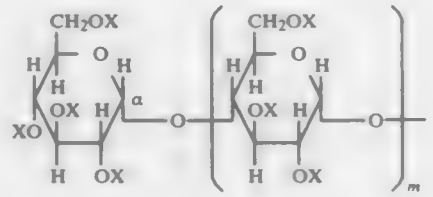
all radicals R^1, R^2 and R^3 independently of one another represent X, or



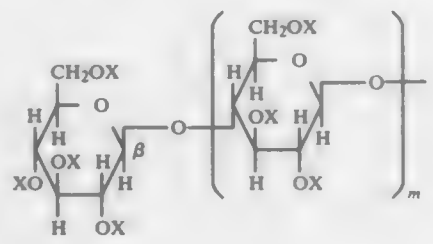
two of the radicals R^1, R^2 and R^3 stand for X, and the third stands for a radical of the formulae (II) to (VII),



(II)



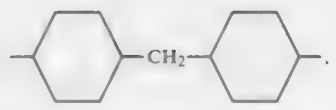
(III)



(IV)

(V)

(VI)



(VII)

wherein

X in the formulae (I) to (VII) represents independently a hydrogen atom or the group $—SO_3H$, wherein at least one X represents the group $—SO_3H$, m stands for 0, 1, 2, 3, 4, 5 or 6,

A in formula (I) represents a straight-chain or branched, saturated alkylene radical having 2 to 22 carbon atoms which is unsubstituted or substituted by one or more radicals $—CO_2R^5$,

or A stands for a single bond or the radical

R^4 and R^5 independently represent a hydrogen atom or a C_1–C_6-alkyl radical, and their salts of inorganic or organic bases.

17. Medicaments, containing one or more compounds of the formula (I), as claimed in claims 1 or 2, and pharmaceutically acceptable excipients and auxiliaries.

5,008,248

VETERINARY COMPOSITIONS FOR THE TREATMENT OF SCOURS AND DEHYDRATION

Robert J. Bywater, and Robert J. Dupe, both of Surrey, England, assignors to Beecham Group p.l.c., Epsom, England

Continuation of Ser. No. 930,498, Nov. 14, 1986, abandoned. This application Jan. 30, 1990, Ser. No. 474,635

1. A veterinary composition, comprising by weight:

75–85% of an actively absorbed monosaccharide,

3.5–5% of an actively absorbed naturally occurring amino acid,

1–3% of a buffering agent,

5–10% of an electrolyte, and

5–10% of one or more citrate salts, said composition not containing any citric acid that is not in the form of a salt.

11. A method of treating diarrhoea in domestic animals, which method comprises administering to the animal suffering from diarrhoea a therapeutically effective amount of the composition as defined in claim 1 dissolved in an aqueous medium.

12. A method of treating hypoglycaemia associated with ovine or bovine ketosis, which method comprises administering to the animal suffering therefrom a therapeutically effective amount of the composition as defined in claim 1 dissolved in an aqueous medium.

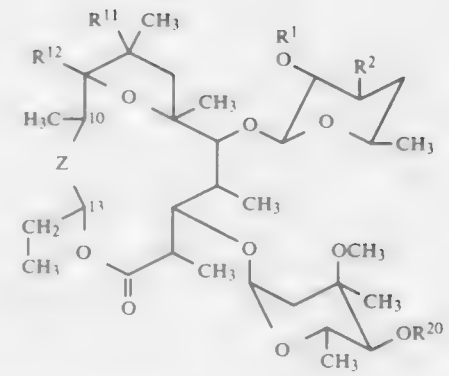
THERAPEUTIC METHOD OF STIMULATING DIGESTIVE TRACT CONTRACTILE MOTION IN MAMMALS

Satoshi Omura, Tokyo, and Zen Itoh, Maebashi, both of Japan, assignors to Kitasato Kenkyusho, Tokyo, Japan

Filed Aug. 25, 1986, Ser. No. 899,985



Claims priority, application Japan, Aug. 31, 1985, 60-190958; Feb. 28, 1986, 61-41413; May 31, 1986, 61-124739

The portion of the term of this patent subsequent to Jun. 30, 2004, has been disclaimed.

Int. Cl.[5] A61K *31/70*

U.S. Cl. 514—29 **14 Claims**

1. A therapeutic method of stimulating digestive tract contractile motion in mammals which comprises administering orally or non-orally to mammals in need of such treatment an effective amount of a digestive tract contractile motion stimulant composition comprising a pharmaceutically acceptable carrier and an effective digestive contractile motion stimulating amount of a compound having the formula:

wherein R^1 is selected from the group consisting of:

a hydrogen atom,

an acyl radical of C_{1-5} aliphatic carboxylic acid,

a C_{6-12} aroyl radical,

a C_{1-6} alkylsulfonyl radical,

a C_{2-12} dialkyloxyphosphoryl radical, and

a C_{12-24} diaryloxyphosphoryl radical;

R^2 is selected from the group consisting of:

a hydrogen atom,

a C_{1-6} alkanoyl radical which may be substituted by C_{1-3} alkoxycarbonyl radical,

a C_{6-12} aroyl radical,

a C_{1-6} alkylsulfonyl radical,

a C_{6-12} arylsulfonyl radical,

a C_{7-20} aralkylsulfonyl radical, and

a C_{1-3} alkyl radical which may be substituted by C_{2-6} alkoxy radical;

wherein Z stands for the formula:

where in R^5 is selected from the group consisting of:

a hydrogen atom,

a C_{1-6} alkanoyl radical,

a C_{6-12} aroyl radical,

a C_{1-6} alkylsulfonyl radical,

a C_{6-12} arylsulfonyl radical,

a C_{7-20} aralkylsulfonyl radical, and

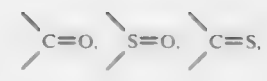
a C_{1-3} alkyl radical which may be substituted by C_{1-4} alkylthio radical,

and R^6 is selected from the group consisting of:

a hydrogen atom,

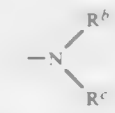
a C_{1-6} alkanoyl radical; and

a C_{1-3} alkyl radical which may be unsubstituted by C_{1-4} alkylthio radical,



or wherein Z stands for the formula:

or Z stands for the for the formula:



wherein Y stands for the formula B-R^8 (wherein R^8 stands for C_{6-12} aryl radical)

or the formula:

wherein each of R^9 and R^{10}, which may e the same or different, stands for a hydrogen atom or a C_{1-6} alkyl radical;

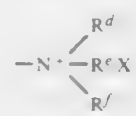
wherein R^b is selected from the group consisting of:

a hydrogen atom and

a C_{1-6} alkyl radical;

and wherein R^c is selected from the group consisting of:

a hydrogen atom,



a C_{2-6} alkyl radical which may be substituted with one or more hydroxyl radicals,

a C_{2-6} alkenyl radical, and

a C_{2-6} alkynyl radical;

or together R^b and R^c from a C_{3-6} cyclic alkylamino radical together with the adjacent nitrogen atom; or

R^a stands for the formula

wherein R^d is a C_{1-6} alkyl radical, and R^e and R^f, which may be the same or different are selected from the group consisting of:

a hydrogen atom,

a C_{1-6} alkyl radical which may be substituted by hydroxyl radical, carboxy radical, cyano radical, or halogen, a C_{3-5} cycloalkyl radical, or a C_{1-3} alkoxycarbonyl radical;

a C_{7-20} aralkyl radical;

a C_{2-6} alkenyl radical; and

a C_{2-6} alkynyl radical; or

together R^e and R^f form a C_{5-7} cyclic alkylamino radical with the adjacent nitrogen atom;

X stands for an anion; and

R^{11} and R^{12} each represent a hydrogen atom or both taken together form a chemical bond.

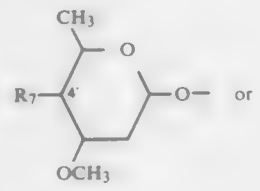
1. A compound having the formula:

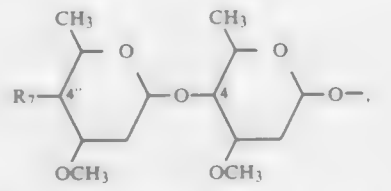
wherein the broken line at the 22,23-position indicates a single or double bond;

R_1 is H or hydroxy; the hydroxy being present only when said broken line indicates a single bond;



R_2 is methyl, ethyl, iso-propyl or sec-butyl

R_3 is hydrogen, methyl or acetyl;



R_4 and R_5 are hydrogen or acetyl;

X is oxygen or a double bond;

R_6 is hydroxy,

or

where R_7 is hydroxy, NR_8R_9, wherein R_8 and R_9 are independently hydrogen, loweralkyl, loweralkanoyl, loweralkyl sulfonyl or substituted benzenesulfonyl, wherein the substituent is halogen or $R_{10}COO$—, wherein R_{10} is a loweralkyl, phenyl or loweralkyl substituted phenyl.

13. A method for the treatment of insect infestations of plants which comprises treating such plants or the soil in which they grow with an effective amount of a compound of claim 1.

1. Sugar beet pectin having at least one of the following properties:

(a) low molecular weight;

(b) highly acetylated;

(c) many hydrophobic domains;

(d) ferulic acid content up to about 3% by weight; and

(e) relatively low viscosity at about 10% by weight

said sugar beet pectin having been prepared by:

suspending sugar beet plant material in an aqueous medium to form a suspension;

adjusting the pH of said suspension to a value less that about 4.5 or greater than about 9.0;

maintaining said suspension at a temperature greater than about 125° C. for from about 15 to about 600 seconds;

subjecting said suspension to mechanical shearing; and

isolating said sugar beet pectin from said suspension.

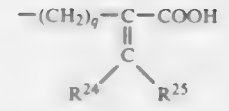
U.S. Cl. 514—201 **7 Claims**

1. A cephalosporin compound of the formula (Ia):



wherein:

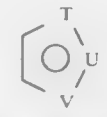
X is sulphur or sulphinyl;

R^1 is 2-aminothiazol-4-yl or 2-aminooxazol-4-yl each optionally substituted in the 5-position by fluorine, chlorine or bromine, or R^1 is 5-aminoisothiazol-3-yl, 5-amino-1,2,4-thiadiazol-3-yl, 3-aminopyrazol-5-yl, 3-aminopyrazol-4-yl, 2-amino-pyrimidin-5-yl, 2-aminopyrid-6-yl, 4-aminopyrimidin-2-yl, 2-amino-1,3,4-thiadiazol-5-yl or 5-amino-1-methyl-1,2,4-triazol-3-yl;

A is of the formula =NOR[2] (having the syn configuration about the double bond) wherein R2 is hydrogen, (1–6C)alkyl, (3–8C)cycloalkyl, (1–3C)alkyl(3–6C)cycloalkyl, (3–6C)cycloalkyl(1–3C)alkyl, (3–6C)alkenyl, optionally substituted by carboxy, (5–8C)cycloalkenyl, (3–6C)alkynyl, (2–5C)alkylcarbamoyl, phenylcarbamoyl, benzylcarbamoyl, di(1–4C)alkyl-carbamoyl(1–4C)alkyl, (1–4C-)haloalkylcarbamoyl (1–4C)-alkyl, (1–3C)haloalkyl, (2–6C)hydroxyalkyl, (1–4C)alkoxy(2–4C)alkyl, (1–4C)alkylthio(2–4C)alkyl, (1–4C)alkanesulphinyl(1–4C)alkyl, (1–4C)alkane-sulphonyl(1–4C)alkyl, amino(2–6C)alkyl, azido(2–6C)alkyl, ureido(2–6C)alkyl, (1–4C)-alkylamino(-1–6C)alkyl, (2–8C)dialkylamino(2–6C) alkyl, (1–5C-)cyanoalkyl, 3-amino-3-carboxypropyl, 2-(amidino)ethyl, 2-(amidinothio)ethyl, 2-(N-aminoamidinothio)ethyl, tetrahydropyran-2-yl, thietan-3-yl, 2-oxopyrrolidinyl, or 2-oxotetrahydrofuranyl,

or —R2 may be of the formula IV:

in which q is 1 or 2 and R24 and R25 are hydrogen or (1–4C)alkyl, or —R2 may be of the formula V:

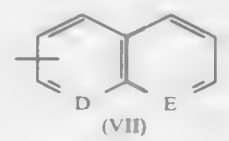


$$-CR^{32}R^{33}-(CH_2)_rCOR^{34}$$

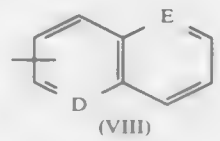
in which r is 0–3, R32 is hydrogen, (1–3C)alkyl or methylthio, R33 is hydrogen, (1–3C)alkyl, (3–7C)cycloalkyl, cyano, carboxy, (2–5C)carboxyalkyl or methanesulphonylamino, or R32 and R33 are joined to form, together with the carbon to which they are attached, a (3–7C)carbocyclic ring, and R34 is hydroxy, amino, (1–4C)alkoxy, (1–4C) alkylmino, or of the formula NHOR35 in which R35 is hydrogen or (1–4C)alkyl;

or A may be of the formula =CH.R3 wherein R3 is hydrogen, halogen, (1–6C)alkyl, (3–7C)cycloalkyl, (2–6C)alkenyl, (3–7C)cycloalkenyl, phenyl or benzyl;

R^4 is hydrogen, methoxy or formamido;

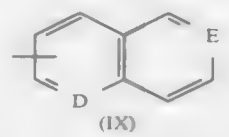


Q is a 5 or 6 membered ring containing NR^7 and 0 to 3 further heteroatoms selected from nitrogen, oxygen and sulphur and optionally fused on an available carbon-carbon or carbon-nitrogen bond to a benzene ring or a ring of the formula (VI):

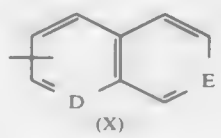


(VI)

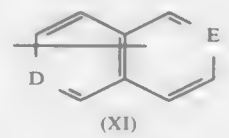
wherein T, U and V are selected from oxygen, sulphur, nitrogen, carbon, —NH— and —CH—;



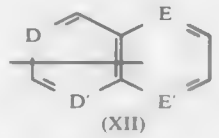
or ring Q is of the formula VII–XXVI:



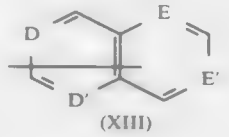
(VII)



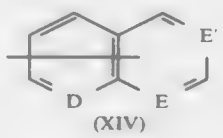
(VIII)



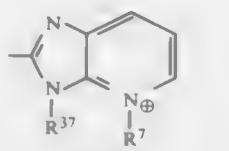
(IX)



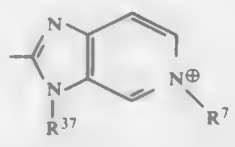
(X)



(XI)

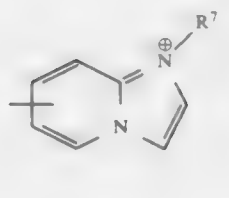


(XII)

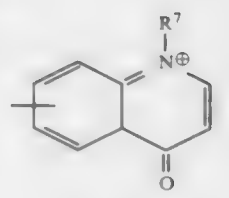


(XIII)

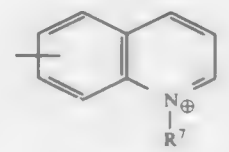
(XIV)



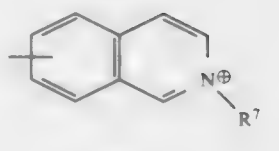
(XV)



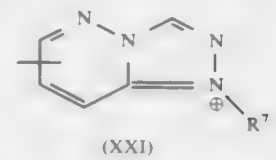
(XVI)



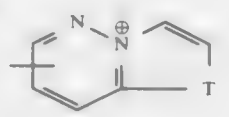
-continued



(XVII)



(XVIII)



(XIX)

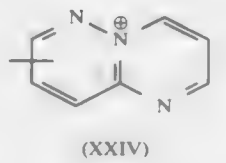
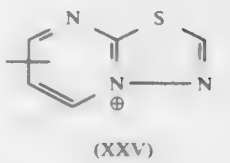
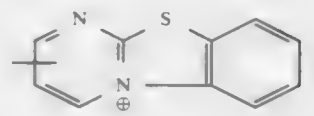
(XXI)



(XXII)



(XXIII)



— = Single or double bond

(XXIV)

(XXV)

(XXVI)

wherein one of D, D^1, E and E^1 represents NR^7 and the remainder represent uncharged nitrogen atoms and R^{37} represents hydrogen or a group R^6 (as hereinafter defined);

Ring Q and the rings VI–XXVI being optionally substituted by at least one group R^5 or R^6 (as hereinafter defined);

on a carbon atom or atoms available for substitution by 1,2 or 3 groups R5 wherein R5 is halogen, (1–6C)alkyl, carboxy, (2–6C)alkoxycarbonyl, (2–6C)alkoxycarbonyl(1–4C)alkyl, (1–6C)-alkoxy, (1–6C)alkylthio, cyano, (1–4C-)cyanoalkyl, amino, (1–6C)-alkylamino, (2–8C)dialkylamino, phenyl (1–4C)alkylamino, nitrophenyl(1–4C)alkylamino, (3–6C)alkenylamino, amino(1–6C)alkylamino, (1–6C)alkoxy(1–6C)alkylamino, hydroxy(1–6C)alkylamino, hydroxy, mercapto, carbamoyl, (2–6C) alkylcarbamoyl, (3–10C)dialkylcarbamoyl, phenylthio and heteroarylthio (wherein heteroaryl is furan, thiophene, imidazole, thiazole, pyrazole, thiadiazole, pyridine, pyrimidine, pyrazine or pyrimidine) wherein when more than one group R5 is present these may be the same or different;

on an uncharged nitrogen atom available for substitution by a group R6 wherein R6 is (1–6C)alkyl, phenyl or benzyl;

R7 is hydrogen, (1–6C)alkyl (optionally substituted by carboxy, (1–6C)alkoxycarbonyl, carbamoyl, mono- or di-(1–4C)alkylcarbamoyl, hydroxy, (1–4C)alkoxy, amino, mono- or di-(1–4C)alkyamino, (1–4C)alkanoyl, benzoyl, cyano, carboxyaminocarbonyl, (1–6C)alkoxycarbonylaminocarbonyl, (1–4C)alkoxy(2–4C)alkoxy or phenyl), (1–6C)alkoxy, phenyl(1–6C)alkoxy, amino, (1–6C)alkylamino, (3–6C)cycloalkyl, (3–6C)cycloalkenyl, cyano(3–6C)cycloalkenyl, (2–6C)alkenyl (optionally substituted by (1–6C)alkyl, halogen, cyano, carbamoyl, mono- or di-(1–4C)alkylcarbamoyl, piperidinocarbonyl or morpholinocarbonyl), 2-ureidoethyl, 2-thioureidoethyl, 2-(thioacetylamino)-ethyl, sulphamoyl, 2-amino-2-carboxyethyl, acetylaminomethyl, phthalimidomethyl, 4-5-dihydro-imidazol-2-ylmethyl, 3,4,5,6-tetrahydropyrimidin-2-ylmethyl, 2-(1,2,3,6-tetrahydro-2,6-dioxopurin-7-ylethyl, 2-hydroxyiminopropyl (syn or anti) [(1–4C)alkoxyimino]-propyl (syn or anti) or phenyl,

or R7 is of the formula $—(CH_2)_2—NR8R9R10$ in which R8, R9 and R10 are (1–4C)alkyl,

or R7 is of the formula $—(CH_2)_s—R11$ in which s is 0–2 and R11 is pyridine, pyridazine, pyrimidine, pyrazine, 1,2,5,6-dihydro-5,6-dioxo-1,2,4-triazine, 2-[(1–4C)alkyl]-1,2,5,6-dihydro-5,6-dioxo-1,2,4-triazine, 1-[(1–4C)alkyl]tetrazole, furan, thiophene, pyrrole, 1-[(1–4C)alkyl]pyrrole, oxazole, thiazole, imidazole, 1-[1–4C)alkyl]imidazole, isoxazole, isothiazole, pyrazoke, 1,2,3-thiadiazoke, 1-[1–4C)alkyl]pyrazole, benzfuran, benzthiophene, indole, oxindole, 1-[(1–4C)alkyl]indole, benzoxazole, benzthiazole, benzimidazole, 1-[(1–4C)alkyl]benzimidazole, or 3,4-dihydro-4-oxo-2H-benzo[e]oxazine (each of these ring systems being linked to $(CH_2)_s$ through carbon and each ring system being optionally substituted by halogen, (1–6C)alkyl, (1–4C)haloalkyl, (3–6C)cycloalkyl, (3–6C)cycloalkyl(1–4C)alkyl, (2–6C)alkenyl, carboxy, (2–6C)alkoxycarbonyl, (1–6C)alkoxy, cyano, (2–6C)-cyanoalkenyl, carbamoyl, mono-or di-(1–4C)alkyl-carbamoyl, (1–4C)alkanoylamino, guanidino, hydroxy, nitro or amino),

or R7 is 2-guanidino-thiazole-4-ylmethyl, hydroxybenzoylmethyl, 2-thenyl, 2-imidazolylmethyl or cinnamyl (each optionally substituted by halogen, nitro or carbamoyl),

or R7 is $—(CH_2)_tNHCOR12$ or $—(CH_2)_tS(O)_u—R12$ in which t is 1–6, u is 0, 1 or 2 and R12 is (1–6C)alkyl or (1–6C)alkoxy,

or R7 is of the formula $(CH_2)_2N=CR13NR14R15$ or $(CH_2)_vC(=NR13)NR14R15$ or a tautomer thereof in which v is 1–6 and R13, R14, R15 are hydrogen or (1–4C)alkyl,

(wherein when R7 is or contains a phenyl group, the phenyl group is optionally substituted by 1 or 2 groups selected from halogen, (1–6C)alkyl, (1–6C)alkoxy, amino, carboxy, nitro, carbamoyl, cyano, trifluoromethyl, aminomethyl, (1–4C)alkanoyl, (1–4C)-alkanoylamino, halo(1–4C)alkyl, (2–6C)alkoxycarbonyl, mono- or di-(1–4C)alkylcarbamoyl, mesyl, vinyl, sulpho, sulphamoyl or mono- or di(1–4C)alkylsulphamoyl) or when the positively charged nitrogen atom occurs at the junction between fused rings R7 is absent;

Y is straight or branched (1–6C)alkylene optionally substituted by cyano, carboxy, (1–4C)alkoxycarbonyl, nitro, halogen, carbamoyl, mono- or di-(1–4C)alkylcarbamoyl or trifluoromethyl; or Y is $—CH_2CH_2NHCO—$ or a bond;

P represents:

(i) a benzene ring optionally fused to a further benzene ring (so forming a naphthyl group) said ring system substituted by groups W and Z which are ortho with respect to one another wherein W is hydroxy or an in vivo hydrolysable ester thereof and Z is hydroxy or an in vivo hydrolysable ester thereof;

ring system P optionally being further substituted by (1–4C)alkyl, halogen, hydroxy, cyano, trifluoromethyl, nitro, amino, mono- or di-(1–4C)alkylamino, formyl, (1–4C)alkanoyl, (1–4C)alkoxy, (1–4C)alkylthio, (1–4C)alkanoyloxy, carbamoyl or mono- or di(1–4C)alkylcarbamoyl;

and the N-oxides thereof where chemically possible;

and pharmaceutically acceptable salts thereof.

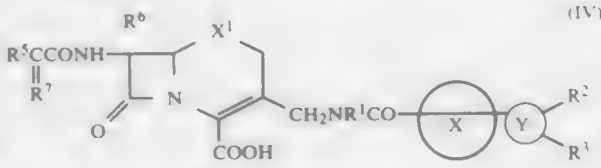
CEPHALOSPORIN COMPOUNDS

Patrice J. Siret, Reims; Frederick H. Jung, Rilly la Montagne, both of France, and William Bell, Macclesfield, England, assignors to Imperial Chemical Industries PLC, London, England and I.C.I.-PHARMA, Gergy Cedex, France



Filed May 10, 1989, Ser. No. 349,663

Claims priority, application United Kingdom, May 10, 1988, 88401143

Int. Cl.[5] C07D *501/38;* **A61K** *31/545*

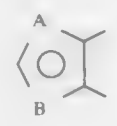
U.S. Cl. 514—202 **8 Claims**

1. A compound of formula (IV)

(IV)

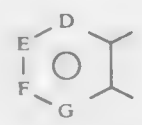
or a salt or ester thereof;

wherein:



X^1 is sulphur or sulphinyl;

R^1 is hydrogen, C_{1-4}alkyl optionally substituted by halo, hydroxy, C_{1-4}alkoxy, carboxy, amino, cyano, C_{1-6}alkanoylamino, phenyl or heteroaryl, or R^1 is C_{2-6}alkenyl;



R^2 is hydroxy or an in vivo hydrolyzable ester thereof;

R^3 is ortho to R^2 and is hydroxy or an in vivo hydrolyzable ester thereof,

X is a ring selected from a group of the sub-formulae (a)–(b).

(a)

(b)

wherein A is CH or a nitrogen atom; B is oxygen, sulphur or a group NR^4; zero, one or two of D, E, F and G are nitrogen atoms and the remainder are CH groups; or X is a pyrazinone, pyridinone, pyridazinone or pyrimidinone ring, or is a thione equivalent of such a ring, said rings having a substituent R^4 on one nitrogen atom, or is pyranone, or pyranthione; the ring X being fused by any two adjacent carbon atoms to ring Y;

R^4 is hydrogen, hydroxy, C_{1-6}alkoxy, phenoxy, C_{2-6}alkenyl or C_{1-6}alkyl, (any of these groups being optionally substituted by hydroxy, C_{1-6}alkoxy, cyano, amino, C_{1-6}alkylamino, di-C_{1-6}alkylamino, carboxy, C_{1-6}alkoxycarbonyl, C_{1-6}alkanoyloxy, carbamoyl, C_{1-6}alkylcarbamoyl, di-C_{1-6}alkylcarbamoyl, C_{1-6}alkoxycarbonylamino, phenyl phenylC_{1-6}alkyl, carboxyaminocarbonyl, C_{1-6}alkoxycarbonylaminocarbonyl, benzoyl or C_{3-6}cycloalkyl) or R^4 is phenyl, C_{3-6} cyclosilkyl, amino, C_{1-6}alkylamino or di-C_{1-6}alkylamino:

wherein the fused X-Y ring system and/or any phenyl group is further optionally substituted by C_{1-6}alkyl, halo, hydroxy, hydroxy, C_{1-6}alkyl, cyano, trifluoromethyl, nitro, amino, C_{1-6}alkylamino, di-C_{1-6}alkylamino, C_{1-6}alkanoyl, C_{1-6}alkoxy, C_{1-6}alkylthio, C_{1-6} alkanoyloxy, carbamoyl, C_{1-6}alkylcarbamoyl, di-C_{1-6} alkyl carbamoyl, carboxy, carboxy C_{1-6} alkyl, C_{1-6}alkoxycarbonyl C_{1-6}alkyl, sulpho sulpho-C_{1-6}alkyl, sulphonamido C_{1-6}alkyl, C_{1-6}alkoxycarbonyl, C_{1-6}alkanoylamino, thioureido or amidino;

ring Y is a 6-membered heteroaryl ring containing only ring atoms selected from carbon and one or two nitrogen atoms, substituted on adjacent carbon atoms by groups R^2 and R^3;

wherein either ring of the fused X-Y ring system is bonded via a carbon atom to the amide linkage;

R^5 is a 2-aminothiazol-4-yl or 2-aminooxazol-4-yl each optionally substituted in the 5-position by fluorine, chlorine or bromine, or R^5 is 5-aminoisothiazol-3-yl, 5-amino-1,2,4-thiadiazol-3-yl, 3-aminopyrazol-5-yl, 3-aminopyrazol-4-yl, 2-aminopyrimidin-5-yl, 2-aminopyrid-6-yl, 4-aminopyrimidin-2-yl, 2-amino-1,3,4-thiadiazol-5-yl or 5-amino-1-methyl-1,2,4-triazol-3-yl;

R^6 is hydrogen, methoxy or formamido; and

R^7 is of the formula $=N.O.R^8$ (having the syn configuration about the double bond) wherein R^8 is hydrogen, (1-6C)alkyl, (3-8C)cycloalkyl, (1-3C)alkyl(3-6C) cycloalkyl, (3-6C)cycloalkyl(1-3C)alkyl, (3-6C)alkenyl, optionally substituted by carboxy, (5-8C)cycloalkenyl, (3-6C)alkynyl, (2-5C)alkylcarbamoyl, phenylcarbamoyl, benzylcarbamoyl, (1-4C)alkylcarbamoyl(1-4C)alkyl, di(1-4C)alkylcarbamoyl(1-4C)alkyl, (1-4C)haloalkylcarbamoyl(1-4)alkyl, (1-3C)haloalkyl, (2-6C)hydroxyalkyl, (1-4C)alkoxy(2-4C)alkyl, (1-4C)alkylthio(2-4C)alkyl, (1-4C)alkenesulphinyl(1-4C)alkyl, (1-4C)alkanesulphonyl(1-4C)alkyl, (2-6C)aminoalkyl, (1-4C)alkylamino(1-6C)alkyl, (2-8C)dialkylamino(2-6C)alkyl, (1-5C)cyanoalkyl, 3-amino-3-carboxypropyl, 2-(amidinothio)ethyl, 2-(N-aminoamidinothio)ethyl, tetrahydropyran-2-yl, thietan-3-yl, 2-oxopyrrolidinyl, or 2-oxotetrahydrofuranyl, or R^8 is of the formula V:

$$—(CH_2)_q—C(COOH)=CR^9R^{10} \qquad V$$

wherein q is one or two and R^9 and R^{10} are independently hydrogen or C_{1-4}alkyl; or R^8 is of the formula VI:

$$—CR^{11}R^{12}—(CH_2)_l—COR^{13} \qquad VI$$

wherein r is 0–3, R^{11} is hydrogen, (1-3C)alkyl or methylthio, R^{12} is hydrogen, (1-3C)alkyl, (3-7C) cycloalkyl, cyano, carboxy, (2-5C)carboxyalkyl or methanesulphonylamino, or R^{11} and R^{12} are joined to form, together with the carbon to which they are attached, a (3-7C)carbocyclic ring, and R^{13} is hydroxy, amino, (1-4C)alkoxy, (1-4C)alkylamino or of the formula $NHOR^{14}$ in which R^{14} is hydrogen or (1-4C)alkyl;

or R^7 may be of the formula $=CH.R^{15}$ wherein R^{15} is hydrogen, halogen, (1-6C)alkyl, (3-7C)cycloalkyl, (2-6C)alkenyl, (3-7C)cycloalkenyl, phenyl or benzyl.

3. In a method of repelling insects and mites the improvement wherein the insect and mite repellent composition comprises at least one substituted α,ω-aminoalcohol derivative of the formula (I)

(I)

in which

X represents hydrogen, COR^{11}, $COOR^{12}$ or R^{13},

R^1 represents an optionally substituted alkyl, alkenyl or alkinyl radical,

R^2, R^{11}, R^{12} and R^{13} are identical or different and represent an optionally substituted alkyl or alkenyl radical,

R^3 to R^{10} are identical or different and represent hydrogen, or represent an optionally substituted alkyl radical,

substitutents in the case of said optionally substituted alkyl, alkenyl, and alkinyl radicals being selected from the group consisting of alkyl, cycloalkyl, C_1–C_4-alkoxy, halogen, and cyano,

and wherein

R^2 and R^3 or R^3 and r^7 or r^3 and R^5 and

R^7, together with the atoms to which they are bonded, can also form a 5 to 7-membered saturated monocyclic ring which is unsubstituted or substituted or substituted by alkyl, and

n and m are identical or different and denote 0 or 1,

with the proviso that X does not represent hydrogen or R^{13} if n and m represent 0.

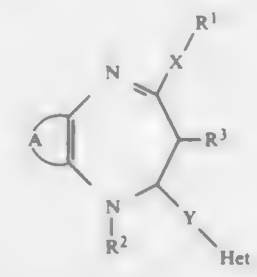
Int. Cl.[5] A61K *31/55;* **C07D** *521/00*

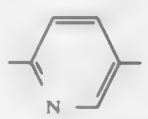


U.S. Cl. 514—220 **7 Claims**

1. A compound of formula (I), (II) or (III)

(I)

(II)



(III)

wherein;

A represents a fused benzene, pyridine, naphthalene, quinoline, thiophene, benzothiophene, pyrazole or isothiazole ring, which ring or rings being optionally substituted by 1 or 2 substituents independently selected from C_1–C_4 alkyl; C_4–C_7 cycloalkyl; halo; perfluoro - (C_1–C_4 alkyl); cyano; (C_1–C_4 alkoxy)-carbonyl; nitro; amino; amino substituted by (C_1–C_4 alkyl) sulfonyl, amino substituted by (C_1–C_4 alkyl)-oxalyl; C_1–C_4 alkoxy - (C_1–C_4 alkyl) imino; hydroxy (C_1–C_4 alkyl), (C_1–C_4 alkoxy)-C_1–C_4 alkyl, (C_1–C_4 alkoxy)-(C_2–C_4 alkoxy)-C_1–C_4 alkyl, —$CONR^5R^6$ wherein R^5 and R^6 are each independently H or C_1–C_6 alkyl, or R^5 is H or C_1–C_4 alkyl and R^6 is C_3–C_7 cycloalkyl, or 2-pyridyl, or R^5 or R^6 are joined together to form, with the nitrogen atom to which they are attached, a morpholino, pyrrolidino or piperidino group; and phenyl, thienyl or pyridyl optionally substituted by halogen, cyano, trifluoromethyl, (C_1–C_4 alkoxy) carbonyl or carbamoyl,

X is O, S or NH

Y is 1, 4 phenylene or a group of formula

R^1 is either H or C_1–C_4 alkyl optionally substituted by a substituent selected from hydroxyl, phenyl, halophenyl, pyridyl, (C_1–C_4 alkoxy) carbonyl, and di (C_1–C_4 alkyl) amino or is C_2–C_4 alkyl substituted by hydroxy or by one or two C_1–C_4 alkoxy groups or $(CH_2)_nCONR^7R^8$ where n = 1–4 and R^7 and R^8 are each independently H or C_1–C_4 alkyl.

R^2 is H or C_1–C_4 alkyl;

R^3 is H or C_1–C_4 alkyl;

the fused ring B is an imidazole, triazole, tetrazole, pyrimidine, imidazoline or tetrahydropyrimidine ring, said fused ring B being optionally substituted by 1 or 2 substituents independently selected from C_1–C_4 alkyl, C_1–C_4 haloalkyl, halo and oxo;

and "Het" is pyridyl, 1,2,4-triazolyl or imidazolyl said "Het" rings optionally fused to a benzene, thiazole or pyridine ring and at least one of said rings optionally being substituted with from one to three substituents independently selected from C_1–C_4 alkyl, C_1–C_4 alkoxy, halo, CF_3, CN and formyl; and wherein the dashed line represents an optional bond; and their pharmaceutically acceptable salts.

7. A medicament comprising a compound for antagonising platelet activating factor of claim 1 and a pharmaceutically acceptable diluent or carrier wherein the medicament comprises 0.1 mg to 1000 mg of the claim 1 compound and the remainder is the diluent or carrier.

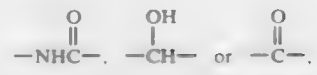
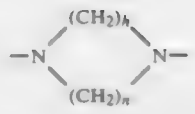
1. A pyrimidinedione compound of the formula (1)

(1)



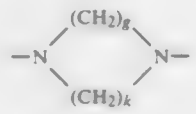
in which A represents $-(CH_2)_m-$, $-B-(CH_2)_k-$, $-D-(CH_2)_l-$,



B represents an oxygen or a sulfur atom,

D represents

R^1 and R^2 each independently represent a hydrogen atom, a lower alkyloxycarbonyl group, an unsaturated lower alkyl group or a lower alkyl group, any one of the hydrogen atoms of said alkyl groups may be substituted by a group selected from the group consisting of a hydroxy group; a lower monoalkylamino group; a lower dialkylamino group; a lower alkyloxy group; a lower alkanoyloxy group; a benzoyloxy group; a benzoyloxy group substituted by a halogen atom or a lower alkyloxy group; a phenyl group; a phenyl group substituted by a halogen atom or a lower alkyloxy group; and a lower alkyloxycarbonyl group, or R^1 and R^2 may be so linked as to make an alkylene chain and thus form a heterocyclic structure;



where h is 2 or 3 and n is 2 or 3;

R^3 and R^4 each independently represent a hydrogen atom or a lower alkyl group;

X^1 and X^2 each independently represent a hydrogen atom, —CO—R^6, a halogen atom, a lower alkyl group, a halogen-substituted lower alkyl group, a hydroxy group, a lower alkyloxy group, a lower alkylthio group, a lower alkyloxycarbonyl group, a carboxy group, a cyano group, an amino group, a lower alkanoyloxy group, a lower alkanoylamino group, a lower alkylsulfonamido group, a lower mono- or di-alkylamino group, a phenyl-substituted lower alkylamino group or an unsaturated lower alkyloxy group;

X^3 represents a hydrogen atom, a nitro group, a methyl group or a cyano group; R^5 represents a hydrogen atom, a lower alkanoyl group, a lower alkylsulfonyl group or a lower alkyl group, or R^1 and R^5 may be so linked as to make an alkylene chain and thus form a heterocyclic structure;

where g is 2 or 3 and k is 2, 3 or 4;

R^6 represents a lower alkyl group, a C_5-C_6 cycloalkyl group or a phenyl group, said phenyl group may be substituted by either one or two of groups selected from the group consisting of a halogen atom, a lower alkyl group, a hydroxy group and a lower alkyloxy group, or a heterocyclic ring;

n represents an integral number 2 or 3; m represents an integral number, 0, 1, 2, 3, or 4; k represents an integral number, 2, 3 or 4; and l represents an integral number, 0, 1, 2, 3 or 4.

12. A method of treating cardic arrythmias comprising administering to a person in need of same an effective amount of the compound of claim 1 or an acid addition salt of the compound of claim 1.

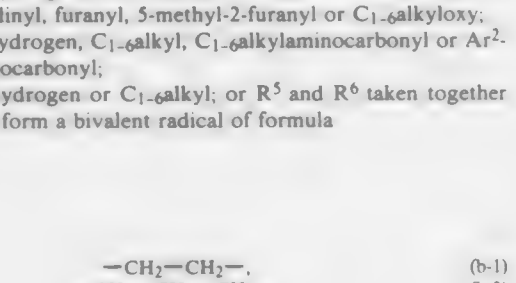
U.S. Cl. 514—272 **18 Claims**



1. A chemical compound having the formula

(I)

a pharmaceutically acceptable addition salt thereof, and a stereochemically isomeric form thereof, wherein

$—A^1=A^2—A^3=A^4—$ is a bivalent radical having the formula

(a-1)
(a-2)
(a-3)
(a-4)
(a-5)
(a-6)
(a-7)

wherein one or two hydrogen atoms of said radicals (a-1) to (a-7) each independently from one another may be replaced by halo, C_{1-6}alkyl, C_{1-6}alkyloxy, hydroxy or trifluoromethyl;

R^1 is hydrogen, C_{1-10}alkyl, C_{3-6}cycloalkyl, Ar^1, mono- and di(Ar^1)-C_{1-6}alkyl, or a radical of formula —Alk—G—R^7, wherein

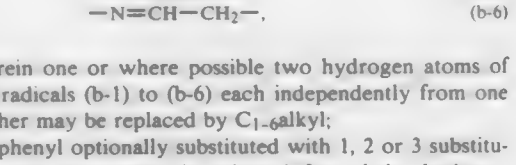
G is O or S; and

R^7 is hydrogen; C_{2-6}alkenyl optionally substituted with Ar^2; C_{3-6}alkynyl, C_{1-6}alkyl optionally substituted with Ar^1, hydroxy, C_{1-6}alkyloxy, carboxyl or C_{1-6}alkyloxycarbonyl;

B is NR^8, CH_2, O, S, SO or SO_2; said R^8 being hydrogen, C_{1-6}alkyl, C_{3-6}cycloalkyl, C_{1-6}alkylcarbonyl, C_{1-6}alkyloxycarbonyl or Ar^2-C_{1-6}alkyl;

R^2 is hydrogen or C_{1-6}alkyl;

n is 0, 1 or 2;



each Alk independently is C_{1-6}alkanediyl;

R^3 is hydrogen or C_{1-6}alkyl;

R^4 is hydrogen, C_{1-6}alkyl optionally substituted with Ar^2, pyridinyl, furanyl, 5-methyl-2-furanyl or C_{1-6}alkyloxy;

R^5 is hydrogen, C_{1-6}alkyl, C_{1-6}alkylaminocarbonyl or Ar^2-aminocarbonyl;

R^6 is hydrogen or C_{1-6}alkyl; or R^5 and R^6 taken together may form a bivalent radical of formula

(b-1)
(b-2)
(b-3)
(b-4)
(b-5)
(b-6)

wherein one or where possible two hydrogen atoms of said radicals (b-1) to (b-6) each independently from one another may be replaced by C_{1-6}alkyl;

Ar^1 is phenyl optionally substituted with 1, 2 or 3 substituents each independently selected from halo, hydroxy, nitro, cyano, trifluoromethyl, C_{1-6}alkyl, C_{1-6}alkyloxy, C_{1-6}alkylthio, mercapto, amino, mono- and di(C_{1-6}alkyl-)amino, carboxyl, C_{1-6}alkyloxycarbonyl and C_{1-6}alkylcarbonyl; thienyl; halothienyl; furanyl optionally substituted with C_{1-6}alkyl and/or hydroxyC_{1-6}alkyl; pyridinyl; pyrimidinyl; pyrazinyl; thiazolyl; or imidazolyl optionally substituted with C_{1-6}alkyl; and

Ar^2 is phenyl optionally substituted with 1, 2 or 3 substituents each independently selected from halo, hydroxy, nitro, cyano, trifluoromethyl, C_{1-6}alkyl, C_{1-6}alkyloxy, C_{1-6}alkylthio, mercapto, amino, mono- and di(C_{1-6}alkyl-)amino, carboxyl, C_{1-6}alkyloxycarbonyl and C_{1-6}alkylcarbonyl.

7. An anti-allergic composition comprising an inert carrier and as active ingredient an antiallergically effective amount of a compound as claimed in claim 1.

5,008,269

METHOD FOR TREATING CIRCULATORY VESSEL OCCLUSION

Elfriede Leniger-Follert, Sprinkstück 3, D-5800 Hagen, Fed. Rep. of Germany

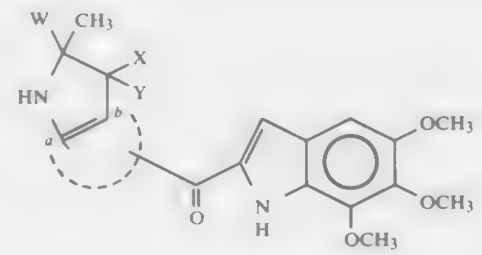
DC-88A DERIVATIVES

Yutaka Kanda, Houston, Tex.; Tohru Yasuzawa, Sakai, Japan; Hiromitsu Saito, Sagamihara, Japan; Hiroshi Sano, Machida, Japan; Eiji Kobayashi, and Makoto Morimoto, both of Shizuoka, Japan, assignors to Kyowa Hakko Kogyo Co., Ltd., Tokyo, Japan

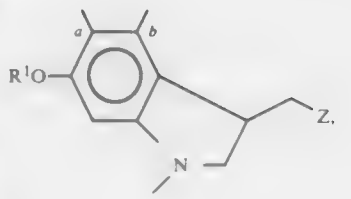


Filed Oct. 18, 1989, Ser. No. 423,788

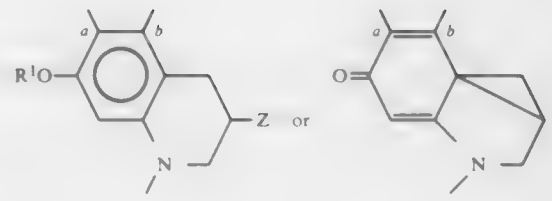
Claims priority, application Japan, Oct. 21, 1988, 63-265582; Mar. 15, 1989, 64-62572

Int. Cl.[5] **A61K** *31/44, 31/40;* **C07D** *471/12, 209/02*

U.S. Cl. 514—292 **15 Claims**



1. A DC88-A derivative represented by the general formula:

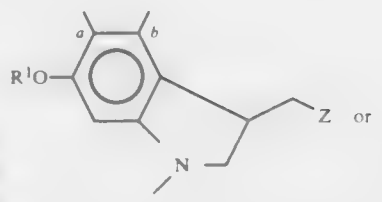


wherein one of X and Y is hydrogen, and the other is OR^2 wherein R^2 represents hydrogen, CH_3, —$COCH_3$ or —COPh wherein Ph represents substituted or unsubstituted phenyl, or X and Y are combined together to form =O;

represents

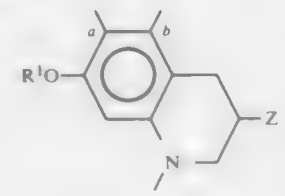
wherein Z represents chlorine or bromine;

R^1 represents hydrogen, straight or branched alkyl having 1 to 4 carbon atoms, COR^3, $CONR^4R^5$, —CO_2R^6, —$SiR^7R^8R^9$ or —CH_2OCH_3, wherein R^3 represents straight or branched alkyl having 1 to 14 carbon atoms, or unsubstituted or substituted phenyl, each of R^4 and R^5 independently represents straight or branched alkyl having 1 to 4 carbon atoms, R^6 represents straight or branched alkyl having 1 to 4 carbon atoms, allyl or aralkyl each of R^7, R^8, and R^9 independently represents straight or branched alkyl having 1 to 4 carbon atoms;



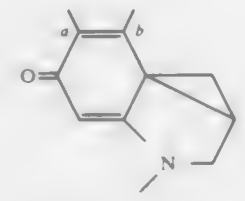
W represents hydrogen, allyl, —CO_2R^{10}, —COR^4, or CH_2OR^2

wherein



R^{10} represents straight or branched alkyl having 1 to 5 carbon atoms, substituted alkyl having 1 to 5 carbon atoms, allyl or benzyl, R^4 and R^2 have the same significance as defined above; provided that when

represents



-continued

wherein R^1 is hydrogen and W is $—CO_2CH_3$ one of X and Y represents hydrogen, and the other represents $—OR^2$ wherein R^2 has the same significance as defined above; and that when

represents

and W is $—CO_2CH_3$, one of X and Y represents hydrogen, and the other represents $—OR^2$ wherein OR^2 has the same significance as defined above.

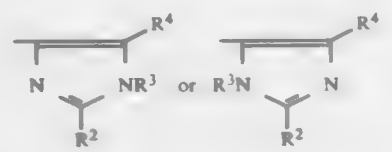
U.S. Cl. 514—292 **7 Claims**



1. A compound of formula (I)

(I)

wherein

Im represents an imidazolyl group of the formula:

R^1 represents a hydrogen atom or a group selected from C_{1-6}alkyl, C_{3-6}alkenyl, C_{3-10}alkynyl, C_{3-7}cycloalkyl, C_{3-7}cycloalkylC_{1-4}alkyl, phenyl, phenylC_{1-3}alkyl, phenylmethoxymethyl, phenoxyethyl, phenoxymethyl, $—CO_2R^5$, $—COR^5$, $—CONR^5R^6$ or $—SO_2R^5$ (wherein R^5 and R^6, which may be the same or different, each represents a hydrogen atom, a C_{1-6}alkyl or C_{3-7}cycloalkyl group, or a phenyl or phenylC_{1-4}alkyl group, in which the phenyl group is unsubstituted or substituted by one or more C_{1-4} alkyl, C_{1-4}alkoxy or hydroxy groups or halogen atoms, with the proviso that R^5 does not represent a hydrogen atom when R^1 represents a group $—CO_2R^5$ or $—SO_2R^5$);

one of the groups represented by R^2, R^3 and R^4 is a hydrogen atom or a C_{1-6}alkyl, C_{3-7}cycloalkyl, C_{3-6}alkenyl, phenyl or phenylC_{1-3}alkyl group, and each of the other two groups, which may be the same or different, represents a hydrogen atom or a C_{1-6}alkyl group;

or a physiologically acceptable salt or solvate thereof.

7. A method of treating a condition mediated through 5-HT_3 receptors which comprises administering to a patient an effective amount to relieve said condition of a compound of formula (I) as defined in claim 1 or a physiologically acceptable salt or solvate thereof.

1. An amino acid derivative of the formula

(I)

wherein

R^1 is hydrogen or an optionally phenyl-substituted alkyl group with 1 to 6 carbon atoms;

R^2 is hydrogen or an optionally phenyl-substituted alkyl group with 1 to 4 carbon atoms;

R^3 is hydrogen, an alkyl group with 1 to 7 carbon atoms which may have an amino group or a phenyl ring in the terminal position, or the group $R^4—CO—$;

R^4 is an alkyl group with 1 to 5 carbon atoms, which, when W=NH, may have an amino group in the α position;

W is oxygen, sulphur or an NH group;

n and m are each 0, 1, or 2, the sum of n and m being 1 or 2;

k is 1, 2, 3 or 4;

A is the group

which may be linked to the ring B in either way;

or a pharmaceutically acceptable salt thereof.

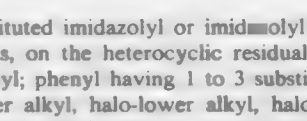
U.S. Cl. 514—312 **18 Claims**

1. A carbostyril compound or pharmaceutically acceptable salt thereof represented by the formula 1a,

(1a)



wherein

R is unsubstituted imidazolyl or imidazolyl having 1 to 3 substituents, on the heterocyclic residual ring, selected from phenyl; phenyl having 1 to 3 substituents selected from lower alkyl, halo-lower alkyl, halogen, hydroxy, amino, lower alkylamino, carboxy and lower alkoxy; cycloalkyl; phenylthio; lower alkyl; lower alkyl having 1 to 2 substituents selected from amino, lower alkylamino and carboxyl; amino; hydroxyl; cyano; carboxyl; lower alkoxycarbonyl; phenyl-lower alkyl; phenyl-lower alkyl having hydroxyl substituents on the phenyl ring; phenylsulfonyl; phenylsulfonyl having lower alkyl substituents on the phenyl ring; lower alkoxysubstituted phenyl-lower alkyl; lower alkylthio; lower alkenyl; lower alkoxy and pyridyl;

R^1 is hydrogen, lower alkyl or phenyl-lower alkyl;

R^2 is hydrogen, halogen, lower alkyl-sulfonyloxy, lower alkoxy or hyroxyl;

Z is oxygen, sulfur,

wherein R^3 is hydrogen or lower alkyl, or —NH—;

A is lower alkylene;

X is sulfur, —SO— or $—SO_2—$; and

the carbon-carbon bond between the 3- and 4-positions in the carbostyril skeleton is a single or double bond.

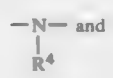
U.S. Cl. 514—334 **13 Claims**

1. A pyridyl-substituted acrylic ester of the formula



(I)

in which

R^1 represents straight-chain or branched alkyl which has 1 to 6 carbon atoms, or represents aralkyl which has 1 to 4 carbon atoms in the straight-chain or branched alkyl moiety and 6 to 10 carbon atoms in the aryl moiety and which is optionally monsubstituted to pollysubstituted in the aryl moiety by identical or different substituents from the group consisting of halogen, cyano, nitro, in each case straight-chain or branched alkyl, alkoxy or alkylthio, each having 1 to 4 carbon atoms, in each case straight-chain or branched halogenoalkyl, halogenoalkoxy or halogenoalkylthio, each having 1 to 4 carbon atoms and 1 to 9 identical or different halogen atoms, each case straight-chain or branched alkoxycarbonyl or alkoximinoalkyl, each having 1 to 8 carbon atoms in the individual alkyl moieties, cycloalkyl which has 3 to 7 carbon atoms, double-linked alkanediyl which has 3 to 5 carbon atoms, aryl, aralkyl, aryloxy or aralkyloxy, each of which has 6 to 10 carbon atoms in the aryl moiety and if appropriate 1 to 4 carbon atoms in the straight-chain or branched alkyl moiety and each of which is optionally monosubstituted to polysubstituted in the aryl moiety by identical or different substituents from the group consisting of halogen, alkyl, alkoxy, alkylthio, halogenoalkyl, halogenoalkoxy or halogenoalkylthio, each having 1 to 4 carbon atoms and if appropriate 1 to 9 identical or different halogen atoms, or heteroarylalkyl or heteroaryl, each of which has 2 to 9 carbon atoms and 1 to 4 identical or different hereto atoms in the heteroaryl moiety and if appropriate 1 to 4 carbon atoms in the straight-chain or branched alkyl moiety and each of which is optionally monosubstituted to polysubstituted in the heteroaryl moiety by identical or different substituents from the group consisting of halogen, alkyl, alkoxy, alkylthio, halogenoalkyl, halogenoalkoxy or halogenoalkylthio, each having 1 to 4 carbon atoms and if appropriate 1 to 9 identical or different halogen atoms;

R^2 represents dialkylamino which has 1 to 6 carbon atoms in each of the individual alkyl moieties, or represents a radical $—Z—R^3$,

X represents oxygen or sulphur or represents a radical

and

Py represents 2-pyridyl, 3-pyridyl or 4-pyridyl, each of which is monosubstituted to polysubstituted by identical or different substituents selected from the group consisting of halogen, cyano, nitro, in each case straight-chain or branched alkyl, alkoxy or alkylthio, each having 1 to 6 carbon atoms, in each case straight-chain or branched halogenoalkyl, halogenoalkoxy or halogenoalkylthio, each having 1 to 4 carbon atoms and 1 to 9 identical or different halogen atoms, in each case straight-chain or branched alkoxycarbonyl, alkoximinoalkyl, dialkylamino or dialkylaminocarbonyl, each having 1 to 4 carbon atoms in the individual alkyl moieties, in each case straight-chain or branched alkenyl or alkinyl, each having 2 to 8 carbon atoms, or aryl, aryloxy, arylthio, arylcarbonyl, aralkyl, aralkenyl, aralkinyl, aralkyloxy or heteroaryl, each of which has 6 to 10 carbon atoms in the aryl moiety and if appropriate 1 to 6 carbon atoms in the straight-chain or branched alkyl moiety or if appropriate 2 to 6 carbon atoms in the straight-chain or branched alkenyl moiety or alkinyl moiety or 2 to 9 carbon atoms and 1 to 4 identical or different hereto atoms in the heteroaryl moiety and each of which is optionally monosubstituted to polysubstituted in the respective aryl moiety or in the heteroaryl

moiety by identical or different substituents from the group consisting of halogen, alkyl, alkoxy, alkylthio, halogenoalkyl, halogenoalkoxy, halogenoalkylthio, dioxyalkylene, halogensubstituted dioxyalkylene and optionally substituted phenyl; where

R^3 represents straight-chain or branched alkyl which has 1 to 6 carbon atoms or represents aralkyl which as 1 to 4 carbon atoms in the straight-chain or branched alkyl moiety and 6 to 10 carbon atoms in the aryl moiety and which is optionally monosubstituted to pollysubstituted in the aryl moiety by identical or different substituents as set forth as possible aryl substituents in the case of R^1,

R^4 represents hydrogen, or represents straight-chain or branched alkyl which has 1 to 6 carbon atoms, or represents straight-chain or branched alkanoyl which has 1 to 6 carbon atoms in the alkyl moiety, or represents aralkyl or aryl which has 1 to 6 carbon atoms in the straight-chain or branched alkyl moiety and 6 to 10 carbon atoms in the respective aryl moiety and each of which is optionally monosubstituted to polysubstituted in the respective aryl moiety by identical or different substituents as set forth as possible aryl substituents in the case of R^1, and

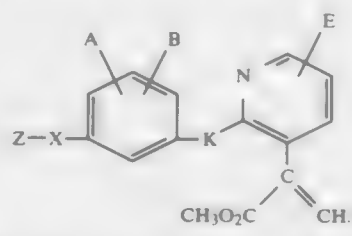
Z represents oxygen or sulphur.

12. A method of combating fungi which comprises applying to such fungi or to a fungus habitat a fungicidally effective amount of a compound according to claim 1.

5,008,276

METHYL α-(2-SUBSTITUTED)PYRID-3-YL-β-METHOXYACRYLATES, COMPOSITIONS CONTAINING THEM AND THEIR USE AS FUNGICIDES

John M. Clough, Buckinghamshire; Christopher R. A. Godfrey; Stephen P. Heaney, both of Berkshire, and Kenneth Anderton, Lancashire, all of England, assignors to Imperial Chemical Industries PLC, London, England



Continuation-in-part of Ser. No. 39,401, Apr. 17, 1987, Pat. No. 4,826,531. This application Oct. 17, 1988, Ser. No. 258,742

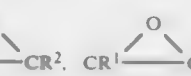
U.S. Cl. 514—335 **5 Claims**



1. A fungicidal compound of the formula (I):

(I)

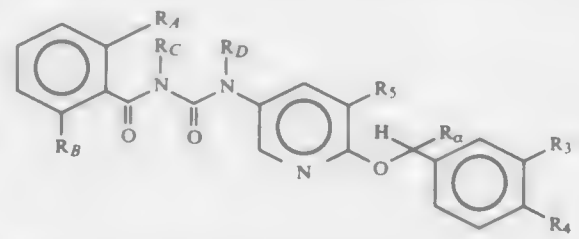
or a stereoisomer thereof, wherein A, B and E, which are the same or different, are H, halo, hydroxy, C_{1-4} alkyl, C_{1-4} alkoxy, C_{1-4} haloalkyl, C_{1-4} haloalkoxy, C_{1-4} alkylcarbonyl, C_{1-4} alkoxycarbonyl, phenoxy, nitro or cyano; K is oxygen or sulphur; X is O; $S(O)_n$, NR^4, CR^1R^2, CHR^5, CO, $CR^1(OR^2)$, $C{=}CR^1R^2$, CHR^1CHR^2, $CR^1{=}R^2$, $CHR^1CR^2{=}CH$, $C{=}C$, $OCHR^1$, CHR^1O, $OCHR^1O$, $S(O)_nCHR^1$, $S(O)_nCHR^1O$, $CHR^1S(O)_n$, CHR^1OSO_2, NR^4CHR^1, CHR^1NR^4, CO_2, O_2C, SO_2O, OSO_2, CO.CO, $COCHR^1$, $COCHR^1O$, CHR^1CO, CHOH.CHR^1, CHR^1.CHOH,

$CONR^4$, $OCONR^4$, NR^4CO, $CSNR^4$, $OCS.NR^4$, SCO.NR^4, NR^4CO_2, NR^4CS, NR^4CSO, NR^4COS, NR^4CONR^4, $S(O)_nNR^4$, $NR^4S(O)_n$, CS_2, S_2C, CO.S, SCO, N=N, N=CR^1, $CR^1{=}N$, $CHR^1CHR^2CH(OH)$, CHR^1OCO, CHR^1SCO, CHR^1NR^4CO, $CHR^1NR^4COR^4$, CHR^1CHR^2CO, O.N=CR^1, $CHR^1O.N{=}CR^2$, $COOCR^1R^2$, $CHR^1CHR^2CHR^3$, $OCHR^1CHR^2$, $(CH_2)_nO$, CHR^1OCHR^2, CHR^1CHR^2O, $OCHR^1CHR^2O$; $S(O)_nCHR^1CHR^2$, $CHR^1S(O)_nCHR^2$, $CHR^1CHR^2S(O)_n$, $CR^1{=}NMR^4$, $NR^4N{=}CR^1$, CHR^1CONR^2, $CHR^1OCO.NR^2$, $CH{=}CHCH_2O$, $COCHR^1CHR^2O$, or $(R^5)_2P^+CHR^2Q^-$; R^1, R^2 and R^3, which are the same or different, are H, C_{1-4} alkyl or phenyl; R^4 is M, C_{1-4} alkyl or COR^1, R^5 is phenyl; Q^- is a halide anion; n is 0, 1 or 2; m is 3, 4 or 5; and Z is aryl or heteroaryl, or aryl or heteroaryl substituted with one or more of halo, hydroxy, mercapto, C_{1-4} alkyl, C_{2-4} alkenyl, C_{2-4} alkynyl, C_{1-4} alkoxy, C_{2-4} alkenyloxy, C_{2-4} alkynyloxy, halo(C_{1-4})alkyl, halo(C_{1-4})alkoxy, C_{1-4} alkylthio, hydroxy(C_{1-4})alkyl, C_{1-4}alkoxy(C_{1-4})alkyl, C_{3-6} cycloalkyl, C_{3-6} cycloalkyl(C_{1-4})alkyl, aryl, heteroaryl, aryloxy, heteroaryloxy, aryl(C_{1-4})alkyl, aryl(C_{1-4})alkyl in which the alkyl moiety is substituted with hydroxy, heteroaryl(C_{1-4})alkyl, aryl(C_{2-4})alkenyl, heteroaryl(C_{2-4})alkenyl, aryl(C_{1-4})alkoxy, heteroaryl(C_{1-4})alkoxy, aryloxy(C_{1-4})alkyl, heteroaryloxy(C_{1-4})alkyl, carbacyloxy, cyano, thiocyanato, nitro, —NR′R″, —NHCOR′, —NHCONR′R″, —CONR′R″, —COOR′, $-OSO_2R'$, $-SO_2R'$, —COR′, —CR=NR″ or —N=CR′R″ in which R′ and R″ are independently hydrogen, C_{1-4} alkyl, C_{1-4} alkoxy, C_{1-4} alkylthio, C_{3-6} cycloalkyl, C_{3-6} cycloalkyl(C_{1-4})alkyl, phenyl or benzyl, or phenyl or benzyl substituted with halogen, C_{1-4} alkyl or C_{1-4} alkoxy; the aryl or heteroaryl rings of any of the foregoing substituents and the phenyl ring of R^5 being unsubstituted or substituted with one or more of halo, hydroxy, mercapto, C_{1-4} alkyl, C_{2-4} alkenyl, C_{2-4} alkynyl, C_{1-4} alkoxy, C_{2-4} alkenyloxy, C_{2-4} alkynyloxy, halo(C_{1-4})alkyl, halo(C_{1-4})alkoxy, C_{1-4} alkylthio, hydroxy(C_{1-4})alkyl, C_{1-4} alkoxy(C_{1-4})alkyl, C_{3-6} cycloalkyl, C_{3-6} cycloalkyl(C_{1-4})alkyl, alkanoyloxy, benzoyloxy, cyano, thiocyanato, nitro, —NR′R″, —NHCOR′, —NHCONR′R″, —CONR′R″, —COOR′, $-OSO_2R'$, $-SO_2R'$, —COR′, —CR′=NR″ or —N=CR′R″ in which R′ and R″ have the meanings given above.

5. A method of combating fungi which comprises applying to plants, to the seeds of plants or to the locus of the plants or seeds, a compound according to claim 1.

5,008,277

N-[(ALPHA-PERHALOALKYLBENZYLOXY)PYRIDYL]-N′-BENZOYLUREA INSECTICIDES



Ernest L. Plummer, Yardley, Pa., assignor to FMC Corporation, Philadelphia, Pa.

Division of Ser. No. 136,045, Dec. 21, 1989, Pat. No. 4,870,089, which is a continuation-in-part of Ser. No. 801,365, Nov. 25, 1985, abandoned. This application Jun. 30, 1989, Ser. No. 374,902

Int. Cl.[5] **C07D** *213/75, 405/12;* **A01N** *43/40*

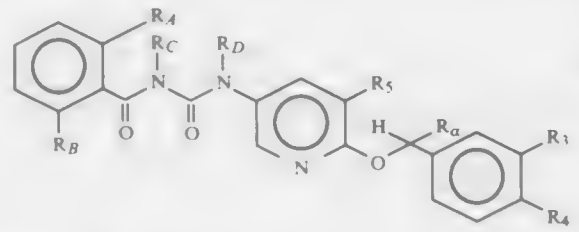
U.S. Cl. 514—337 **23 Claims**

1. An insecticidal benzoylurea compound of the formula

wherein

R_A is selected from the group consisting of -hydrogen, -halogen, -lower alkyl, -lower alkoxy, -benzyl, and -benzyloxy;

R_B is selected from -hydrogen and -halogen;



R_C and R_D together constitute a —COCO— bridge;

Rα is a lower perhaloalkyl substituent;

R_3 is selected from the group consisting of -hydrogen, -halogen and -phenylthio, and R_4 is selected from the group consisting of -hydrogen, -halogen, -lower alkyl, -lower alkoxy, -lower alkoxyalkyl, -lower haloalkoxy, -lower alkylthio, -lower alkylsulfonyl, and -diallylamino; or R_3 and R_4 together constitute a $-OCH_2O-$, $-CH_2C(CH_3)_2O-$, or $-CF_2CF_2O-$ bridge; and

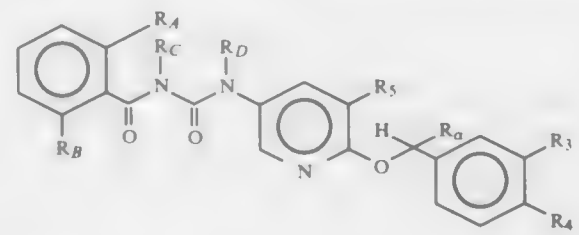
R_5 is -hydrogen or -lower alkyl.

10. A method for controlling insects which comprises applying to plants upon which insects feed and whose control is desired an insecticidally effective amount of a compound of the formula

wherein

R_A is selected from the group consisting of -hydrogen, -halogen, -lower alkyl, -lower alkoxy, -benzyl, and -benzyloxy;

R_B is selected from -hydrogen and -halogen;



R_C and R_D together constitute a -COCO- bridge;

Rα is a lower perhaloalkyl substituent;

R_3 is selected from the group consisting of -hydrogen, -halogen and -phenylthio, and R_4 is selected from the group consisting of -hydrogen, -halogen, -lower alkyl, -lower alkoxy, -lower alkoxyalkyl, -lower haloalkoxy, -lower alkylthio, -lower alkylsulfonyl, and -diallylamino; or R_3 and R_4 together constitute a $-OCH_2O-$, $-CH_2C(CH_3)_2O-$, or $-CF_2CF_2O-$ bridge; and

R_5 is -hydrogen or -lower alkyl.

13. An insecticidal benzoylurea compound of the formula

wherein

R_A is selected from the group consisting of -hydrogen, -halogen, -lower alkyl, -lower alkoxy, -benzyl, and -benzyloxy;

R_B is selected from -hydrogen and -halogen;

R_C and R_D are both -hydrogen;

Rα is a lower perhaloalkyl substituent;

R_3 and R_4 together constitute a $-OCH_2O-$, $-CH_2C(CH_3)_2O-$, or $-CF_2CF_2O-$ bridge; and

R_5 is -hydrogen or -lower alkyl.

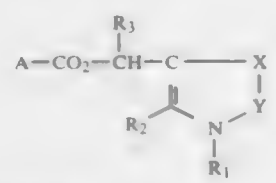
NOVEL PYRETHRINOIDS

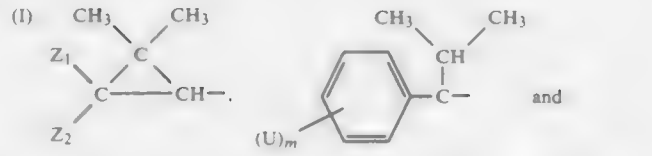
Jacques Demassey, Montevrain; Jean-Pierre Demoute, Montreuil-Sous-Bois, and Jean Tessier, Vincennes, all of France, assignors to Roussel Uclaf, Paris, France



Division of Ser. No. 221,948, Jul. 20, 1988, Pat. No. 4,925,862. This application Nov. 7, 1989, Ser. No. 432,529

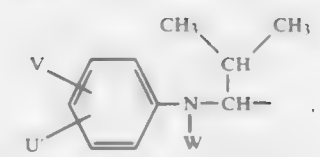
Claims priority, application France, Jul. 20, 1987, 87 10202

Int. Cl.[5] **A01N** *43/76, 53/00;* **C07D** *263/14, 263/24*



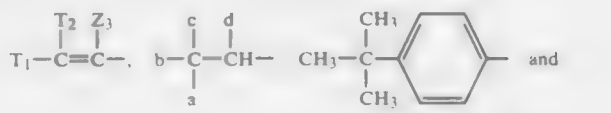
U.S. Cl. 514—376 **54 Claims**

1. All stereoisomeric forms and mixtures thereof of a compound of the formula

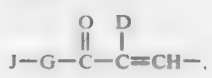


I

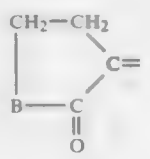
wherein X is —O—, Y is —C═O, —C═S or $—CH_2—$, R_1 is selected from the group consisting of hydrogen, halogen, saturated or unsaturated alkyl of 1 to 8 carbon atoms and saturated or unsaturated cycloalkyl of 3 to 8 carbon atoms, the latter two being unsubstituted or substituted with at least one halogen and carbocyclic aryl of 6 to 14 carbon atoms, R_2 is selected from the group consisting of hydrogen, $—CF_3$, $—NO_2$, —CN, halogen, alkoxy of 1 to 8 carbon atoms, aryl of 6 to 14 carbon atoms, an ester, saturated or unsaturated alkyl of 1 to 8 carbon atoms and saturated or unsaturated cycloalkyl of 3 to 8 carbon atoms, the latter two being unsubstituted or substituted with at least one halogen, R_3 is selected from the group consisting of hydrogen, alkyl of 1 to 3 carbon atoms, —CN and —CN═CH and A is selected from the group consisting of



(I)



and



wherein Z_1 and Z_2 are methyl or Z_1 is hydrogen and Z_2 is selected from the group consisting of

and

Z_3 is hydrogen or halogen, T_1 and T_2 are individually selected from the group consisting of hydrogen, halogen, $—CF_3$, —CN, phenyl optionally substituted with a halogen and alkyl and alkoxy of 1 to 8 carbon atoms or taken together form

or taken together with the cabon to which they are attached form a cycloalkyl of 3 to 6 carbon atoms, B is —O— or —S—, a,b,c, and d are individually halogen, D is selected from the group consisting of hydrogen, halogen and alkoxy of 1 to 8 carbon atoms, G is —O— or —S—, J is selected from the group consisting of optionally unsaturated alkyl and haloalkyl of 1 to 8 carbon atoms, optionally unsaturated cycloalky of 3 to 8 carbon atoms and carboxyclic aryl of 6 to 14 carbon atoms, all optionally substituted with at least one functional group, U is selected from the group consisting of halogen and alkyl and alkoxy of 1 to 8 carbon atoms optionally substituted with at least one halogen, m is 0,1 or 1 and if 2 the Us may be different, U' and V are individually selected from the group consisting of hydrogen, halogen and $—CF_3$ and W is hydrogen or $—CH_3$.

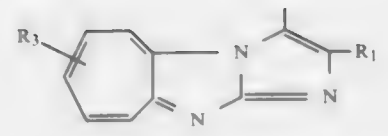
CYCLIC GUANIDINE DERIVATIVES, ANTI-ULCERATIVES AND METHODS OF MANUFACTURING THE SAME

Tsuyoshi Tomiyama; Akira Tomiyama; Tadashi Shirai, all of Sakaki; Shuuichi Wakabayashi, Koushoku; Tomoyuki Kawai, Nagano; Naoto Ueyama, Ueda, and Motoharu Sonegawa, Nagano, all of Japan, assignors to Kotobuki Seiyaku Co. Ltd., Nagano, Japan

Filed Dec. 13, 1989, Ser. No. 450,264

Claims priority, application Japan, Dec. 28, 1988, 63-332550

Int. Cl.[5] **C07D** *235/30, 235/04;* **A61K** *31/415*



U.S. Cl. 514—393 **9 Claims**

1. A compound of the formula:

wherein:

A is

wherein:

R_1 represents a lower alkyl or phenyl group, said phenyl group being optionally substituted by a lower alkyl, alkoxy or halogeno group;

R_3 is a hydrogen atom or a lower alkyl group, and

R represents a lower alkyl, alkenyl, alkynyl, alkanoyl, alkenoyl, dialkylaminoalkyl, cyanoalkyl, alkoxycarbonylalkyl, carboxy alkenyl, alkoxycarbonyl, alkoxyalkylcarbonyl, dialkylamino carbonyl, dialkylaminothiocarbonyl, phenoxyallkylcarbonyl, piperidinoalkyl, pyridine carbonyl, substituted or unsubstituted benzoyl, or substituted or unsubstituted benzyl group and pharmaceutically acceptable acid addition salts thereof.

3. An anti-gastric ulcerative agent comprising a pharmaceutically acceptable carrier and as an active ingredient a compound defined in claim 1.

5,008,283

USE OF TENIDAP TO INHIBIT ACTIVATION OF COLLAGENASE AND TO INHIBIT THE ACTIVITY OF MYELOPEROXIDASE

Warren D. Blackburn, Jr., and Leland D. Loose, both of Groton, Conn., assignors to Pfizer Inc., New York, N.Y.

Filed Mar. 19, 1990, Ser. No. 495,868

Int. Cl.[5] **A01N** *43/38*

U.S. Cl. 514—414 **21 Claims**

1. A method of inhibiting activation of collagenase in a mammal in need thereof which comprises administering to said mammal a collagenase activation inhibiting amount of tenidap or a pharmaceutically-acceptable base salt thereof.

5,008,284

METHOD OF REDUCING PRE- AND POST-ISCHEMIC MYOCARDIAL ARRHYTHMIAS AND FIBRILLATION

Gary J. Grover, Stockton, N.J., and James L. Bergey, Lansdale, Pa., assignors to E. R. Squibb & Sons, Inc., Princeton, N.J.

Division of Ser. No. 311,321, Feb. 15, 1989, Pat. No. 4,931,464. This application Dec. 18, 1989, Ser. No. 452,037

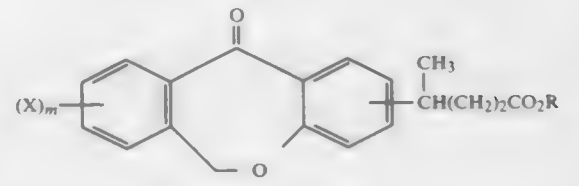
Int. Cl.[5] **A61K** *31/675*

U.S. Cl. 514—423 **4 Claims**

1. A method of reducing pre- and post-ischemic arrhythmias and fibrillation as well as reducing arrhythmias associated with congestive heart failure in a mammalian species which comprises administering to a mammalian species in need of such treatment an effective amount of fosinopril or a pharmaceutically acceptable salt of fosinopril alone or in combination with a thrombolytic agent or antifibillatory agent or with a non-pharmaceutical reperfusion technique.

5,008,285

(6,11-DIHYDRO-11-OXODIBENZ[b,e]OXEPIN-YL)PENTANOIC ACIDS AND DERIVATIVES THEREOF



Lawrence L. Martin, Lebanon, and Linda L. Setescak, Somerville, both of N.J., assignors to Hoechst-Roussel Pharmaceuticals, Inc., Somerville, N.J.

Continuation-in-part of Ser. No. 252,328, Oct. 3, 1988, abandoned, which is a continuation of Ser. No. 945,626, Dec. 23, 1986, abandoned, which is a continuation of Ser. No. 604,672, Apr. 27, 1984, abandoned. This application Nov. 1, 1989, Ser. No. 430,045

Int. Cl.[5] **A61K** *31/335;* **C07D** *313/12*

U.S. Cl. 514—450 **2 Claims**

1. A method of suppressing arthritic inflammation with low gastric irritability in mammals which comprises orally administering to a mammal in need of arthritic type inflammation suppression with low gastric irritability an effective amount of a compound of the formula

wherein R is hydrogen or loweralkyl of 1 to 5 carbon atoms; X is hydrogen, loweralkyl of 1 to 5 carbon atoms, loweralkoxy of 1 to 5 carbon atoms, halogen or trifluoromethyl, and m is 1 or 2, the optical antipode thereof; or a pharmaceutically acceptable salt thereof.

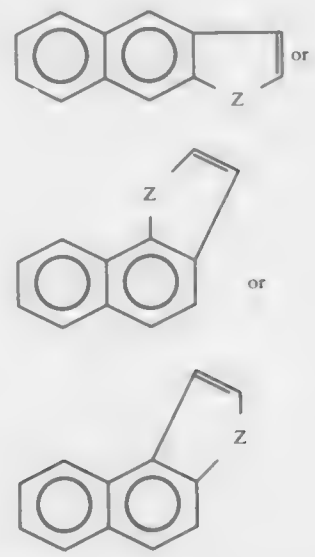
CERTAIN SUBSTITUTED NAPHTHOFURANS WITH ANTI-TUMOR PROPERTIES

Kenneth W. Bair, Chapel Hill, N.C., assignor to Burroughs Wellcome Co., Research Triangle Park, N.C.

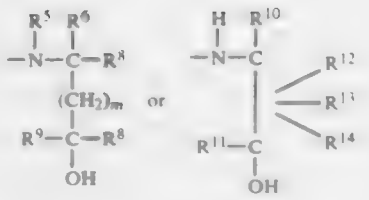
Division of Ser. No. 132,724, Dec. 11, 1987, Pat. No. 4,866,070, Continuation of Ser. No. 801,085, Nov. 22, 1985, abandoned, Continuation-in-part of Ser. No. 673,355, Nov. 20, 1984, abandoned. This application Aug. 28, 1989, Ser. No. 401,612



Int. Cl.[5] **A61K** *31/34;* **C07D** *307/92*

U.S. Cl. 514—468 **11 Claims**

1. A compound of the formula (I):



$$ArCH_2R^1 \qquad (I)$$

or a monomethyl or monoethyl ether thereof, an ester thereof derived from a C_{1-6} alkanoic acid or a pharmaceutically acceptable acid addition salt thereof wherein Ar is

wherein Z is O

wherein R^1 contains not more than eight carbon atoms and is a group:

wherein m is 0 or 1;
R^5 is hydrogen;
R^6 and R^7 are the same or different and each is hydrogen or C_{1-5} alkyl, or C_{1-5} alkyl substituted by hydroxy;
R^8 and R^9 are the same or different and each is hydrogen or C_{1-3} alkyl;
—C—C— is a five- or six-membered saturated carbocyclic ring;
R^{10} is hydrogen, methyl or hydroxymethyl;
R^{11}, R^{12} and R^{13} are the same or different and each is hydrogen or methyl; and R^{14} is hydrogen, methyl, hydroxy or hydroxymethyl.

PHARMACEUTICAL COMPOSITIONS HAVING ANTINEOPLASTIC ACTIVITY

Sergio Monti, Lugano, Switzerland, assignor to Onco-Pharm Development AG, Vaduz/Lichtenstein, Fed. Rep. of Germany

Filed Mar. 3, 1989, Ser. No. 318,905
Claims priority, application Switzerland, Mar. 7, 1988, 842/88
Int. Cl.[5] A61K *31/28, 31/095*
U.S. Cl. 514—492 **6 Claims**

1. A method for treating a neoplasm sensitive to treatment with a selenium compound in a human consisting of administering to said humans in need thereof an effective amount of a diselenide of formula I

R—Se—Se—R′ (I)

wherein R and R′ which can be the same or different represent a linear or branched chain C_1–C_{20}-alkyl or C_2–C_{20}-alkenyl group and a pharmaceutically acceptable vegetal oil carrier.

5,008,288

CARNITINE DIRECTED PHARMACEUTICAL AGENTS

Alfred Stracher, 47 The Oaks, Roslyn Estates, N.Y. 11576, and Leo Kesner, 1726 E. 32nd St., Brooklyn, N.Y. 11234

Division of Ser. No. 3,888, Jan. 15, 1987, Pat. No. 4,866,040, which is a continuation-in-part of Ser. No. 816,546, Jan. 6, 1986, Pat. No. 4,742,081. This application May 4, 1989, Ser. No. 347,361
The portion of the term of this patent subsequent to May 3, 2005, has been disclaimed.
Int. Cl.[5] A61K *31/24, 31/44, 37/02;* **C07K** *17/02*
U.S. Cl. 514—535 **11 Claims**

1. A compound comprising a carrier selected from the group consisting of carnitine and cysteic acid covalently bonded through an alcohol, carboxyl or amine group to a pharmaceutically active compound selected from the group consisting of pepstatin, procainamide, quinidine, propranolol and leucyl argininal.

6. A compound according to claim 1, wherein the pharmaceutically active compound is procainamide.

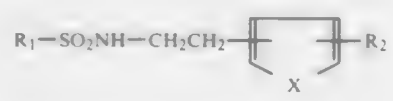
5,008,289

COMPOSITION FOR TREATING NASAL DISORDERS AND HEADACHES

Joel E. Bernstein, Deerfield, Ill., assignor to GalenPharma, Inc., Deerfield, Ill.

Filed Dec. 2, 1988, Ser. No. 279,586
Int. Cl.[5] A61K *31/24, 31/16*
U.S. Cl. 514—535 **7 Claims**

1. A composition for treating the symptoms of nasal disorders and headaches, said composition comprising:
a solution or suspension formulated from a pharmaceutically acceptable carrier for instillation into the nose, said solution or suspension containing capsaicin in concentrations from about 0.001% to about 1% weight
and including a pharmaceutically acceptable local anesthetic selected from the group consisting of lidocaine or benzocaine in concentrations from about 0.5% to about 20% by weight.



5,008,290

SULPHONAMIDOETHYL COMPOUNDS AND PHARMACEUTICAL COMPOSITIONS COMPRISING THESE COMPOUNDS

Armin Heckel; Josef Nickl; Erich Muller; Berthold Narr; Johannes Weisenberger; Wolfgang Eisert, and Thomas Muller, all of Biberach, Fed. Rep. of Germany, assignors to Dr. Karl Thomae GmbH, Biberach an der Riss, Fed. Rep. of Germany

Division of Ser. No. 92,742, Sep. 3, 1987, Pat. No. 4,870,076. This application Mar. 3, 1989, Ser. No. 319,397
Claims priority, application Fed. Rep. of Germany, Sep. 3, 1986, 3629929
Int. Cl.[5] A61K *31/34;* **C07D** *307/54*
U.S. Cl. 514—544 **6 Claims**

1. Sulphonamidoethyl compounds of formula

(I)

wherein
R_1 is phenyl optionally mono-, di- or trisubstituted by halo, methyl or methoxy, where the substituents may be the same or different, or benzyl, nitrophenyl, acetamidophenyl or thienyl,
R_2 is hydroxycarbonyl or alkoxycarbonyl with a total of 2 to 4 carbon atoms bonded via straight chained or branched C_1–C_5 alkylene or via C_2–C_5 alkenylene, whilst any methylene group in the above-mentioned alkylene or alkenylene groups, which must be liked to the heterocyclic group, may be replaced by hydroxymethylene or carbonyl, and
X is oxygen,
the enantiomers and salts thereof with inorganic or organic bases, if R_2 comprises hydroxycarbonyl.

5. A method for treatment of thromboembolic disorders in a warm-blooded animal which comprises administering to said animal a therapeutically acceptable amount of a compound as recited in claim 1.

5,008,291

METHOD AND COMPOSITION FOR ACHIEVING CHEMOTHERAPEUTIC ACTIVITY

John P. Minton; Thomas E. Webb, and Hussein M. Abou-Issa, all of Columbus, Ohio, assignors to Ohio State University Research Foundation, Columbus, Ohio

Continuation-in-part of Ser. No. 89,568, Aug. 26, 1987, abandoned. This application Nov. 13, 1989, Ser. No. 436,046
The portion of the term of this patent subsequent to Apr. 23, 2008, has been disclaimed.
Int. Cl.[5] A61K *31/185*
U.S. Cl. 514—578 **7 Claims**

1. A dietary supplement for use as a chemotherapeutic agent in treating mammary cancer in humans or animals via steady and prolonged inhibition of beta-glucuronidase and via elevation of the level of cellular cAMP (cyclic AMP) and of histone kinases, the supplement consisting essentially of approximately 0.01 to 0.02 parts by weight of calcium glucarate for inhibiting beta-glucuronidase and approximately 0.0003 to 0.0006 parts by weight of N-(4-hydroxyphenyl) retinamide for elevating levels of cellular cAMP and of histone kinases.

4. A method of treating mammary cancer in humans or animals comprising administering an amount, which is safe and sufficient of the dietary supplement of claim 1 including the glucarolactone-based compound and the retinoid-based compound, or a pharmaceutically acceptable salt thereof to a patient having at least one mammary tumor.

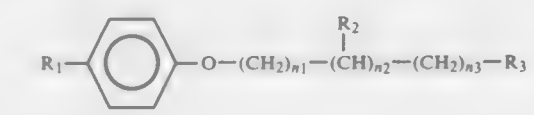
1. A method of combatting insects which comprises applying onto plants to be protected or onto the insects or the environment thereof an effective amount of a pesticidal composition which comprises a compound selected from the group consisting of N-{2-(4-fluorophenyl)-1-methyl}-ethyl-N-methyl-N-propynyl amine, its optical isomers, and its acid addition salts, as an active ingredient.



5,008,293

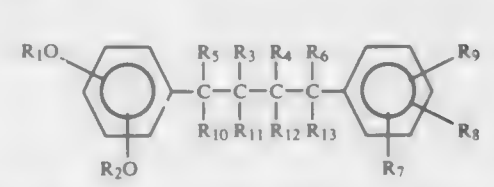
PROCESS FOR THE TREATMENT OF THE SKIN TO ALLEVIATE SKIN DISEASES ARISING FROM CONTACT SENSITIZATION OR IRRITATION UTILIZING P-SUBSTITUTED PHENOXY ALKANOLS

Frank M. Berger, 515 E. 72nd St., Ste. 30E, New York, N.Y. 10021

Filed Jul. 22, 1988, Ser. No. 223,146
Int. Cl.[5] A61K *31/075*
U.S. Cl. 514—718 **8 Claims**

1. A process for alleviating contact sensitization or irritation which arises when an agent giving rise to contact hypersensitivity is administered topically to the skin of the animal, which comprises administering with the said agent an amount therapeutically effective to inhibit such contact hypersensitivity or specific irritation of a substituted phenoxy alkanol having the formula:

in which:
R_1 substituted in ortho, meta or para position or combination of these is selected from hydrogen, halogen, alkyl having from one to six carbon atoms, preferably p-chlorine or p-tertiary-butyl; and bivalent cycloalkylene condensed with the phenyl group at adjacent ring carbons thereof, such as in indane;
R_2 and R_3 are hydrogen or hydroxyl and at least one of R_2 and R_3 is hydroxyl; and
n_1, n_2 and n_3 represent the number of CH_2, CHR_2 and CH_2 groups, respectively, and are numbers within the range from 1 to 10.



5,008,294

METHODS OF TREATING TUMORS WITH COMPOSITIONS OF CATECHOLIC BUTANES

Edward S. Neiss, Denver, and Larry M. Allen, Golden, both of Colo., assignors to Chemex Pharmaceuticals, Inc., Denver, Colo.

Continuation-in-part of Ser. No. 52,120, May 4, 1987, abandoned, which is a continuation of Ser. No. 699,923, Feb. 11, 1985, abandoned, which is a continuation-in-part of Ser. No. 365,781, Apr. 5, 1982, abandoned, which is a continuation-in-part of Ser. No. 49,886, Jun. 19, 1979, abandoned. This application Jun. 3, 1987, Ser. No. 57,481
Int. Cl.[5] A61K *31/05*
U.S. Cl. 514—731 **34 Claims**

1. A method for inhibiting the growth of a tumor which comprises topically administering to the situs of the tumor of a mammal in need of said treatment an effective amount of a composition comprising at least 1 catecholic butane of the formula:

wherein R_1 and R_2 are independently H, lower alkyl, lower acyl, or alkylene;
R_3, and R_4, R_5, R_6, R_{10}, R_{11}, R_{12} and R_{13} are independently H or lower alkyl;
R_7, R_8 and R_9 are independently H, hydroxy, lower alkoxy, lower acyloxy, or any two adjacent groups together may be alkylene dioxy.

5,008,295

METHOD INHIBITING THE GROWTH OF CANCER CELLS

Hoyoku Nishino, Hirakata; Ryozo Iwasaki, Tokyo; Akio Okabe, Tokyo, and Yuki Yogo, Tokyo, all of Japan, assignors to Lion Corporation, Tokyo, Japan

Filed Jul. 28, 1988, Ser. No. 225,020
Claims priority, application Japan, Jul. 30, 1987, 62-191301
Int. Cl.[5] A61K *31/015*
U.S. Cl. 514—766 **9 Claims**

1. A method of inhibiting the growth of cancer cells which are susceptible to treatment with α-carotene, said method consisting essentially of:
administerting an effective cancer cell growth inhibiting amount of α-carotene to a mammal having said cancer cells.

5,008,296

BREATHABLE MICROPOROUS FILM

Mitchell K. Antoon, Jr., and David J. Hill, both of Wilmington, Del., assignors to Hercules Incorporated, Wilmington, Del.

Division of Ser. No. 224,632, Jul. 27, 1988, Pat. No. 4,293,650.
This application Mar. 29, 1990, Ser. No. 500,975
Int. Cl.[5] C08J 9/32, 9/36; B29C 55/12
U.S. Cl. 521—91 7 Claims

1. A breathable film composition comprising:
20 to 37% by weight of a polymer or copolymer of an α-olefin having 2-8 carbons or mixtures thereof,
60 to 75% by weight of calcium carbonate or glass beads having particle sizes of 10 to 25 micrometers,
0.1 to 3.0% by weight of calcium stearate, and
optionally, 0 to 2% by weight of a UV light, oxygen, and heat stabilizer,
wherein the moisture level in the blended composition is maintained below 700 ppm prior to forming a casting and then, based on the polymer or copolymer used, stretching the casting to produce oriented film in 2 directions from about 1.5 to 7 times in each direction in a temperature range of from about 20° to about 160° C. and each oriented film having a Gurley porosity (method B, ASTM D-726) of 0.1 second to 85 seconds so that the film has good air and water vapor transmission rates but is substantially impenetrable by liquid water.

5,008,297

METHOD FOR PRODUCING PHENOL RESIN FOAMS AND METHOD OF MAKING FOAMED LAMINATES

Akihiro Maruyama; Munehiko Kato; Takumi Ishiwaka; Katsuto Seki, and Takashi Ohashi, all of Yokohama, Japan, assignors to Bridgestone Corporation, Tokyo, Japan

Filed May 25, 1989, Ser. No. 356,945
Claims priority, application Japan, May 27, 1988, 63-129987; May 27, 1988, 63-129988
Int. Cl.[5] C08G 18/14
U.S. Cl. 521—136 7 Claims

1. A method for producing a phenol resin foam which comprises blending a resol phenol resin, a blowing agent and a catalyst; and foaming the resultant blend, said resol phenol resin comprising a mixture of a low molecular weight resol phenol resin with a number average molecular weight of less than 200 and a high molecular weight resol phenol resin with a number average molecular weight of greater than 200 are mixed at a weight ratio of from 5/95 to 80/20.

5,008,298

EXPANDABLE THERMOPLASTIC RESIN BEADS

Richard B. Allen, Pittsfield, Mass.; William E. Gibbs, Chesapeake, Va., and Lynn M. Hans, Pittsfield, Mass., assignors to General Electric Co., N.Y.

Division of Ser. No. 502,095, Mar. 30, 1990, Pat. No. 4,968,466, which is a division of Ser. No. 384,774, Jul. 24, 1989, Pat. No. 4,920,153, which is a division of Ser. No. 232,900, Aug. 16, 1988, Pat. No. 4,874,796, which is a division of Ser. No. 62,004, Jun. 12, 1987, Pat. No. 4,782,098. This application Aug. 29, 1990, Ser. No. 574,703
Int. Cl.[5] C08J 9/22
U.S. Cl. 521—139 7 Claims

1. A thermoformed structure of an interpolymer of from 1 to 50 parts of a polyphenylene ether resin and from 99 to 50 parts of a polymerized vinyl aromatic monomer per 100 parts of resin and monomer foam prepared by the method which comprises:
(a) subjecting a sheet of said foam having a density of less than 20 lbs./ft.^{3} to a first temperature sufficient to permit a shaped formation to be effected therein;
(b) effecting a shape in said sheet while at said temperature; and
(c) reducing the temperature of said sheet to a second temperature permitting permanent retention of said shape in said sheet at or below said second temperature.

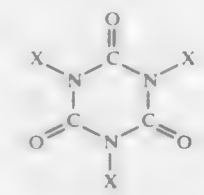
5,008,299

RIGID POLYURETHANE FOAMS WITH LOW THERMAL CONDUCTIVITIES

Benjamin W. Tucker, Bethany, and Debkumar Bhattacharjee, Meriden, both of Conn., assignors to The Dow Chemical Company, Midland, Mich.

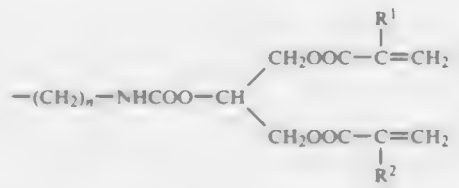
Continuation of Ser. No. 282,369, Dec. 9, 1988, abandoned. This application Feb. 20, 1990, Ser. No. 482,380
Int. Cl.[5] C08G 18/42, 18/48
U.S. Cl. 521—159 18 Claims

1. In a rigid cellular polyurethane prepared by bringing together under foam forming conditions an aromatic polyisocyanate and a polyhydric combination comprising (a) a polyester polyol derived from crude reaction residues or from scrap polyester resins and (b) a conventional polyol, the improvement which comprises employing as said conventional polyol (b) from about 5 to about 30 percent by weight based on the combined weight of (a) and (b) of a cross-linking polyether polyol to result in an initial insulation K factor of consistently about 0.093 to about 0.100 btu-in/hr. ft^2°F. in said polyurethane.



5,008,300

VISIBLE LIGHT RAY-CURABLE MONOMERIC COMPOSITION FOR FASTENING LOOSE TEETH



Takayuki Makino, Otake; Nobuhiro Mukai, Hiroshima, and Hitoshi Ige, Otake, all of Japan, assignors to Mitsubishi Rayon Company Ltd., Tokyo, Japan

Filed Sep. 11, 1989, Ser. No. 405,891
Claims priority, application Japan, Sep. 16, 1988, 63-230062
Int. Cl.[5] A61K 6/00; C08F 26/06, 226/06
U.S. Cl. 522—8 10 Claims

1. A visible light ray-curable monomeric dental adhesion composition consisting essentially of:
(a) a filler component consisting of at least one type of fine, solid particles having an average size of from 0.01 to 100 μm and in an amount of from 40% to 85% base on the total weight of the monomeric composition;
(b) a polyfunctional monomer component consisting of at least one type of radical polymerizable, polyfunctional monomer selected from the group consisting of 2,2-bis[4-(methacryloxyethoxy)phenyl]propane and a hexafunctional urethane acrylate compound of the formula.

wherein X is a group of the formula:

n is an integer of 1 to 10, and R^1 and R^2 are each selected from the group consisting of a hydrogen atom and a methyl radical;
(c) a monofunctional monomer component comprising at least one type of radical polymerizable, monofunctional monomer selected from the group consisting of 2-hydroxyethyl methacrylate, 2-methacryloyloxyethyl phosphate, benzyl methacrylate, and 2-ethylhexyl methacrylate;
the monofunctional monomer component (c) being present in an amount of from 1% to 80% based on the total weight of the polyfunctional monomer component (b) and the monofunctional monomer component (c), and
the polyfunctional monomer component (b) and the monofunctional monomer component (c) being present in a total amount of from 15% to 80% based on the total weight of the monomeric composition; and
(d) a photopolymerization initiator; said monomeric composition having a viscosity of 1,000 to 500,000 cps at a temperature of 25° C.

5,008,301

ULTRAVIOLET CURING CONFORMAL COATING WITH DUAL SHADOW CURE

William E. Dennis, and Bernard VanWert, both of Midland, Mich., assignors to Dow Corning Corporation, Midland, Mich.

Filed Feb. 21, 1989, Ser. No. 313,407
Int. Cl.[5] G08G 77/06; C08G 77/20
U.S. Cl. 522—13 32 Claims

1. In an ultraviolet radiation curable composition comprising a mixture of (A) an acrylamide functional polydiorganosiloxane present in an amount of at least 10 weight percent and is an acrylamide polyorganosiloxane having at least two organic groups which have acrylamide group functionality bonded to silicon atoms through Si—C bonds and on the average at least 20 but less than 1500 siloxane units per molecule, the organic groups bonded to the silicon atoms other than those having the acrylamide group functional are selected from the group consisting of methyl and phenyl; (B) a methacryloxyalkyl functional and alkoxy functional polydiorganosiloxane present in an amount of at least 20 weight percent and is a polydiorganosiloxane having endgroups where there are two alkoxy groups per endgroup bonded to silicone through an Si—O bond and one methacrylate group bonded to silicon atoms through Si—C bonds and having on the average less than 350 diorganosiloxane units per molecule, said diorganosiloxane units being selected from dimethylsiloxane units, diphenylsiloxane units, and methylphenylsiloxane units wherein at least 50 percent of the organic groups of the diorganosiloxane are methyl; (C) a photoinitiator, and (D) an organic titanate, the improvement comprising increasing the storage stability by the addition of (E) 1,1-bis-tertiary-butylperoxy cyclohexane in a sufficient quantity to also provide cure activated by heat in areas shadowed from ultraviolet radiation.

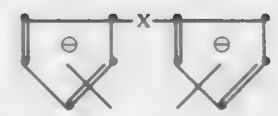
TITANOCENES, THE USE THEREOF, AND N-SUBSTITUTED PYRROLES

Rinaldo Hüsler, Marly, Switzerland; Bernd Klingert, Inzlingen, Fed. Rep. of Germany; Manfred Rembold, Aesch, and Eginhard Steiner, Füllinsdorf, both of Switzerland, assignors to Ciga-Geigy Corporation, Ardsley, N.Y.

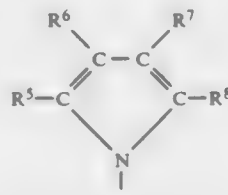


Filed Nov. 21, 1988, Ser. No. 273,522
Claims priority, application Switzerland, Dec. 1, 1987, 4683/87
Int. Cl.[5] B01J 31/00; C08F 2/50, 4/76; C07D 207/00
U.S. Cl. 522—14 21 Claims

1. A titanocene of the formula 1

(I)

in which both R^1 radicals, independently of one another, are cyclopentadienyl⊖, indenyl⊖ or 4,5,6,7-tetrahydroindenyl⊖, each of which is unsubstituted or mono- or polysubstituted by C_1–C_{18}alkyl or -alkoxy, C_2–C_{18}alkenyl, C_5–C_8cycloalkyl, C_6–C_{16}aryl, C_7–C_{16}aralkyl, SiR_3^4, GeR_3^4, cyano or halogen, or both R^1 together are a radical of the formula II



(II)

unsubstituted or substituted as above, in which X is —CH_2—n where n=1, 2 or 3, unsubstituted or phenyl-substituted alkylidene having 2 to 12 carbon atoms, cycloalklidene having 5 to 7 ring carbon atoms, SiR_2^4, SiR_2^4—O—SiR_2^4, GeR_2^4 or SnR_2^4, and R^4 is C_1–C_{12}alkyl, C_5–C_{12}cycloalkyl, C_6–C_{16}aryl or C_7–C_{16}aralkyl, R^2 is a 6-membered carbocyclic or 5- or 6-membered heterocyclic aromatic ring which is substituted by fluorine atoms in at least one of the two ortho-positions to the titanium-carbon bond, and in which the aromatic ring may contain further substituents, R^3, independently, is as defined for R^2 or R^2 and R^3 together are a radical of the formula III

—Q—Y—Q— (III)

in which Q is a carbocyclic aromatic ring where the two bonds are each in the ortho-position to the Y group and the second ortho-position to the titanium-carbon bond is in each case substituted by a fluorine atom and where Q may contain further substituents, and Y is CH_2, alkylidene having 2 to 12 carbon atoms, cycloalkylidene having 5 to 7 ring carbon atoms, NR^4, O, S, SO, SO_2, CO, SiR_2^4, GeR_2^4 or SnR_2^4, and R^4 is as defined above, wherein, in the titanocenes, R^2 and R^3 are substituted by a radical of the formula IV

(IV)

in which R^5, R^6, R^7 and R^8, independently of one another, are a hydrogen atom, linear or branched C_1–C_{18}alkyl, C_2–C_5alkenyl, C_7–C_9aralkyl or -alkaryl, C_8–C_{10}alkaralkyl, C_6–C_{10}aryl, 2-furyl, C_5–C_8cycloalkyl, C_5–C_8cycloalkenyl, C_2–C_{12}alkanoyl or C_2–C_{12}alkoxycarbonyl each of which is unsubstituted or substituted by C_2–C_8dialkylamino or -aminomethyl, bis-[2-(C_1–C_4alkoxy)ethyl]-amino or -aminomethyl, morpholino, morpholinylmethyl, piperidino, piperidinylmethyl, N-methylpiperazino, N-methylpiperazinylmethyl, pyrrolidino, pyrrolidinylmethyl, quaternary C_3–C_{10}trialkylammonium or -ammoniummethyl, C_1–C_{12}alkoxy, —$OCH_2CH_2)_1$0-C_1–C_{16}alkyl in which 1 is a number from 1 to 20, 1,3-dioxolan-2-yl, 4-methyl-1,3-dioxolan-2-yl, —$OCH_2CH_2$0—, C_1–C_{12}alkoxycarbonyl, C_2–C_{12}alkanoyloxy, C_2–C_{12}alkanoyl, C_1–C_{12}alkylthio, halogen, cyano or SiR_3^4 in which R^4 is as defined above; or are —CHO, —SiR_3^4 or —GeR_3^4 in which R^4 is as defined above; or R^5 and R^6 and/or R^7 and R^8 or R^6 and R^7 in each case together are —$(CH_2)_3$—, —$(CH_2)_4$—, —CH=CH—CH=CH—, —CH=CH—C(R^{11})=CR—, —CH_2OCH_2— or —$CH_2N(C_1$–C_4alkyl)CH_2— in which R^{11} is hydroxyl, C_1–C_4alkoxy or C_2–C_4alkanoyloxy.

17. A method of photopolymerizing a non-volatile, monomeric, oligomeric or polymeric compound containing at least one polymerizable, ethylenically unsaturated double bond, which comprises
adding an effective photoinitiating amount of at least one titanocene of formula I according to claim 1 to said compound, and
irradiating the composition obtained.

18. A method according to claim 17 wherein at least one additional photoinitiator is also added.

19. A method according to claim 18 wherein the additional photoinitiator is selected from the group consisting of a ben-

zoin alkyl ether, a benzophenone, a benzil ketal, a 4-aroyl-1,3-dioxolane, a dialkoxyacetophenone, an α-hydroxyacetophenone, an α-aminoacetophenone and an α-hydroxycycloalkyl phenyl ketone.

5,008,303

MOLDING COMPOSITION FOR MAKING CASTING PATTERNS

Oswald Gasser, Seefeld; Rainer Guggenberger, Herrsching, and Klaus Ellrich, Wörthsee, all of Fed. Rep. of Germany, assignors to ESPE Stiftung & Co. Produktions- und Vertriebs KG, Seefeld, Fed. Rep. of Germany

Filed Jan. 26, 1990, Ser. No. 471,087

Claims priority, application Fed. Rep. of Germany, Jan. 27, 1989, 3902417

Int. Cl.[5] **B22C** *7/00, 9/02;* **C08F** *2/00*

U.S. Cl. 522—64 **7 Claims**

1. A molding composition, for making casting patterns, comprising:

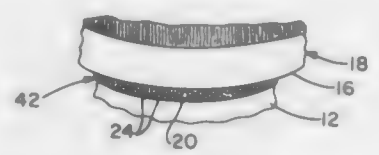
(a) 10–99.89% by weight of at least one of the group consisting of di and polyfunctional acrylic acid and methacrylic acid ester, all of which burn without leaving a residue;

(b) 0.01–5% by weight of an initiator system that can initiate the radical polymerization;

(c) 0–80% by weight of at least one of the group consisting of organic fillers, pigments, and other auxiliary substances, all of which burn without leaving a residue, whereby the quantity particulars of the respective components of (a), (b), and (c) are each related to the total amount of (a)+(b)+(c); and

(d) 0.1–30% by weight, with respect to component (a), of a chemically inert organic compound that burns without leaving a residue and has a boiling point and/or sublimation point in the range of >150° C.

5,008,304



ORTHODONTIC APPLIANCE ADHESIVE

Bradley A. Kmmtt, 2616 Mayfield Rd., No. 2, Cleveland Heights, Ohio 44106

Filed May 17, 1989, Ser. No. 353,620

Int. Cl.[5] **C08J** *7/00*

U.S. Cl. 523—118 **12 Claims**

1. An adhesive composite, comprising:

an adhesive material; and

a plurality of release particles suspended within said adhesive material, said particles being coated with a hydrophobic coating for repelling said adhesive material to remain substantially unattached thereto.

5,008,305

TREATED SILICA FOR REINFORCING SILICONE ELASTOMER

Linda D. Keenan; Theodore L. Knapp; Carl M. Monroe, and Olgerts Skostins, all of Midland, Mich., assignors to Dow Corning Corporation, Midland, Mich.

Filed Feb. 6, 1989, Ser. No. 306,193

The portion of the term of this patent subsequent to Jan. 15, 2008, has been disclaimed.

Int. Cl.[5] **C08K** *9/06*

U.S. Cl. 523—212 **11 Claims**

1. An improved reinforcing silica filler having a surface area of greater than 50 m^2/g, said surface having been treated by mixing 100 parts by weight of silica, having from 0.5 to 6 parts by weight of adsorbed moisture, with a treating mixture comprising from 1 to 30 parts by weight of volatile treating agent of the formula $R_xSi(OR')_{4-x}$, wherein R is a alkyl, alkenyl, or aryl radical having from 1 to 6 carbon atoms which may be substituted with halogen atoms, R' is an alkyl radical having from 1 to 3 carbons atoms, x is 1 or 2, and R and R' are chosen so that the vapor pressure of the alkoxysilane equals or exceeds 0.0001 atmosphere at treatment temperature, for a period of time sufficient to allow the desired amount of treating agent to be adsorbed onto the surface of the particulate filler, wherein the volatile treating agent comprises a combination of from 0.2 to 10 parts by weight of volatile treating agent of the formula $Vi_xSi(OR')_{4-x}$ and from 0.2 to 15 parts by weight of volatile treating agent of the formula $Ph_xSi(OR')_{4-x}$, where Vi is vinyl radical and Ph is phenyl radical.

5,008,306

REINFORCED THERMOPLASTICS SHEET AND ITS MANUFACTURING PROCESS

Michel Goguelin, Charavines, France, assignor to Exxon Chemical Patents Inc., Florham Park, N.J.

Filed Jul. 22, 1988, Ser. No. 223,022

Claims priority, application France, Jul. 23, 1987, 87 10490

Int. Cl.[5] **C08K** *7/00*

U.S. Cl. 523—220 **26 Claims**

1. A process for preparing by the wet method a reinforced thermoplastics semi-finished product in sheet form, which process comprises the following steps:

(a) mixing

(i) a first aqueous dispersion of an ionic dispersing agent having an ionic charge with reinforcing fibers, and

(ii) a second aqueous dispersion containing at least one thermoplastics polymer powder and at least one ionic polymer additive of opposite charge to that of the ionic dispersing agent of the first dispersion, to form a mixture,

(b) incorporating into the mixture a flocculating agent in ionic polymer form, of high molecular weight and of charge opposite to that of said mixture, and

(c) draining the resulting suspension and drying the resulting semi-finished product.

5,008,307

LIQUID SILICONE RUBBER COMPOSITION CAPABLE OF YIELDING A THERMAL CONDUCTIVE VULCANIZED PRODUCT

Hiroshi Inomata, Takasaki, Japan, assignor to Shin-Etsu Chemical Co., Ltd., Japan

Continuation of Ser. No. 178,167, Apr. 6, 1988, abandoned. This application Dec. 11, 1989, Ser. No. 449,330

Claims priority, application Japan, Apr. 6, 1987, 62-83990

Int. Cl.[5] **C08K** *7/08*

U.S. Cl. 523—220 **13 Claims**

1. A liquid silicone rubber composition capable of yielding a vulcanized product having good thermal conductivity, said composition comprising:

100 parts by weight of an organopolysiloxane having the following average unit formula

$$R_xSiO_{(4-x)/2}$$

in which each R represents an unsubstituted or substituted monovalent hydrocarbon group, and X is a value of 1.8 to 3.0, the organopolysiloxane containing at least 0.1 mole % of an aliphatic unsaturated group in one molecule and having a viscosity of from 50 to 10,000 centistokes at 25° C.;

from 0.1 to 50 parts by weight of an organohydrogenpolysiloxane having at least two ≡SiH bonds in one molecule;

from 270 to 900 parts by weight of an alumina filler made of (a) from 10 to 95 wt % of an alumina powder having a substantially spherical shape and an average size of from 10 to 50 micrometers and, correspondingly, (b) from 90 to 5 wt % of an alumina powder having an average size less than 10 micrometers; and

a catalytic amount of platinum or a platinum-containing compound catalyst for the addition reaction between the organopolysiloxane and the organohydrogenpolysiloxane.

5,008,308

THERMAL ADHESIVE COATING COMPOSITION BASED ON EPOXY RESIN, HIGH TG POLYMER, AMINE CURING AGENT AND FILM FORMING AGENT

Teruyuki Takahashi, Ashiya, and Mitsuru Kohno, Sanda, both of Japan, assignors to Kawasaki Steel Corp., Hyogo, Japan

Filed Feb. 17, 1989, Ser. No. 312,883

Int. Cl.[5] **C08L** *63/00*

U.S. Cl. 523—406 **2 Claims**

1. Thermal adhesive coating composition consisting essentially of

(A) an emulsion of a thermoplastic synthetic resin having a glass transition temperature of not lower than 60° C.,

(B) an emulsion of an epoxy resin,

(C) an amine base curing agent for the epoxy resin, said curing agent being capable of reacting with said component (B) when heated, and

(D) a film forming assistant agent having solubility in water at 20° C. of not higher than 20g/100cc and having solubility therein of water at 20° C. of not lower than 0.5g/100cc, the weight ratio of the solid resin contents in said component (A) to those in said component (B) being 60/40 to 98/2.

5,008,309

BALANCING PUTTY

Hiromitu Ibe, Kosai; Ichiro Akutagawa, Nagareyama, and Kunimitsu Matsuzaki, Yono, all of Japan, assignors to Asmo Co., Ltd. and Somar Corporation, both of, Japan

Filed Apr. 20, 1989, Ser. No. 340,734

Int. Cl.[5] **C08K** *3/30, 3/08*

U.S. Cl. 523—442 **8 Claims**

1. A balancing putty comprising:

(a) an epoxy resin;

(b) a curing agent capable of curing the epoxy resin when heated at a temperature of 60° C. or more,

(c) a first, finely divided inorganic filler having a specific gravity of 4.0 g/cm^3 or more; and

(d) a second, finely divided inorganic filler comprising a thixotropic agent having a specific gravity of less than 4.0 g/cm^3, said balancing putty having a density of at least 2.0 g/cm^3 and a consistency of 1–12 mm in terms of penetration.

5,008,310

POLYMER COMPOSITES BASED CELLULOSE-V

Alphons D. Beshay, 3595 de Courval, Trois-Rivières, Quebec G8Z 1S8, Canada

Filed May 15, 1989, Ser. No. 353,365

Int. Cl.[5] **C08L** *89/00;* **C08K** *3/00, 3/34*

U.S. Cl. 524—13 **9 Claims**

1. A composite material comprising a synthetic polymeric or copolymeric material or rubber, and an organic material selected from the group consisting of cellulosic or starch material, wherein said cellulosic or starch material is essentially grafted by a free radical generating process with isocyanate agent.

5,008,311

SUBSTANTIALLY SOLVENT FREE ASPHALTIC AND METHOD RELATING THERETO

Ronald J. Janoski, Chagrin Falls, Ohio, assignor to Tremco Incorporated, Cleveland, Ohio

Filed Mar. 17, 1989, Ser. No. 324,932

Int. Cl.[5] **C08L** *95/00, 75/08*

U.S. Cl. 524—59 **5 Claims**

1. A substantially solvent-free asphalt based material comprising:

about 15 to about 75 weight parts asphalt;

a compatibilizing agent in an amount greater than about 0.01 weight parts, wherein the amount of compatiblizing agent is not so great as to be capable of dissolving the asphalt;

about 25 to 75 weight parts polyurethane prepolymer in its cured or uncured states; wherein said compatiblizing agent comprises a polymeric material comprising:

a polymer unit, or two such units being either identical or different and linked together by an ester, carbon or ether bond, said unit having the following formula:

$$CH_3—(C_nH_{2n})—R_1$$

wherein:

n is 4 or more, and

R_1 is COOH, COO^-M^+, $COOR_2$ or R_2,

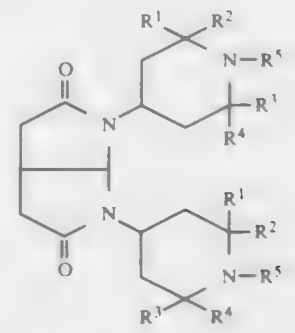
wherein:

M is a metal other than lead, cobalt, tin zirconium or titanium, and R_2 is a substantially saturated organic chain having a backbone substantially comprising carbon-carbon, carbon-oxygen, or carbon-nitrogen linkages, or combinations thereof, wherein the backbone's pendant constituents are either—H or —OH and wherein at least one pendant constituent is —OH.

5,008,312

2,6-POLYALKYLPIPERIDINE-SUBSTITUTED BISLACTAMS AND THEIR USE FOR THE STABILIZATION OF ORGANIC MATERIAL, IN PARTICULAR OF PLASTICS, AND MATERIALS STABILIZED THEREWITH

Alexander Aumueller, Deidesheim; Peter Neumann, Mannheim, and Hubert Trauth, Dudenhofen, all of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany



Filed Aug. 7, 1989, Ser. No. 390,216

Claims priority, application Fed. Rep. of Germany, Aug. 16, 1988, 3827641

Int. Cl.[5] **C08K** *5/3417;* **C07D** *401/00*

U.S. Cl. 524—92 **13 Claims**

1. A bislactam of the formula I

(I)

where R^1, R^2, R^3 and R^4 independently of one another are each C_1–C_4-alkyl, or R^1 and R^2 or R^3 and R^4 or R^1 and R^2 and R^3 and R^4 form a tetra- or pentamethylene radical, and R^5 is hydrogen, carbonyl-C_1–C_8-alkyl, benzoyl, C_1–C_8-alkyl, C_7–C_{10}-phenylalkyl, the phenyl nucleus being unsubstituted or substituted by one or two C_1–C_4-alkyl, C_1–C_4-alkoxy, fluorine, chlorine or bromine radicals, or is C_1–C_3-cyanoalkyl, C_2–C_4-

hydroxyalkyl, C_2- or C_3-aminoalkyl, and the acid addition salts and hydrates of these compounds.

5,008,313

IMPACT MODIFIER FOR THERMOPLASTIC RESIN HAVING GOOD HEAT DISCOLORATION RESISTANCE AND HEAT DETERIORATION RESISTANCE, AND THERMOPLASTIC RESIN COMPOSITION COMPRISING THIS IMPACT MODIFIER

Kazuo Kishida, Hiroshima; Kiyokazu Kitai, Tokyo, and Masaaki Mohri, Hiroshima, all of Japan, assignors to Mitsubishi Rayon Company, Ltd., Tokyo, Japan

Filed Mar. 27, 1989, Ser. No. 329,256

Claims priority, application Japan, Mar. 28, 1988, 63-074171

Int. Cl.[5] C08K *5/13, 5/524, 5/41*

U.S. Cl. 524—120 **13 Claims**

1. An impact modifier for a thermoplastic resin having an excellent heat discoloration resistance and heat deterioration resistance, which comprises:

(I) 100 parts by weight of a graft copolymer formed by graft-polymerizing (B) a monomer having a vinyl group in the molecule onto (A) a butadiene polymer and, incorporated therein,

(II) 0.01 to 5 parts by weight of a thioether type heat stabilizer selected from the group consisting of 3,3'-thiodipropionic acid, dialkyl 3,3'-thiodipropionates, pentaerythrityl-tetrakis (3-alkylthiopropionates), tetrakis methanes and bis-sulfides,

(III) 0.01 to 5 parts by weight of a phosphite type heat stabilizer selected from the group consisting of tris(nonylphenyl) phosphite, distearylpentaerythritol diphosphite, tris (2,4-di-tertiary-butylphenyl) phosphite, di(2,4-di-tertiarybutylphenyl) pentaerythritol diphosphite and bis(2,6-di-tertiary-butyl-4-methylphenyl)pentaerythritol diphosphite, and

(IV) 0.01 to 5 parts by weight of a phenol type heat stabilizer having a molecular weight of at least 500 which is selected from the group consisting of 1,1,3-tris(2-methyl-4-hydroxy-5-tertiary-butylphenyl)butane, n-octadecyl-3-(3',5'-di-tertiary-butyl-4'-hydroxyphenyl) propionate, tetrakis methane, triethylene glycol bis and pentaerythrityl tetrakis.

5,008,314

POLYPHENYLENE ETHER COMPOSITIONS RESISTANT TO ENVIRONMENTAL STRESS CRACKING

Gim F. Lee, Jr., Albany, N.Y., assignor to General Electric Co., Selkirk, N.Y.

Filed Dec. 21, 1989, Ser. No. 454,654

Int. Cl.[5] C08K *5/52;* **C08L** *71/12*

U.S. Cl. 524—143 **12 Claims**

1. A thermoplastic resin blend for molding articles with resistance to environmental stress cracking and having improved melt flow properties, which comprises, in homogeneous admixture

(a) from about 5 to about 95 weight percent of a polyphenylene ether resin having an average intrinsic viscosity below about 0.4; and

(b) from about 95 to about 5 weight percent of a polystyrene resin having an average intrinsic viscosity above about 0.85.

5,008,315

COMPOSITION

Linda H. Nelson, Evansville, Ind., assignor to General Electric Company, Mt. Vernon, Ind.

Filed Dec. 19, 1989, Ser. No. 452,479

The portion of the term of this patent subsequent to Sep. 26, 2006, has been disclaimed.

Int. Cl.[5] C08K *5/58*

U.S. Cl. 524—180 **13 Claims**

1. A composition comprising an admixture of

a polybutylene terephthalate

b a mold release and/or impact improving effective amount of a fluid hydrogenated or non hydrogenated oligomer of an alpha olefin.

5,008,316

INTERNAL LUBRICANT FOR GLASS REINFORCED POLYARYLENE SULFIDE

Lachhman Wadhwa, Plainfield, N.J., and Andrew M. Steurer, Kenton, Ky., assignors to Hoechst Celanese Corporation, Bridgewater, N.J.

Continuation of Ser. No. 159,812, Feb. 25, 1988, abandoned. This application Sep. 1, 1989, Ser. No. 403,047

Int. Cl.[5] C08K *5/20, 3/40*

U.S. Cl. 524—230 **30 Claims**

1. A molding composition comprising polyarylene sulfide and 0.01 to 2.0 weight percent of an internal lubricant comprising stearyl erucamide to provide said composition with mold release properties.

5,008,317

COMPOSITIONS WHICH CAN BE CROSSLINKED TO FORM FLAME RETARDANT AND/OR TRACKING RESISTANT AND ARC RESISTANT ORGANOPOLYSILOXANE ELASTOMERS

Dietrich Wolfer, Oberndorf, Austria, and Wilhelm Marsch, Haiming, Fed. Rep. of Germany, assignors to Wacker-Chemie GmbH, Munich, Fed. Rep. of Germany

Filed Sep. 14, 1989, Ser. No. 407,003

Claims priority, application Fed. Rep. of Germany, Sep. 16, 1988, 3831478

Int. Cl.[5] C08K *5/54*

U.S. Cl. 524—262 **20 Claims**

1. A composition which can be crosslinked to form flame retardant and/or tracking resistant and arc resistant organopolysiloxane elastomers, comprising a crosslinkable organopolysiloxane composition containing an additive, which is obtained by mixing:

(A) 60 to 80 percent by weight of diorganopolysiloxane having 75 to 85 mol percent of dimethylsiloxane units and 15 to 25 mol percent of vinylmethylsiloxane units,

(B) 20 to 35 percent by weight of a metal oxide selected from the group consisting of titanium dioxide, zirconium dioxide, zinc oxide, Ce(III) oxide and Ce(IV) oxide, with the proviso that only titanium dioxide or zirconium dioxide is used to achieve tracking resistance and arc resistance,

(C) 0.05 to 0.25 percent by weight of platinum, selected from the group consisting of a platinum compound and a platinum complex, calculated as the element, and

(D) 1 to 5 percent by weight of an organosilicon compound having basic nitrogen bonded via carbon to silicon

in which the sum of the percentages of (A) to (D) is equal to 100 percent by weight and the percent by weight is based on the total weight of the additive.

5,008,318

NOVEL COMPOSITE FILM AND PREPARATION THEREOF

Keizou Ishii, Ashiya; Teruaki Kuwajima, Higashiosaka; Hiroshi Miwa, Itami; Akio Kashihara, Hirakata, and Shinichi Ishikura, Kyoto, all of Japan, assignors to Nippon Paint Co., Ltd., Osaka, Japan

Continuation of Ser. No. 879,583, Jun. 27, 1986, abandoned, which is a continuation-in-part of Ser. No. 652,677, Sep. 19, 1984, abandoned. This application Feb. 17, 1989, Ser. No. 313,354

Int. Cl.[5] C08K *5/10*

U.S. Cl. 524—284 **2 Claims**

1. In a resinous composition consisting essentially of

(a) a liquid medium,

(b) at least one resin which is soluble in said liquid medium (a) and forms a continuous film, and

(c) particles of at least one resin which is insoluble in the combination of said (a) and said (b), an improvement which is characterized by further containing

(d) a microdomain forming agent which is an organic compound fulfilling the requirements:

$$R \geq 160$$

at least an $In \geq 70$

$$\Sigma In/R \geq 0.5$$

wherein R represents a quantity of organic characters, In is a quantity of inorganic characters of inorganic group No. n, and n is an integer of 1 and more and corresponds to the number of inorganic groups in the molecule, and forms a composite film consisting essentially of a continuous phase of said resin (b) and a discontinuous phase of microdomains which are 0.03 to 10 microns in size and are aggregates of said resin particles (c).

5,008,319

HOMOGENEOUS MIXTURES OF SOLID ORGANIC ACIDS AND SOLID CATIONIC ESTER-BASED POLYMER FLOCCULANTS

Ronald E. Highsmith, Skaneateles, and Eric H. Larson, Marcellus, both of N.Y., assignors to Polypure, Inc., Solvay, N.Y.

Filed Feb. 1, 1990, Ser. No. 473,351

Int. Cl.[5] C08K *5/09*

U.S. Cl. 524—321 **8 Claims**

1. A homogeneous composition of a solid, water soluble organic acid and a solid cationic ester-based polymeric flocculant which is a copolymer of acrylamide and a cationic monomer, said mixture having fewer fine particles than the solid polymer flocculant particles prior to incorporation into said composition, said polymeric flocculant particles being coated by said acid, thereby said mixture being resistant to mechanical segregation or stratification.

5,008,320

PLATINUM OR RHODIUM CATALYZED MULTILAYER CERAMIC COATINGS FROM HYDROGEN SILSESQUIOXANE RESIN AND METAL OXIDES

Loren A. Haluska; Keith W. Michael, both of Midland, and Leo Tarhay, Sanford, all of Mich., assignors to Dow Corning Corporation, Midland, Mich.

Division of Ser. No. 938,678, Dec. 4, 1986, Pat. No. 4,911,992. This application Dec. 7, 1989, Ser. No. 447,482

Int. Cl.[5] C08K *3/10, 5/07*

U.S. Cl. 524—361 **5 Claims**

1. A composition of matter comprising a hydrocarbon solvent solution of a mixture of (a) hydrogen silesquioxane resin; (b) one or more metal oxide precursors selected from the group consisting of an aluminum alkoxide, a titanium alkoxide and a zirconium alkoxide; and (c) a metal catalyst selected from the group consisting of platinum catalysts and rhodium catalysts, wherein the hydrogen silsesquioxane resin (a) is diluted in the hydrocarbon solvent to low solids, the metal oxide precursor or precursors (b) are present in an amount such that the resultant ceramic coating contains from 0.1 % weight percent up to approximately 30 % weight percent metal oxide, and the metal catalyst (c) is present in an amount sufficient to enhance the oxidation and cure of the hydrogen silsesquioxane resin.

PREPARATION OF STABLE WATER-IN-OIL EMULSIONS OF HYDROLYZED POLYMERS OF N-VINYLAMIDES AND THEIR USE

Heinrich Hartmann, Limburgerhof; Walter Denzinger, Speyer; Michael Kroener, Mannheim; Norbert Sendhoff, Gruenstadt, and Enrique Freudenberg, Schifferstadt, all of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany

Filed Nov. 20, 1989, Ser. No. 438,034

Claims priority, application Fed. Rep. of Germany, Dec. 20, 1988, 3842820

Int. Cl.[5] C08F *2/32*

U.S. Cl. 524—378 **5 Claims**

1. A stable water-in-oil emulsion of a hydrolyzed polymer of N-vinylamides, of the formula

$$R-CO-\underset{\displaystyle R_1}{\underset{|}{N}}-CH=CH_2 \qquad (I)$$

where R and R^1 are each H or C_1-C_6-alkyl, prepared by the steps comprising:

(a) polymerization of a compound of the formula I alone or as a mixture of other monoethylenically unsaturated monomers in the presence of polymerization initiator and emulsifiers, in the form of a water-in-oil emulsion, to give a water-in-oil polymer emulsion; and

(b) subsequent hydrolysis of the polymer in the form of the water-in-oil polymer emulsion in the presence of an acid or base and from 1–30% by weight, based on the polymer, of an emulsifier which is obtained by

(A) reacting a C_{10-22}- fatty alcohol with epichlorohydrin in a molar ratio of from 1:0.5 to 1:1.5 to give a glycidyl ether,

(B) reacting the glycidyl ether with (1) a saturated C_{2-6}-alcohol containing from 2–6 OH groups or (2) its monoether with a C_{10-22}- fatty alcohol, in a molar ratio of glycidyl ether to (1) or (2) of from 1:0.5 to 1:6, in the presence of an acid or base, and

(C) alkoxylating the reaction product from (II) with one or more C_{2-4}-alkylene oxides in a molar ratio of from 1:1 to 1:6.

HYDROPHOBIC POLYMER PRODUCTS

Joseph A. Vasta, deceased, late of Wilmington, and by Rita Vasta, executrix, 1412 Jan Dr., Webster Farms, Wilmington, both of Del. 19803

Filed Dec. 23, 1988, Ser. No. 288,911

Int. Cl.[5] C08K *5/04, 5/06*

U.S. Cl. 524—398 **9 Claims**

1. A polymeric product obtained by bringing together, in an organic liquid, in contact with an appropriate polymerization initiator and under conditions suitable for polymerization,

(a) styrene,

(b) 2-ethylhexyl acrylate, 2-ethyl hexyl methacrylate or butyl acrylate,

(c) acrylic acid or methacrylic acid,

(d) polyethylene oxide having a molecular weight M_n of 20,000–400,000 and

(e) a cobalt compound which provides Co^{+2} or Co^{+3} ions.

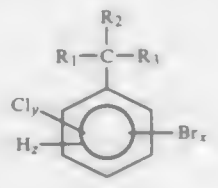
5,008,323

FLAME RETARDANT PVC RESIN COMPOSITIONS

Nicolai A. Favstritsky, and Robert J. Nulph, both of Lafayette, Ind., assignors to Great Lakes Chemical Corporation, West Lafayette, Ind.

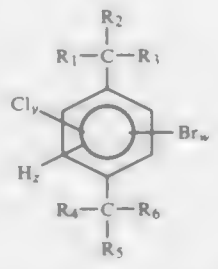
Continuation of Ser. No. 107,236, Oct. 9, 1987, abandoned. This application Sep. 13, 1989, Ser. No. 406,882

Int. Cl.[5] C08K *5/03*



U.S. Cl. 524—469 **7 Claims**

1. A flame retardant PVC resin composition comprising:



a PVC resin;

a non-flame retardant primary plasticizer;

as a flame retardant plasticizer, an effective amount of a polybrominated higher alkylbenzene, wherein the polybrominated higher alkylbenzene is a compound of the structure:

or

where x is 4 or 5, y is zero or 1, z is zero or 1, w is 2 to 4; where R_1 and R_4 are hydrogen or methyl, and R_2, R_3, R_5, R_5, R_6 are alkyl groups ranging independently from 1 to 16 carbon atoms and where the total number of carbon atoms in each of (R_1, R_2 and R_3) and (R_4, R_5 and R_6) ranges from 5 to 17; an effective amount of polybrominated higher alkylbenzene containing about 30–70 percent bromine by weight of the flame retardant plasticizer;

a stabilizer; and

an enhancing agent.

U.S. Cl. 524—504 **10 Claims**

1. A composition useful for damping purposes comprising:

(a) crosslinked elastomer containing microscopically discrete segments of

(b) multi-phase thermoplastic elastomeric polymer having at least two polymeric phases comprising:

(1) an initial linear or lightly crosslinked polymeric phase polymerized from an alpha, beta-unsaturated monomer, wherein said alpha,beta-ethylenically unsaturated monomer comprises from 0 to about two percent by weight of multi-ethylenically unsaturated monomer,

(2) a second polymeric phase in the form of discrete domains of about 2 to about 50 nanometers in diameter dispersed within said initial polymeric phase, wherein said second polymeric phase is polymerized from at least one ethylenically unsaturated monomer comprised of about 5 percent to 100 percent by weight multifunctional monomer having at least two sites of ethylenic unsaturation,

wherein the weight ratio of said second polymeric phase to said initial polymeric phase plus said second polymeric phase is from about 1:100 to about 1:2.

7. A process for damping comprising:

(a) blending

(i) a crosslinkable elastomer;

(ii) a multi-phase thermoplastic elastomeric polymer having at least two polymeric phases comprising:

(1) an initial linear or lightly crosslinked polymeric phase polymerized from an alpha,beta-ethylenically unsaturated monomer wherein said alpha,beta-ethylenically unsaturated monomer comprises from 0 to about two percent by weight of multi-ethylenically unsaturated monomer,

(2) a second polymeric phase in the form of discrete domains of about 2 to about 50 nanometers in diameter dispersed within said initial polymeric phase, wherein said second polymeric phase is polymerized from at least one ethylenically unsaturated monomer comprised of about 5 percent to 100 percent by weight multifunctional monomer having at least two sites of ethylenic unsaturation,

wherein the weight ratio of said second polymeric phase to said initial polymeric phase plus said second polymeric phase is from about 1:100 to about 1:2;

(iii) at least one curative and optionally one or more reinforcing particulate fillers, wherein the ratio of said optional reinforcing particulate filler to said crosslinkable elastomer plus said multi-phase polymer plus said reinforcing particulate filler is up to about 1:2.5;

(b) molding said resultant blend;

(c) curing said blend to form a crosslinked elastomer containing microscopically discrete segments of said multiphase polymer;

(d) placing said cured molded blend between two surfaces, at least one of which is subject to vibrations, and damping said vibrations.

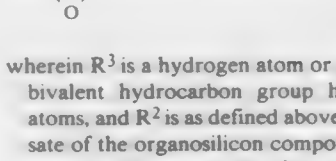
1. An aqueous organosilicon resin coating comprising:



(I) an organosilicon resin which is a condensation product prepared from

(i) a first component which is at least one member selected from the group consisting of (a) an organosilicon compound represented by the formula

(A)

wherein R^1 is a hydrocarbon group having 1 to 12 carbon atoms, R^2 is a hydrocarbon group having 1 to 8 carbon atoms and a is 0, 1 or 2, and (b) a low condensate of the organosilicon compound represented by the formula (A);

(ii) a second component which is at least one member selected from the group consisting of (a) an organosilicon compound represented by the formula

(B)

wherein R^3 is a hydrogen atom or a methyl group, R^4 is a bivalent hydrocarbon group having 1 to 8 carbon atoms, and R^2 is as defined above, and (b) a low condensate of the organosilicon compound represented by the formula (B), wherein the first component and the second component are used in a ratio of the former to the latter of 50–99.5:0.5–40 mole %; and

(iii) a third component which is at least one tertiary amine compound selected from the group consisting of trimethylamine, triethylamine, tri-n-butylamine, N-methyldiethanolamine, N-dimethylethanolamine, triethanolamine, diethylaminoethanol, N,N-dimethylcyclohexylamine, pyridine, α-picoline, β-picoline, γ-picoline, 2,4-lutidine, 2,6-lutidine, N-methylpiperidine, and N-methylpyrrolidine,

said organosilicon resin containing a quaternary ammonium group which is formed by a reaction of the tertiary amine compound with a glycidyl group in the organosilicon resin; and

(II) an aqueous medium.

CURABLE ADHESIVES

Robert Guerra, Fremont, and Pravin Soni, Union City, both of Calif., assignors to Raychem Corporation, Menlo Park, Calif.

Filed Dec. 21, 1988, Ser. No. 288,331
Int. Cl.[5] C08L 23/26, 27/08
U.S. Cl. 525—193 12 Claims

1. An adhesive composition comprising:

(a) about 30 to about 50% by weight of a thermoplastic vinylidene fluoride homopolymer or copolymer;

(b) about 5 to about 40% by weight of an elastomeric vinylidene fluoride;

(c) about 5 to about 25% by weight of a thermoplastic ethylene copolymer comprising at least 50 mole% of units derived from ethylene and at least 5 mole % of units derived from at least one unsaturated comonomer containing at least one polar group;

(d) about 1 to about 10% by weight of a crosslinking agent component; and

(e) 0 to about 20% by weight of a tackifier; all percentages by weight being based on the total weight of the five components.

5,008,341

TRANSPARENT THERMOPLASTIC BLENDS

Rainer Bueschl, Roedersheim-Gronau, and Peter Klaerner, Battenberg, both of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany

Filed Aug. 31, 1989, Ser. No. 401,239
Claims priority, application Fed. Rep. of Germany, Sep. 20, 1988, 3831874
Int. Cl.[5] C08L 33/06, 45/00, 25/02, 27/08
U.S. Cl. 525—216 10 Claims

1. A transparent polyblend formed from

(a) 99.9–0.1% by weight of a styrene or α-methyl styrene and acrylonitrile copolymer containing from 11 to 30% by weight of acrylonitrile monomer units, and

(b) 0.1–99.9% by weight of a cycloalkyl (meth)acrylate homopolymer or copolymer with up to 99.9% by weight of units of methyl methacrylate.

5,008,342

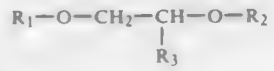
EPOXY CONTAINING IMPACT MODIFIERS FOR THERMOPLASTIC RESINS

Shrikant V. Phadke, 14416 Brittmore Ave., Baton Rouge, La. 70817

Continuation-in-part of Ser. No. 4,088, Jan. 16, 1987, abandoned. This application Aug. 23, 1988, Ser. No. 235,364
Int. Cl.[5] C08F 255/02; C08L 51/00, 67/00, 77/00
U.S. Cl. 525—263 21 Claims

1. A modifier for improving the impact and knitline strength of polyester or polyamide resins in which it is dispersed comprising the product of a reaction in bulk at elevated temperature in the molten state and in the presence of (1) a peroxide catalyst of (2) an elastomeric backbone polymer selected from the group consisting of (a) a copolymer rubber formed by copolymerization of ethylene and one or more mono-olefins containing 3–16 carbon atoms and (b) an interpolymer rubber formed by interoplymerization of ethylene, one or more C_3–C_{16} mono-olefins, and a polyene and (3) a free radical polymerizable ethylenically unsaturated monomer having an epoxy functionality, wherein said bulk reaction product has a gel content greater than 5 percent, an epoxy functionality within the range of 2.5–13.0 per 1000 carbon atoms and degree of graft of at least 2.5%.

5,008,343



PROCESS FOR THE PREPARATION OF POLYMERS BASED ON CONJUGATED DIENES AND OPTIONALLY MONOVINYLAROMATIC COMPOUNDS

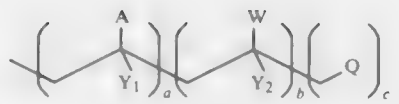
Walter Hellermann, Dorsten; Christoph Herrmann, Marl; Hans-Bernd Fuchs, Marl; Karl-Heinz Nordsiek, Marl, and Jurgen Wolpers, Haltern, all of Fed. Rep. of Germany, assignors to Huls Aktiengesellschaft, Marl, Fed. Rep. of Germany

Continuation of Ser. No. 190,640, May 4, 1988, abandoned. This application Feb. 20, 1990, Ser. No. 492,317
Claims priority, application Fed. Rep. of Germany, Jul. 28, 1987, 3724870
Int. Cl.[5] C08F 255/02, 255/06; C08K 3/06; B32B 27/08
U.S. Cl. 525—316 14 Claims

1. A process for preparing block-free conjugated diene polymers, comprising:

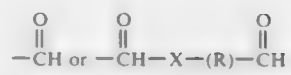
anionically polymerizing monomers consisting essentially of at least two compounds selected from the group consisting of 1,3-butadiene, isoprene and styrene in an inert organic solvent in the presence of an organolithium compound as a catalyst and a cocatalyst of a glycol dialkyl ether:

wherein R_3 is hydrogen, methyl or ethyl, R_1 and R_2 are alkyl groups of different numbers of carbon atoms selected from the group consisting of methyl, ethyl, n-propyl, isopropyl, n-butyl, iso-butyl, sec-butyl and t-butyl, and the total number of carbon atoms in the alkyl groups R_1 and R_2 ranges from 5 to 7.



5,008,344

TEMPORARY WET STRENGTH RESINS AND PAPER PRODUCTS CONTAINING SAME



David W. Bjorkquist, Wyoming, Ohio, assignor to The Procter & Gamble Company, Cincinnati, Ohio

Filed Jul. 5, 1988, Ser. No. 215,132
Int. Cl.[5] C08F 8/00
U.S. Cl. 525—328.2 11 Claims

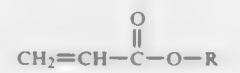
1. A water soluble, temporary wet strength resin comprising a polymer characterized by the substantially complete absence of nucleophilic functionalities and having the formula:

wherein: A is

and X is —O—, —NH—, or —NCH_3—, and R is an unsubstituted aliphatic group; Y_1 and Y_2 are independently —H, —CH_3 or a halogen; W is a non-nucleophilic, aliphatic amide; Q is a cationic monomeric unit; the mole percent of a is from about 1% to about 70%, the mole percent of b is from about 10% to about 90%; and the mole percent of c is from about 1% to about 40%; said resin having an average molecular weight of between about 40,000 and about 400,000.

5,008,345

NO-POST-CURE METHOD OF CURING POLYACRYLATE POLYMERS



Fred R. Wolf, Avon Lake, Ohio, assignor to Zeon Chemical USA, Inc., Avon Lake, Ohio

Continuation of Ser. No. 227,396, Aug. 4, 1988, abandoned, which is a continuation-in-part of Ser. No. 101,883, Sep. 28, 1987, abandoned. This application May 18, 1990, Ser. No. 551,098
Int. Cl.[5] C08F 8/40
U.S. Cl. 525—340 16 Claims

1. A no-post-cure method of curing polyacrylate rubber having halogen and carboxy cure sites, comprising:

mixing an effective amount of a curative with said polyacrylate rubber until a uniform vulcanizable composition results:

said acrylate rubber comprising(a) from about 40 percent to about 99.8 percent by weight of an acrylate of the formula:

wherein R is selected from the group consisting of an alkyl radical containing 1 to 18 carbon atoms, an alkoxyalkyl, an alkylthioalkyl, and a cyanoalkyl radical containing 2 to 12 carbon atoms; (b) from about 0.1 percent to about 30 percent by weight of a halogen-containing monomer selected from the group consisting of halogen-containing vinylene hydrocarbons and halogen-containing vinyl monomers having the halogen group at least two carbon atoms removed from an oxygen group; (c) from about 0.1 percent to about 20 percent by weight of a carboxyl-containing monomer; and (d) up to about 35 percent by weight of a copolymerizable monomer containing a terminal vinylidene group;

said curative comprising a metallic stearate and a quaternary salt selected from the class consisting of an ammonium quaternary halogen salt, an ammonium quaternary hydroxide salt, a phosphonium quaternary halogen salt, and a phosphonium quarternary hydroxide salt;

processing said composition and maintaining said composition below an activation temperature range prior to a curing step whereby said composition does not undergo any substantial amount of cure prior to said curing step, said activation temperature range being form about 75° C. to about 85° C.,; and

heating during said curing step said composition to above an activation temperature range which causes said composition to substantially cure whereby no-post-curing is necessary and whereby said process permits large scale commercial production.

5,008,346

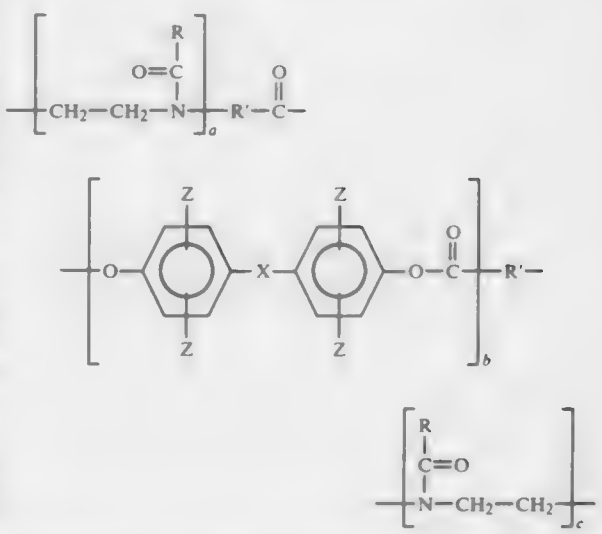
GRAFT COPOLYMERS OF POLY(P-PHENYLENE BENZBISIMIDAZOLE)

Robert C. Evers, Dayton; Thuy D. Dang, Springfield, both of Ohio, and D. Roger Moore, Clute, Tex., assignors to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.

Filed Apr. 28, 1989, Ser. No. 345,251
Int. Cl.[5] C08L 79/04
U.S. Cl. 525—426 3 Claims

1. A fusible, rod-like, graft copolymer having repeating units of the formula:

wherein X is (—CH_2CH_2CONH—)m or (—CH_2—CH(CH-3)—O—)n. wherein m has an average value of 5.0 to 35.0 and n has an average value of 1.0 to 30.0.



5,008,347

POLYALKYLOXAZOLINE-POLYCARBONATE-POLYALKYLOXAZOLINE TRIBLOCK COPOLYMER COMPATIBILIZER FOR POLYCARBONATE/POLYAMIDE BLENDS

Bruce P. Thill, and Bruce A. King, both of Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich.

Division of Ser. No. 264,920, Oct. 31, 1988, Pat. No. 4,954,579. This application Jun. 18, 1990, Ser. No. 540,971
Int. Cl.[5] C08L 69/00, 77/00; C08G 64/18
U.S. Cl. 525—433 20 Claims

1. A triblock copolymer of the formula:

wherein X is a divalent C_1–C_{15} hydrocarbon radical, a single bond, —O—, —S—, —S_2—, —SO—, —SO_2—, or —CO—, R is a monovalent C_1–C_4 alkyl radical, R′ is a divalent C_7–C_{19}

alkyl radical, each Z is independently hydrogen, a halo radical, or a C_1–C_4 alkyl radical, b is a number greater than 0 equal to the number of repeated carbonate units in the polycarbonate block segment of the triblock copolymer, and a and c are each independently numbers greater than 0 equal to the numbers of repeated alkyloxazoline units in the polyalkyloxazoline block segments of the triblock copolymer.

5,008,348

INFUSIBILIZATION OF ORGANIC SILAZANE POLYMERS

Yoshifumi Takeda; Minoru Takamizawa, and Akira Hayashida, all of Joetsu, Japan, assignors to Shin-Etsu Chemical Co., Ltd., Tokyo, Japan

Filed Jun. 27, 1989, Ser. No. 371,716

Claims priority, application Japan, Jun. 30, 1988, 63-163592; Jul. 26, 1988, 63-186324

Int. Cl.[5] C08F *283/00*

U.S. Cl. 525—474 **20 Claims**

1. A method for infusibilizing an organic silazane polymer, comprising the steps of melting, shaping and then infusibilizing the organic silazane polymer, the infusibilizing step including contacting the shaped polymer at a sufficiently low temperature to maintain the polymer infusible with an inert gas containing the vapor of at least one compound selected from the group consisting of:

(1) silicon compounds having the formula

$$RaSiX_{4-a}$$

wherein

R is a radical selected from the group consisting of hydrogen, lower alkyl, alkenyl, and aryl radicals;

X is a chlorine, bromine or iodine atom, and

a has a value of from 0 to 2, and when a is equal to 2, R may be the same or different;

(2) boron compounds having the formula

$$BX_3$$

wherein X is as defined above;

(3) phosphorus compounds having the formula

$$PX_b$$

wherein

X is as defined above, and

b is equal to 3 or 5; and

(4) metal compounds having the formula

$$MX_c$$

wherein

M is a metal selected from the group consisting of Al, Ti, V, Fe, Ga, Ge, Zr, Nb, Sn, Sb, Te, Ta, W, and Bi,

c is a number equal to the valence of the metal and

X is as defined above,

and then exposing the shaped polymer to enhance the infusibility of polymer articles with an inert gas containing water vapors or ammonia.

5,008,349

SILICONE PRIMER COMPOSITIONS

Jeffrey A. Kosal, Midland County, and Terence J. Swihart, Bay County, both of Mich., assignors to Dow Corning Corporation, Midland, Mich.

Filed Oct. 26, 1989, Ser. No. 426,835

Int. Cl.[5] C08F *283/00*

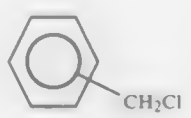
U.S. Cl. 525—477 **47 Claims**

1. A composition comprising the reaction product of:

(A) a resinous copolymeric siloxane consisting essentially of $R_3SiO_{\frac{1}{2}}$ units and $Si_{4/2}$ units wherein the ratio of $R_3SiO_{\frac{1}{2}}$ units to $SiO_{4/2}$ units is 0.4:1 to 1.2:1 and each R independently denotes a monovalent hydrocarbon radical, said siloxane resin having residual hydroxyl functionality thereon; and

(B) an organosilane selected from the group consisting of those having the formulas

$$(X)_{3-a}SiR'G \quad \text{and} \quad (X)_3SiR'G$$
$$\qquad\quad R''_a$$



wherein X is selected from the group consisting of an alkoxy group having 1 to 3 carbon atoms, an acyloxy group having 2 to 4 carbon atoms and a halide radical, R' is a divalent hydrocarbon group having 2 to 8 carbon atoms, R'' is selected from the group consisting of an alkyl radical having 1 to 12 carbon atoms and a phenyl radical, a is 1 or 2 and G is selected from the group consisting of (i) an acryl group selected from the group consisting of

$$-OC(O)C(A)=CH_2 \quad \text{and} \quad -NC(O)C(A)=CH_2$$

in which A is independently selected from the group consisting of hydrogen and a methyl radical,

(ii) a glycidoxy group,

(iii) an aromatic group of the formula

(iv) an anilino group and

(v) an amine group selected from the group consisting of

$$-NHQ \text{ and } -NQ_2$$

wherein Q is independently selected from the group consisting of

$$-CH_2COOR''',$$

$$-CH_2CH_2COOR''',$$

$$-CH(CH_2COOR''')_2,$$

$$-CH_2CH(CH_2COOR''')_2,$$

and

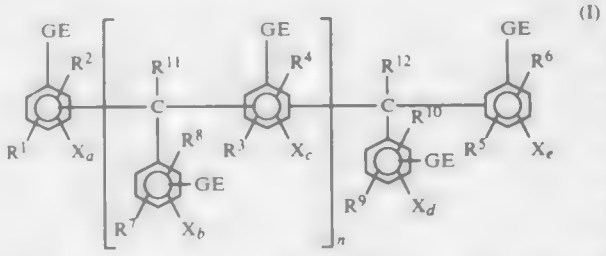
$$-CH_2CH_2N(CH_2CH_2COOR''')_2$$

in which R''' is an alkyl radical having 1 to 3 carbon atoms, the ratio of said silane (B) to said siloxane resin (A) being such as to provide from about 0.1 to about 3 equivalents of X for each equivalent of hydroxyl of said component (A).

5,008,350

GLYCIDYL ETHERS OF PHENOLIC COMPOUNDS AND PROCESS FOR PRODUCING THE SAME

Noriaki Saito; Shuichi Kanagawa, and Hideshi Sakamoto, all of Niihama, Japan, assignors to Sumitomo Chemical Company, Limited, Osaka, Japan



Filed Dec. 12, 1988, Ser. No. 282,569

Claims priority, application Japan, Dec. 16, 1987, 62-319289; Dec. 26, 1987, 62-331287

Int. Cl.[5] C08G *59/32*

U.S. Cl. 525—507 **3 Claims**

1. A glycidyl ether of the formula (I):

(I)

wherein each of R^1 through R^6 represents an alkyl group of from 1 to 6 carbon atoms; each of R^7 through R^{12} represents a hydrogen atom or an alkyl group of from 1 to 4 carbon atoms; X represents a chlorine or bromine atom; GE represents a glycidyl ether group; a, b, c, d, and e are 0 or 1; and n is the average number of from 0.5 to 5.

5,008,351

REACTING EPOXY RESIN AND SUBSTITUTED UREA OR BIURET WITH BLOCKED ISOCYANATE GROUP DICARBOXYLIC ANHYDRIDE COMPOUND PRODUCT

Willibald Paar, Graz, Austria, assignor to Vianova Kunstharz, A.G., Werndorf, Austria

Division of Ser. No. 195,290, May 18, 1988, Pat. No. 4,851,486. This application May 15, 1989, Ser. No. 351,477

Claims priority, application Austria, May 18, 1987, 1248/87

Int. Cl.[5] C08G *18/06, 59/14, 63/68*

U.S. Cl. 525—528 **9 Claims**

1. Process for producing self-crosslinking paint binders based on amino-modified epoxy resin esters comprising reacting 5 to 100 mole-% of the epoxy groups of an epoxy resin having an epoxy equivalent weight of from 160 to 2000 with a carboxylic compound of the formula —

$$HOOC - R_1 - CO - NR_2 - CO - NH - R_3 - /NCO/,$$

wherein

R_1 is a saturated or unsaturated aliphatic, cycloaliphatic, or aromatic hydrocarbon radical,

R_2 is an aliphatic hydrocarbon radical,

R_3 is an aliphatic, cycloaliphatic, or aromatic hydrocarbon radical, and

—/NCO/ is a blocked isocyanate group, or the group —NR_2—CO—NH—R_3—/NCO/ is a radical formed from a substituted urea or a substituted biuret carrying at least one blocked isocyanate, group,

and any remaining epoxy groups with primary and/or secondary amines, the weight ratios being chosen such that the final product does not contain free epoxy groups and has an amine value of at least 30 mg KOH/g.

5,008,352

SUBSTITUTED AROMATIC POLYMERS

Brian N. Hendy, Middlesborough, England, assignor to Imperial Chemical Industries PLC, London, England

Filed Feb. 8, 1989, Ser. No. 307,563

Claims priority, application United Kingdom, Feb. 8, 1988, 8802796; Feb. 8, 1988, 8802797

Int. Cl.[5] C08G *75/23, 65/48*

U.S. Cl. 525—534 **15 Claims**

1. An aryl-ether polymer having aromatic rings linked to neighbouring rings in its chain through O and/or a direct link, at least some of said aromatic rings carrying a nuclear substituent sulphonamide group $SO_2NR'R''$, where R' is an aliphatic unsubstituted or substituted hydrocarbon group and R'' is hydrogen or an unsubstituted or substituted aliphatic hydrocarbon group, said neighbouring rings being part of repeating units Ph X Ph, where Ph is paraphenylene and X is SO_2 and/or CO, and being present in a molar proportion at least equal to that of said aromatic rings, said aryl-ether polymer being derived from a corresponding polymer carrying a plurality of groups SO_2Z, where Z is halogen, and possibly also groups SO_2OM, where M is 1/m of a cation of valency m, and being characterized in that said aryl-ether polymer contains, by moles, 0 to 10% of groups SO_2OM, based on the total groups SO_2OM and $SO_2NR'R''$.

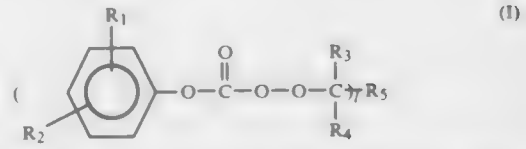
13. A process of producing purified water which comprises contacting water containing dissolved impurity with one side of a cationic sulphonamide substituted polymer according to claim 1 applying to the impurity-containing water a hydrostatic pressure in excess of the osmotic pressure of that solution, and recovering purified water from the other side of that membrane.

15. A membrane comprising at least one polymer according to any one of claims 1 to 6 suitable for separation technologies, selected from the group consisting of ion-exchange, reverse osmosis and ultrafiltration.

5,008,353

ORGANIC PEROXIDE HAVING A POLYMERIZATION-REGULATING ABILITY

Takeshi Komai, Chita; Kazuo Matsuyama, Gamagori, and Isao Honma, Chita, all of Japan, assignors to Nippon Oil and Fats Co., Ltd., Japan



Division of Ser. No. 895,995, Aug. 13, 1986, Pat. No. 4,929,747. This application Nov. 14, 1988, Ser. No. 270,214

Claims priority, application Japan, Aug. 21, 1985, 60-181623; Aug. 21, 1985, 60-181624

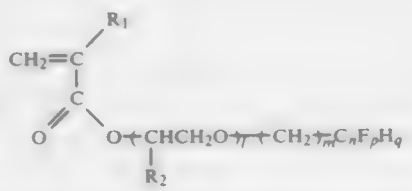
Int. Cl.[5] C08F *4/34, 4/36*

U.S. Cl. 526—230.5 **11 Claims**

1. A process for polymerizing unsaturated monomers, which comprises initiating and regulating the polymerization with an organic peroxide of the formula (I) in an amount of 0.00005-14 0.2 mole based on 1 mole of the unsaturated monomer

(I)

wherein R_1 and R_2 represent hydrogen atoms; R_3 and R_4 represent the same or different lower alkyl groups having 1–4 carbon atoms; and R_5 represents an alkyl group having 2–12 carbon atoms in the case of l=1, or a $—CH_2—_m$ group (wherein m is an integer of 2–4) in the case of l=2.



5,008,354

CONTACT LENS

Takeyuki Sawamoto, Tokyo; Masashi Nomura, Kodama, and Niro Tarumi, Akishima, all of Japan, assignors to HOYA Corporation, Tokyo, Japan

Filed Apr. 26, 1989, Ser. No. 343,389
Claims priority, application Japan, Apr. 30, 1988, 63-108423
Int. Cl.[5] C08F *18/20*; G02C *7/04*
U.S. Cl. 526—246 15 Claims

1. A contact lens having no water absorbability consisting of a polymer comprising, as an essential component, at least one fluorine-containing monomer represented by the general formula

(I)

wherein R_1 and R_2 are independently H or CH_3 and may be the same or different, l is an integer of 1–5, m is an integer of 1–2, n is an integer of 4–10, p is an integer of 8 or more, q is an integer of 0 or more, and $p+q=2n+1$.

5,008,355

SLURRY POLYMERIZATION OF MALEIC ANHYDRIDE AND ACRYLIC ACID IN A COSOLVENT SYSTEM OF ETHYL ACETATE AND CYCLOHEXANE

Mohammed Tazi, Wayne, and Krystyna Plochocka, Scotch Plains, both of N.J., assignors to GAF Chemicals Corporation, Wayne, N.J.

Filed Mar. 29, 1990, Ser. No. 501,059
Int. Cl.[5] C08F *34/02*
U.S. Cl. 526—271 10 Claims

1. A slurry polymerization process for preparing uncrosslinked copolymers of maleic anhydride and acrylic acid or methacrylic acid, optionally including a C_1–C_4 alkyl vinyl ether, having a predetermined weight average molecular weight of about 10,000 to one million which comprises:

copolymerizing about 20 to 60 mole percent of maleic anhydride, about 40 to 80 mole percent of acrylic acid or methacrylic acid, and from 0 to 25 mole percent of a C_1–C_4 alkyl vinyl ether, in the presence of a free radical initiator, at about 60° to 80° C., in a cosolvent system comprising about 10 to 75 percent by weight of ethyl acetate and about 25 to 90 percent by weight of an aliphatic or cycloaliphatic hydrocarbon having a boiling point at least 10° C. above the reaction temperature, without the presence of a protective colloid, to produce a pumpable slurry of said copolymer in said cosolvent system,

pumping the slurry from the reactor, and

recovering the copolymer therefrom as a uniform, fine powder having substantially no residual maleic anhydride.

5,008,356

CYCLO-OLEFINIC RANDOM COPOLYMER, OLEFINIC RANDOM COPOLYMER, AND PROCESS FOR PRODUCING CYCLO-OLEFINIC RANDOM COPOLYMERS

Naoshi Ishimaru, Yamaguchi; Toshiyuki Tsutsui, Ohtake; Akinori Toyota, and Norio Kashiwa, both of Iwakuni, all of Japan, assignors to Mitsui Petrochemical Industries, Ltd., Tokyo, Japan

Division of Ser. No. 162,200, Feb. 29, 1988. This application May 31, 1989, Ser. No. 359,131
Claims priority, application Japan, Mar. 2, 1987, 62-45152; Dec. 11, 1987, 62-312112; Dec. 15, 1987, 62-315206; Feb. 1, 1988, 63-19622
Int. Cl.[5] C08F *10/00*
U.S. Cl. 526—281 9 Claims

1. A process for producing a cyclo-olefinic random copolymer, which comprises copolymerizing an alpha-olefin and a cyclo-olefin in the presence of a catalyst formed from

(A) a compound of a transition metal of Group IVB of the periodic table having as a ligand a multidentate coordination compound in which at least two conjugated cycloalkadienyl groups or substituted products thereof are bonded via a lower alkylene group, and

(B) an aluminoxane.

5,008,357

RESIN FOR MAGNETIC RECORDING MEDIA FROM VINYL CHLORIDE POLYMER WITH QUATERNARY GROUPS

Takeshi Nakachi; Akio Hata, both of Shinnanyo, and Yoshihisa Watanabe, Uji, all of Japan, assignors to Sekisui Kagaku Kogyo Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 236,350, Aug. 22, 1988, Pat. No. 4,861,683, which is a continuation of Ser. No. 30,457, Mar. 25, 1987, abandoned. This application Jun. 26, 1989, Ser. No. 371,590
Int. Cl.[5] C08F *220/34*
U.S. Cl. 526—292.2 1 Claim

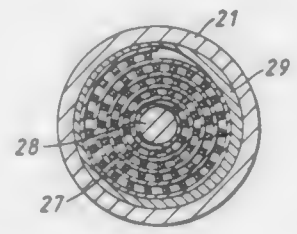
1. A resin used for magnetic recording media, comprising a vinyl chloride copolymer containing vinyl monomers with hydroxyl groups and methacryloyloxyethyltrimethylammonium chloride as component units, wherein

the content of the vinyl chloride is in the range of 60 to 95% by weight,

the content of the vinyl monomers with hydroxyl groups is in the range of 1 to 30% by weight,

the content of the methacryloyloxyethyltrimethylammonium chloride is in the range of 0.05 to 5% by weight in the vinyl chloride copolymer, and

the average degree of polymerization in said vinyl chloride copolymer is in the range of about 150 to 600



5,008,358

POLYMER COMPOSITIONS

Larry Anderson, Battersea; Gregory N. Batts; Malcolm D. Purbrick, both of Bushey; Clare E. Scriven, Harrow, and Stephen A. Jones, Barnet, all of England, assignors to Eastman Kodak Company, Rochester, N.Y.

PCT No. PCT/GB90/00014, § 371 Date Sep. 4, 1990, § 102(e) Date Sep. 4, 1990, PCT Pub. No. WO90/07528, PCT Pub. Date Jul. 12, 1990
PCT Filed Jan. 4, 1990, Ser. No. 571,617
Claims priority, application United Kingdom, Jan. 6, 1989, 8900221
Int. Cl.[5] C08F *12/16, 22/00, 20/18, 222/18*
U.S. Cl. 526—292.3 5 Claims

5. A method of making a hydrophilic crosslinkable copolymer which method comprises forming a composition comprising an ester of an ethylenically unsaturated carboxylic acid wherein the ester group contains a labile primary hydroxyl group, a halohydroxyalkyl ester of an ethylenically unsaturated carboxylic acid and a polymerisation initiator and subjecting the composition to conditions which generate free radicals from the polymerisation initiator.

5,008,359

ISOCYANATE MODIFIED CELLULOSE PRODUCTS AND METHOD FOR THEIR MANUFACTURE

Frank R. Hunter, Bellevue, Wash., assignor to Weyerhaeuser Company, Tacoma, Wash.

Filed Nov. 25, 1988, Ser. No. 275,824
Int. Cl.[5] C08H *5/04*; C08G *18/00*; B32B *21/06, 23/04*
U.S. Cl. 527—103 29 Claims

1. A method for making a modified cellulose product which comprises:

impregnating a cellulosic material with an amount of essentially uncatalyzed polyisocyanate within a range of about 8 to 20% by weight of polyisocyanate to cellulosic material; and

heating the polyisocyanate-impregnated cellulosic material at a temperature within a range of about 105°–245° C. (221°–473° F.) for a time not exceeding about 5 minutes and at a pressure within a range of about 2700 to 8300 kPa (390 to 1200 psi) so as to cure the polyisocyanate.

ORGANOSILICON MATERIALS

John K. Bard, and Julia S. Burnier, both of Wilmington, Del., assignors to Hercules Incorporated, Wilmington, Del.

Filed Oct. 16, 1989, Ser. No. 422,214
Int. Cl.[5] C08G *77/04*
U.S. Cl. 528—25 28 Claims

1. A prepreg which comprises fiber reinforcement impregnated with the partial hydrosilation reaction product of:

(a) at least one polyene having at least two non-aromatic carbon-carbon double bonds highly reactive in hydrosilation, the carbon-carbon double bonds being either in an alpha, beta or gamma position on a linear carbon moiety, next to two bridgehead positions in a strained polycyclic aliphatic ring structure, or in a cyclobutene ring;

(b) dicyclopentadiene and, optionally, one or more other polycyclic polyene having at least two chemically distinguishable non-aromatic, non-conjugated carbon-carbon double bonds in its rings;

(c) at least one cyclic polysiloxane containing three or more ≡SiH groups;

wherein about 55 to about 75% of the ≡SiH groups of the at least one cyclic polysiloxane (c) are reacted and the prepreg is substantially tack-free.

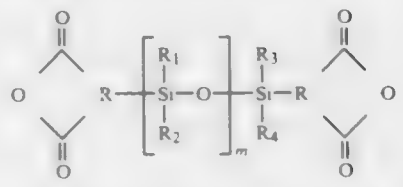
CRYSTALLINE POLYIMIDESILOXANES



Chung J. Lee, Amherst, N.Y., assignor to Occidental Chemical Corporation, Niagara Falls, N.Y.

Filed Jan. 2, 1990, Ser. No. 459,498
Int. Cl.[5] C08G *77/04*
U.S. Cl. 528—26 11 Claims

1. A crystalline polyimidesiloxane comprising a reaction product of benzophenone dianhydride and an organic diamine selected from the group consisting of bis-4(4-aminophenoxy) phenyl sulfone, 2,2-bis-4[4-aminophenoxy phenyl]-propane, and mixtures thereof, and a siloxane monomer selected from the group consisting of siloxane diamines having the formula

and siloxane dianhydrides having the formula

wherein the benzophenone dianhydride and the organic diamine(s) form an oligomer within said polyimidesiloxane of 1 to 10 repeating units, where m is 1 to 10, R is a tri-radical, and R_1, R_2, R_3, and R_4 are independently selected from substituted or unsubstituted aliphatic mono-radical of 1 to 12 carbon atoms or substituted or unsubstituted aromatic mono-radical of 6 to 10 carbon atoms and each R′ is independently selected from substituted or unsubstituted aliphatic di-radical of 1 to 12 carbon atoms or substituted or unsubstituted aromatic di-radical of 6 to 10 carbon atoms.

BINDERS SOLUBLE IN AQUEOUS ALKALI AND CONTAINING SILANYL GROUPS IN THE SIDE CHAIN, PROCESS FOR PREPARING SAME AND ALSO PHOTOSENSITIVE MIXTURE CONTAINING THESE COMPOUNDS

Peter Wilharm, Wiesbaden; Gerhard Buhr, Koenigstein, and Juergen Fuchs, Floersheim-Wicker, all of Fed. Rep. of Germany, assignors to Hoechst Aktiengesellschaft, Frankfurt am Main, Fed. Rep. of Germany

Filed Apr. 3, 1989, Ser. No. 332,511
Claims priority, application Fed. Rep. of Germany, Apr. 2, 1988, 3811242
Int. Cl.[5] C08G *77/04*
U.S. Cl. 528—28 23 Claims

1. A silylated polymeric binder derived from a polymer bearing aliphatic or aromatic hydroxyl groups or both aliphatic and aromatic hydroxyl groups, at least a portion of which is modified by groups of the formulae I and II

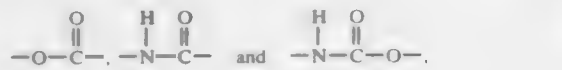
$$[(A-B_n)_mC]-[(D_oE_p)BC]_u- \quad (I)$$

and

$$[(D_oE_p)BC]_r- \quad (II),$$

wherein

A denotes a silanyl group containing at least 2 silicon atoms in total linked to each other, but not more than 3 silicon atoms linked to each other in an unbranched chain of silicon atoms;



B denotes a bridging group having the formula IV:

$$-(b_1)_r-(X)-(b_2)_s- \quad (IV)$$

wherein

b_1 denotes a (C_1–C_4)alkylene of a group containing at least one C—C double bond and resulting from Diels-Alder reaction of an alkadienylene, with a dienophile;

X denotes a single bond, —O—, —S—, $—SO_2—$, —NH—, $—NR^1—$,

wherein

R^1 is a (C_1-C_3)alkyl;

b_2 denotes arylene or cycloalkylene; and

r, s each denotes 0 or 1, with the proviso that for the bridging group B the sum of the values of r and s is at least 1;

C denotes a group derived from a functional group which has been reacted with a hydroxyl group with formation of a covalent bond

D denotes a di- or polyvalent radical of a mono- or polyhydric aliphatic alcohol;

E denotes a di- or polyvalent radical of a mono- or polyhydric aromatic alcohol;

n denotes 0 or 1;

m denotes 1 or 2; and

o, p, u, and v each denote 0 or 1.

5,008,363

LOW TEMPERATURE ACTIVE ALIPHATIC AROMATIC POLYCARBODIIMIDES

Charles B. Mallon, and Howard Chu, both of Belle Mead, N.J., assignors to Union Carbide Chemicals and Plastics Technology Corporation, Danbury, Conn.

Filed Mar. 23, 1990, Ser. No. 497,925
Int. Cl.[5] C08F *8/30*
U.S. Cl. 528—49 **20 Claims**

1. A method for preparing a mixed aliphatic/aromatic polycarbodiimide comprising:

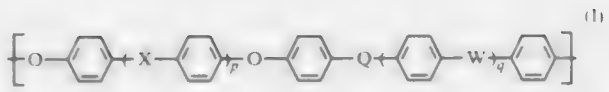
(a) polymerizing a saturated aliphatic diisocyanate or a saturated cycloaliphatic diisocyanate or a mixture thereof, optionally containing a polyfunctional isocyanate, in the presence of a polycarbodiimide polymerization catalyst to form a polycarbodiimide intermediate having free isocyanate groups;

(b) reacting said polycarbodiimide intermediate with a monofunctional isocyanate-reactive compound or a mixture thereof in an amount insufficient to react with all of said free isocyanate groups, and

(c) further polymerizing said polycarbodiimide intermediate in the presence of an aromatic diisocyanate and said catalyst under polycarbodiimide-forming conditions until essentially all of the isocyanate groups are depleted.

5,008,364

THERMOPLASTIC MOLDING MATERIALS WHICH ARE STABLE AT HIGH TEMPERTURES AND HAVE IMPROVED MELT STABILITY

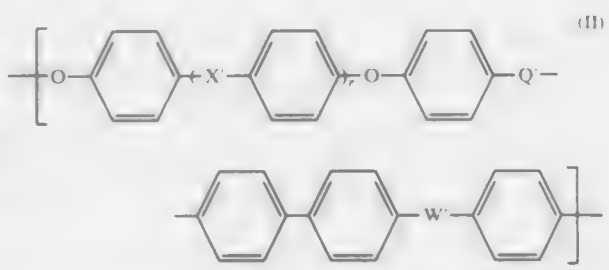


Peter Ittemann, Ludwigshafen; Georg N. Simon, Limburgerhof; Gerhard Heinz, Weisenheim; Hartmut Zeiner, Plankstadt; Hermann Buchert, Bad Duerkheim, and Joachim Seibring, Lambsheim, all of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany

Filed Jun. 20, 1988, Ser. No. 209,215
Claims priority, application Fed. Rep. of Germany, Jun. 27, 1987, 3721337; Sep. 30, 1987, 3732931
Int. Cl.[5] C08G *8/02, 75/20*
U.S. Cl. 528—172 **7 Claims**

1. A thermoplastic molding material which is stable at high temperatures and contains, an essential components,

(A) from 20 to 100% by weight of a polyaryl ether sulfone consisting of

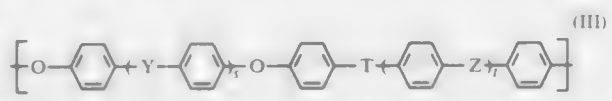


(A_1) from 0 to 100 mol % of units of the formula I

(I)

and

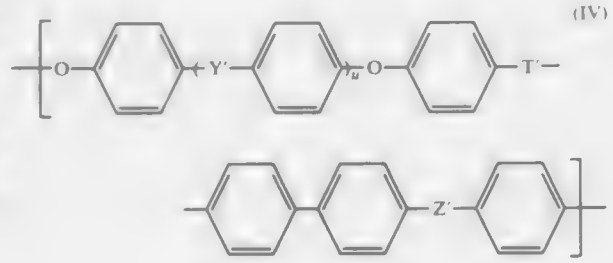
(A_2) from 0 to 100 mol % of units of the formula II



(II)

or their C_1-C_6-alkyl or alkoxy, aryl, chlorine or fluorine derivatives which are substituted in the nucleus, where X, X', Q, Q', W and W' independently of one another are each $—SO_2—$, —O—, —CO—, a chemical bond or —CR-R'— and in each case one or more of the substituents X, Q, W and X', Q, and W' are $—SO_2—$, R and R' are each hydrogen, C_1-C_6-alkyl or alkoxy, aryl or their fluorine or chlorine derivatives, and p, q and r are each 0 or 1, and furthermore

(B) from 0 to 80% by weight of a polyaryl ether ketone consisting of



(B_1) from 0 to 100 mol % of units of the formula III

(III)

and

(B_2) from 0 to 100 mol % of units of the formula

(IV)

or their C_1-C_6-alkyl, C_1-C_6-alkoxy, phenyl, chlorine or fluorine derivatives which are substituted in the nucleus, where Y, Y', T, T', Z and Z' are each —CO—, CR''R''', a chemical bond or —O— and one or more of the substituents Y, T, and Z or Y', T' and Z' are —CO—, R'' and R''' may have the same meanings as R and R', and s, t and u are each 0 or 1, and

(C) from 0 to 90% by weight of fibrous or particulate fillers or a mixture of these,

wherein the said molding material contains not more than 100 ppm, based on total polymer and calculated as alkali metal, of an alkali metal salt as obtained by polycondensation of the respective precursor monomers in an aprotic polar solvent in the presence of an alkali metal carbonate, followed by filtration over a pressure filter and precipitation in water and extraction of the precipitated polycondensation product forming a powder with water until a residual alkali metal content of less than 100 ppm is obtained.

5,008,365

PROCESS FOR THE MANUFACTURE OF UREA-FORMALDEHYDE RESINS CONTAINING MELAMINE

Bernard Druet, Choisy Aubac, and Gerald Rochet, Fontaines Chaaly, both of France, assignors to Norsolor (Orkem Group), Paris LaDefense, France

Continuation of Ser. No. 289,274, Dec. 23, 1988, abandoned. This application Feb. 8, 1990, Ser. No. 477,144
Claims priority, application France, Dec. 23, 1987, 87 17997
Int. Cl.[5] C08G *12/32*
U.S. Cl. 528—230 **19 Claims**

1. A multistage process for the manufacture of urea-melamine-formaldehyde resins containing not more than 10% of melamine and exhibiting a final F/NH_2 molar ratio of between 0.5 and 0.575, the NH_2 groups being the sum total of the NH_2 groups of urea and of melamine which are used, comprising adding the melamine in a first stage of condensation of urea and of a source of formaldehyde, the condensation with melamine being conducted at an acidic pH, under heat, the quantity of urea and formaldehyde used being such that the F/NH_2 molar ratio at this stage is not more than 1.5, the molar equivalents of the NH_2 groups being the sum total of the NH_2 groups of urea and of melamine used until the viscosity of the solution is at least 345 mPa s at 40° C., and introducing additional urea to resultant hot condensation product in a second stage, the quantity of urea an formaldehyde used being such that the F/NH_2 molar ratio at this stage is not more than 1.5, the molar equivalents of the NH_2 groups being the sum total of the NH_2 groups of urea and of melamine used, and introducing additional urea to resultant condensation product in a second stage at an acidic pH to effect further condensation so as to obtain said final F/NH_2 molar ratio.

5,008,366

PROCESS FOR PRODUCING ADHESIVES FROM POLYETHYLENE TEREPHTHALATE

Oscar M. Bathe, Woodridge, Ill., assignor to Amoco Corporation, Chicago, Ill.

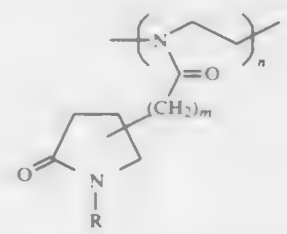
Filed Apr. 25, 1990, Ser. No. 514,428
Int. Cl.[5] C08G *63/46*
U.S. Cl. 528—272 **10 Claims**

1. A process for the preparation of high tack adhesive compositions, as hot melt adhesives for paper, aluminum and polyethylene substrates and as pressure-sensitive adhesives for paper and aluminum substrates, comprising the reaction product of a trimellitic acid polyester ether and a polyol of a molecular weight ranging from about 100 to about 650, and polyethylene terephthalate, which process comprises:

(a) preparing a trimellitic acid polyester ether of at least 500 molecular weight and less than about 1500 molecular weight and an acid number of up to 10 by reacting trimellitic anhydride or trimellitic acid with a polyethylene glycol of molecular weight from about 100 to about 650, wherein mole ratio of said trimellitic anhydride or trimellitic acid to said polyethylene glycol is at least 1:3, in the presence of an esterification catalyst at a temperature within the range of from about 380° F. to about 500° F. at a pressure ranging from about 1 to about 30 atmospheres;

(b) reacting in situ said trimellitic acid polyester ether with polyethylene terephthalate at a temperature within the range of from about 450° F. to about 480° F., a pressure from about 1 to about 30 atmospheres, wherein mole ratio of said trimellitic acid polyester ether to said polyethylene terephthalate is in the range of from about 1:1 to about 1:3, to prepare a copolymer of trimellitic acid polyester ether and polyethylene terephthalate of a molecular weight within the range of from about 1000 to about 1200, a functionality of at least 3, and an acid number of from about 3 to about 10; and

(c) recovering said copolymers of trimellitic acid polyester ether and polyethylene terephthalate as a liquid at elevated temperature or as a solid at ambient temperature.



5,008,367

POLY(PYRROLIDONYL OXAZOLINE)

Gary Dandreaux, Bloomfield; Robert B. Login, Oakland; John J. Merianos, Middletown; Paul Garelick, South Plainfield; Krystyna Plochocka, Scotch Plains; Max Negrin, Bloomfield, and Jenn S. Shih, Paramus, all of N.J., assignors to GAF Chemicals Corporation, Wayne, N.J.

Division of Ser. No. 349,362, May 8, 1989, Pat. No. 4,933,463. This application Mar. 19, 1990, Ser. No. 495,078
Int. Cl.[5] C08G *69/14*
U.S. Cl. 528—326 **3 Claims**

1. A homopolymer having recurring units of the formula:

wherein n has a value of 10 to 50,000, where R is H or alkyl, and m is 0 to 4.

5,008,368

PREPARATION OF POLY(ARYLENE SULFIDE/SULFONE) POLYMER WITH ADDITION OF WATER AFTER POLYMERIZATION IS INITIATED

Afif M. Nesheiwat, Chatham, N.J., assignor to Phillips Petroleum Company, Bartlesville, Okla.

Filed Aug. 3, 1989, Ser. No. 389,020
Int. Cl.[5] C08G *75/14*
U.S. Cl. 528—388 **15 Claims**

1. A method of producing a poly(arylene sulfide/sulfone) polymer which comprises:

(a) contacting reactants comprising an alkali metal sulfide, a dihalogenated aromatic sulfone, a polar organic compound, at least one base and an alkali metal carboxylate under suitable conditions to initiate a polymerization reaction,

(b) thereafter adding an amount of water while maintaining polymerization conditions,

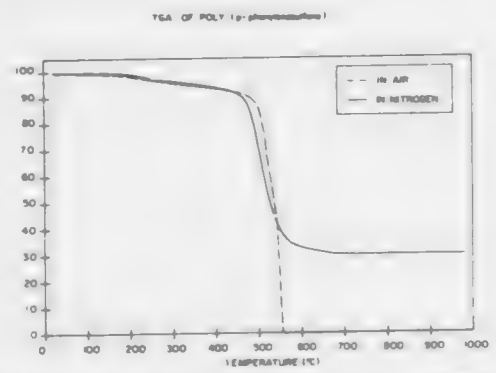
(c) terminating the polymerization reaction, and

(d) recovering the poly(arylene sulfide/sulfone) polymer.

5,008,369

PREPARATION OF POLYSULFONES

Douglas R. Robello, Webster, and Abraham Ulman, Rochester, both of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.



Filed Nov. 1, 1989, Ser. No. 430,039
Int. Cl.[5] C08G *75/14, 75/18, 75/20*
U.S. Cl. 528—391 **11 Claims**

1. A process for the preparation of a polysulfone, said process comprising the self-condensation of a reactant in the presence of an initiator for the self-condensation,

said reactant having a leaving group and a sulfinate group conjugated by an aromatic group Ar, to which said leaving group and aromatic group are substituted, said sulfinate group having the formula $—SO_2M^+$, wherein M is an alkali metal,

said initiator having a bridging group, selected from the carbonyl group or the sulfonyl group, bonded to two

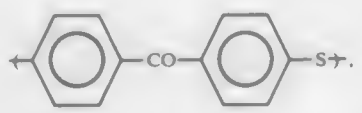
aromatic groups, each of which has a halogen in a position ortho or para to said bridging group,

said process being conducted at a temperature sufficient to cause said self-condensation to take place.

5,008,370

POLY(ARYLENE THIOETHER-KETONES) IMPROVED IN MELT STABILITY AND PREPARATION PROCESS THEREOF

Ken Kashiwadate; Yoshikatsu Satake, both of Iwaki; Takashi Kaneko, Shiroyama; Masahiro Tada, Matsudo, and Takayuki Katto, Iwaki, all of Japan, assignors to Kureha Kagaku Kogyo K.K., Japan



Filed Nov. 3, 1989, Ser. No. 431,118

Claims priority, application Japan, Nov. 11, 1988, 63-283553

Int. Cl.[5] C08F *283/00*

U.S. Cl. 528—481 **5 Claims**

1. A process for the preparation of a poly(arylene thioether-ketone) improved in melt stability, which comprises subjecting a poly(arylene thioetherketone) to a heat treatment for $5-5\times10^3$ minutes in a powdery state and a temperature range of 200°-350° C., said poly(arylene thioether-ketone) having predominant recurring units of the formula

wherein the —CO— and —S— are in the para position to each other, and having the following physical properties (a)–(c):

(a) melting point, Tm being 310°-380° C.;

(b) melt crystallization temperature, Tmc (420° C./10 min) being at least 210° C., and residual melt crystallization enthalpy, ΔHmc (420° C./10 min) being at least 10 J/g, wherein Tmc (420° C./10 min) and ΔHmc (420° C./10 min) are determined by a differential scanning calorimeter at a cooling rate of 10° C./min after the poly(arylene thioether-ketone) is held at 50° C. for 5 minutes in an inert gas atmosphere, heated to 420° C. at a rate of 75° C./min and then held for 10 minutes at 420° C.: and

(c) reduced viscosity being 0.2–2.0 dl/g as determined by viscosity measurement at 25° C. and a polymer concentration of 0.5 g/dl in 98 percent by weight sulfuric acid.

SUBMICRON LIGNIN DISPERSIONS

Mitchell S. Dimitri, Charleston, S.C., assignor to Westvaco Corporation, New York, N.Y.

Division of Ser. No. 255,444, Oct. 11, 1988, Pat. No. 4,957,557. This application Oct. 23, 1989, Ser. No. 408,846

Int. Cl.[5] C08H *5/02*

U.S. Cl. 530—501 **4 Claims**

1. A method of producing a lignin product comprised of lignin particles of submicron median particle diameter comprising the steps of preparing an aqueous solution containing

from about 12 to 18% lignin by weight, about 2 to 15 moles of ammonium hydroxide, about 4 to 12 moles of formaldehyde, and about 0.25 to 1.25 moles of a base selected from the group consisting of sodium hydroxide and potassium hydroxide, per mole of lignin present in the solution, heating the solution to a temperature of at least about 150° F. for sufficient time to cross link the lignin to precipitate lignin particles of submicron median particle diameter suspended in an aqueous colloidal suspension.

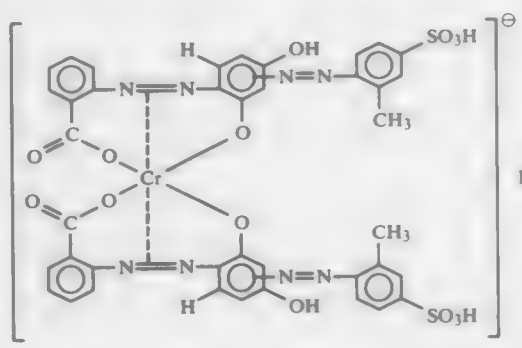
CHROMIUM COMPLEXES OF SULFO GROUP CONTAINING DISAZO COMPOUNDS HAVING A RESORCINOL BISCOUPLING COMPONENT RADICAL

Herbert Holliger, Allschwil, Switzerland, assignor to Sandoz Ltd., Basel, Switzerland



Continuation of Ser. No. 715,701, Mar. 25, 1985, abandoned, which is a continuation of Ser. No. 188,687, Sep. 19, 1980, abandoned. This application Oct. 29, 1987, Ser. No. 114,901

Claims priority, application Switzerland, Sep. 25, 1979, 8638/79

Int. Cl.[5] **C09B** *45/28, 33/04;* **D06P** *1/10, 3/00*

U.S. Cl. 534—684 **6 Claims**

1. A 1:2 chromium complex of the formula

or a salt thereof.

5,008,380

PROCESS FOR THE CONVERSION OF DAUNORUBICIN INTO DOXORUBICIN

Gaetano Palladino; Peter MacDonald, and Ettore Bigatti, all of Milan, Italy, assignors to Sicor Societa 'Italiana Corticosteroidi S.p.A., Milan, Italy

Filed Nov. 9, 1988, Ser. No. 269,199

Claims priority, application Italy, Oct. 11, 1988, 22260 A/88

Int. Cl.[5] **C07H** *15/24, 15/00*

U.S. Cl. 536—6.4 **1 Claim**

1. A process for the preparation of doxorubicin, which consists of reacting 14-bromo-daunorubicin 13, 13-diethylketal in aqueous medium, in the absence of organic solvents, with oxalic acid first at pH 1–2 and, after hydrolysis of the ketal group, at pH 2–6 to obtain doxorubicin 14-oxalate ester, hydrolyzing said ester and isolating doxorubicin from the reaction mixture.

5,008,381

SELECTIVE CLEAVAGE OF NARINGIN

Zdenek Kratky, New Milford, and John S. Tandy, Litchfield, both of Conn., assignors to Nestec S.A., Vevey, Switzerland

Continuation-in-part of Ser. No. 116,555, Nov. 3, 1987, abandoned. This application Feb. 23, 1990, Ser. No. 483,879

Int. Cl.[5] **C07H** *1/00, 1/08*

U.S. Cl. 536—8 **20 Claims**

1. A process for treating naringin for obtaining L-rhamnose and naringenin-7-O-glucoside comprising:

heating naringin in aqueous solution in agitated contact with an acidic catalyst in an amount sufficient for providing H^+ ions to naringin molecules for cleaving the O-glycosidic linkage of the naringin molecule which connects the naringin molecule L-rhamnose and naringenin-7-O-glucoside moieties while substantially avoiding cleaving the naringin molecule O-glucosidic linkage which connects the naringin molecule glucose and naringenin moieties and thereby forming a liquid reaction medium;

cooling the liquid reaction medium to form a liquid phase and a semi-solid phase;

separating the liquid phase from the semi-solid phase; and

isolating L-rhamnose from the liquid phase and isolating naringenin-7-O-glucoside from the semi-solid phase.

15. A process for treating naringin for obtaining L-rhamnose comprising:

heating naringin in aqueous solution to a temperature of from about 70° C. to 200° C. in agitated contact with an acid catalyst selected from a group consisting of a strong cationic exchange resin, hydrochloric acid having a molarity in the naringin solution which does not exceed about 0.1 M and trifluoroacetic acid having a molarity in the naringin solution which does not exceed about 0.2 M for from about 5 secs to 6 hrs for forming a reaction medium containing L-rhamnose and naringenin-7-O-glucoside;

cooling the liquid reaction medium to form a liquid phase and a semi-solid phase;

separating the liquid phase from the semi-solid phase; and

isolating L-rhamnose from the liquid phase.

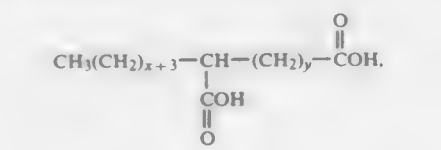
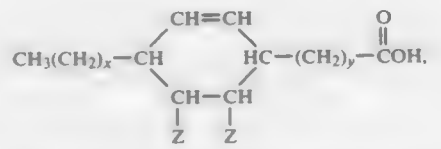
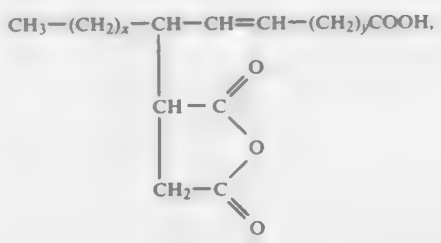
CATIONIC AQUEOUS BITUMINOUS EMULSION-AGGREGATE SLURRIES PREPARATION



Peter Schilling, and Hans G. Schreuders, both of Charleston, S.C., assignors to Westvaco Corporation, New York, N.Y.

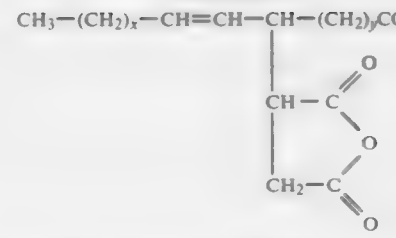


Division of Ser. No. 263,440, Oct. 27, 1988, Pat. No. 4,877,457, which is a continuation-in-part of Ser. No. 197,100, May 20, 1988, Pat. No. 4,810,299. This application Jul. 20, 1989, Ser. No. 370,052

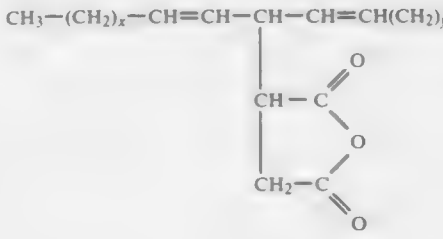


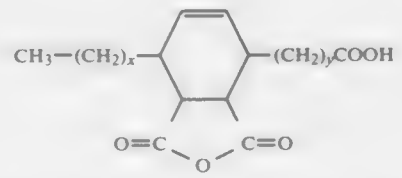
Int. Cl.[5] **C08L** *95/00;* **C09D** *3/24;* **B01J** *13/00*

U.S. Cl. 536—11 **4 Claims**



1. A composition of matter obtained by (1) modifying a polyamine by reaction with a member of the group consisting of sulfonated fatty acids, resin acids (rosin) reacted with maleic anhydride or fumaric acid, and epoxidized esters of unsaturated fatty esters from the group consisting of tallates, oleates, linoleates, glycerides, and polycarboxylic acids and their anhydrides of the formulae





-continued

wherein x and y are integers from 3 to 9, x and y together equal 10–14, at least one Z is a carboxylic acid group and any remaining Z is hydrogen and (2) reacting the modified polyamine with a sugar-containing syrup.

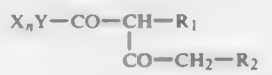
SURFACE-ACTIVE AGENTS

John D. Bu'lock; James K. Sutherland, both of Manchester, and Michael J. Donnelly, Coventry, all of United Kingdom, assignors to 31 Research Exploitation Limited, London, England

PCT No. PCT/GB87/00243, § 371 Date Nov. 3, 1988, § 102(e) Date Nov. 3, 1988, PCT Pub. No. WO87/06236, PCT Pub. Date Oct. 22, 1987



PCT Filed Apr. 9, 1987, Ser. No. 263,775

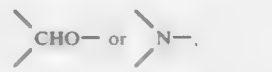
Claims priority, application United Kingdom, Apr. 12, 1986, 8608960

Int. Cl.[5] **C07H** *13/06, 15/12;* **C07C** *69/716;* **B01F** *17/00*

U.S. Cl. 536—4.1 **15 Claims**

1. A process for the preparation of a surface-active substance having the formula

(II)

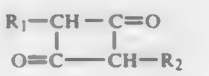


wherein;

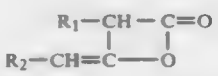
each of R_1 and R_2, which may be the same or different, is an alkyl chain having from 6 to 20 carbon atoms;

X is a mono- or di-valent hydrophilic moiety;

n is 1 or 2; and,



Y is $-CH_2O-$ or $-NH-$ or



said process comprising reacting a compound of the formula

X_nYH

in which X,Y and n are as defined hereinabove, with a diketene of the formula III or IV;

(III)

(IV)

wherein R_1 and R_2 are as stated above, so that the group YH is acylated by the diketene, the acylation reaction being carried out in the presence of a non-acylable nitrogenous base as proton acceptor catalyst and in a polar aprotic solvent medium.

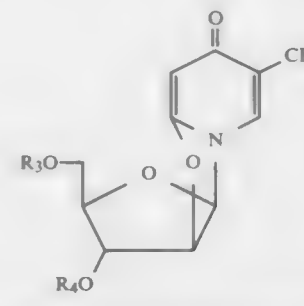
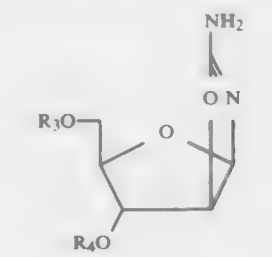
PROCESS FOR THE PRODUCTION OF O2,2'-ANHYDRO-1-(β-D-ARABINOFURANOSYL)THYMINE



Charles W. Murtiashaw, North Stonington, Conn., assignor to Pfizer Inc., New York, N.Y.

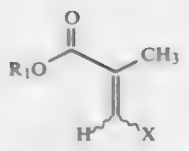
Filed Jul. 12, 1988, Ser. No. 217,906

Int. Cl.[5] **C07H** *19/09, 19/073*



U.S. Cl. 536—23 **14 Claims**

1. A process for the production of a compound of the formula:



(I)

wherein R_3 is selected from the group consisting of hydrogen, triphenylmethyl or silyl which is substituted by three substituents selected from the group consisting of C_1–C_6 alkyl or phenyl and R_4 is selected from the group consisting of hydrogen, or silyl which is substituted by three substituents selected from the group consisting of C_1–C_6 alkyl or phenyl; comprising condensing a compound of the formula:

(II)

wherein R_3 is selected from the group consisting of hydrogen, triphenylmethyl, or silyl which is substituted by three substituents selected from the group consisting of C_1–C_6 alkyl or phenyl and R_4 is selected from the group consisting of hydrogen, or silyl which is substituted by three substituents selected from the group consisting of C_1–C_6 alkyl or phenyl with a compound of the formula:

(III)

wherein R_1 is selected from the group consisting of C_1-C_4 alkyl; X is selected from the group consisting of halogen, or OR_2, wherein R_2 is selected from the group consisting of H, C_1-C_4 alkyl or phenyl; in the presence of a reaction-inert solvent at a temperature of from about 0° to about 150° C.

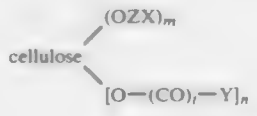
CELLULOSE DERIVATIVES AND FIBERS AND MEMBRANES MADE THEREFROM

Michael Diamantoglou, Erlenbach, Fed. Rep. of Germany, assignor to Akzo N.V., Netherlands

Filed Jul. 15, 1988, Ser. No. 219,309



Claims priority, application Fed. Rep. of Germany, Jul. 18, 1987, 3723897

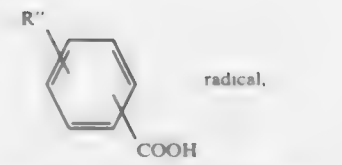
The portion of the term of this patent subsequent to Jan. 1, 2008, has been disclaimed.

Int. Cl.[5] **C08B** *3/20, 11/20, 15/05;* **D01F** *2/02*

U.S. Cl. 536—56 **23 Claims**

1. A cellulose derivative which conforms to the following formula:

wherein



Z has a maximum carbon chain length of 18 carbon atoms and is selected from the group consisting of alkylene, alkenylene, and alkynylene radicals, which may be straight-chain or branched, and wherein the carbon chain may be interrupted by a member selected from the group consisting of O, S, N, P, Si, —CO—, —CONR—, and —COO—, and which may be substituted; cycloalkylene radicals, which may have heteroatoms selected from the group consisting of O, S, N, P and Si and which may be substituted, arylene, arylalkylene, arylalkenylene and arylalkynylene radicals, which may have heteroatoms selected from the group consisting of O, S, N, P and SI and which may be substituted; bisarylalkylene and bisarylene radicals, which may be substituted; condensed aromatic compound radicals, which may be substituted; and heterocyclic compound radicals, which may be substituted;

X is selected from the group consisting of —H, $—NR_2$ $—N^+R_3$, —COOH, a carboxylic acid salt, —COOR, $CONR_2$, —CO—R, —CS—R, —CSOH, a salt thereof, —CSOR, $CSNR_2$, $—CO_3H$, a sulfonic acid salt, $—SO_3R$, $—SO_2—R$, $—SO_2NR_2$, —SR, —SOR, $—SONR_2$, $—PO_3H_2$, a salt thereof, $—PO(OR)_2$, $PO_2H(NR_2)$, $—PO(NR_2)_2$, PO_2H_2, —POH(OR), —CN, $—NO_2$, —OR, halogen, and $—Si(OR)_3$;

R is selected from the group consisting of hydrogen; alkyl, alkynyl, and alkenyl groups having from 1 to 25 carbon atoms, which may be straight-chain or branched, and which may be substituted; cycloalkyl groups, which may have heteroatoms selected from the group consisting of O, S, N, P and Si and which may be substituted; and tolyl, benzyl, and phenyl groups, which may have heteroatoms selected from the group consisting of O, S, N, P and Si and which may be substituted;

t=0 or 1, such that when t=1,

Y is selected from the group consisting of a

radical,

$—(CH_2)_r—COOH$, $—(C_2H_3)—COOH$, $(CH_2)_r—H$

$—(C_2R''_4)—COOH$, $—CR''=CR''—COOH$, —(CH=CH—COOH); $—NR'_2$, —NHR′, $—NHSO_2R'$, and —R′; wherein

R′ has a maximum carbon chain length of 18 carbon atoms and is selected from the group consisting of alkyl, alkenyl, and alkynyl groups having from 1 to 36 carbon atoms which may be straight-chain or branched and wherein the carbon chain may be interrupted by a member selected from the group consisting of O, S, N, P, Si, —CO—, —CONR—, and —COO—, and which may be substituted; cycloalkyl radicals, which may have heteroatoms selected from the group consisting of O, S, N, P and Si and which may be substituted; aryl, arylakyl, arylalkenyl, and arylalkynyl radicals, which may have heteroatoms selected from the group consisting of O, S, N, P and Si and which may be substituted; bisarylalkyl and bisaryl radicals, which may be substituted; condensed aromatic compound radicals, which may be substituted; and heterocyclic compound radicals, which may be substituted;

R″ is selected from the group consisting of X and R′; and

r=1 to 20;

m=0 to 2.5;

n=0.01 to 2.95;

and when

t=0,

Y is a member selected from the group consisting of CS—R′, CO—OR′, CSNH—R′, $CSNR'_2$, $SO_2—OR'$, $SO_2—R'$, $SO_2NR'_2$, SO—R′, $SONR'_2$, PO_3H_2, $PO_2R'_2$, POR'_2, and $PO(OR')_2$;

and

R′ has a maximum carbon chain length of 18 carbon atoms and is a member selected from the group consisting of hydrogen; alkyl, alkenyl, and alkynyl groups having from 1 to 36 carbon atoms, which may be straight-chain or branched, wherein the carbon chain may be interrupted by a member selected from the group consisting of O, S, N, P, Si, —CO—, —CONR— and —COO—, and which may be substituted; cycloalkyl radicals which may have heteroatoms selected from the group consisting of O, S, N, P and Si and which may be substituted; aryl, arylalkyl, arylalkenyl, and arylalkynyl radicals, which may have heteroatoms selected from the group consisting of O, S, N, P and Si and which may be substituted; bisarylalkyl and bisaryl radicals, which may be substituted; condensed aromatic compound radicals, which may be substituted; and heterocyclic compound radicals, which may be substituted;

wherein

m=0 to 2.5

n=0.01 to 2.95, and

wherein a degree of polymerization of said derivative is higher than 400, and which is synthesized from cellulose in a mixture of LiCl and one or more members selected from the group consisting of dimethyl acetamide and N-methylpyrrolidone.

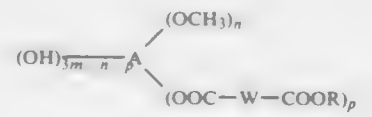
METHYLATED CYCLODEXTRIN TYPE COMPOUNDS AND PROCESS FOR PREPARING SAME

Tibor Szabó; László Institóris; József Szejtli; Lajos Szente, all of Budapest, and Ildikó Jod/e,acu/a/ l, Debrecen, all of Hungary, assignors to Chinoin Gyogyszer es Vegyeszeti Termekek Gyara RT., Budapest, Hungary

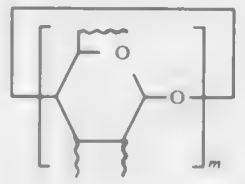


Filed Oct. 12, 1988, Ser. No. 256,857

Claims priority, application Hungary, Oct. 13, 1987, 4605/87

Int. Cl.[5] **C08B** *37/16*

U.S. Cl. 536—103 **8 Claims**



1. A partially methylated carboxyacyl-cyclodextrin of the formula (I),

(I)

wherein

A means the cyclodextrin skeleton of the formula (II)

(II)

containing the substituents in the position labelled by the wavy line;

W stands for an alkylene, alkenylene or arylene group;

R means hydrogen, alkyl, aryl or aralkyl;

m is 6, 7 or 8;

n is an integer from 1 to 2m; and

p is 2m−n+z, wherein the value of z is from 0 to 3 with the proviso that p does not equal 0 or a salt thereof.

5,008,387

PROCESS FOR PURIFYING SUCROSE FATTY ACID ESTERS

Shusaku Matsumoto, Kyoto; Yoshio Hatakawa, Higashiosaka, and Akihiko Nakajima, Kyoto, all of Japan, assignors to Dai-Ichi Kogyo Seiyaku Co., Ltd., Kyoto, Japan

Filed Apr. 14, 1989, Ser. No. 338,012

Claims priority, application Japan, Apr. 18, 1988, 63-95243

Int. Cl.[5] **C07H** *1/00, 13/00;* **C13F** *3/00*

U.S. Cl. 536—119 **19 Claims**

10. A process for preparing a powder of a sucrose fatty acid ester which comprises subjecting an aqueous solution of a reaction mixture obtained by the reaction of sucrose and a fatty acid methyl ester in the presence of a catalyst to ultrafiltration, said reaction mixture containing the unreacted sucrose, the unreacted fatty acid methyl ester, the catalyst, a soap, a fatty acid and a volatile component, thereby separating the unreacted sucrose, a salt drived from the catalyst and the volatile component with water, bringing the remaining aqueous solution containing the sucrose fatty acid ester, the unreacted fatty acid methyl ester, the soap and the fatty acid into contact with a reverse osmosis membrane, thereby concentrating the aqueous solution, and spray drying the resulting concentrate.

5,008,388

PROCESS FOR PREPARATION OF A NEW HEMIN COMPLEX
